

CSi

CSI API ETABS v1

Introduction

This document illustrates how to connect to ETABS using the CSI Application Programming Interface (API) from a variety of clients.

The API is defined in the form of a .NET 4.7.1 dynamic link library, and is implemented by ETABS. It can be accessed from .NET 4.7.1 and COM based clients.

Please note that ETABS must be installed both on the API client development machine, and on the client end-user's machine.

İ»İ

CSI API ETABS v1

Release Notes

This topic contains the following sections:

- [Current Version](#)
- [Select Notes from Previous Versions](#)
- [See Also](#)

▲ Current Version

Remote API

The ETABS API can now be used to start and/or connect to a running instance of ETABS on a Remote Computer, allowing for models with many load cases to be analyzed in a parallel, distributed manner. Please refer to the page, [Remote API](#)

ETABSV17 Deprecated

ETABSV17, ETABS 2016, ETABS 2015 and ETABS 2013 are no longer supported. It is recommended that all client applications be upgraded to reference the latest version of ETABSV1.DLL or CSiAPIv1.DLL .

▲ Select Notes from Previous Versions

ETABSV1.DLL

Beginning with Version 18 of ETABS, the API library no longer has the program version as part of its name. So, while the name of the API library for ETABS version 17 was ETABSV17.DLL , the name of the API library for ETABS version 18 is **ETABSV1.DLL** . The name of the API library will remain ETABSV1.DLL , even as new major versions of ETABS are released. A new API function, `cHelper.GetOAPIVersionNumber` , has been added. This API version number will increment as new API functions are added, but the API library name will remain ETABSV1.DLL .

Once users reference the new ETABSV1.DLL in their client applications, they will no longer need to update with every major release. The ETABSV1.DLL reference in their client application will automatically use the latest edition of ETABSV1.DLL that is registered with each product installation. Even so, developers should always use `cHelper.GetOAPIVersionNumber` to check which version of the API library they are using.

CSiAPIv1.DLL

Beginning with Version 18 of ETABS, a new API library, **CSiAPIv1.DLL**, has been introduced. This library is compatible with SAP2000, CSiBridge, and ETABS. It will be available with all new versions of each product. Developers can now create API client applications that reference CSiAPIv1.DLL , and connect to either SAP2000, CSiBridge, or ETABS, without any code changes required. Similar to the new ETABSV1.DLL , the assembly name CSiAPIv1.DLL will not change, even as new major versions of SAP2000, CSiBridge, and ETABS are released. CSiAPIv1.DLL also exposes

Introduction

cHelper.GetOAPIVersionNumber , which should be used by developers to check which version of the API library they are using. As the version increases and new functionality is added, compatibility with previous versions will be preserved, and client applications will not require recompilation.

The latest version of CSiAPIv1.DLL included with ETABS version 18 is strong-named, making it incompatible for .NET clients developed with previously released versions of CSiAPIv1.DLL that were released with SAP2000 or CSiBridge v21.0.0 - v21.0.2 . .NET clients that reference previous versions of CSiAPIv1.DLL can be recompiled with the latest assembly included with ETABS version 18 in order for the client to be compatible with all products.

Interactive Database

A powerful new feature, the Interactive Database, has been added to the API in ETABS version 18. This feature allows the API user to retrieve all available data in the program, including analysis and design results. It also allows the user to set nearly all model parameters programmatically. Please refer to the page, [Interactive Database](#)

Attaching to a Running Instance

API client applications can connect to a manually started instance of ETABS. Please refer to the page, [Attaching to a Manually Started Instance of ETABS](#)

CSI API ETABS v1

Attaching to a Manually Started Instance of ETABS

These instructions document the steps necessary to attach to instances of ETABS that were started manually. The example code is in VB.NET.

1. Start ETABS manually, e.g. by clicking on the program shortcut
2. Instead of creating a new ETABSObject, attach to the instance of the ETABSObject that was created and added to the Running Object Table by ETABS.

The code below creates an ETABSObject and starts the program:

VB

Copy

```
Dim myETABSObject As ETABSv1.cOAPI
Dim myHelper as ETABSv1.cHelper = New ETABSv1.Helper

myETABSObject = myHelper.CreateObject("C:\Program Files (x86)\Computers and Structures\ETA

ret = myETABSObject.ApplicationStart()

Dim mySapModel As ETABSv1.cSapModel = myETABSObject.SapModel
```

Replace the code above with the code below to attach to the existing ETABSObject. Since the program is already started, there is no need to call ETABSObject.ApplicationStart:

VB

Copy

```
Dim myETABSObject As ETABSv1.cOAPI
Dim myHelper as ETABSv1.cHelper = New ETABSv1.Helper

myETABSObject = myHelper.GetObject("CSI.ETABS.API.ETABSObject")

Dim mySapModel As ETABSv1.cSapModel = myETABSObject.SapModel
```

3. Other calls can then be made normally. The program can be ended manually or by calling ETABSObject.ApplicationExit
4. Please note that if multiple instances of ETABS are manually started, an API client can only attach to the instance that was started first.

CSI API ETABS v1

Information for Plugin Developers

This topic contains the following sections:

- [Plugin Considerations](#)
- [The cPlugin Class](#)
- [Adding Plugins](#)

Plugins can be developed to make use of the ETABS API from inside the program.

No license is required to use the API for plugin development, beyond having a valid license for ETABS. However, technical support for developing with the API is not included. For qualified users and third-party developers who would like technical support to help them build solutions and integrations with ETABS using the ETABS API, Computers and Structures, Inc. has created a subscription-based service, CSI Developer Network (CSIDN) (see <http://www.csiamerica.com/support/csidsn>). Developers must subscribe to CSIDN to be eligible for technical support for the ETABS API.

Plugins can be developed in a .NET compatible language (e.g. VB.NET, C#, etc.) as a .NET DLL, or by using any language capable of creating a COM server compiled as a DLL. An example plugin project can be found at:

<https://wiki.csiamerica.com/display/kb/Sample+Plugin+1>

■ Plugin Considerations

The plugin must reference the ETABSV1 API library (either ETABSV1.DLL or ETABSV1.TLB), which must be registered on the developer's and the user's systems. This registration takes place during the installation of ETABS. The ETABSV1.DLL is compiled as AnyCPU, hence it can be referenced by both 64-bit and AnyCPU-compiled plugin projects.

Please note that COM plugins must be registered for COM on the user's system, before they can be used in ETABS. This will require that the ETABSV1.DLL be present in the directory where the COM plugin is being registered. It is the plugin developer's responsibility to instruct users how to install the plugin. Plugins should be installed only after ETABS has been installed. COM Plugin developers should consider that registering assemblies usually requires administrative permissions, which many users may not have.

Plugins compiled as 32-bit will not work with 64-bit ETABS.

We recommend that developers create .NET plugins that are compiled as 64-bit or AnyCPU . This will allow your plugin to be called from both 64-bit ETABS, and will not require registration.

Please make sure your plugin is stable, handles errors well, and does not cause any unintended changes to the user's model.

We will attempt to maintain a stable interface in ETABS, however, that cannot be guaranteed, and updates to your plugin may be required for future versions of ETABS.

■ The cPlugin Class

In order for ETABS to be able to launch your plugin, your plugin assembly must contain a class called cPlugin that implements the cPluginContract interface in the ETABS API.

Please refer to the cPluginContract page for an explanation of its methods. They are also described below.

Class cPlugin must contain two methods, cPlugin.Info and cPlugin.Main

VB

Copy

```
Public Function Info(ByRef Text As String) As Integer
```

The function cPlugin.Info has one reference argument, Text, and returns a 32-bit signed integer. The return value should be zero if successful. The string argument should be filled in by the function, and may be plain text or rich text. This string will be displayed when the user first adds the plugin to ETABS. You can use this string to tell the user the purpose and author of the plugin. This is in addition to any information you may provide when the user executes the plugin.

VB

Copy

```
Public Sub Main(ByRef SapModel As ETABSV1.cSapModel, ByRef ISapPlugin As ETABSV1.cPluginCallback)
```

The subroutine cPlugin.Main is the entry point to launch your plugin. All functionality in your plugin will proceed from this method. If your plugin has an initial form, it should be opened within this method.

cPlugin.Main has two reference arguments of types ETABSV1.cSapModel and ETABSV1.cPluginCallback:

The SapModel argument is a reference to the SapModel object upon which all operations will be performed

For the ISapPlugin argument, please refer to the cPluginCallback page for an explanation of its properties. Its only method is very important and explained below.

VB

Copy

```
ETABSV1.cPluginCallback.Finish(ByVal iVal As Integer)
```

ETABSV1.cPluginCallback contains a Finish subroutine that must be called immediately before the plugin closes (e.g., if the plugin has a single main window, at the end of the close event of that form). Its one argument, iVal, is an error flag to let ETABS know if the operation was successful or not. Zero indicates no error. ETABS will wait indefinitely for ETABSV1.cPluginCallback.Finish to be called, so the plugin programmer must make sure that it is called when the plugin completes.

It is OK for cPlugin.Main to return before the actual work is completed (e.g., return after displaying a form where the functionality implemented in the plugin can be accessed through different command buttons). However, it is imperative to call ETABSv1.cPluginCallback.Finish to return control back to ETABS when the plugin is ready to close.

Your plugin should include options for the user to obtain information about the product, developer, and technical support. Support for your plugin will not be provided by Computers and Structures, Inc.

As currently implemented, the cPlugin object will be destroyed between invocations from the ETABS Tools menu command that calls it, so data cannot be saved.

Adding Plugins

Plugin Name	Menu Text	Plugin Path
-------------	-----------	-------------

External Plugin Data Form

Adding a COM Plugin

To add a COM plugin to the Tools menu in ETABS, users will select "Add/Show Plugins" from the Tools menu. In the External Plugin Data form, they will type the name of the COM server DLL in the "Plugin Name" field.

Please note that ETABS will look for the plugin by Type Library name (usually the name of the plugin project), which you define when developing your COM server DLL. We suggest using a unique name such as ETABSPlugIn_xxx_yyy, where xxx is your (company) name, and yyy is the name to distinguish the plugin from other plugins that you develop, e.g. ETABSPlugIn_OmniCorp_Robo1.

Introduction

The "Plugin Name" must exactly match the COM server DLL name. However, the plugin will appear under the Tools menu under the "Menu Text" name. That can be whatever the user likes, but it should be different for each plugin added.

The "Plugin Path" field should be left blank for COM plugins.

After clicking the "Add" button, the "Status" field will indicate whether the plugin was successfully located in the registry and loaded.

Adding a .NET Plugin

The process for adding a .NET plugin is much simpler. In the External Plugin Data form, the user should simply browse for and select the plugin .NET DLL and click the "Add" button. The rest of the fields will be automatically populated. It is still recommended that .NET plugins be given unique names.

CSI API ETABS v1

Interactive Database

Beginning with Version 18, ETABS includes a new set of database tables that allow significantly better interactive editing capability (similar to other CSI programs, such as SAP2000 and SAFE). For API users who wish to take advantage of these interactive tables, a new class has been added, `cDatabaseTables`. It is recommended that API users first familiarize themselves with the new database tables using the ETABS GUI, to understand how data can be requested, viewed, modified, and applied to the model.

Generally, the API user will start with a call to `GetAvailableTables`. They can decide which tables they want to retrieve data from, or edit and apply to the model. A call to `GetAllFieldsInTable` will show the user which columns the table has, and which columns can be edited and imported.

If the user simply wants to retrieve data, they can use one of the `GetTableForDisplay...` functions. Functions are provided to set the Load Cases, Load Combinations, and Load Patterns for which data is desired. The `SetOutputOptionsForDisplay` function can be used to set other options for display.

If the user would like to edit a table and import it into the model, they should start by calling one of the `GetTableForEditing...` functions. This will retrieve the table data in one of several formats. The user can then edit that data, but they must ensure that the format of the data is not altered. Then they can import the edited table data with the respective `SetTableForEditing...` function. These functions only operate on one table at a time, but any number of edited tables can be imported by calling them successively. Finally, to apply the edited tables to the model, the user will call `ApplyEditedTables`. If for any reason the user would like to clear the internal list of edited tables set using the `SetTableForEditing...` functions, they can call the `CancelTableEditing` function.

For thorough descriptions of database table operations, please refer to the function documentation in `cDatabaseTables`. For detailed examples of interactive database editing using the API, please visit the CSI Wiki page at: <https://wiki.csiamerica.com> and search for "interactive database API".

CSI API ETABS v1

Launching the Installed Version of ETABS Automatically

With the release of ETABS 2016 v16.1.0, new functionality has been added to the cHelper interface to allow users to launch the application without supplying the path to the ETABS.exe . The example code is in VB.NET.

1. Previously, users would launch the program with the function cHelper.CreateObject , providing the full path to the ETABS.exe as an argument, as below:

VB

Copy

```
Dim myETABSObject As ETABSV1.COAPI
```

```
Dim myHelper as ETABSV1.cHelper = New ETABSV1.Helper
```

```
myETABSObject = myHelper.CreateObject("C:\Program Files (x86)\Computers and Structures\ETA
```

```
ret = myETABSObject.ApplicationStart()
```

```
Dim mySapModel As ETABSV1.cSapModel = myETABSObject.SapModel
```

2. While the code above is still available, a simpler method has been added to cHelper . The CreateObjectProgID function takes the Program ID as an argument, and automatically launches the most recently installed version of ETABS:

VB

Copy

```
Dim myETABSObject As ETABSV1.COAPI
```

```
Dim myHelper as ETABSV1.cHelper = New ETABSV1.Helper
```

```
myETABSObject = myHelper.CreateObjectProgID("CSI.ETABS.API.ETABSObject")
```

```
ret = myETABSObject.ApplicationStart()
```

```
Dim mySapModel As ETABSV1.cSapModel = myETABSObject.SapModel
```

CSI API ETABS v1

Programming Concepts Used in the CSI API

This topic contains the following sections:

- Option Base
- Fixed-Size and Dynamic Arrays
- Optional Arguments
- ByVal and ByRef

Some of the programming concepts and definitions that apply to the CSI API are explained herein.

▲ Option Base

ETABS uses a lower bound of 0 for all arrays. Any program that accesses ETABS through the API should also use a lower bound of 0 for its arrays.

▲ Fixed-Size and Dynamic Arrays

Arrays can be used to refer to a series of variables by the same name and to use a number (an index) to distinguish them. Visual Basic has two types of arrays: fixed-size and dynamic. A fixed-size array always remains the same size. A dynamic array can change its size while the program is running.

A fixed-size array is declared with the size indicated. For example, the following line declares MyFixedArray dimensioned to 2.

VB

Copy

```
Dim MyFixedArray(2) as Double
```

Dimensioning the array to 2 means that it holds three data items:

VB

Copy

```
MyFixedArray(0) = first data item
MyFixedArray(1) = second data item
MyFixedArray(2) = third data item
```

Dynamic arrays are declared with no size indicated as shown here:

VB

Copy

```
Dim MyDynamicArray() as Double
```

Dynamic arrays are dimensioned sometime after they are declared using a statement such as the following:

VB

Copy

```
ReDim MyDynamicArray(2)
```

Any array that is dimensioned inside ETABS must be declared as a dynamic array so that ETABS can redimension it. It is probably a good idea to declare all arrays as dynamic arrays for simplicity. As an example, the analysis results obtained through the CSI API are stored in arrays that are defined as dynamic arrays by the user and then dimensioned and filled inside of ETABS.

Optional Arguments

Some of the CSI API functions have optional arguments. For example, the CountLoadDispl function has two optional arguments: Name and LoadPat. It is not necessary to include the optional arguments when calling this function. All four of the following calls are valid.

VB

Copy

```
ret = SapModel.PointObj.CountLoadDispl(Count)
```

```
ret = SapModel.PointObj.CountLoadDispl(Count, Name)
```

```
ret = SapModel.PointObj.CountLoadDispl(Count, , LoadPat)
```

```
ret = SapModel.PointObj.CountLoadDispl(Count, Name, LoadPat)
```

Note in the third example, the first optional item is not included and the second optional item is included. In that case, commas must be used to delineate the missing arguments.

ByVal and ByRef

Variables are passed to the CSI API functions using the ByRef or the ByVal keyword.

ByVal means that the variable is passed by value. This allows the CSI API to access a copy of the variable but not the original variable. This means the value of the variable in another application can not be changed by the API.

ByRef means the argument is passed by reference. This passes the address of the variable to the CSI API instead of passing a copy of the value. It allows the CSI API to access the actual variable, and, as a result, allows ETABS to change the variable's actual value in an application.

Variables are passed ByRef when data needs to be returned in them from ETABS to your application. In addition, the API requires that all arrays be passed ByRef.

ï»¿

CSI API ETABS v1

Remote API

The ETABS API can be used to start and/or connect to a running instance of ETABS on a remote computer that is running the API Service. This can be particularly useful if you need to run many load cases (e.g., earthquakes for performance-based design), and there are multiple machines available for running analyses simultaneously.

Simultaneous runs can be started on multiple Remote Computers using an API script or plug-in, and results can be merged to the Main Computer programmatically, without user intervention, as they become available. Other applications could include using distributed processing to run a large parameter study or Monte Carlo simulation.

Terminology

- **Main Computer** - Your primary computer
- **Remote Computer** - Any other computer that you have access to (physically or over the network) and that is available for running analyses and/or API scripts
- **API Service** - `CSiAPIService.exe` command line utility running on a remote computer that enables Remote API
- **TCP Port** - A TCP (Transmission Control Protocol) port is an integer between 0 to 65535 used to identify which service is to receive a packet/message sent to a Remote Computer

Requirements and Limitations

- Depending on the type of firewall installed on a Remote Computer, you may have to create a firewall exception on that Remote Computer to allow the API Service to communicate on your network. This is done automatically for Windows Firewall during the installation of ETABS, but it may have to be manually done for other firewalls and will require administrative privileges. This is typically a one-time operation.
- The API Service has two modes:

◆ Product-Specific:

- ◊ Listens to connections made from ETABSV1.dll at default TCP port 11647
- ◊ This is the default mode and can be started using the following command:

`CSiAPIService.exe` or `CSiAPIService.exe --api A`

◆ Cross-Product:

- ◊ Listens to connections made from CSiAPIv1.dll at default TCP port 11646
- ◊ This can be started using the following command:

`CSiAPIService.exe --api C`

- Multiple API Service instances can be run simultaneously on a Remote Computer as long as they do not use the same TCP port. In case of TCP port conflicts with other programs, it is possible to assign a specific TCP port to each API Service instance using the following command:

◆ `CSiAPIService.exe --port [portNumber]`

where [portNumber] is between 1024 and 49151

It is also possible to override the default TCP port for Product-Specific and Cross-Product API modes using the following Windows environment variables:

◆ Product-Specific: `ETABSV1_COAPI_DEFAULT_PORT`

◆ Cross-Product: `CSiAPIv1_COAPI_DEFAULT_PORT`

▲ Procedure

- Install the ETABS program on the Main and Remote Computers
- On each Remote Computer, open a command prompt and run `CSiAPIService.exe`, located in the ETABS installation folder, to start the API Service
 - ◆ **Tip:** Type `CSiAPIService.exe --help` to view a detailed list of options where you can set
 - ◇ The TCP port to use
 - ◇ API mode: Product-specific or Cross-product
 - ◆ **Tip:** You can set the API Service to run automatically when your computer starts. See [Change which apps run automatically at startup in Windows 10](#) for details
- On your Main Computer, run a script, program, or ETABS Plug-in that uses one of the following API calls to start (`CreateObject`) or connect to (`GetObject`) an instance of ETABS on a Remote Computer:
 - ◆ `cHelper.CreateObjectHost( ByVal hostName As String, ByVal fullPath As String)`
 - ◆ `cHelper.CreateObjectHostPort( ByVal hostName As String, ByVal portNumber As Integer, ByVal fullPath As String)`
 - ◆ `cHelper.CreateObjectProgIDHost( ByVal hostName As String, ByVal progID As String)`
 - ◆ `cHelper.CreateObjectProgIDHostPort( ByVal hostName As String, ByVal portNumber As Integer, ByVal progID As String)`
 - ◆ `cHelper.GetObjectHost( ByVal hostName As String, ByVal progID As String)`
 - ◆ `cHelper.GetObjectHostPort( ByVal hostName As String, ByVal portNumber As Integer, ByVal progID As String)`

The above API calls receive the name of the Remote Computer (e.g. `hostName = "myserver"`), and optionally a TCP port number, in addition to the arguments of the regular `cHelper.CreateObject()` or `GetObject()` API calls. Upon successful instantiation at a Remote Computer, subsequent calls to the returned `cOAPI` object will execute on the Remote Computer. API calls can be used to open models, modify them, run analysis and design, extract results, and merge

Introduction

results back to identical models on the Main Computer.

CSI API ETABS v1

Unit Abbreviations

In the documentation of each CSI API function, parameters that have units associated with them are followed by one of the following abbreviations, to indicate the units for those parameters.

[L] = Length

[F] = Force, [F] = [ML/s²]

[M] = Mass

[s] = Time, seconds

[T] = Temperature

[cyc] = Cycles

[rad] = Radians (angle measurement)

[deg] = Degrees (angle measurement)

Combinations of these abbreviations are used in many cases. For example, moments are indicated as [FL] and stresses are indicated as [F/L²].

CSi

CSI API ETABS v1

Overview

The steps that follow provide a general overview of the procedure for connecting to ETABS through the API.

1. Early bind to the interface: `ETABSV1.dll` for .NET 4.5 clients and `ETABSV1.tlb` for COM clients.
2. Late bind to `ETABS.exe`, create an instance of the "ETABSObject", and get a reference to the `cOAPI` interface.
3. Use the `cOAPI` interface to start/end the program and get a reference to the `cSapModel` interface to access all API classes and functions.
4. **This step is only necessary when ETABS.exe is located on a network share.**

Find the configuration file for the API client ([clientname].exe.config) under its installation folder and add the following to it:

XML

Copy

```
<configuration>
  <runtime>
    <loadFromRemoteSources enabled="true" />
  </runtime>
</configuration>
```

If the configuration file is not present, create it with the above contents.

i>>i

CSI API ETABS v1

Visual Basic for Applications (VBA) via Excel

1. Create a new VBA project.
2. Add a reference to `ETABSv1.tlb` to the VBA project. This early binds to the API using the COM interface. `ETABSv1.tlb` can be found in the directory where ETABS is installed.
3. Add a new module to the VBA project and paste in the following, ready-to-run code.

VB

Copy

Sub Main()

```

' set the following flag to True to attach to an existing instance of the program
' otherwise a new instance of the program will be started
Dim AttachToInstance As Boolean
AttachToInstance = False

' set the following flag to True to manually specify the path to ETABS.exe
' this allows for a connection to a version of ETABS other than the latest installation
' otherwise the latest installed version of ETABS will be launched
Dim SpecifyPath As Boolean
SpecifyPath = False

' if the above flag is set to True, specify the path to ETABS below
Dim ProgramPath As String
ProgramPath = "C:\Program Files\Computers and Structures\ETABS 19\ETABS.exe"

' full path to the model
' set it to the desired path of your model
Dim ModelDirectory As String
ModelDirectory = "C:\CSi_ETABS_API_Example"
If Len(Dir(ModelDirectory, vbDirectory)) = 0 Then
    MkDir ModelDirectory
End If

Dim ModelName As String
ModelName = "ETABS_API_Example.edb"

Dim ModelPath As String
ModelPath = ModelDirectory & Application.PathSeparator & ModelName

' create API helper object
Dim myHelper As ETABSv1.cHelper
Set myHelper = New ETABSv1.Helper

' dimension the ETABS Object as c0API type
Dim myETABSObject As ETABSv1.c0API
Set myETABSObject = Nothing

' use ret to check return values of API calls
Dim ret As Long

If AttachToInstance Then
    ' attach to a running instance of ETABS
    ' get the active ETABS object

```

Introduction

```
Set myETABSObject = myHelper.GetObject("CSI.ETABS.API.ETABSObject")
Else
  If SpecifyPath Then
    'create an instance of the ETABS object from the specified path
    Set myETABSObject = myHelper.CreateObject(ProgramPath)
  Else
    'create an instance of the ETABS object from the latest installed ETABS
    Set myETABSObject = myHelper.CreateObjectProgID("CSI.ETABS.API.ETABSObject")
  End If
  'start ETABS application
  myETABSObject.ApplicationStart
End If

'get a reference to cSapModel to access all API classes and functions
Dim mySapModel As ETABSv1.cSapModel
Set mySapModel = myETABSObject.SapModel

'initialize model
ret = mySapModel.InitializeNewModel()

'create steel deck template model
ret = mySapModel.File.NewSteelDeck(4, 12, 12, 4, 4, 24, 24)

'save model
ret = mySapModel.File.Save(ModelPath)

'run analysis
ret = mySapModel.Analyze.RunAnalysis

'close ETABS
myETABSObject.ApplicationExit (False)

'clean up variables
Set mySapModel = Nothing
Set myETABSObject = Nothing

If ret = 0 Then
  MsgBox "API script completed successfully."
Else
  MsgBox "API script FAILED to complete."
End If

Exit Sub

ErrorHandler:
  MsgBox "Cannot run API script: " & Err.Description

End Sub
```

CSI API ETABS v1

Visual Basic or C# 2012 (.NET 4.0)

1. Create a new project of type Windows Form Application
2. Add a reference to â ETABSv1.dllâ to the .NET project. This early binds to the API using the .NET interface.
3. Add a button to the form, double-click the button, then paste in the following, ready-to-run code.

C#VBC++F#Copy

```

using System;
using System.Collections.Generic;
using System.ComponentModel;
using System.Data;
using System.Drawing;
using System.Linq;
using System.Text;
using System.Windows.Forms;

namespace WindowsFormsApplication1
{
    public partial class Form1 : Form
    {
        public Form1()
        {
            InitializeComponent();
        }

        private void button1_Click(object sender, EventArgs e)
        {
            //set the following flag to true to attach to an existing instance of the prog
            //otherwise a new instance of the program will be started
            bool AttachToInstance;
            AttachToInstance = false;

            //set the following flag to true to manually specify the path to ETABS.exe
            //this allows for a connection to a version of ETABS other than the latest ins
            //otherwise the latest installed version of ETABS will be launched
            bool SpecifyPath;
            SpecifyPath = false;

            //if the above flag is set to true, specify the path to ETABS below
            string ProgramPath;
            ProgramPath = @"C:\Program Files\Computers and Structures\ETABS 19\ETABS.exe";

            //full path to the model
            //set it to an already existing folder
            string ModelDirectory = @"C:\CSi_ETABS_API_Example";
            try
            {
                System.IO.Directory.CreateDirectory(ModelDirectory);
            }
            catch (Exception ex)

CSI API ETABS v1

Visual C++ 2012

This example was created and tested in Microsoft Visual C++ 2012.

1. Create a Visual C++ Win32 project using the template Win32 Console Application.
2. In the Win32 Application Wizard, add common header files for ATL under the Application Settings tab.
3. Copy the ETABSv1.tlb file from the installation folder to the project directory. It should be copied to the same level as your client application's project file.
4. Open the "stdafx.h" file generated by the wizard by double clicking on it and add the following line to the end of the document:

C++

Copy

```
#include <atlsafe.h>
```

5. Open the .cpp file generated by the wizard by double-clicking on it and paste in the following ready-to-run code:

C++

Copy

```
#include "stdafx.h"
```

```
#import "ETABSv1.tlb" no_dual_interfaces
```

```
using namespace std;
```

```
bool CheckHRESULT(HRESULT hRes, const wchar_t* msg)
```

```
{
    if (hRes == S_FALSE || FAILED(hRes)) {
        MessageBox(0, msg, L"ERROR!", MB_SETFOREGROUND);
        return (false);
    }
    return (true);
}
```

```
int _tmain(int argc, _TCHAR* argv[])
```

```
{
    // set the following flag to true to attach to an existing instance of the program
    // otherwise a new instance of the program will be started
    bool bAttachToInstance;
    bAttachToInstance = false;

    // set the following flag to true to manually specify the path to ETABS.exe
    // this allows for a connection to a version of ETABS other than the latest installation
    // otherwise the latest installed version of ETABS will be launched
    bool bSpecifyPath;
    bSpecifyPath = false;

    // if the above flag is set to true, specify the path to ETABS below
    const wchar_t* ProgramPath;
    ProgramPath = L"C:\\Program Files\\Computers and Structures\\ETABS 19\\ETABS.exe";

    // use res to check if functions return successfully (res = 0) or fail (res = nonzero)
```

Introduction

```

CSI API ETABS v1

MATLAB

This example was created and tested using MATLAB R2016a.

1. Create a new MATLAB ".m" file
2. Paste in the following, ready-to-run code:

Copy

```
%% clean-up the workspace & command window
clear;
clc;

%%set the following flag to true to attach to an existing instance of the program otherwise
AttachToInstance = false(); % true(); %

%% set the following flag to true to manually specify the path to ETABS.exe
%% this allows for a connection to a version of ETABS other than the latest installation
%% otherwise the latest installed version of ETABS will be launched
SpecifyPath = false(); % true(); %

%% if the above flag is set to true, specify the path to ETABS below
ProgramPath = 'C:\Program Files\Computers and Structures\ETABS 18\ETABS.exe';

%% full path to API dll
%% set it to the installation folder
APIDLLPath = 'C:\Program Files\Computers and Structures\ETABS 18\ETABSv1.dll';

%% full path to the model
%% set it to the desired path of your model
ModelDirectory = 'C:\Csi_ETABS_API_Example';
if ~exist(ModelDirectory, 'dir')
    mkdir(ModelDirectory);
end
ModelName = 'API_1-001.edb';
ModelPath = strcat(ModelDirectory, filesep, ModelName);

%% create API helper object
a = NET.addAssembly(APIDLLPath);
helper = ETABSv1.Helper;
helper = NET.explicitCast(helper, 'ETABSv1.cHelper');

if AttachToInstance
    %% attach to a running instance of ETABS
    ETABSObject = helper.GetObject('CSI.ETABS.API.ETABSObject');
    ETABSObject = NET.explicitCast(ETABSObject, 'ETABSv1.cOAPI');
else
    if SpecifyPath
        %% create an instance of the ETABS object from the specified path
        ETABSObject = helper.CreateObject(ProgramPath);
    else
        %% create an instance of the ETABS object from the latest installed ETABS
        ETABSObject = helper.CreateObjectProgID('CSI.ETABS.API.ETABSObject');
    end
    ETABSObject = NET.explicitCast(ETABSObject, 'ETABSv1.cOAPI');

    %% start ETABS application
    ETABSObject.ApplicationStart;
end
```

Introduction

```
helper = 0;

%% create SapModel object
SapModel = NET.explicitCast(ETABSObject.SapModel, 'ETABSV1.cSapModel');

%% initialize model
ret = SapModel.InitializeNewModel;

CSI API ETABS v1

Python (COM)

This example was created using Python 3.4.3

1. Download and install Python 3.4.3 or higher for Windows. Python is freely available at python.org
2. Install the Python package "comtypes".

If you are using Python 3.4 or higher, you may install by opening a command prompt with administrative privileges and entering the command:

```
C:\>python -m pip install comtypes
```

Please note that your computer must be connected to the internet for the above command to work.

3. Create a Python .py file using IDLE or any text editor and paste in the following code. Please pay attention to the comments in this code block; they contain important information about running the script.

Python

Copy

```
import os
import sys
import comtypes.client

#set the following flag to True to attach to an existing instance of the program
#otherwise a new instance of the program will be started
AttachToInstance = True

#set the following flag to True to manually specify the path to ETABS.exe
#this allows for a connection to a version of ETABS other than the latest installation
#otherwise the latest installed version of ETABS will be launched
SpecifyPath = False

#if the above flag is set to True, specify the path to ETABS below
ProgramPath = "C:\Program Files\Computers and Structures\ETABS 19\ETABS.exe"

#full path to the model
#set it to the desired path of your model
APIPath = 'C:\CSi_ETABS_API_Example'
if not os.path.exists(APIPath):
    try:

CSI API ETABS v1

Python (NET)

This example was created using Python 3.8.6

1. Download and install a Python version between 3.4.3 and 3.8.6 for Windows. At the time of this writing (Jan 2021), a required library for this example will not work with Python 3.9. Python is freely available at python.org
2. Install the Python package "pythonnet".

If you are using Python 3.4 or higher, you may install by opening a command prompt with administrative privileges and entering the command:

```
C:\>python -m pip install pythonnet
```

Please note that your computer must be connected to the internet for the above command to work.

3. Create a Python .py file using IDLE or any text editor and paste in the following code. Please pay attention to the comments in this code block; they contain important information about running the script. This example includes an option for executing on a remote computer.

Python

Copy

```
import os
import sys
import clr
```

```
clr.AddReference("System.Runtime.InteropServices")
from System.Runtime.InteropServices import Marshal
```

```
#set the following path to the installed ETABS program directory
clr.AddReference(R'C:\Program Files\Computers and Structures\ETABS 19\ETABSv1.dll')
from ETABSv1 import *
```

```
#set the following flag to True to execute on a remote computer
Remote = False
```

```
#if the above flag is True, set the following variable to the hostname of the remote computer
#remember that the remote computer must have ETABS installed and be running the CSiAPIServ
RemoteComputer = "SpareComputer-DT"
```

```
#set the following flag to True to attach to an existing instance of the program
#otherwise a new instance of the program will be started
AttachToInstance = False
```

```
#set the following flag to True to manually specify the path to ETABS.exe
#this allows for a connection to a version of ETABS other than the latest installation
#otherwise the latest installed version of ETABS will be launched
SpecifyPath = False
```

```
#if the above flag is set to True, specify the path to ETABS below
ProgramPath = "C:\Program Files\Computers and Structures\ETABS 19\ETABS.exe"
```

```
#full path to the model
#set it to the desired path of your model
```

Introduction

```

Enumerations

Ä	Enumeration	Description
☞	<u>e2DFrameType</u>	
☞	<u>e3DFrameType</u>	
☞	<u>eAreaDesignOrientation</u>	The possible design orientations for a shell.
☞	<u>eCNameType</u>	
☞	<u>eConstraintAxis</u>	
☞	<u>eConstraintType</u>	
☞	<u>eDeckType</u>	The possible deck types.
☞	<u>eDesignActionType</u>	
☞	<u>eDiaphragmOption</u>	
☞	<u>eForce</u>	The force units that can be specified for the model.

Introduction

 <u>eFrameDesignOrientation</u>	The possible design orientations for a frame.
 <u>eFramePropType</u>	
 <u>eHingeLocationType</u>	
 <u>eItemType</u>	
 <u>eItemTypeElm</u>	
 <u>eLength</u>	The length units that can be specified for the model.
 <u>eLinkPropType</u>	
 <u>eLoadCaseType</u>	
 <u>eLoadPatternType</u>	
 <u>eMatCoupledType</u>	
 <u>eMatType</u>	
 <u>eMatTypeAluminum</u>	
 <u>eMatTypeColdFormed</u>	
 <u>eMatTypeConcrete</u>	
 <u>eMatTypeRebar</u>	
 <u>eMatTypeSteel</u>	
 <u>eMatTypeTendon</u>	
 <u>eNamedSetType</u>	
 <u>eObjType</u>	
 <u>eReturnCode</u>	
 <u>eShellType</u>	The possible shell types.
 <u>eSlabType</u>	The possible slab types.
 <u>eSuperObjectClass</u>	
 <u>eTemperature</u>	The temperature units that can be specified for the model.
 <u>eTemplateType</u>	
 <u>eUnits</u>	The units that can be specified for the model.
 <u>eWallPierRebarLayerType</u>	The pier rebar types.
 <u>eWallPropType</u>	The wall property type.
 <u>eWallSpandrelRebarLayerType</u>	The pier rebar types.

CSI API ETABS v1

cAnalysisResults Interface

Namespace: $\hat{A}$ ETABSV1

Assembly: $\hat{A}$ ETABSV1 (in ETABSV1.dll) Version: 1.0.0.0 (1.24.0.0)

▲ Syntax

C#

VB

C++

F#

Copy

```
public interface cAnalysisResults
```

```
Public Interface cAnalysisResults
```

```
Dim instance As cAnalysisResults
```

```
public interface class cAnalysisResults
```

```
type cAnalysisResults = interface end
```

The cAnalysisResults type exposes the following members.

▲ Properties

$\hat{A}$ Name Description

 Setup

Top

▲ Methods

$\hat{A}$

Name

Description

 AreaForceShell

Reports the area forces for the specified area elements that are assigned shell section properties (not plane or asolid properties). Note that the forces reported are per unit of in-plane length.

 AreaJointForceShell

Reports the area joint forces for the point elements at each corner of the specified area elements that have shell-type properties

 AreaStrainShell

 AreaStrainShellLayered

 AreaStressShell

Reports the area stresses for the specified area elements that are assigned shell section properties. Stresses are reported at each point element associated with the area element

 AreaStressShellLayered

Reports the area stresses for the specified area elements that are assigned layered shell section properties

 AssembledJointMass

Reports the assembled joint masses for the specified point elements

Introduction

⇒ <u>BaseReact</u>	Reports the structure total base reactions
⇒ <u>BaseReactWithCentroid</u>	Reports the structure total base reactions and includes information on the centroid of the translational reaction forces
⇒ <u>BucklingFactor</u>	Reports buckling factors obtained from buckling load cases
⇒ <u>FrameForce</u>	Reports the frame forces for the specified line elements
⇒ <u>FrameJointForce</u>	Reports the frame joint forces for the point elements at each end of the specified line elements
⇒ <u>GeneralizedDispl</u>	Reports the displacement values for the specified generalized displacements
⇒ <u>JointAcc</u>	Reports the joint accelerations for the specified point elements. The accelerations reported by this function are relative accelerations.
⇒ <u>JointAccAbs</u>	Reports the joint absolute accelerations for the specified point elements. Absolute and relative accelerations are the same, except when reported for time history load cases subjected to acceleration loading
⇒ <u>JointDispl</u>	Reports the joint displacements for the specified point elements. The displacements reported by this function are relative displacements
⇒ <u>JointDisplAbs</u>	Reports the absolute joint displacements for the specified point elements. Absolute and relative displacements are the same except when reported for time history load cases subjected to acceleration loading
⇒ <u>JointDrifts</u>	Reports the joint drifts
⇒ <u>JointReact</u>	Reports the joint reactions for the specified point elements. The reactions reported are from restraints, springs and grounded (one-joint) links.
⇒ <u>JointVel</u>	Reports the joint velocities for the specified point elements. The velocities reported by this function are relative velocities
⇒ <u>JointVelAbs</u>	Reports the joint absolute velocities for the specified point elements. Absolute and relative velocities are the same, except when reported for time history load cases subjected to acceleration loading
⇒ <u>LinkDeformation</u>	Reports the link internal deformations
⇒ <u>LinkForce</u>	Reports the link forces at the point elements at the ends of the specified link elements
⇒ <u>LinkJointForce</u>	Reports the joint forces at the point elements at the ends of the specified link elements
⇒ <u>ModalLoadParticipationRatios</u>	Reports the modal load participation ratios for each selected modal analysis case

Introduction

- ⇒ [ModalParticipatingMassRatios](#) Reports the modal participating mass ratios for each mode of each selected modal analysis case
- ⇒ [ModalParticipationFactors](#) Reports the modal participation factors for each mode of each selected modal analysis case
- ⇒ [ModalPeriod](#) Reports the modal period, cyclic frequency, circular frequency and eigenvalue for each selected modal load case
- ⇒ [ModeShape](#) Reports the modal displacements (mode shapes) for the specified point elements
- ⇒ [PanelZoneDeformation](#) Reports the panel zone (link) internal deformations
- ⇒ [PanelZoneForce](#) Reports the panel zone (link) forces at the point elements at the ends of the specified panel zone (link) elements
- ⇒ [PierForce](#) Retrieves pier forces for any defined pier objects in the model
- ⇒ [SectionCutAnalysis](#) Reports the section cut force for sections cuts that are specified to have an Analysis (F1, F2, F3, M1, M2, M3) result type
- ⇒ [SectionCutDesign](#) Reports the section cut force for sections cuts that are specified to have a Design (P, V2, V3, T, M2, M3) result type
- ⇒ [SpandrelForce](#) Retrieves spandrel forces for any defined spandrel objects in the model
- ⇒ [StoryDrifts](#) Reports the story drifts

cAnalysisResults Methods

The cAnalysisResults type exposes the following members.

Methods

Á	Name	Description
⇒	<u>AreaForceShell</u>	Reports the area forces for the specified area elements that are assigned shell section properties (not plane or asolid properties). Note that the forces reported are per unit of in-plane length.
⇒	<u>AreaJointForceShell</u>	Reports the area joint forces for the point elements at each corner of the specified area elements that have shell-type properties
⇒	<u>AreaStrainShell</u>	
⇒	<u>AreaStrainShellLayered</u>	
⇒	<u>AreaStressShell</u>	Reports the area stresses for the specified area elements that are assigned shell section properties. Stresses are reported at each point element associated with the area element
⇒	<u>AreaStressShellLayered</u>	Reports the area stresses for the specified area elements that are assigned layered shell section properties
⇒	<u>AssembledJointMass</u>	Reports the assembled joint masses for the specified point elements
⇒	<u>BaseReact</u>	Reports the structure total base reactions
⇒	<u>BaseReactWithCentroid</u>	Reports the structure total base reactions and includes information on the centroid of the translational reaction forces
⇒	<u>BucklingFactor</u>	Reports buckling factors obtained from buckling load cases
⇒	<u>FrameForce</u>	Reports the frame forces for the specified line elements
⇒	<u>FrameJointForce</u>	Reports the frame joint forces for the point elements at each end of the specified line elements
⇒	<u>GeneralizedDispl</u>	Reports the displacement values for the specified generalized displacements
⇒	<u>JointAcc</u>	Reports the joint accelerations for the specified point elements. The accelerations reported by this function are relative accelerations.
⇒	<u>JointAccAbs</u>	Reports the joint absolute accelerations for the specified point elements. Absolute and relative accelerations are the same, except when reported for time history load cases subjected to acceleration loading
⇒	<u>JointDispl</u>	

	Reports the joint displacements for the specified point elements. The displacements reported by this function are relative displacements
⇒ <u>JointDisplAbs</u>	Reports the absolute joint displacements for the specified point elements. Absolute and relative displacements are the same except when reported for time history load cases subjected to acceleration loading
⇒ <u>JointDrifts</u>	Reports the joint drifts
⇒ <u>JointReact</u>	Reports the joint reactions for the specified point elements. The reactions reported are from restraints, springs and grounded (one-joint) links.
⇒ <u>JointVel</u>	Reports the joint velocities for the specified point elements. The velocities reported by this function are relative velocities
⇒ <u>JointVelAbs</u>	Reports the joint absolute velocities for the specified point elements. Absolute and relative velocities are the same, except when reported for time history load cases subjected to acceleration loading
⇒ <u>LinkDeformation</u>	Reports the link internal deformations
⇒ <u>LinkForce</u>	Reports the link forces at the point elements at the ends of the specified link elements
⇒ <u>LinkJointForce</u>	Reports the joint forces at the point elements at the ends of the specified link elements
⇒ <u>ModalLoadParticipationRatios</u>	Reports the modal load participation ratios for each selected modal analysis case
⇒ <u>ModalParticipatingMassRatios</u>	Reports the modal participating mass ratios for each mode of each selected modal analysis case
⇒ <u>ModalParticipationFactors</u>	Reports the modal participation factors for each mode of each selected modal analysis case
⇒ <u>ModalPeriod</u>	Reports the modal period, cyclic frequency, circular frequency and eigenvalue for each selected modal load case
⇒ <u>ModeShape</u>	Reports the modal displacements (mode shapes) for the specified point elements
⇒ <u>PanelZoneDeformation</u>	Reports the panel zone (link) internal deformations
⇒ <u>PanelZoneForce</u>	Reports the panel zone (link) forces at the point elements at the ends of the specified panel zone (link) elements
⇒ <u>PierForce</u>	Retrieves pier forces for any defined pier objects in the model
⇒ <u>SectionCutAnalysis</u>	Reports the section cut force for sections cuts that are specified to have an Analysis (F1, F2, F3, M1, M2, M3) result type
⇒ <u>SectionCutDesign</u>	Reports the section cut force for sections cuts that are specified to have a Design (P, V2, V3, T, M2,

Introduction

M3) result type

Retrieves spandrel forces for any defined spandrel objects in the model

Reports the story drifts

```

Parameters

Name

Type: SystemString

The name of an existing area object, area element or group of objects, depending on the value of the ItemTypeElm item

ItemTypeElm

Type: ETABSv1eItemTypeElm

This is one of the following items in the eItemTypeElm enumeration.

Introduction

If this item is ObjectElm, the result request is for the area elements corresponding to the area object specified by the Name item.

If this item is Element, the result request is for the area element specified by the Name item.

If this item is GroupElm, the result request is for the area elements corresponding to all area objects included in the group specified by the Name item.

If this item is SelectionElm, the result request is for area elements corresponding to all selected area objects and the Name item is ignored.

NumberResults

Type:Â SystemInt32

The total number of results returned by the program

Obj

Type:Â SystemString

This is an array that includes the area object name associated with each result, if any

Elm

Type:Â SystemString

This is an array that includes the area element name associated with each result

PointElm

Type:Â SystemString

This is an array that includes the name of the point element where the results are reported

LoadCase

Type:Â SystemString

This is an array that includes the name of the analysis case or load combination associated with each result

StepType

Type:Â SystemString

This is an array that includes the step type, if any, for each result

StepNum

Type:Â SystemDouble

This is an array that includes the step number, if any, for each result

F11

Type:Â SystemDouble

The area element internal F11 membrane direct force per length reported in the area element local coordinate system. [F/L]

F22

Type:Â SystemDouble

The area element internal F22 membrane direct force per length reported in the area element local coordinate system. [F/L]

F12

Type:Â SystemDouble

The area element internal F12 membrane shear force per length reported in the area element local coordinate system. [F/L]

FMax

Type:Â SystemDouble

The maximum principal membrane force per length. [F/L]

FMin

Type: SystemDouble

The minimum principal membrane force per length. [F/L]

FAngle

Type: SystemDouble

The angle measured counter clockwise (when the local 3 axis is pointing toward you) from the area local 1 axis to the direction of the maximum principal membrane force. [deg]

FVM

Type: SystemDouble

The area element internal Von Mises membrane force per length. [F/L]

M11

Type: SystemDouble

The area element internal M11 plate bending moment per length reported in the area element local coordinate system. This item is only reported for area elements with properties that allow plate bending behavior. [FL/L]

M22

Type: SystemDouble

The area element internal M22 plate bending moment per length reported in the area element local coordinate system. This item is only reported for area elements with properties that allow plate bending behavior. [FL/L]

M12

Type: SystemDouble

The area element internal M12 plate twisting moment per length reported in the area element local coordinate system. This item is only reported for area elements with properties that allow plate bending behavior. [FL/L]

MMax

Type: SystemDouble

The maximum principal plate moment per length. This item is only reported for area elements with properties that allow plate bending behavior. [FL/L]

MMin

Type: SystemDouble

The minimum principal plate moment per length. This item is only reported for area elements with properties that allow plate bending behavior. [FL/L]

MAngle

Type: SystemDouble

The angle measured counter clockwise (when the local 3 axis is pointing toward you) from the area local 1 axis to the direction of the maximum principal plate moment. This item is only reported for area elements with properties that allow plate bending behavior. [deg]

V13

Type: SystemDouble

The area element internal V13 plate transverse shear force per length reported in the area element local coordinate system. This item is only reported for area elements with properties that allow plate bending behavior. [F/L]

V23

Type: SystemDouble

The area element internal V23 plate transverse shear force per length reported in the area element local coordinate system. This item is only reported for area elements with properties that allow plate bending behavior. [F/L]

VMax

Type: SystemDouble

The maximum plate transverse shear force. It is equal to the square root of the sum of the squares of V13 and V23. This item is only reported for area elements with properties that allow plate bending behavior. [F/L]

VAngle

Type: SystemDouble

The angle measured counter clockwise (when the local 3 axis is pointing toward you) from the area local 1 axis to the direction of Vmax. This item is only reported for area elements with properties that allow plate bending behavior. [deg]

Return Value

Type: Int32

Returns zero if the forces are successfully recovered, otherwise it returns a nonzero value

Remarks

See Results for more information.

    'create ETABS object
    Dim myHelper as cHelper = New Helper
    EtabsObject = myHelper.CreateObjectProgID("CSI.ETABS.API.ETABSObject")

    'start ETABS application
    ret = EtabsObject.ApplicationStart()
```

Return Value

Introduction

```
'create SapModel object
    SapModel = EtabsObject.SapModel

'initialize model
    ret = SapModel.InitializeNewModel()

'create steel deck template model
    ret = SapModel.File.NewSteelDeck(4,12,12,4,4,24,24)

'run analysis
    System.IO.Directory.CreateDirectory("c:\CSI_API_temp")
    ret = SapModel.File.Save("C:\CSI_API_temp\example.edb")
    ret = SapModel.Analyze.RunAnalysis()

'deselect all cases and combos
    ret = SapModel.Results.Setup.DeselectAllCasesAndCombosForOutput()

'set case selected for output
    ret = SapModel.Results.Setup.SetCaseSelectedForOutput("DEAD")

'get area forces for area object "1"
    ret = SapModel.Results.AreaForceShell("1", eItemTypeElm.ObjectElm, NumberResults, Obj, Elm)

'close ETABS
    EtabsObject.ApplicationExit(False)

'clean up variables
    SapModel = Nothing
    EtabsObject = Nothing
End Sub
```

CSI API ETABS v1

cAnalysisResultsAddLanguageSpecificTextSet("LSTF22BCCA_0?cpp62nu=.");

Method

Reports the area joint forces for the point elements at each corner of the specified area elements that have shell-type properties

Namespace: $\hat{A}$ ETABSV1

Assembly: $\hat{A}$ ETABSV1 (in ETABSV1.dll) Version: 1.0.0.0 (1.24.0.0)

Syntax

C#

VB

C++

F#

Copy

```

    M3 : float[] byref -> int

```

Parameters

Name

Type: SystemString

The name of an existing area object, area element or group of objects, depending on the value of the ItemTypeElm item

ItemTypeElm

Type:Â ETABSv1eItemTypeElm

This is one of the following items in the eItemTypeElm enumeration.

If this item is ObjectElm, the result request is for the area elements corresponding to the area object specified by the Name item.

If this item is Element, the result request is for the area element specified by the Name item.

If this item is GroupElm, the result request is for the area elements corresponding to all area objects included in the group specified by the Name item.

If this item is SelectionElm, the result request is for area elements corresponding to all selected area objects and the Name item is ignored.

NumberResults

Type:Â SystemInt32

The total number of results returned by the program

Obj

Type:Â SystemString

This is an array that includes the area object name associated with each result, if any

Elm

Type:Â SystemString

This is an array that includes the area element name associated with each result

PointElm

Type:Â SystemString

This is an array that includes the name of the point element where the results are reported

LoadCase

Type:Â SystemString

This is an array that includes the name of the analysis case or load combination associated with each result

StepType

Type:Â SystemString

This is an array that includes the step type, if any, for each result

StepNum

Type:Â SystemDouble

This is an array that includes the step number, if any, for each result

F1

Type:Â SystemDouble

This is an array that contains the joint force component in the point element local 1 axis direction. [F].

F2

Type:Â SystemDouble

This is an array that contains the joint force component in the point element local 2 axis direction. [F].

F3

Type:Â SystemDouble

This is an array that contains the joint force component in the point element

local 3 axis direction. [F].

M1

Type: SystemDouble

This is an array that contains the joint moment component about the point element local 1 axis direction. [FL].

M2

Type: SystemDouble

This is an array that contains the joint moment component about the point element local 2 axis direction. [FL].

M3

Type: SystemDouble

This is an array that contains the joint moment component about the point element local 3 axis direction. [FL].

Return Value

Type: Int32

Returns zero if the forces are successfully recovered, otherwise it returns a nonzero value.

Remarks

See Results for more information.

Examples

VB

Copy

```
Public Sub Example()
```

```
    'dimension variables
    Dim SapObject as cOAPI
    Dim SapModel As cSapModel
    Dim ret As Integer = -1
    Dim NumberResults As Integer
    Dim Obj() As String
    Dim Elm() As String
    Dim PointElm() As String
    Dim LoadCase() As String
    Dim StepType() As String
    Dim StepNum() As Double
    Dim F1() As Double
    Dim F2() As Double
    Dim F3() As Double
    Dim M1() As Double
    Dim M2() As Double
    Dim M3() As Double

    'create ETABS object
    Dim myHelper as cHelper = New Helper
    EtabsObject = myHelper.CreateObjectProgID("CSI.ETABS.API.ETABSObject")

    'start ETABS application
    ret = EtabsObject.ApplicationStart()

    'create SapModel object
    SapModel = EtabsObject.SapModel

    'initialize model
    ret = SapModel.InitializeNewModel()
```

Introduction

```
'create steel deck template model
    ret = SapModel.File.NewSteelDeck(4,12,12,4,4,24,24)

'run analysis
    System.IO.Directory.CreateDirectory("c:\CSI_API_temp")
    ret = SapModel.File.Save("C:\CSI_API_temp\example.edb")
    ret = SapModel.Analyze.RunAnalysis()

'deselect all cases and combos
    ret = SapModel.Results.Setup.DeselectAllCasesAndCombosForOutput()

'set case selected for output
    ret = SapModel.Results.Setup.SetCaseSelectedForOutput("DEAD")

'get area joint forces for area object "1"
    ret = SapModel.Results.AreaJointForceShell("1", eItemTypeElm.ObjectElm, NumberResults, Obj

'close ETABS
    EtabsObject.ApplicationExit(False)

'clean up variables
    SapModel = Nothing
    EtabsObject = Nothing
End Sub
```

```

Parameters

Name

Type:Â SystemString

The name of an existing area object, area element or group of objects, depending on the value of the ItemTypeElm item

ItemTypeElm

Type:Â ETABSv1eItemTypeElm

This is one of the following items in the eItemTypeElm enumeration.

If this item is ObjectElm, the result request is for the area elements corresponding to the area object specified by the Name item.

If this item is Element, the result request is for the area element specified by the Name item.

If this item is GroupElm, the result request is for the area elements corresponding to all area objects included in the group specified by the Name item.

If this item is SelectionElm, the result request is for area elements corresponding to all selected area objects and the Name item is ignored.

NumberResults

Type:Â SystemInt32

The total number of results returned by the program

Obj

Type:Â SystemString

This is an array that includes the area object name associated with each result, if any

Elm

Type:Â SystemString

This is an array that includes the area element name associated with each result

PointElm

Type:Â SystemString

This is an array that includes the name of the point element where the results are reported

LoadCase

Type:Â SystemString

This is an array that includes the name of the analysis case or load combination associated with each result

StepType

Type:Â SystemString

This is an array that includes the step type, if any, for each result

StepNum

Type:Â SystemDouble

This is an array that includes the step number, if any, for each result

S11Top

Type:Â SystemDouble

The area element internal S11 at the top of the specified area element, at the specified point element location, reported in the area element local coordinate system. [F/L2]

S22Top

Type:Â SystemDouble

The area element internal S22 at the top of the specified area element, at the

specified point element location, reported in the area element local coordinate system. [F/L2]

S12Top

Type: SystemDouble

The area element internal S12 at the top of the specified area element, at the specified point element location, reported in the area element local coordinate system. [F/L2]

SMaxTop

Type: SystemDouble

The area element maximum principal stress at the top of the specified area element, at the specified point element location. [F/L2]

SMinTop

Type: SystemDouble

The area element minimum principal stress at the top of the specified area element, at the specified point element location. [F/L2]

SAngleTop

Type: SystemDouble

The angle measured counter clockwise (when the local 3 axis is pointing toward you) from the area local 1 axis to the direction of the maximum principal stress, at the top of the specified area element. [deg]

SVMTop

Type: SystemDouble

The area element internal top Von Mises stress at the specified point element. [F/L2]

S11Bot

Type: SystemDouble

The area element internal S11 at the bottom of the specified area element, at the specified point element location, reported in the area element local coordinate system. [F/L2]

S22Bot

Type: SystemDouble

The area element internal S22 at the bottom of the specified area element, at the specified point element location, reported in the area element local coordinate system. [F/L2]

S12Bot

Type: SystemDouble

The area element internal S12 at the bottom of the specified area element, at the specified point element location, reported in the area element local coordinate system. [F/L2]

SMaxBot

Type: SystemDouble

The area element maximum principal stress at the bottom of the specified area element, at the specified point element location. [F/L2]

SMinBot

Type: SystemDouble

The area element minimum principal stress at the bottom of the specified area element, at the specified point element location. [F/L2]

SAngleBot

Type: SystemDouble

The angle measured counter clockwise (when the local 3 axis is pointing toward you) from the area local 1 axis to the direction of the maximum principal stress,

at the bottom of the specified area element. [deg]

SVMBot

Type: SystemDouble

The area element internal bottom Von Mises stress at the specified point element. [F/L2]

S13Avg

Type: SystemDouble

The area element average S13 out-of-plane shear stress at the specified point element. This item is only reported for area elements with properties that allow plate bending behavior. [F/L2]

S23Avg

Type: SystemDouble

The area element average S23 out-of-plane shear stress at the specified point element. This item is only reported for area elements with properties that allow plate bending behavior. [F/L2]

SMaxAvg

Type: SystemDouble

The area element maximum average out-of-plane shear stress. It is equal to the square root of the sum of the squares of S13Avg and S23Avg. This item is only reported for area elements with properties that allow plate bending behavior. [F/L2]

SAngleAvg

Type: SystemDouble

The angle measured counter clockwise (when the local 3 axis is pointing toward you) from the area local 1 axis to the direction of SMaxAvg. This item is only reported for area elements with properties that allow plate bending behavior. [deg]

Return Value

Type: Int32

Returns zero if the stresses are successfully recovered, otherwise it returns a nonzero value.

Remarks

See Results for more information.

Examples

```

Parameters

Name

Type: SystemString

The name of an existing area object, area element or group of objects, depending on the value of the ItemTypeElm item

ItemTypeElm

Type: ETABSv1eItemTypeElm

This is one of the following items in the eItemTypeElm enumeration.

If this item is ObjectElm, the result request is for the area elements corresponding to the area object specified by the Name item.

If this item is Element, the result request is for the area element specified by the Name item.

If this item is GroupElm, the result request is for the area elements corresponding to all area objects included in the group specified by the Name item.

If this item is SelectionElm, the result request is for area elements corresponding to all selected area objects and the Name item is ignored.

NumberResults

Parameters

	Type:Â <u>SystemInt32</u> The total number of results returned by the program
Obj	Type:Â <u>SystemString</u> This is an array that includes the area object name associated with each result, if any
Elm	Type:Â <u>SystemString</u> This is an array that includes the area element name associated with each result
Layer	Type:Â <u>SystemString</u> This is an array that includes the layer name associated with each result
IntPtNum	Type:Â <u>SystemInt32</u> This is an array that includes the integration point number within the specified layer of the area element
IntPtLoc	Type:Â <u>SystemDouble</u> This is an array that includes the integration point relative location within the specified layer of the area element. The location is between -1 (bottom of layer) and +1 (top of layer), inclusive. The midheight of the layer is at a value of 0
PointElm	Type:Â <u>SystemString</u> This is an array that includes the name of the point element where the results are reported
LoadCase	Type:Â <u>SystemString</u> This is an array that includes the name of the analysis case or load combination associated with each result
StepType	Type:Â <u>SystemString</u> This is an array that includes the step type, if any, for each result
StepNum	Type:Â <u>SystemDouble</u> This is an array that includes the step number, if any, for each result
S11	Type:Â <u>SystemDouble</u> The area element internal S11 stress at the specified point element location, for the specified layer and layer integration point, reported in the area element local coordinate system. [F/L2]
S22	Type:Â <u>SystemDouble</u> The area element internal S22 stress at the specified point element location, for the specified layer and layer integration point, reported in the area element local coordinate system. [F/L2]
S12	Type:Â <u>SystemDouble</u> The area element internal S12 stress at the specified point element location, for the specified layer and layer integration point, reported in the area element local coordinate system. [F/L2]
SMax	

Type: SystemDouble

The area element maximum principal stress at the specified point element location, for the specified layer and layer integration point. [F/L2]

SMin

Type: SystemDouble

The area element minimum principal stress at the specified point element location, for the specified layer and layer integration point. [F/L2]

SAngle

Type: SystemDouble

The angle measured counter clockwise (when the local 3 axis is pointing toward you) from the area local 1 axis to the direction of the maximum principal stress. [deg]

SVM

Type: SystemDouble

The area element internal Von Mises stress at the specified point element location, for the specified layer and layer integration point. [F/L2]

S13Avg

Type: SystemDouble

The area element average S13 out-of-plane shear stress at the specified point element location, for the specified layer and layer integration point. [F/L2]

S23Avg

Type: SystemDouble

The area element average S23 out-of-plane shear stress at the specified point element location, for the specified layer and layer integration point. [F/L2]

SMaxAvg

Type: SystemDouble

The area element maximum average out-of-plane shear stress for the specified layer and layer integration point. It is equal to the square root of the sum of the squares of S13Avg and S23Avg. [F/L2]

SAngleAvg

Type: SystemDouble

The angle measured counter clockwise (when the local 3 axis is pointing toward you) from the area local 1 axis to the direction of SMaxAvg. [deg]

Return Value

Type: Int32

Returns zero if the stresses are successfully recovered, otherwise it returns a nonzero value

Remarks

See [Results](#) for more information.

)
```

```
abstract AssembledJointMass :
    Name : string *
    ItemTypeElm : eItemTypeElm *
    NumberResults : int byref *
    PointElm : string[] byref *
    U1 : float[] byref *
    U2 : float[] byref *
    U3 : float[] byref *
    R1 : float[] byref *
    R2 : float[] byref *
    R3 : float[] byref -> int
```

Parameters

Name

Type:Â SystemString

The name of an existing point object, point element, or group of objects depending on the value of the ItemTypeElm item.

ItemTypeElm

Type:Â ETABSv1eItemTypeElm

This is one of the following items in the eItemTypeElm enumeration.

If this item is ObjectElm, the result request is for the point element corresponding to the point object specified by the Name item.

If this item is Element, the result request is for the point element specified by the Name item.

If this item is GroupElm, the result request is for all point elements directly or indirectly specified in the group specified by the Name item.

If this item is SelectionElm, the result request is for all point elements directly or indirectly selected and the Name item is ignored.

NumberResults

Type:Â SystemInt32

The total number of results returned by the program.

PointElm

Type:Â SystemString

This is an array that includes the point element name associated with each result

U1

Type: SystemDouble

This array contains the translational mass in the point element local 1 direction for each result. [M]

U2

Type: SystemDouble

This array contains the translational mass in the point element local 2 direction for each result. [M]

U3

Type: SystemDouble

This array contains the translational mass in the point element local 3 direction for each result. [M]

R1

Type: SystemDouble

This array contains the rotational mass moment of inertia about the point element local 1 axis for each result. [ML2]

R2

Type: SystemDouble

This array contains the rotational mass moment of inertia about the point element local 2 axis for each result. [ML2]

R3

Type: SystemDouble

This array contains the rotational mass moment of inertia about the point element local 3 axis for each result. [ML2]

Return Value

Type: Int32

Returns zero if the masses are successfully recovered, otherwise it returns a nonzero value

Remarks

See [Results](#) for more information.

Examples

VB

Copy

```
Public Sub Example()
    Dim SapModel As cSapModel
    Dim EtabsObject As cOAPI
    Dim ret As Integer = -1
    Dim NumberResults As Integer
    Dim Obj() As String
    Dim Elm() As String
    Dim PointElm() As String
    Dim U1() As Double
    Dim U2() As Double
    Dim U3() As Double
    Dim R1() As Double
    Dim R2() As Double
    Dim R3() As Double

    'create ETABS object
    Dim myHelper as cHelper = New Helper
    EtabsObject = myHelper.CreateObjectProgID("CSI.ETABS.API.ETABSObject")
```

Introduction

```
'start ETABS application
    ret = EtabsObject.ApplicationStart()

'create SapModel object
    SapModel = EtabsObject.SapModel

'initialize model
    ret = SapModel.InitializeNewModel()

'create steel deck template model
    ret = SapModel.File.NewSteelDeck(4,12,12,4,4,24,24)

'run analysis
    System.IO.Directory.CreateDirectory("c:\CSI_API_temp")
    ret = SapModel.File.Save("C:\CSI_API_temp\example.edb")
    ret = SapModel.Analyze.RunAnalysis()

'get assembled joint mass for all point elements
    ret = SapModel.Results.AssembledJointMass("ALL", eItemTypeElm.GroupElm, NumberResults, Poi

'close ETABS
    EtabsObject.ApplicationExit(False)

'clean up variables
    SapModel = Nothing
    EtabsObject = Nothing
End Sub
```

    GZ : float byref -> int

```

Parameters

NumberResults

Type:Â SystemInt32

The total number of results returned by the program

LoadCase

Type:Â SystemString

This is an array that includes the name of the analysis case or load combination associated with each result

StepType

Type:Â SystemString

This is an array that includes the step type, if any, for each result

StepNum

Type:Â SystemDouble

This is an array that includes the step number, if any, for each result

FX

	Type: <u>SystemDouble</u> This array contains the base reaction force in the global X direction for each result. [F]
FY	Type: <u>SystemDouble</u> This array contains the base reaction force in the global Y direction for each result. [F]
FZ	Type: <u>SystemDouble</u> This array contains the base reaction force in the global Z direction for each result. [F]
MX	Type: <u>SystemDouble</u> This array contains the base reaction moment about the global X axis for each result. [FL]
ParamMy	Type: <u>SystemDouble</u> This array contains the base reaction moment about the global Y axis for each result. [FL]
MZ	Type: <u>SystemDouble</u> This array contains the base reaction moment about the global Z axis for each result. [FL]
GX	Type: <u>SystemDouble</u> The global X coordinate of the point at which the base reactions are reported. [L]
GY	Type: <u>SystemDouble</u> The global Y coordinate of the point at which the base reactions are reported. [L]
GZ	Type: <u>SystemDouble</u> The global Z coordinate of the point at which the base reactions are reported. [L]

Return Value

Type: Int32

Returns zero if the reactions are successfully recovered, otherwise it returns a nonzero value

Remarks

See [Results](#) for more information.

    XCentroidForFZ : float[] byref *
    YCentroidForFZ : float[] byref *
    ZCentroidForFZ : float[] byref -> int

```

Parameters

NumberResults

Type:Â SystemInt32

The total number of results returned by the program

LoadCase

Type:Â SystemString

This is an array that includes the name of the analysis case or load combination associated with each result

StepType

Type:Â SystemString

This is an array that includes the step type, if any, for each result

StepNum

Type:Â SystemDouble

This is an array that includes the step number, if any, for each result

FX

Type:Â SystemDouble

This array contains the base reaction force in the global X direction for each result. [F]

FY

Type:Â SystemDouble

This array contains the base reaction force in the global Y direction for each result. [F]

FZ

Type:Â SystemDouble

This array contains the base reaction force in the global Z direction for each

result. [F]

MX
Type: SystemDouble
This array contains the base reaction moment about the global X axis for each result. [FL]

ParamMy
Type: SystemDouble
This array contains the base reaction moment about the global Y axis for each result. [FL]

MZ
Type: SystemDouble
This array contains the base reaction moment about the global Z axis for each result. [FL]

GX
Type: SystemDouble
The global X coordinate of the point at which the base reactions are reported. [L]

GY
Type: SystemDouble
The global Y coordinate of the point at which the base reactions are reported. [L]

GZ
Type: SystemDouble
The global Z coordinate of the point at which the base reactions are reported. [L]

XCentroidForFX
Type: SystemDouble
This is an array of the global X coordinates of the centroid of all global X-direction translational reaction forces for each result. [L]

YCentroidForFX
Type: SystemDouble
This is an array of the global Y coordinates of the centroid of all global X-direction translational reaction forces for each result. [L]

ZCentroidForFX
Type: SystemDouble
This is an array of the global Z coordinates of the centroid of all global X-direction translational reaction forces for each result. [L]

XCentroidForFY
Type: SystemDouble
This is an array of the global X coordinates of the centroid of all global Y-direction translational reaction forces for each result. [L]

YCentroidForFY
Type: SystemDouble
This is an array of the global Y coordinates of the centroid of all global Y-direction translational reaction forces for each result. [L]

ZCentroidForFY
Type: SystemDouble
This is an array of the global Z coordinates of the centroid of all global Y-direction translational reaction forces for each result. [L]

XCentroidForFZ

Type: SystemDouble

This is an array of the global X coordinates of the centroid of all global Z-direction translational reaction forces for each result. [L]

YCentroidForFZ

Type: SystemDouble

This is an array of the global Y coordinates of the centroid of all global Z-direction translational reaction forces for each result. [L]

ZCentroidForFZ

Type: SystemDouble

This is an array of the global Z coordinates of the centroid of all global Z-direction translational reaction forces for each result. [L]

Return Value

Type: Int32

Returns zero if the reactions are successfully recovered, otherwise it returns a nonzero value

Remarks

See Results for more information. Note that the reported base reaction centroids are not the same as the centroid of the applied loads

Examples

```

cAnalysisResultsspan id="LSTF34E86BD_0"AddLanguageSpecificTextSet("LSTF34E86BD_0?cp07::|nu=".

Parameters**NumberResults**Type: SystemInt32

The total number of results returned by the program

LoadCaseType: SystemString

This is an array that includes the name of the analysis case or load combination associated with each result

StepTypeType: SystemString

This is an array that includes the step type for each result. For buckling factors, the step type is always Mode

StepNumType: SystemDouble

This is an array that includes the step number for each result. For buckling factors, the step number is always the buckling mode number

FactorType: SystemDouble

This is an array that includes the buckling factors

Return ValueType: Int32

Returns zero if the factors are successfully recovered, otherwise it returns a nonzero value

▲ **Remarks**See Results for more information.▲ **Examples**

    V3 : float[] byref *
    T : float[] byref *
    M2 : float[] byref *
    M3 : float[] byref -> int
```

Parameters**Name**

Type:Â SystemString

The name of an existing line object, line element or group of objects, depending on the value of the ItemTypeElm item.

ItemTypeElm

Type:Â ETABSv1eItemTypeElm

This is one of the following items in the eItemTypeElm enumeration.

If this item is ObjectElm, the result request is for the line elements corresponding to the line object specified by the Name item.

If this item is Element, the result request is for the line element specified by the Name item.

If this item is GroupElm, the result request is for the line elements corresponding to all line objects included in the group specified by the Name item.

If this item is SelectionElm, the result request is for line elements corresponding to all selected line objects and the Name item is ignored.

NumberResults

Type:Â SystemInt32

The total number of results returned by the program

Obj

Type:Â SystemString

This is an array that includes the line object name associated with each result, if any

ObjSta

Type:Â SystemDouble

This is an array that includes the distance measured from the I-end of the line object to the result location

Elm

Type:Â SystemString

This is an array that includes the line element name associated with each result

ElmSta

Type:Â SystemDouble

This is an array that includes the distance measured from the I-end of the line element to the result location

LoadCase

Type:Â SystemString

This is an array that includes the name of the analysis case or load combination associated with each result

StepType

Type:Â SystemString

This is an array that includes the step type, if any, for each result

StepNum

Type:Â SystemDouble

This is an array that includes the step number, if any, for each result

P

- Type: SystemDouble
This is a one dimensional array of the axial force for each result. [F]
- V2
Type: SystemDouble
This is a one dimensional array of the shear force in the local 2 direction for each result. [F]
- V3
Type: SystemDouble
This is a one dimensional array of the shear force in the local 3 direction for each result. [F]
- T
Type: SystemDouble
This is a one dimensional array of the torsion for each result. [FL]
- M2
Type: SystemDouble
This is a one dimensional array of the moment about the local 2-axis for each result. [FL]
- M3
Type: SystemDouble
This is a one dimensional array of the moment about the local 3-axis for each result. [FL]

Return Value

Type: Int32

Returns zero if the forces are successfully recovered, otherwise it returns a nonzero value

Remarks

See Results for more information.

Examples

VB

Copy

```
Public Sub Example()
    Dim SapModel As cSapModel
    Dim EtabsObject As cOAPI
    Dim ret As Integer = -1
    Dim NumberResults As Integer
    Dim Obj() As String
    Dim ObjSta() As Double
    Dim Elm() As String
    Dim ElmSta() As Double
    Dim LoadCase() As String
    Dim StepType() As String
    Dim StepNum() As Double
    Dim P() As Double
    Dim V2() As Double
    Dim V3() As Double
    Dim T() As Double
    Dim M2() As Double
    Dim M3() As Double

    'create ETABS object
    Dim myHelper as cHelper = New Helper
    EtabsObject = myHelper.CreateObjectProgID("CSI.ETABS.API.ETABSObject")
```

Introduction

```
'start ETABS application
    ret = EtabsObject.ApplicationStart()

'create SapModel object
    SapModel = EtabsObject.SapModel

'initialize model
    ret = SapModel.InitializeNewModel()

'create steel deck template model
    ret = SapModel.File.NewSteelDeck(4,12,12,4,4,24,24)

'run analysis
    System.IO.Directory.CreateDirectory("c:\CSI_API_temp")
    ret = SapModel.File.Save("C:\CSI_API_temp\example.edb")
    ret = SapModel.Analyze.RunAnalysis()

'deselect all cases and combos
    ret = SapModel.Results.Setup.DeselectAllCasesAndCombosForOutput()

'set case selected for output
    ret = SapModel.Results.Setup.SetCaseSelectedForOutput("DEAD")

'get frame forces
    ret = SapModel.Results.FrameForce("1", eItemTypeElm.ObjectElm, NumberResults, Obj, ObjSta, ObjSta2)

'close ETABS
    EtabsObject.ApplicationExit(False)

'clean up variables
    SapModel = Nothing
    EtabsObject = Nothing
End Sub
```

    F3 : float[] byref *
    M1 : float[] byref *
    M2 : float[] byref *
    M3 : float[] byref -> int

```

Parameters

Name

Type: SystemString

The name of an existing line object, line element or group of objects, depending on the value of the ItemTypeElm item.

ItemTypeElm

Type:Â ETABSv1eItemTypeElm

This is one of the following items in the eItemTypeElm enumeration.

If this item is ObjectElm, the result request is for the line elements corresponding to the line object specified by the Name item.

If this item is Element, the result request is for the line element specified by the Name item.

If this item is GroupElm, the result request is for the line elements corresponding to all line objects included in the group specified by the Name item.

If this item is SelectionElm, the result request is for line elements corresponding to all selected line objects and the Name item is ignored.

NumberResults

Type:Â SystemInt32

The total number of results returned by the program

Obj

Type:Â SystemString

This is an array that includes the line object name associated with each result, if any

Elm

Type:Â SystemString

This is an array that includes the line element name associated with each result

PointElm

Type:Â SystemString

This is an array that includes the point element name associated with each result

LoadCase

Type:Â SystemString

This is an array that includes the name of the analysis case or load combination associated with each result

StepType

Type:Â SystemString

This is an array that includes the step type, if any, for each result

StepNum

Type:Â SystemDouble

This is an array that includes the step number, if any, for each result

F1

Type:Â SystemDouble

These is a one dimensional array that includes the joint force component in the point element local 1-axis direction [F]

F2

Type:Â SystemDouble

These is a one dimensional array that includes the joint force component in the point element local 2-axis direction [F]

F3

Type:Â SystemDouble

These is a one dimensional array that includes the joint force component in the

point element local 3-axis direction [F]

M1

Type: SystemDouble

These is a one dimensional array that includes the joint moment component about the point element local 1-axis. [FL]

M2

Type: SystemDouble

These is a one dimensional array that includes the joint moment component about the point element local 2-axis. [FL]

M3

Type: SystemDouble

These is a one dimensional array that includes the joint moment component about the point element local 3-axis. [FL]

Return Value

Type: Int32

Returns zero if the forces are successfully recovered, otherwise it returns a nonzero value

Remarks

See Results for more information.

Examples

VB

Copy

```
Public Sub Example()
    Dim SapModel As cSapModel
    Dim EtabsObject As cOAPI

CSI API ETABS v1

cAnalysisResultsAddLanguageSpecificTextSet("LST95D3B2B2_0?cp120::|nu=")

Method

Reports the displacement values for the specified generalized displacements

Namespace: ETABSv1

Assembly: ETABSv1 (in ETABSv1.dll) Version: 1.0.0.0 (1.24.0.0)

Syntax

C#

VB

C++

F#

Copy

```
int GeneralizedDispl(
    string Name,
    ref int NumberResults,
    ref string[] GD,
    ref string[] LoadCase,
    ref string[] StepType,
    ref double[] StepNum,
    ref string[] DType,
    ref double[] Value
)
```

```
Function GeneralizedDispl (
    Name As String,
    ByRef NumberResults As Integer,
    ByRef GD As String(),
    ByRef LoadCase As String(),
    ByRef StepType As String(),
    ByRef StepNum As Double(),
    ByRef DType As String(),
    ByRef Value As Double()
) As Integer
```

```
Dim instance As cAnalysisResults
Dim Name As String
Dim NumberResults As Integer
Dim GD As String()
Dim LoadCase As String()
Dim StepType As String()
Dim StepNum As Double()
Dim DType As String()
Dim Value As Double()
Dim returnValue As Integer
```

```
returnValue = instance.GeneralizedDispl(Name,
    NumberResults, GD, LoadCase, StepType,
    StepNum, DType, Value)
```

```
int GeneralizedDispl(

```

array<String>^% LoadCase,
array<String>^% StepType,
array<double>^% StepNum,
array<String>^% DType,
array<double>^% Value
)

abstract GeneralizedDispl :
    Name : string *
    NumberResults : int byref *
    GD : string[] byref *
    LoadCase : string[] byref *
    StepType : string[] byref *
    StepNum : float[] byref *
    DType : string[] byref *
    Value : float[] byref -> int

```

Parameters

Name

Type:Â SystemString

The name of an existing generalized displacement for which results are returned.

If the program does not recognize this name as a defined generalized displacement, it returns results for all selected generalized displacements, if any. For example, entering a blank string (i.e., "") for the name will prompt the program to return results for all selected generalized displacements

NumberResults

Type:Â SystemInt32

The total number of results returned by the program

GD

Type:Â SystemString

This is an array that includes the generalized displacement name associated with each result

LoadCase

Type:Â SystemString

This is an array that includes the name of the analysis case or load combination associated with each result

StepType

Type:Â SystemString

This is an array that includes the step type, if any, for each result

StepNum

Type:Â SystemDouble

This is an array that includes the step number, if any, for each result

DType

Type:Â SystemString

This is an array that includes the generalized displacement type for each result. It is either Translation or Rotation

Value

Type:Â SystemDouble

This is an array of the generalized displacement values for each result. [L] when DType is Translation , [rad] when DType is Rotation

Return Value

Type: $\hat{A}$ Int32

Returns zero if the displacements are successfully recovered, otherwise it returns a nonzero value

▲ **Remarks**

See Results for more information.

```

Parameters

Name

Type: SystemString

The name of an existing point object, point element, or group of objects depending on the value of the ItemTypeId item.

ItemTypeId

Type: ETABSv1eItemTypeId

This is one of the following items in the eItemTypeId enumeration.

Introduction

If this item is ObjectElm, the result request is for the point element corresponding to the point object specified by the Name item.

If this item is Element, the result request is for the point element specified by the Name item.

If this item is GroupElm, the result request is for all point elements directly or indirectly specified in the group specified by the Name item.

If this item is SelectionElm, the result request is for all point elements directly or indirectly selected and the Name item is ignored.

NumberResults

Type:Â SystemInt32

The total number of results returned by the program.

Obj

Type:Â SystemString

This is an array that includes the point object name associated with each result, if any. Some results will have no point object associated with them. For those cases, this item will be blank.

Elm

Type:Â SystemString

This is an array that includes the point element name associated with each result.

LoadCase

Type:Â SystemString

This is an array that includes the name of the analysis case or load combination associated with each result.

StepType

Type:Â SystemString

This is an array that includes the step type, if any, for each result.

StepNum

Type:Â SystemDouble

This is an array that includes the step number, if any, for each result.

U1

Type:Â SystemDouble

This is a one dimensional array that includes the translational acceleration in the point element local 1 direction for each result. [L/s²]

U2

Type:Â SystemDouble

This is a one dimensional array that includes the translational acceleration in the point element local 2 direction for each result. [L/s²]

U3

Type:Â SystemDouble

This is a one dimensional array that includes the translational acceleration in the point element local 3 direction for each result. [L/s²]

R1

Type:Â SystemDouble

This is a one dimensional array that includes the rotational acceleration about the point element local 1 direction for each result. [rad/s²]

R2

Type: SystemDouble

This is a one dimensional array that includes the rotational acceleration about the point element local 2 direction for each result. [rad/s2]

R3

Type: SystemDouble

This is a one dimensional array that includes the rotational acceleration about the point element local 3 direction for each result. [rad/s2]

Return Value

Type: Int32

Returns zero if the accelerations are successfully recovered, otherwise it returns a nonzero value

Remarks

See Results for more information.

```

Parameters

Name

Type: SystemString

The name of an existing point object, point element, or group of objects depending on the value of the ItemTypeId item.

ItemTypeId

Type: ETABSv1eItemTypeId

This is one of the following items in the eItemTypeId enumeration.

Introduction

If this item is ObjectElm, the result request is for the point element corresponding to the point object specified by the Name item.

If this item is Element, the result request is for the point element specified by the Name item.

If this item is GroupElm, the result request is for all point elements directly or indirectly specified in the group specified by the Name item.

If this item is SelectionElm, the result request is for all point elements directly or indirectly selected and the Name item is ignored.

NumberResults

Type:Â SystemInt32

The total number of results returned by the program.

Obj

Type:Â SystemString

This is an array that includes the point object name associated with each result, if any. Some results will have no point object associated with them. For those cases, this item will be blank.

Elm

Type:Â SystemString

This is an array that includes the point element name associated with each result.

LoadCase

Type:Â SystemString

This is an array that includes the name of the analysis case or load combination associated with each result.

StepType

Type:Â SystemString

This is an array that includes the step type, if any, for each result.

StepNum

Type:Â SystemDouble

This is an array that includes the step number, if any, for each result.

U1

Type:Â SystemDouble

This is a one dimensional array that includes the translational acceleration in the point element local 1 direction for each result. [L/s²]

U2

Type:Â SystemDouble

This is a one dimensional array that includes the translational acceleration in the point element local 2 direction for each result. [L/s²]

U3

Type:Â SystemDouble

This is a one dimensional array that includes the translational acceleration in the point element local 3 direction for each result. [L/s²]

R1

Type:Â SystemDouble

This is a one dimensional array that includes the rotational acceleration about the point element local 1 direction for each result. [rad/s²]

R2

Type: SystemDouble

This is a one dimensional array that includes the rotational acceleration about the point element local 2 direction for each result. [rad/s2]

R3

Type: SystemDouble

This is a one dimensional array that includes the rotational acceleration about the point element local 3 direction for each result. [rad/s2]

Return Value

Type: Int32

Returns zero if the accelerations are successfully recovered, otherwise it returns a nonzero value

Remarks

See Results for more information.

```

Parameters

Name

Type: SystemString

The name of an existing point object, point element, or group of objects depending on the value of the ItemTypeId item.

ItemTypeId

Type: ETABSv1eItemTypeId

This is one of the following items in the eItemTypeId enumeration.

Introduction

If this item is ObjectElm, the result request is for the point element corresponding to the point object specified by the Name item.

If this item is Element, the result request is for the point element specified by the Name item.

If this item is GroupElm, the result request is for all point elements directly or indirectly specified in the group specified by the Name item.

If this item is SelectionElm, the result request is for all point elements directly or indirectly selected and the Name item is ignored.

NumberResults

Type:Â SystemInt32

The total number of results returned by the program.

Obj

Type:Â SystemString

This is an array that includes the point object name associated with each result, if any. Some results will have no point object associated with them. For those cases, this item will be blank.

Elm

Type:Â SystemString

This is an array that includes the point element name associated with each result.

LoadCase

Type:Â SystemString

This is an array that includes the name of the analysis case or load combination associated with each result.

StepType

Type:Â SystemString

This is an array that includes the step type, if any, for each result.

StepNum

Type:Â SystemDouble

This is an array that includes the step number, if any, for each result.

U1

Type:Â SystemDouble

This is a one dimensional array that includes the displacement in the point element local 1 direction for each result. [L]

U2

Type:Â SystemDouble

This is a one dimensional array that includes the displacement in the point element local 2 direction for each result. [L]

U3

Type:Â SystemDouble

This is a one dimensional array that includes the displacement in the point element local 3 direction for each result. [L]

R1

Type:Â SystemDouble

This is a one dimensional array that includes the rotation about the point element local 1 direction for each result. [rad]

R2

Type: SystemDouble

This is a one dimensional array that includes the rotation about the point element local 2 direction for each result. [rad]

R3

Type: SystemDouble

This is a one dimensional array that includes the rotation about the point element local 3 direction for each result. [rad]

Return Value

Type: Int32

Returns zero if the displacements are successfully recovered, otherwise it returns a nonzero value

Remarks

See Results for more information.

    R2 : float[] byref *
    R3 : float[] byref -> int

```

Parameters

Name

Type: SystemString

The name of an existing point object, point element, or group of objects depending on the value of the ItemTypeElm item.

ItemTypeElm

Type: ETABSv1eItemTypeElm

This is one of the following items in the eItemTypeElm enumeration.

Introduction

If this item is ObjectElm, the result request is for the point element corresponding to the point object specified by the Name item.

If this item is Element, the result request is for the point element specified by the Name item.

If this item is GroupElm, the result request is for all point elements directly or indirectly specified in the group specified by the Name item.

If this item is SelectionElm, the result request is for all point elements directly or indirectly selected and the Name item is ignored.

NumberResults

Type:Â SystemInt32

The total number of results returned by the program.

Obj

Type:Â SystemString

This is an array that includes the point object name associated with each result, if any. Some results will have no point object associated with them. For those cases, this item will be blank.

Elm

Type:Â SystemString

This is an array that includes the point element name associated with each result.

LoadCase

Type:Â SystemString

This is an array that includes the name of the analysis case or load combination associated with each result.

StepType

Type:Â SystemString

This is an array that includes the step type, if any, for each result.

StepNum

Type:Â SystemDouble

This is an array that includes the step number, if any, for each result.

U1

Type:Â SystemDouble

This is a one dimensional array that includes the displacement in the point element local 1 direction for each result. [L]

U2

Type:Â SystemDouble

This is a one dimensional array that includes the displacement in the point element local 2 direction for each result. [L]

U3

Type:Â SystemDouble

This is a one dimensional array that includes the displacement in the point element local 3 direction for each result. [L]

R1

Type:Â SystemDouble

This is a one dimensional array that includes the rotation about the point element local 1 direction for each result. [rad]

R2

Type: SystemDouble

This is a one dimensional array that includes the rotation about the point element local 2 direction for each result. [rad]

R3

Type: SystemDouble

This is a one dimensional array that includes the rotation about the point element local 3 direction for each result. [rad]

Return Value

Type: Int32

Returns zero if the displacements are successfully recovered, otherwise it returns a nonzero value

Remarks

See Results for more information.

```

Parameters

NumberResults

Type:Â SystemInt32

The total number of results returned by the program

Story

Type:Â SystemString

This is an array of the story levels associated with each result

Label

Type:Â SystemString

This is an array of the point labels for each result

Name

Type:Â SystemString

This is an array of the unique point names for each result

LoadCase

Type:Â SystemString

This is an array of the names of the analysis case or load combination associated with each result

StepType

Type:Â SystemString

This is an array of the step types, if any, for each result

StepNum

Type: SystemDouble

This is an array of the step numbers, if any, for each result

DisplacementX

Type: SystemDouble

This is an array of the displacements in the X direction [L]

DisplacementY

Type: SystemDouble

This is an array of the displacements in the Y direction [L]

DriftX

Type: SystemDouble

This is an array of the drifts in the X direction [L]

DriftY

Type: SystemDouble

This is an array of the drifts in the Y direction [L]

Return Value

Type: Int32

Returns zero if the results are successfully recovered, otherwise it returns a nonzero value

```

Parameters

Name

Type: SystemString

The name of an existing point object, point element, or group of objects depending on the value of the ItemTypeElm item.

ItemTypeElm

Type: ETABSv1eItemTypeElm

This is one of the following items in the eItemTypeElm enumeration.

Introduction

If this item is ObjectElm, the result request is for the point element corresponding to the point object specified by the Name item.

If this item is Element, the result request is for the point element specified by the Name item.

If this item is GroupElm, the result request is for all point elements directly or indirectly specified in the group specified by the Name item.

If this item is SelectionElm, the result request is for all point elements directly or indirectly selected and the Name item is ignored.

NumberResults

Type:Â SystemInt32

The total number of results returned by the program.

Obj

Type:Â SystemString

This is an array that includes the point object name associated with each result, if any. Some results will have no point object associated with them. For those cases, this item will be blank.

Elm

Type:Â SystemString

This is an array that includes the point element name associated with each result.

LoadCase

Type:Â SystemString

This is an array that includes the name of the analysis case or load combination associated with each result.

StepType

Type:Â SystemString

This is an array that includes the step type, if any, for each result.

StepNum

Type:Â SystemDouble

This is an array that includes the step number, if any, for each result.

F1

Type:Â SystemDouble

This is a one dimensional array that includes the reaction forces in the point element local 1 axis direction. [F].

F2

Type:Â SystemDouble

This is a one dimensional array that includes the reaction forces in the point element local 2 axis direction. [F].

F3

Type:Â SystemDouble

This is a one dimensional array that includes the reaction forces in the point element local 3 axis direction. [F].

M1

Type:Â SystemDouble

This is a one dimensional array that includes the reaction moments about the point element local 1 axis direction. [FL].

M2

Type: SystemDouble

This is a one dimensional array that includes the reaction moments about the point element local 2 axis direction. [FL].

M3

Type: SystemDouble

This is a one dimensional array that includes the reaction moments about the point element local 3 axis direction. [FL].

Return Value

Type: Int32

Returns zero if the reactions are successfully recovered; otherwise it returns a nonzero value.

Remarks

See Results for more information.

Examples

```

Parameters

Name

Type:Â SystemString

The name of an existing point object, point element, or group of objects depending on the value of the ItemTypeElm item.

ItemTypeElm

Type:Â ETABSv1eItemTypeElm

This is one of the following items in the eItemTypeElm enumeration.

Introduction

If this item is ObjectElm, the result request is for the point element corresponding to the point object specified by the Name item.

If this item is Element, the result request is for the point element specified by the Name item.

If this item is GroupElm, the result request is for all point elements directly or indirectly specified in the group specified by the Name item.

If this item is SelectionElm, the result request is for all point elements directly or indirectly selected and the Name item is ignored.

NumberResults

Type:Â SystemInt32

The total number of results returned by the program.

Obj

Type:Â SystemString

This is an array that includes the point object name associated with each result, if any. Some results will have no point object associated with them. For those cases, this item will be blank.

Elm

Type:Â SystemString

This is an array that includes the point element name associated with each result.

LoadCase

Type:Â SystemString

This is an array that includes the name of the analysis case or load combination associated with each result.

StepType

Type:Â SystemString

This is an array that includes the step type, if any, for each result.

StepNum

Type:Â SystemDouble

This is an array that includes the step number, if any, for each result.

U1

Type:Â SystemDouble

This is a one dimensional array that includes the translational velocity in the point element local 1 direction for each result. [L/s]

U2

Type:Â SystemDouble

This is a one dimensional array that includes the translational velocity in the point element local 2 direction for each result. [L/s]

U3

Type:Â SystemDouble

This is a one dimensional array that includes the translational velocity in the point element local 3 direction for each result. [L/s]

R1

Type:Â SystemDouble

This is a one dimensional array that includes the rotational velocity about the point element local 1 direction for each result. [rad/s]

R2

Type: SystemDouble

This is a one dimensional array that includes the rotational velocity about the point element local 2 direction for each result. [rad/s]

R3

Type: SystemDouble

This is a one dimensional array that includes the rotational velocity about the point element local 3 direction for each result. [rad/s]

Return Value

Type: Int32

Returns zero if the velocities are successfully recovered, otherwise it returns a nonzero value

Remarks

See Results for more information.

Examples

```

Parameters

Name

Type: SystemString

The name of an existing point object, point element, or group of objects depending on the value of the ItemTypeElm item.

ItemTypeElm

Type: ETABSv1eItemTypeElm

This is one of the following items in the eItemTypeElm enumeration.

Introduction

If this item is ObjectElm, the result request is for the point element corresponding to the point object specified by the Name item.

If this item is Element, the result request is for the point element specified by the Name item.

If this item is GroupElm, the result request is for all point elements directly or indirectly specified in the group specified by the Name item.

If this item is SelectionElm, the result request is for all point elements directly or indirectly selected and the Name item is ignored.

NumberResults

Type:Â SystemInt32

The total number of results returned by the program.

Obj

Type:Â SystemString

This is an array that includes the point object name associated with each result, if any. Some results will have no point object associated with them. For those cases, this item will be blank.

Elm

Type:Â SystemString

This is an array that includes the point element name associated with each result.

LoadCase

Type:Â SystemString

This is an array that includes the name of the analysis case or load combination associated with each result.

StepType

Type:Â SystemString

This is an array that includes the step type, if any, for each result.

StepNum

Type:Â SystemDouble

This is an array that includes the step number, if any, for each result.

U1

Type:Â SystemDouble

This is a one dimensional array that includes the translational velocity in the point element local 1 direction for each result. [L/s]

U2

Type:Â SystemDouble

This is a one dimensional array that includes the translational velocity in the point element local 2 direction for each result. [L/s]

U3

Type:Â SystemDouble

This is a one dimensional array that includes the translational velocity in the point element local 3 direction for each result. [L/s]

R1

Type:Â SystemDouble

This is a one dimensional array that includes the rotational velocity about the point element local 1 direction for each result. [rad/s]

R2

Type: SystemDouble

This is a one dimensional array that includes the rotational velocity about the point element local 2 direction for each result. [rad/s]

R3

Type: SystemDouble

This is a one dimensional array that includes the rotational velocity about the point element local 3 direction for each result. [rad/s]

Return Value

Type: Int32

Returns zero if the velocities are successfully recovered, otherwise it returns a nonzero value

Remarks

See Results for more information.

    R3 : float[] byref -> int

```

Parameters

Name

Type: [SystemString](#)

The name of an existing link object, link element, or group of objects depending on the value of the ItemTypeElm item.

ItemTypeElm

Type: [ETABSv1eItemTypeElm](#)

This is one of the following items in the [eItemTypeElm](#) enumeration.

If this item is ObjectElm, the result request is for the link element corresponding to the point object specified by the Name item.

If this item is Element, the result request is for the link element specified by the Name item.

If this item is GroupElm, the result request is for all link elements directly or indirectly specified in the group specified by the Name item.

If this item is SelectionElm, the result request is for all link elements directly or indirectly selected and the Name item is ignored.

NumberResults

Type:Â SystemInt32

The total number of results returned by the program.

Obj

Type:Â SystemString

This is an array that includes the link object name associated with each result, if any.

Elm

Type:Â SystemString

This is an array that includes the link element name associated with each result.

LoadCase

Type:Â SystemString

This is an array that includes the name of the analysis case or load combination associated with each result.

StepType

Type:Â SystemString

This is an array that includes the step type, if any, for each result.

StepNum

Type:Â SystemDouble

This is an array that includes the step number, if any, for each result.

U1

Type:Â SystemDouble

This is an array that includes the internal translational deformation of the link in the link element local 1-axis direction [L]

U2

Type:Â SystemDouble

This is an array that includes the internal translational deformation of the link in the link element local 2-axis direction [L]

U3

Type:Â SystemDouble

This is an array that includes the internal translational deformation of the link in the link element local 3-axis direction [L]

R1

Type:Â SystemDouble

This is an array that includes the internal rotational deformation of the link about the link element local 1-axis direction [L]

R2

Type:Â SystemDouble

This is an array that includes the internal rotational deformation of the link about the link element local 2-axis direction [L]

R3

Type: SystemDouble

This is an array that includes the internal rotational deformation of the link about the link element local 3-axis direction [L]

Return Value

Type: Int32

Returns zero if the deformations are successfully recovered, otherwise it returns a nonzero value

Remarks

See Results for more information.

Examples

VB

Copy

    T : float[] byref *
    M2 : float[] byref *
    M3 : float[] byref -> int

```

Parameters

Name

Type: SystemString

The name of an existing link object, link element, or group of objects depending on the value of the ItemTypeElm item.

ItemTypeElm

Parameters

Type:Â ETABSv1eItemTypeElm

This is one of the following items in the eItemTypeElm enumeration.

If this item is ObjectElm, the result request is for the link element corresponding to the point object specified by the Name item.

If this item is Element, the result request is for the link element specified by the Name item.

If this item is GroupElm, the result request is for all link elements directly or indirectly specified in the group specified by the Name item.

If this item is SelectionElm, the result request is for all link elements directly or indirectly selected and the Name item is ignored.

NumberResults

Type:Â SystemInt32

The total number of results returned by the program.

Obj

Type:Â SystemString

This is an array that includes the link object name associated with each result, if any.

Elm

Type:Â SystemString

This is an array that includes the link element name associated with each result.

PointElm

Type:Â SystemString

This is an array that includes the point element name associated with each result.

LoadCase

Type:Â SystemString

This is an array that includes the name of the analysis case or load combination associated with each result.

StepType

Type:Â SystemString

This is an array that includes the step type, if any, for each result.

StepNum

Type:Â SystemDouble

This is an array that includes the step number, if any, for each result.

P

Type:Â SystemDouble

This is an array that includes the link axial force (in the link local 1-axis direction) at the specified point element. [F]

V2

Type:Â SystemDouble

This is an array that includes the link shear force component in the link element local 2-axis direction. [F]

V3

Type:Â SystemDouble

This is an array that includes the link shear force component in the link element local 3-axis direction. [F]

T

Type: SystemDouble

This is an array that includes the link torsion (about the link local 1-axis) at the specified point element. [FL]

M2

Type: SystemDouble

This is an array that includes the link moment component about the link element local 2-axis. [FL]

M3

Type: SystemDouble

This is an array that includes the link moment component about the link element local 3-axis. [FL]

Return Value

Type: Int32

Returns zero if the forces are successfully recovered, otherwise it returns a nonzero value

Remarks

See Results for more information.

    F3 : float[] byref *
    M1 : float[] byref *
    M2 : float[] byref *
    M3 : float[] byref -> int

```

Parameters

Name

Type: SystemString

The name of an existing link object, link element, or group of objects depending on the value of the ItemTypeElm item.

ItemTypeElm

Type:Â ETABSv1eItemTypeElm

This is one of the following items in the eItemTypeElm enumeration.

If this item is ObjectElm, the result request is for the link element corresponding to the point object specified by the Name item.

If this item is Element, the result request is for the link element specified by the Name item.

If this item is GroupElm, the result request is for all link elements directly or indirectly specified in the group specified by the Name item.

If this item is SelectionElm, the result request is for all link elements directly or indirectly selected and the Name item is ignored.

NumberResults

Type:Â SystemInt32

The total number of results returned by the program.

Obj

Type:Â SystemString

This is an array that includes the link object name associated with each result, if any.

Elm

Type:Â SystemString

This is an array that includes the link element name associated with each result.

PointElm

Type:Â SystemString

This is an array that includes the point element name associated with each result.

LoadCase

Type:Â SystemString

This is an array that includes the name of the analysis case or load combination associated with each result.

StepType

Type:Â SystemString

This is an array that includes the step type, if any, for each result.

StepNum

Type:Â SystemDouble

This is an array that includes the step number, if any, for each result.

F1

Type:Â SystemDouble

This is an array that includes the joint force component in the point element local 1-axis direction. [F]

F2

Type:Â SystemDouble

This is an array that includes the joint force component in the point element local 2-axis direction. [F]

F3

Type:Â SystemDouble

This is an array that includes the joint force component in the point element local 3-axis direction. [F]

M1

Type: SystemDouble

This is an array that includes the joint moment component about the point element local 1-axis. [FL]

M2

Type: SystemDouble

This is an array that includes the joint moment component about the point element local 2-axis. [FL]

M3

Type: SystemDouble

This is an array that includes the joint moment component about the point element local 3-axis. [FL]

Return Value

Type: Int32

Returns zero if the forces are successfully recovered, otherwise it returns a nonzero value

Remarks

See Results for more information.

Examples

VB

Copy

```
Public Sub Example()
    Dim SapModel As cSapModel
    Dim EtabsObject As cOAPI

```

LoadCase : string[] byref *
ItemType : string[] byref *
Item : string[] byref *
Stat : float[] byref *
Dyn : float[] byref -> int

```

Parameters

NumberResults

Type: SystemInt32

The total number of results returned by the program

LoadCase

Type: SystemString

This is an array that includes the name of the modal load case associated with each result

ItemType

Type: SystemString

This is an array that includes Load Pattern, Acceleration, Link or Panel Zone. It specifies the type of item for which the modal load participation is reported

Item

Type: SystemString

This is an array whose values depend on the ItemType. If the ItemType is Load Pattern, this is the name of the load pattern.

If the ItemType is Acceleration, this is UX, UY, UZ, RX, RY, or RZ, indicating the acceleration direction.

If the ItemType is Link, this is the name of the link followed by U1, U2, U3, R1, R2, or R3 (in parenthesis), indicating the link degree of freedom for which the output is reported.

If the ItemType is Panel Zone, this is the name of the joint to which the panel zone is assigned, followed by U1, U2, U3, R1, R2, or R3 (in parenthesis), indicating the degree of freedom for which the output is reported.

Stat

Type: SystemDouble

This is an array that includes the percent static load participation ratio

Dyn

Type: SystemDouble

This is an array that includes the percent dynamic load participation ratio

Return Value

Type: Int32

Returns zero if the data is successfully recovered; otherwise it returns a nonzero value

Remarks

See [Results](#) for more information.

    SumRY : float[] byref *
```

SumRZ : float[] byref -> int

Parameters

NumberResults

Type:Â SystemInt32

The total number of results returned by the program

LoadCase

Type:Â SystemString

This is an array that includes the name of the modal load case associated with each result

StepType

Type:Â SystemString

This is an array that includes the step type, if any, for each result. For modal results, this will always be Mode

StepNum

Type:Â SystemDouble

This is an array that includes the step number for each result. For modal results, this is always the mode number

Period

Type:Â SystemDouble

This is an array that includes the period for each result. [s]

UX

Type:Â SystemDouble

This is an array that includes the modal participating mass ratio for the structure Ux degree of freedom. The ratio applies to the specified mode

UY

Type:Â SystemDouble

This is an array that includes the modal participating mass ratio for the structure Uy degree of freedom. The ratio applies to the specified mode

UZ

Type:Â SystemDouble

This is an array that includes the modal participating mass ratio for the structure Uz degree of freedom. The ratio applies to the specified mode

SumUX

Type:Â SystemDouble

This is an array that includes the cumulative sum of the modal participating mass ratios for the structure Ux degree of freedom

SumUY

Type:Â SystemDouble

This is an array that includes the cumulative sum of the modal participating mass ratios for the structure Uy degree of freedom

SumUZ

Type:Â SystemDouble

This is an array that includes the cumulative sum of the modal participating mass ratios for the structure Uz degree of freedom

RX

Type:Â SystemDouble

This is an array that includes the modal participating mass ratio for the structure Rx degree of freedom. The ratio applies to the specified mode

RY

Type: SystemDouble

This is an array that includes the modal participating mass ratio for the structure Ry degree of freedom. The ratio applies to the specified mode

RZ

Type: SystemDouble

This is an array that includes the modal participating mass ratio for the structure Rz degree of freedom. The ratio applies to the specified mode

SumRX

Type: SystemDouble

This is an array that includes the cumulative sum of the modal participating mass ratios for the structure Rx degree of freedom

SumRY

Type: SystemDouble

This is an array that includes the cumulative sum of the modal participating mass ratios for the structure Ry degree of freedom

SumRZ

Type: SystemDouble

This is an array that includes the cumulative sum of the modal participating mass ratios for the structure Rz degree of freedom

Return Value

Type: Int32

Returns zero if the data is successfully recovered; otherwise it returns a nonzero value

Remarks

See [Results](#) for more information.

Examples

VB

Period

Type: SystemDouble

This is an array that includes the period for each result. [s]

UX

Type: SystemDouble

This is an array that includes the modal participation factor for the structure Ux degree of freedom. The ratio applies to the specified mode. [Fs2]

UY

Type: SystemDouble

This is an array that includes the modal participation factor for the structure Uy degree of freedom. The ratio applies to the specified mode. [Fs2]

UZ

Type: SystemDouble

This is an array that includes the modal participation factor for the structure Uz degree of freedom. The ratio applies to the specified mode. [Fs2]

RX

Type: SystemDouble

This is an array that includes the modal participation factor for the structure Rx degree of freedom. The ratio applies to the specified mode. [FLs2]

RY

Type: SystemDouble

This is an array that includes the modal participation factor for the structure Ry degree of freedom. The ratio applies to the specified mode. [FLs2]

RZ

Type: SystemDouble

This is an array that includes the modal participation factor for the structure Rz degree of freedom. The ratio applies to the specified mode. [FLs2]

ModalMass

Type: SystemDouble

This is an array that includes the modal mass for the specified mode. This is a measure of the kinetic energy in the structure as it is deforming in the specified mode. [FLs2]

ModalStiff

Type: SystemDouble

This is an array that includes the modal stiffness for the specified mode. This is a measure of the strain energy in the structure as it is deforming in the specified mode. [FL]

Return Value

Type: Int32

Returns zero if the data is successfully recovered; otherwise it returns a nonzero value

▲ Remarks

See [Results](#) for more information.

▲ Examples

VB

Copy

```

)

abstract ModalPeriod :
    NumberResults : int byref *
    LoadCase : string[] byref *
    StepType : string[] byref *
    StepNum : float[] byref *
    Period : float[] byref *
    Frequency : float[] byref *
    CircFreq : float[] byref *
    EigenValue : float[] byref -> int

```

Parameters

NumberResults

Type: SystemInt32

The total number of results returned by the program

LoadCase

Type: SystemString

This is an array that includes the name of the modal load case associated with each result

StepType

Type: SystemString

This is an array that includes the step type, if any, for each result. For modal results, this will always be Mode

StepNum

Type: SystemDouble

This is an array that includes the step number for each result. For modal results, this is always the mode number

Period

Type: SystemDouble

This is an array that includes the period for each result. [s]

Frequency

Type: SystemDouble

This is an array that includes the cyclic frequency for each result. [1/s]

CircFreq

Type: SystemDouble

This is an array that includes the circular frequency for each result. [rad/s]

EigenValue

Type: SystemDouble

This is an array that includes the eigenvalue for the specified mode for each result. [rad²/s²]

Return Value

Type: Int32

Returns zero if the data is successfully recovered; otherwise it returns a nonzero value

Remarks

See [Results](#) for more information.

    U3 : float[] byref *
    R1 : float[] byref *
    R2 : float[] byref *
    R3 : float[] byref -> int

```

Parameters

Name

Type: [SystemString](#)

The name of an existing point object, point element, or group of objects depending on the value of the ItemTypesElm item.

ItemTypesElm

Type: [ETABSv1eItemTypesElm](#)

This is one of the following items in the [eItemTypesElm](#) enumeration.

Introduction

If this item is ObjectElm, the result request is for the point element corresponding to the point object specified by the Name item.

If this item is Element, the result request is for the point element specified by the Name item.

If this item is GroupElm, the result request is for all point elements directly or indirectly specified in the group specified by the Name item.

If this item is SelectionElm, the result request is for all point elements directly or indirectly selected and the Name item is ignored.

NumberResults

Type:Â SystemInt32

The total number of results returned by the program.

Obj

Type:Â SystemString

This is an array that includes the point object name associated with each result, if any. Some results will have no point object associated with them. For those cases, this item will be blank.

Elm

Type:Â SystemString

This is an array that includes the point element name associated with each result.

LoadCase

Type:Â SystemString

This is an array that includes the name of the analysis case or load combination associated with each result.

StepType

Type:Â SystemString

This is an array that includes the step type, if any, for each result.

StepNum

Type:Â SystemDouble

This is an array that includes the step number, if any, for each result.

U1

Type:Â SystemDouble

This is a one dimensional array that includes the displacement in the point element local 1-axis direction for each result. [L]

U2

Type:Â SystemDouble

This is a one dimensional array that includes the displacement in the point element local 2-axis direction for each result. [L]

U3

Type:Â SystemDouble

This is a one dimensional array that includes the displacement in the point element local 3-axis direction for each result. [L]

R1

Type:Â SystemDouble

This is a one dimensional array that includes the rotation about the point element local 1-axis for each result. [rad]

R2

Type: SystemDouble

This is a one dimensional array that includes the rotation about the point element local 2-axis for each result. [rad]

R3

Type: SystemDouble

This is a one dimensional array that includes the rotation about the point element local 3-axis for each result. [rad]

Return Value

Type: Int32

Returns zero if the displacements are successfully recovered, otherwise it returns a nonzero value

Remarks

See Results for more information.

Examples

VB

Copy

```
Public Sub Example()

    'dimension variables

    U3 : float[] byref *
    R1 : float[] byref *
    R2 : float[] byref *
    R3 : float[] byref -> int

```

Parameters

Name

Type: SystemString

The name of an existing link object, link element, or group of objects depending on the value of the ItemTypeElm item.

ItemTypeElm

Type: ETABSv1eItemTypeElm

This is one of the following items in the eItemTypeElm enumeration.

If this item is ObjectElm, the result request is for the panel zone (link) element corresponding to the panel zone assignment to the point object specified by the Name item.

If this item is Element, the result request is for the panel zone (link) element specified by the Name item.

If this item is GroupElm, the result request is for all panel zone (link) elements directly or indirectly specified in the group specified by the Name item.

If this item is SelectionElm, the result request is for all panel zone (link) elements directly or indirectly selected and the Name item is ignored.

For GroupElm and SelectionElm a panel zone (link) element may be indirectly specified through point objects that have panel zone assignments.

NumberResults

Type:Â SystemInt32

The total number of results returned by the program.

Elm

Type:Â SystemString

This is an array that includes the panel zone (link) element name associated with each result.

LoadCase

Type:Â SystemString

This is an array that includes the name of the analysis case or load combination associated with each result.

StepType

Type:Â SystemString

This is an array that includes the step type, if any, for each result.

StepNum

Type:Â SystemDouble

This is an array that includes the step number, if any, for each result.

U1

Type:Â SystemDouble

This is a one dimensional array that includes the internal translational deformation of the panel zone (link) in the link element local 1-axis direction. [L]

U2

Type:Â SystemDouble

This is a one dimensional array that includes the internal translational deformation of the panel zone (link) in the link element local 2-axis direction. [L]

U3

Type:Â SystemDouble

This is a one dimensional array that includes the internal translational deformation of the panel zone (link) in the link element local 3-axis direction. [L]

R1

Type:Â SystemDouble

This is a one dimensional array that includes the internal rotational deformation of the panel zone (link) about the link element local 1-axis. [L]

R2

Type:Â SystemDouble

This is a one dimensional array that includes the internal rotational deformation of the panel zone (link) about the link element local 2-axis. [L]

R3

Type:Â SystemDouble

This is a one dimensional array that includes the internal rotational deformation

of the panel zone (link) about the link element local 3-axis. [L]

Return Value

Type: $\hat{A}$ Int32

Returns zero if the deformations are successfully recovered, otherwise it returns a nonzero value

Remarks

See Results for more information.

array<double>^% M3
)

```

```

abstract PanelZoneForce :
    Name : string *
    ItemTypeId : eItemTypeId *
    NumberResults : int byref *
    Elm : string[] byref *
    PointId : string[] byref *
    LoadCase : string[] byref *
    StepType : string[] byref *
    StepNum : float[] byref *
    P : float[] byref *
    V2 : float[] byref *
    V3 : float[] byref *
    T : float[] byref *
    M2 : float[] byref *
    M3 : float[] byref -> int

```

Parameters

Name

Type: SystemString

The name of an existing point object, point element, or group of objects depending on the value of the ItemTypeId item.

ItemTypeId

Type: ETABSv1eItemTypeId

This is one of the following items in the eItemTypeId enumeration.

Introduction

If this item is ObjectElm, the result request is for the panel zone (link) element corresponding to the panel zone assignment to the point object specified by the Name item.

If this item is Element, the result request is for the panel zone (link) element specified by the Name item.

If this item is GroupElm, the result request is for all panel zone (link) elements directly or indirectly specified in the group specified by the Name item.

If this item is SelectionElm, the result request is for all panel zone (link) elements directly or indirectly selected and the Name item is ignored.

For GroupElm and SelectionElm a panel zone (link) element may be indirectly specified through point objects that have panel zone assignments.

NumberResults

Type:Â SystemInt32

The total number of results returned by the program.

Elm

Type:Â SystemString

This is an array that includes the panel zone (link) element name associated with each result.

PointElm

Type:Â SystemString

This is an array that includes the point element name associated with each result.

LoadCase

Type:Â SystemString

This is an array that includes the name of the analysis case or load combination associated with each result.

StepType

Type:Â SystemString

This is an array that includes the step type, if any, for each result.

StepNum

Type:Â SystemDouble

This is an array that includes the step number, if any, for each result.

P

Type:Â SystemDouble

This is an array that includes the panel zone (link) axial force (in the link local 1-axis direction) at the specified point element. [F]

V2

Type:Â SystemDouble

This is an array that includes the panel zone (link) shear force component in the link element local 2-axis direction. [F]

V3

Type:Â SystemDouble

This is an array that includes the panel zone (link) shear force component in the link element local 3-axis direction. [F]

T

Type:Â SystemDouble

This is an array that includes the panel zone (link) torsion (about the link local

1-axis) at the specified point element. [FL]

M2

Type: SystemDouble

This is an array that includes the panel zone (link) moment component about the link element local 2-axis. [F]

M3

Type: SystemDouble

This is an array that includes the panel zone (link) moment component about the link element local 3-axis. [F]

Return Value

Type: Int32

Returns zero if the forces are successfully recovered, otherwise it returns a nonzero value

Remarks

See Results for more information.

Examples

VB

Copy

```
Public Sub Example()

    'dimension variables
    Dim SapObject as c0API
    Dim SapModel As cSapModel
    Dim ret As Integer = -1
    Dim NumberResults As Integer
    Dim Elm() As String
    Dim PointElm() As String
    Dim LoadCase() As String
    Dim StepType() As String
    Dim StepNum() As Double
    Dim P() As Double
    Dim V2() As Double
    Dim V3() As Double
    Dim T() As Double
    Dim M2() As Double
    Dim M3() As Double

    'create ETABS object
    Dim myHelper as cHelper = New Helper
    EtabsObject = myHelper.CreateObjectProgID("CSI.ETABS.API.ETABSObject")

    'start ETABS application
    ret = EtabsObject.ApplicationStart()

    'create SapModel object
    SapModel = EtabsObject.SapModel

    'initialize model
    ret = SapModel.InitializeNewModel()

    'create steel deck template model
    ret = SapModel.File.NewSteelDeck(4,12,12,4,4,24,24)

    'assign panel zone to point object "3"
    ret = SapModel.PointObj.SetPanelZone("3", 1, 2, 0, 0, "", 0, 0, 0)
```

Introduction

```
'run analysis
  System.IO.Directory.CreateDirectory("c:\CSI_API_temp")
  ret = SapModel.File.Save("C:\CSI_API_temp\example.edb")
  ret = SapModel.Analyze.RunAnalysis()

'deselect all cases and combos
  ret = SapModel.Results.Setup.DeselectAllCasesAndCombosForOutput()

'set case selected for output
  ret = SapModel.Results.Setup.SetCaseSelectedForOutput("MODAL")

'get panel zone force for point object "3"
  ret = SapModel.Results.PanelZoneForce("3", eItemTypeElm.ObjectElm, NumberResults, Elm, Poi

'close ETABS
  EtabsObject.ApplicationExit(False)

'clean up variables
  SapModel = Nothing
  EtabsObject = Nothing
End Sub
```

    V3 : float[] byref *
    T : float[] byref *
    M2 : float[] byref *
    M3 : float[] byref -> int
```

Parameters

NumberResults

Type:Â SystemInt32

The total number of results returned by the program

StoryName

Type:Â SystemString

The story name of the pier object

PierName

Type:Â SystemString

The name of the pier object

LoadCase

Type:Â SystemString

The names of the load case

Location

Type:Â SystemString

The location on the pier, either "Top" or "Bottom", of the result being reported

P

Type:Â SystemDouble

The axial force [F]

V2

Type:Â SystemDouble

The shear force in the local 2 direction [F]

V3

T	Type:Â <u>SystemDouble</u>
	The shear force in the local 3 direction [F]
M2	Type:Â <u>SystemDouble</u>
	The torsion [FL]
M3	Type:Â <u>SystemDouble</u>
	The moment about the local 3 axis [FL]

Return Value

Type:Â Int32

Returns zero if the results are successfully retrieved; otherwise returns nonzero

    F3 : float[] byref *  
    M1 : float[] byref *  
    M2 : float[] byref *  
    M3 : float[] byref -> int
```

Parameters

NumberResults

Type:Â SystemInt32

The number total of results returned by the program

SCut

Type:Â SystemString

This is an array that includes the name of the section cut associated with each result

LoadCase

Type:Â SystemString

This is an array that includes the name of the analysis case or load combination associated with each result.

StepType

Type:Â SystemString

This is an array that includes the step type, if any, for each result.

StepNum

Type:Â SystemDouble

This is an array that includes the step number, if any, for each result.

F1

Type:Â SystemDouble

This is an array that includes the force in the section cut local 1-axis directions for each result. [F]

F2

Type: SystemDouble

This is an array that includes the force in the section cut local 2-axis directions for each result. [F]

F3

Type: SystemDouble

This is an array that includes the force in the section cut local 3-axis directions for each result. [F]

M1

Type: SystemDouble

This is an array that includes the moment about the section cut local 1-axis for each result. [FL]

M2

Type: SystemDouble

This is an array that includes the moment about the section cut local 1-axis for each result. [FL]

M3

Type: SystemDouble

This is an array that includes the moment about the section cut local 1-axis for each result. [FL]

Return Value

Type: Int32

Returns zero if the section cut forces are successfully recovered, otherwise it returns a nonzero value

Remarks

See [Results](#) for more information.

Examples

VB

Copy

```
Public Sub Example()
    Dim SapModel As cSapModel
    Dim EtabsObject As cOAPI
    Dim ret As Integer = -1

    V3 : float[] byref *  
    T : float[] byref *  
    M2 : float[] byref *  
    M3 : float[] byref -> int
```

Parameters

NumberResults

Type: System.Int32

The number total of results returned by the program

SCut

Type: System.String

This is an array that includes the name of the section cut associated with each result

LoadCase

Type: System.String

This is an array that includes the name of the analysis case or load combination associated with each result.

StepType

Type: System.String

This is an array that includes the step type, if any, for each result.

StepNum

Type: System.Double

This is an array that includes the step number, if any, for each result.

P

Type: System.Double

This is a one dimensional array of the axial force for each result. [F]

V2

Type: SystemDouble

This is a one dimensional array of the shear force in the section cut local 2 direction for each result. [F]

V3

Type: SystemDouble

This is a one dimensional array of the shear force in the section cut local 3 direction for each result. [F]

T

Type: SystemDouble

This is a one dimensional array of the torsion for each result. [FL]

M2

Type: SystemDouble

This is a one dimensional array of the moment about the section cut local 2-axis for each result. [FL]

M3

Type: SystemDouble

This is a one dimensional array of the moment about the section cut local 3-axis for each result. [FL]

Return Value

Type: Int32

Returns zero if the section cut forces are successfully recovered, otherwise it returns a nonzero value

Remarks

See [Results](#) for more information.

CSI API ETABS v1

cAnalysisResultsAddLanguageSpecificTextSet("LST32059737_0") Method

Retrieves spandrel forces for any defined spandrel objects in the model

Namespace: ETABSV1

Assembly: ETABSV1 (in ETABSV1.dll) Version: 1.0.0.0 (1.24.0.0)

■ Syntax

C#

VB

C++

F#

Copy

```
int SpandrelForce(
    ref int NumberResults,
    ref string[] StoryName,
    ref string[] SpandrelName,
    ref string[] LoadCase,
    ref string[] Location,
    ref double[] P,
    ref double[] V2,
    ref double[] V3,
    ref double[] T,
    ref double[] M2,
    ref double[] M3
)
```

```
Function SpandrelForce (
    ByRef NumberResults As Integer,
    ByRef StoryName As String(),
    ByRef SpandrelName As String(),
    ByRef LoadCase As String(),
    ByRef Location As String(),
    ByRef P As Double(),
    ByRef V2 As Double(),
    ByRef V3 As Double(),
    ByRef T As Double(),
    ByRef M2 As Double(),
    ByRef M3 As Double()
) As Integer
```

```
Dim instance As cAnalysisResults
Dim NumberResults As Integer
Dim StoryName As String()
Dim SpandrelName As String()
Dim LoadCase As String()
Dim Location As String()
Dim P As Double()
Dim V2 As Double()
Dim V3 As Double()
Dim T As Double()
Dim M2 As Double()
Dim M3 As Double()
Dim returnValue As Integer
```

Introduction

```
returnValue = instance.SpandrelForce(NumberResults,  
StoryName, SpandrelName, LoadCase,  
Location, P, V2, V3, T, M2, M3)
```

```
int SpandrelForce(  
int% NumberResults,  
array<String^>^% StoryName,  
array<String^>^% SpandrelName,  
array<String^>^% LoadCase,  
array<String^>^% Location,  
array<double>^% P,  
array<double>^% V2,  
array<double>^% V3,  
array<double>^% T,  
array<double>^% M2,  
array<double>^% M3  
)
```

```
abstract SpandrelForce :  
    NumberResults : int byref *

    SpandrelName : string[] byref *  
    LoadCase : string[] byref *  
    Location : string[] byref *  
    P : float[] byref *  
    V2 : float[] byref *  
    V3 : float[] byref *  
    T : float[] byref *  
    M2 : float[] byref *  
    M3 : float[] byref -> int
```

Parameters

NumberResults

Type:Â SystemInt32

The total number of results returned by the program

StoryName

Type:Â SystemString

The story name of the spandrel object

SpandrelName

Type:Â SystemString

The name of the spandrel object

LoadCase

Type:Â SystemString

The names of the load case

Location

Type:Â SystemString

The location on the spandrel, either "Left" or "Right", of the result being reported

P

Type:Â SystemDouble

The axial force [F]

V2

Type:Â SystemDouble

The shear force in the local 2 direction [F]

V3	Type: <u>SystemDouble</u> The shear force in the local 3 direction [F]
T	Type: <u>SystemDouble</u> The torsion [FL]
M2	Type: <u>SystemDouble</u> The moment about the local 2 axis [FL]
M3	Type: <u>SystemDouble</u> The moment about the local 3 axis [FL]

Return ValueType: Int32

Returns zero if the results are successfully retrieved; otherwise returns nonzero

array<double>^% Y,
array<double>^% Z
)
```

```
abstract StoryDrifts :
    NumberResults : int byref *
    Story : string[] byref *
    LoadCase : string[] byref *
    StepType : string[] byref *
    StepNum : float[] byref *
    Direction : string[] byref *
    Drift : float[] byref *
    Label : string[] byref *
    X : float[] byref *
    Y : float[] byref *
    Z : float[] byref -> int
```

Parameters

NumberResults

Type:Â [SystemInt32](#)

The total number of results returned by the program

Story

Type:Â [SystemString](#)

This is an array of the story levels for each result

LoadCase

Type:Â [SystemString](#)

This is an array of the names of the analysis case or load combination associated with each result

StepType

Type:Â [SystemString](#)

This is an array of the step types, if any, for each result

StepNum

Type:Â [SystemDouble](#)

This is an array of the step numbers, if any, for each result

Direction

Type:Â [SystemString](#)

This is an array of the directions of the Drift values

Drift

Type:Â [SystemDouble](#)

This is an array of the drift values

Label

Type: [SystemString](#)

This is an array of the point labels for each result

X

Type: [SystemDouble](#)

This is an array of the displacements in the X direction [L]

Y

Type: [SystemDouble](#)

This is an array of the displacements in the Y direction [L]

Z

Type: [SystemDouble](#)

This is an array of the displacements in the Z direction [L]

Return Value

Type: [Int32](#)

Returns zero if the results are successfully recovered, otherwise it returns a nonzero value

▲ **Remarks**

CSI API ETABS v1

cAnalysisResultsSetup Interface

Namespace: Â ETABSv1

Assembly: Â ETABSv1 (in ETABSv1.dll) Version: 1.0.0.0 (1.24.0.0)

▲ Syntax

C#

VB

C++

F#

Copy

```
public interface cAnalysisResultsSetup
```

```
Public Interface cAnalysisResultsSetup
```

```
Dim instance As cAnalysisResultsSetup
```

```
public interface class cAnalysisResultsSetup
```

```
type cAnalysisResultsSetup = interface end
```

The cAnalysisResultsSetup type exposes the following members.

▲ Methods

Â	Name	Description
⇒	<u>DeselectAllCasesAndCombosForOutput</u>	Deselects all load cases and response combinations for output.
⇒	<u>GetCaseSelectedForOutput</u>	Checks if a load case is selected for output.
⇒	<u>GetComboSelectedForOutput</u>	Checks if a load combination is selected for output
⇒	<u>GetOptionBaseReactLoc</u>	Retrieves the global coordinates of the location at which the base reactions are reported
⇒	<u>GetOptionBucklingMode</u>	
⇒	<u>GetOptionDirectHist</u>	Retrieves the output option for direct history results.
⇒	<u>GetOptionModalHist</u>	Retrieves the output option for modal history results.
⇒	<u>GetOptionModeShape</u>	
⇒	<u>GetOptionMultiStepStatic</u>	
⇒	<u>GetOptionMultiValuedCombo</u>	
⇒	<u>GetOptionNLStatic</u>	
⇒	<u>SetCaseSelectedForOutput</u>	Sets a load case selected for output flag.
⇒	<u>SetComboSelectedForOutput</u>	Sets a load combination selected for output flag

- ⇒ [SetOptionBaseReactLoc](#)
- ⇒ [SetOptionBucklingMode](#)
- ⇒ [SetOptionDirectHist](#)
- ⇒ [SetOptionModalHist](#)
- ⇒ [SetOptionModeShape](#)
- ⇒ [SetOptionMultiStepStatic](#)
- ⇒ [SetOptionMultiValuedCombo](#)
- ⇒ [SetOptionNLStatic](#)

Sets the output option for modal history results.

CSI API ETABS v1

cAnalysisResultsSetupAddLanguageSpecificTextSet("Method

Sets a load case selected for output flag.

Namespace: ETABSv1

Assembly: ETABSv1 (in ETABSv1.dll) Version: 1.0.0.0 (1.24.0.0)

Syntax

C#

VB

C++

F#

Copy

```
int SetCaseSelectedForOutput(
    string Name,
    bool Selected = true
)
```

```
Function SetCaseSelectedForOutput (
    Name As String,
    Optional Selected As Boolean = true
) As Integer
```

```
Dim instance As cAnalysisResultsSetup
Dim Name As String
Dim Selected As Boolean
Dim returnValue As Integer
```

```
returnValue = instance.SetCaseSelectedForOutput(Name,
    Selected)
```

```
int SetCaseSelectedForOutput(
    String^ Name,
    bool Selected = true
)
```

```
abstract SetCaseSelectedForOutput :
    Name : string *
    ?Selected : bool
(* Defaults:
    let _Selected = defaultArg Selected true
*)
-> int
```

Parameters

Name

Type: SystemString

The name of an existing load case.

Selected (Optional)

Type: SystemBoolean

This item is True if the specified load case is to be selected for output,

otherwise it is False.

Return Value

Type: Int32

Returns zero if the selected flag is successfully set; otherwise it returns nonzero.

▲ **Remarks**

▲ **Examples**

VB

Copy

```
Public Sub Example()
    Dim SapModel As cSapModel
    Dim EtabsObject As cOAPI
    Dim ret As Integer = -1

    'create ETABS object
    Dim myHelper as cHelper = New Helper
    EtabsObject = myHelper.CreateObjectProgID("CSI.ETABS.API.ETABSObject")

    'start ETABS application
    ret = EtabsObject.ApplicationStart()

    'create SapModel object
    SapModel = EtabsObject.SapModel

    'initialize model
    ret = SapModel.InitializeNewModel()

    'create steel deck template model
    ret = SapModel.File.NewSteelDeck(4,12,12,4,4,24,24)

    'run analysis
    System.IO.Directory.CreateDirectory("c:\CSI_API_temp")
    ret = SapModel.File.Save("C:\CSI_API_temp\example.edb")
    ret = SapModel.Analyze.RunAnalysis

    'deselect all cases and combos
    ret = SapModel.Results.Setup.DeselectAllCasesAndCombosForOutput

    'set case selected for output
    ret = SapModel.Results.Setup.SetCaseSelectedForOutput("DEAD")

    'close ETABS
    EtabsObject.ApplicationExit(False)

    'clean up variables
    SapModel = Nothing
    EtabsObject = Nothing
End Sub
```

CSI API ETABS v1

cAnalyze Interface

Namespace: [ETABSV1](#)

Assembly: [ETABSV1](#) (in ETABSV1.dll) Version: 1.0.0.0 (1.24.0.0)

Syntax

[C#](#)

[VB](#)

[C++](#)

[F#](#)

[Copy](#)

```
public interface cAnalyze
```

```
Public Interface cAnalyze
```

```
Dim instance As cAnalyze
```

```
public interface class cAnalyze
```

```
type cAnalyze = interface end
```

The cAnalyze type exposes the following members.

Methods

A

Name

Description

 [CreateAnalysisModel](#)

Creates the analysis model. If the analysis model is already created and current, nothing is done.

 [DeleteResults](#)

Deletes results for load cases.

 [GetActiveDOF](#)

Retrieves the model global degrees of freedom.

 [GetCaseStatus](#)

Retrieves the status for all load cases.

 [GetDesignResponseOption](#)

Retrieves the design and response recovery options.

 [GetRunCaseFlag](#)

Retrieves the run flags for all analysis cases.

 [GetSolverOption](#)

DEPRECATED. Please see [GetSolverOption_2\(Int32, String\)](#) or [GetSolverOption_3\(Int32, Int32, Int32, String\)](#)

 [GetSolverOption_1](#)

DEPRECATED. Please see [GetSolverOption_2\(Int32, String\)](#) or [GetSolverOption_3\(Int32, Int32, Int32, String\)](#)

 [GetSolverOption_2](#)

Retrieves the model solver options.

 [GetSolverOption_3](#)

Retrieves the model solver options.

 [MergeAnalysisResults](#)

Merges analysis results from a given model.

 [ModifyUndeformedGeometry](#)

Modifies the undeformed geometry based on displacements obtained from a specified load case

 [ModifyUndeformedGeometryModeShape](#)

Modifies the undeformed geometry based on the mode shapes of a specified mode

 [RunAnalysis](#)

Runs the analysis.

- ⇒ [SetActiveDOF](#) Sets the model global degrees of freedom.
- ⇒ [SetDesignResponseOption](#) Sets the design and response recovery options.
- ⇒ [SetRunCaseFlag](#) Sets the run flag for load cases.
- ⇒ [SetSolverOption](#) DEPRECATED. Please see [SetSolverOption_2\(Int32, Int32, Int32, String\)](#) or [SetSolverOption_3\(Int32, Int32, Int32, String\)](#)
- ⇒ [SetSolverOption_1](#) DEPRECATED. Please see [SetSolverOption_2\(Int32, Int32, Int32, String\)](#) or [SetSolverOption_3\(Int32, Int32, Int32, String\)](#)
- ⇒ [SetSolverOption_2](#) Sets the model solver options.
- ⇒ [SetSolverOption_3](#) Sets the model solver options.

CSI API ETABS v1

cAnalyze Methods

The [cAnalyze](#) type exposes the following members.

Methods

Á	Name	Description
⇒	CreateAnalysisModel	Creates the analysis model. If the analysis model already exists and current, nothing is done.
⇒	DeleteResults	Deletes results for load cases.
⇒	GetActiveDOF	Retrieves the model global degrees of freedom.
⇒	GetCaseStatus	Retrieves the status for all load cases.
⇒	GetDesignResponseOption	Retrieves the design and response recovery options.
⇒	GetRunCaseFlag	Retrieves the run flags for all analysis cases.
⇒	GetSolverOption	DEPRECATED. Please see GetSolverOption_2(Int32, Int32, Int32, String) or GetSolverOption_3(Int32, Int32, Int32, String)
⇒	GetSolverOption_1	DEPRECATED. Please see GetSolverOption_2(Int32, Int32, Int32, String) or GetSolverOption_3(Int32, Int32, Int32, String)
⇒	GetSolverOption_2	Retrieves the model solver options.
⇒	GetSolverOption_3	Retrieves the model solver options.
⇒	MergeAnalysisResults	Merges analysis results from a given model.
⇒	ModifyUndeformedGeometry	Modifies the undeformed geometry based on displacements obtained from a specified load case
⇒	ModifyUndeformedGeometryModeShape	Modifies the undeformed geometry based on the mode shapes of a specified mode
⇒	RunAnalysis	Runs the analysis.
⇒	SetActiveDOF	Sets the model global degrees of freedom.
⇒	SetDesignResponseOption	Sets the design and response recovery options.
⇒	SetRunCaseFlag	Sets the run flag for load cases.
⇒	SetSolverOption	DEPRECATED. Please see SetSolverOption_2(Int32, Int32, Int32, String) or SetSolverOption_3(Int32, Int32, Int32, String)
⇒	SetSolverOption_1	DEPRECATED. Please see SetSolverOption_2(Int32, Int32, Int32, String) or SetSolverOption_3(Int32, Int32, Int32, String)
⇒	SetSolverOption_2	Sets the model solver options.
⇒	SetSolverOption_3	Sets the model solver options.

CSI API ETABS v1

cAnalyzeAddLanguageSpecificTextSet("LST2B502D76_0") Method

Creates the analysis model. If the analysis model is already created and current, nothing is done.

Namespace: [ETABSv1](#)

Assembly: [ETABSv1](#) (in ETABSv1.dll) Version: 1.0.0.0 (1.24.0.0)

▲ Syntax

[C#](#)

[VB](#)

[C++](#)

[F#](#)

[Copy](#)

```
int CreateAnalysisModel()
```

```
Function CreateAnalysisModel As Integer
```

```
Dim instance As cAnalyze
```

```
Dim returnValue As Integer
```

```
returnValue = instance.CreateAnalysisModel()
```

```
int CreateAnalysisModel()
```

```
abstract CreateAnalysisModel : unit -> int
```

Return Value

Type: [Int32](#)

Returns zero if the analysis model is successfully created or it already exists and is current, otherwise it returns a nonzero value.

▲ Remarks

It is not necessary to call this function before running an analysis. The analysis model is automatically created, if necessary, when the model is run.

▲ Examples

[VB](#)

[Copy](#)

```
Public Sub Example()
```

```
    Dim SapModel As cSapModel
```

```
    Dim EtabsObject As cOAPI
```

```
    Dim ret As Integer = -1
```

```
    'create ETABS object
```

```
    Dim myHelper as cHelper = New Helper
```

```
    EtabsObject = myHelper.CreateObjectProgID("CSI.ETABS.API.ETABSObject")
```

```
    'start ETABS application
```

```
    ret = EtabsObject.ApplicationStart()
```

```
    'create SapModel object
```

cAnalyzeAddLanguageSpecificTextSet("LST2B502D76_0?cpp=::|nu[287](#)Create

Introduction

```
SapModel = EtabsObject.SapModel

'initialize model
ret = SapModel.InitializeNewModel()

'create steel deck template model
ret = SapModel.File.NewSteelDeck(4,12,12,4,4,24,24)

'create the analysis model
ret = SapModel.Analyze.CreateAnalysisModel

'close ETABS
EtabsObject.ApplicationExit(False)

'clean up variables
SapModel = Nothing
EtabsObject = Nothing
End Sub
```

CSI API ETABS v1

cAnalyzeAddLanguageSpecificTextSet("LST1AE922AB_0") Method

Deletes results for load cases.

Namespace: [ETABSv1](#)

Assembly: [ETABSv1](#) (in ETABSv1.dll) Version: 1.0.0.0 (1.24.0.0)

▲ Syntax

[C#](#)

[VB](#)

[C++](#)

[F#](#)

[Copy](#)

```
int DeleteResults(
    string Name,
    bool All = false
)
```

```
Function DeleteResults (
    Name As String,
    All As Boolean = false
) As Integer
```

```
Dim instance As cAnalyze
Dim Name As String
Dim All As Boolean
Dim returnValue As Integer
```

```
returnValue = instance.DeleteResults(Name,
All)
```

```
int DeleteResults(
    String^ Name,
    bool All = false
)
```

```
abstract DeleteResults :
    Name : string *
    ?All : bool
(* Defaults:
    let _All = defaultArg All false
*)
-> int
```

Parameters

Name

Type: [SystemString](#)

The name of an existing load case that is to have its results deleted.

This item is ignored when the All item is True.

All (Optional)

cAnalyze.AddLanguageSpecificTextSet("LST1AE922AB_0?cpp=::|nu289;Delete

Type: System.Boolean

If this item is True, the results are deleted for all load cases, and the Name item is ignored.

Return Value

Type: Int32

Returns zero if the results are successfully deleted; otherwise it returns a nonzero value.

▲ Remarks

▲ Examples

VB

Copy

```
Public Sub Example()
    Dim SapModel As cSapModel
    Dim EtabsObject As cOAPI
    Dim ret As Integer = -1

    'create ETABS object
    Dim myHelper as cHelper = New Helper
    EtabsObject = myHelper.CreateObjectProgID("CSI.ETABS.API.ETABSObject")

    'start ETABS application
    ret = EtabsObject.ApplicationStart()

    'create SapModel object
    SapModel = EtabsObject.SapModel

    'initialize model
    ret = SapModel.InitializeNewModel()

    'create steel deck template model
    ret = SapModel.File.NewSteelDeck(4,12,12,4,4,24,24)

    'run analysis
    System.IO.Directory.CreateDirectory("c:\CSI_API_temp")
    ret = SapModel.File.Save("C:\CSI_API_temp\example.edb")
    ret = SapModel.Analyze.RunAnalysis

    'delete load case results
    ret = SapModel.Analyze.DeleteResults("MODAL")

    'close ETABS
    EtabsObject.ApplicationExit(False)

    'clean up variables
    SapModel = Nothing
    EtabsObject = Nothing
End Sub
```

CSI API ETABS v1

cAnalyzeAddLanguageSpecificTextSet("LST711F6396_0?cpp=::|nu=294;GetCaseStatus") Method

Retrieves the status for all load cases.

Namespace: [ETABSv1](#)

Assembly: [ETABSv1](#) (in ETABSv1.dll) Version: 1.0.0.0 (1.24.0.0)

■ Syntax

[C#](#)

[VB](#)

[C++](#)

[F#](#)

[Copy](#)

```
int GetCaseStatus(
    ref int NumberItems,
    ref string[] CaseName,
    ref int[] Status
)
```

```
Function GetCaseStatus (
    ByRef NumberItems As Integer,
    ByRef CaseName As String(),
    ByRef Status As Integer()
) As Integer
```

```
Dim instance As cAnalyze
Dim NumberItems As Integer
Dim CaseName As String()
Dim Status As Integer()
Dim returnValue As Integer
```

```
returnValue = instance.GetCaseStatus(NumberItems,
    CaseName, Status)
```

```
int GetCaseStatus(
    int% NumberItems,
    array<String^>^% CaseName,
    array<int>^% Status
)
```

```
abstract GetCaseStatus :
    NumberItems : int byref *
    CaseName : string[] byref *
    Status : int[] byref -> int
```

Parameters

NumberItems

Type: [System.Int32](#)

The number of load cases for which the status is reported.

CaseName

Type: SystemString

This is an array that includes the name of each analysis case for which the status is reported.

Status

Type: SystemInt32

This is an array containing integers from 1 to 4, indicating the load case status.

1. Not run
2. Could not start
3. Not finished
4. Finished

Return Value

Type: Int32

Returns zero if the status is successfully retrieved; otherwise it returns a nonzero value.

▲ Remarks

▲ Examples

VB

Copy

```
Public Sub Example()
    Dim SapModel As cSapModel
    Dim EtabsObject As cOAPI
    Dim ret As Integer = -1
    Dim NumberItems As Integer
    Dim CaseName() As String
    Dim Status() As Integer

    'create ETABS object
    Dim myHelper as cHelper = New Helper
    EtabsObject = myHelper.CreateObjectProgID("CSI.ETABS.API.ETABSObject")

    'start ETABS application
    ret = EtabsObject.ApplicationStart()

    'create SapModel object
    SapModel = EtabsObject.SapModel

    'initialize model
    ret = SapModel.InitializeNewModel()

    'create steel deck template model
    ret = SapModel.File.NewSteelDeck(4,12,12,4,4,24,24)

    'set load case run flag
    ret = SapModel.Analyze.SetRunCaseFlag("MODAL", False)

    'run analysis
    System.IO.Directory.CreateDirectory("c:\CSI_API_temp")
    ret = SapModel.File.Save("C:\CSI_API_temp\example.edb")
    ret = SapModel.Analyze.RunAnalysis

    'get load case status
    ret = SapModel.Analyze.GetCaseStatus(NumberItems, CaseName, Status)

    'close ETABS
    EtabsObject.ApplicationExit(False)
```

```
'clean up variables

CSI API ETABS v1

cAnalyzeAddLanguageSpecificTextSet("LST9F9E0209_0") Method

Retrieves the design and response recovery options.

Namespace: ETABSv1

Assembly: ETABSv1 (in ETABSv1.dll) Version: 1.0.0.0 (1.24.0.0)

▲ Syntax

C#

VB

C++

F#

Copy

```
int GetDesignResponseOption(
    ref int NumberDesignThreads,
    ref int NumberResponseRecoveryThreads,
    ref int UseMemoryMappedFilesForResponseRecovery,
    ref bool ModelDifferencesOKWhenMergingResults
)
```

```
Function GetDesignResponseOption (
    ByRef NumberDesignThreads As Integer,
    ByRef NumberResponseRecoveryThreads As Integer,
    ByRef UseMemoryMappedFilesForResponseRecovery As Integer,
    ByRef ModelDifferencesOKWhenMergingResults As Boolean
) As Integer
```

```
Dim instance As cAnalyze
Dim NumberDesignThreads As Integer
Dim NumberResponseRecoveryThreads As Integer
Dim UseMemoryMappedFilesForResponseRecovery As Integer
Dim ModelDifferencesOKWhenMergingResults As Boolean
Dim returnValue As Integer
```

```
returnValue = instance.GetDesignResponseOption(NumberDesignThreads,
    NumberResponseRecoveryThreads,
    UseMemoryMappedFilesForResponseRecovery,
    ModelDifferencesOKWhenMergingResults)
```

```
int GetDesignResponseOption(
    int% NumberDesignThreads,
    int% NumberResponseRecoveryThreads,
    int% UseMemoryMappedFilesForResponseRecovery,
    bool% ModelDifferencesOKWhenMergingResults
)
```

```
abstract GetDesignResponseOption :
    NumberDesignThreads : int byref *
    NumberResponseRecoveryThreads : int byref *
    UseMemoryMappedFilesForResponseRecovery : int byref *
    ModelDifferencesOKWhenMergingResults : bool byref -> int
```

Parameters

NumberDesignThreads

Type:Â SystemInt32

Number of threads that design can use. Positive if user specified, negative if program determined.

NumberResponseRecoveryThreads

Type:Â SystemInt32

Number of threads that response recovery can use. Positive if user specified, negative if program determined.

UseMemoryMappedFilesForResponseRecovery

Type:Â SystemInt32

Flag for using memory mapped files for response recovery.

◊ -2 = Not using memory mapped files (Program Determined).

◊ -1 = Not using memory mapped files (user specified).

◊ 1 = Using memory mapped files (user specified).

◊ 2 = Using memory mapped files (Program Determined).

ModelDifferencesOKWhenMergingResults

Type:Â SystemBoolean

Flag for merging results in presence of any model differences. True if results from two models that are not identical are OK to merge, false otherwise.

Return ValueType:Â Int32

Returns zero if the options are successfully retrieved; otherwise it returns a nonzero value.

    array<bool>^% Run
)
```

```
abstract GetRunCaseFlag :
    NumberItems : int byref *
    CaseName : string[] byref *
    Run : bool[] byref -> int
```

Parameters

NumberItems

Type: [System.Int32](#)

The number of load cases for which the run flag is reported.

CaseName

Type: SystemString

This is an array that includes the name of each analysis case for which the run flag is reported.

Run

Type: SystemBoolean

This is an array of boolean values indicating if the specified load case is to be run.

Return Value

Type: Int32

Returns zero if the flags are successfully retrieved; otherwise it returns a nonzero value.

CSI API ETABS v1

cAnalyzeAddLanguageSpecificTextSet("LSTE1520482_0") Method

Retrieves the model solver options.

Namespace: [ETABSV1](#)

Assembly: [ETABSV1](#) (in ETABSV1.dll) Version: 1.0.0.0 (1.24.0.0)

▲ Syntax

[C#](#)

[VB](#)

[C++](#)

[F#](#)

[Copy](#)

```
int GetSolverOption_2(
    ref int SolverType,
    ref int SolverProcessType,
    ref int NumberParallelRuns,
    ref string StiffCase
)
```

```
Function GetSolverOption_2 (
    ByRef SolverType As Integer,
    ByRef SolverProcessType As Integer,
    ByRef NumberParallelRuns As Integer,
    ByRef StiffCase As String
) As Integer
```

```
Dim instance As cAnalyze
Dim SolverType As Integer
Dim SolverProcessType As Integer
Dim NumberParallelRuns As Integer
Dim StiffCase As String
Dim returnValue As Integer
```

```
returnValue = instance.GetSolverOption_2(SolverType,
    SolverProcessType, NumberParallelRuns,
    StiffCase)
```

```
int GetSolverOption_2(
    int% SolverType,
    int% SolverProcessType,
    int% NumberParallelRuns,
    String^% StiffCase
)
```

```
abstract GetSolverOption_2 :
    SolverType : int byref *
    SolverProcessType : int byref *
    NumberParallelRuns : int byref *
    StiffCase : string byref -> int
```

Parameters**SolverType**Type: SystemInt32

This is 0, 1 or 2, indicating the solver type.

- ◊ 0 = Standard solver
- ◊ 1 = Advanced solver
- ◊ 2 = Multi-threaded solver

SolverProcessTypeType: SystemInt32

This is 0, 1 or 2, indicating the process the analysis is run.

- ◊ 0 = Auto (program determined)
- ◊ 1 = GUI process
- ◊ 2 = Separate process

NumberParallelRunsType: SystemInt32

This is an integer not including -1 or 0.

- ◊ Less than -1 = The negative of the program determined value when the assigned value is 0 = Auto parallel (use up to all physical cores - limited by license).
- ◊ 1 = Serial.
- ◊ Greater than 1 = User defined parallel (use up to this fixed number of cores - limited by license).

StiffCaseType: SystemString

The name of the load case used when outputting the mass and stiffness matrices to text files. If this item is blank, no matrices are output.

Return ValueType: Int32

Returns zero if the options are successfully retrieved; otherwise it returns a nonzero value.

▲ **Remarks**▲ **Examples**

VB

Copy

```
Public Sub Example()
    Dim SapModel As cSapModel
    Dim EtabsObject As cOAPI
    Dim ret As Integer = -1
    Dim SolverType As Integer
    Dim SolverProcessType As Integer

    String^% StiffCase
)
```

cAnalyzeAddLanguageSpecificTextSet("LST25E7C0A1_0?cpp=::|nu310;GetSol

```

abstract GetSolverOption_3 :
    SolverType : int byref *
    SolverProcessType : int byref *
    NumberParallelRuns : int byref *
    ResponseFileSizeMaxMB : int byref *
    NumberAnalysisThreads : int byref *
    StiffCase : string byref -> int

```

Parameters

SolverType

Type: SystemInt32

This is 0, 1 or 2, indicating the solver type.

- ◇ 0 = Standard solver
- ◇ 1 = Advanced solver
- ◇ 2 = Multi-threaded solver

SolverProcessType

Type: SystemInt32

This is 0, 1 or 2, indicating the process the analysis is run.

- ◇ 0 = Auto (program determined)
- ◇ 1 = GUI process
- ◇ 2 = Separate process

NumberParallelRuns

Type: SystemInt32

This is an integer not including -1 or 0.

- ◇ Less than -1 = The negative of the program determined value when the assigned value is 0 = Auto parallel (use up to all physical cores - limited by license).
- ◇ 1 = Serial.
- ◇ Greater than 1 = User defined parallel (use up to this fixed number of cores - limited by license).

ResponseFileSizeMaxMB

Type: SystemInt32

The maximum size of a response file in MB before a new response file is created. Positive if user specified, negative if program determined.

NumberAnalysisThreads

Type: SystemInt32

Number of threads that the analysis can use. Positive if user specified, negative if program determined.

StiffCase

Type: SystemString

The name of the load case used when outputting the mass and stiffness matrices to text files. If this item is blank, no matrices are output.

Return Value

Type: Int32

Returns zero if the options are successfully retrieved; otherwise it returns a nonzero value.

▲ Remarks

▲ Examples

VB

Copy

```

Public Sub Example()
    Dim SapModel As cSapModel
    Dim EtabsObject As cOAPI
    Dim ret As Integer = -1
    Dim SolverType As Integer
    Dim SolverProcessType As Integer
    Dim NumberParallelRuns As Integer
    Dim StiffCase As String
    Dim ResponseFileSizeMaxMB As Integer
    Dim NumberAnalysisThreads As Integer

    'create ETABS object
    Dim myHelper as cHelper = New Helper
    EtabsObject = myHelper.CreateObjectProgID("CSI.ETABS.API.ETABSObject")

    'start ETABS application
    ret = EtabsObject.ApplicationStart()

    'create SapModel object
    SapModel = EtabsObject.SapModel

    'initialize model
    ret = SapModel.InitializeNewModel()

    'create steel deck template model
    ret = SapModel.File.NewSteelDeck(4,12,12,4,4,24,24)

    'get model solver options
    ret = SapModel.Analyze.GetSolverOption_3(SolverType, SolverProcessType, NumberParallelRuns)

    'close ETABS
    EtabsObject.ApplicationExit(False)

    'clean up variables
    SapModel = Nothing
    EtabsObject = Nothing
End Sub

CSI API ETABS v1

cAnalyzeAddLanguageSpecificTextSet("LST80A9194C_0")

Method

Merges analysis results from a given model.

Namespace: [ETABSV1](#)

Assembly: [ETABSV1](#) (in ETABSV1.dll) Version: 1.0.0.0 (1.24.0.0)

▲ Syntax

[C#](#)

[VB](#)

[C++](#)

[F#](#)

[Copy](#)

```
int MergeAnalysisResults(
    string SourceFileName
)
```

```
Function MergeAnalysisResults (
    SourceFileName As String
) As Integer
```

```
Dim instance As cAnalyze
Dim SourceFileName As String
Dim returnValue As Integer
```

```
returnValue = instance.MergeAnalysisResults(SourceFileName)
```

```
int MergeAnalysisResults(
    String^ SourceFileName
)
```

```
abstract MergeAnalysisResults :
    SourceFileName : string -> int
```

Parameters

SourceFileName

Type: [SystemString](#)

Full path to the model file to import results from.

Return Value

Type: [Int32](#)

Returns zero if the results are successfully merged; otherwise it returns a nonzero value.

▲ Remarks

The analysis model is automatically created as part of this function.

See [Merging Analysis Results](#) section in program help file for requirements and limitations.

cAnalyzeid="LST80A9194C_0"AddLanguageSpecificTextSet("LST80A9194C_0?cpp=::|nu3.13MergeA

IMPORTANT NOTE: Your model must have a file path defined before merging analysis results. If the model is opened from an existing file, a file path is defined. If the model is created from scratch, the File.Save function must be called with a file name before merging analysis results. Saving the file creates the file path.

Examples

VB

Copy

```
Public Sub Example()
    Dim myHelper As cHelper
    Dim SapModel As cSapModel
    Dim EtabsObject As cOAPI
    Dim ret As Integer = -1

    'create ETABS object
    myHelper = New Helper
    EtabsObject = myHelper.CreateObjectProgID("CSI.ETABS.API.ETABSObject")

    'start ETABS application
    ret = EtabsObject.ApplicationStart()

    'create SapModel object
    SapModel = EtabsObject.SapModel

    'initialize model
    ret = SapModel.InitializeNewModel()

    'create steel deck template model
    ret = SapModel.File.NewSteelDeck(4,12,12,4,4,24,24)

    'run analysis
    System.IO.Directory.CreateDirectory("c:\CSI_API_temp\source")
    ret = SapModel.File.Save("C:\CSI_API_temp\source\model.edb")
    ret = SapModel.Analyze.RunAnalysis

    'initialize a new model
    ret = SapModel.InitializeNewModel()

    'create the same steel deck template model
    ret = SapModel.File.NewSteelDeck(4,12,12,4,4,24,24)

    'merge analysis results
    ret = SapModel.Analyze.SetSolverOption_2(1, 2, 0)
    System.IO.Directory.CreateDirectory("c:\CSI_API_temp\target")
    ret = SapModel.File.Save("C:\CSI_API_temp\target\model.edb")
    ret = SapModel.Analyze.MergeAnalysisResults("C:\CSI_API_temp\source\model.edb")

    'close ETABS
    EtabsObject.ApplicationExit(False)

    'clean up variables
    SapModel = Nothing
    EtabsObject = Nothing
    myHelper = Nothing
End Sub

)
```

```
abstract ModifyUndeformedGeometry :
    CaseName : string *
    SF : float *
    ?Stage : int *
    ?Original : bool
(* Defaults:
    let _Stage = defaultArg Stage -1
    let _Original = defaultArg Original false
*)
```

cAnalyzeAddLanguageSpecificTextSet("LST8DFA66A1_0?cpp=::|nu316;Modify

-> int

Parameters

CaseName

Type:Â SystemString

The name of the static load case from which displacements are obtained.

SF

Type:Â SystemDouble

The scale factor applied to the displacements.

Stage (Optional)

Type:Â SystemInt32

This item applies only when the specified load case is a staged construction load case. It is the stage number from which the displacements are obtained.

Specifying a -1 for this item means to use the last run stage.

Original (Optional)

Type:Â SystemBoolean

If this item is True, all other input items in this function are ignored and the original undeformed geometry data is reinstated.

Return Value

Type:Â Int32

Returns zero if it is successful; otherwise it returns a nonzero value

▲Remarks

▲Examples

```
(* Defaults:
    let _Original = defaultArg Original false
*)
-> int
```

Parameters

CaseName

Type:Â SystemString

The name of a load case

Mode

Type:Â SystemInt32

The mode shape

MaxDispl

Type:Â SystemDouble

The maximum displacement to which the mode shape will be scaled

Direction

Type:Â SystemInt32

The direction in which to apply the geometry modification

1. X

2. Y

3. Z

4. Resultant

Original (Optional)

Type:Â SystemBoolean

If this item is True, all other input items in this function are ignored and the original undeformed geometry data is reinstated.

Return Value

Type:Â Int32

Returns zero if it is successful; otherwise it returns a nonzero value

CSI API ETABS v1

cAnalyzeAddLanguageSpecificTextSet("LST7E890C17_0") Method

Runs the analysis.

Namespace: [ETABSv1](#)

Assembly: [ETABSv1](#) (in ETABSv1.dll) Version: 1.0.0.0 (1.24.0.0)

▲ Syntax

[C#](#)

[VB](#)

[C++](#)

[F#](#)

[Copy](#)

```
int RunAnalysis()
```

```
Function RunAnalysis As Integer
```

```
Dim instance As cAnalyze
```

```
Dim returnValue As Integer
```

```
returnValue = instance.RunAnalysis()
```

```
int RunAnalysis()
```

```
abstract RunAnalysis : unit -> int
```

Return Value

Type: [Int32](#)

Returns zero if the analysis model is successfully run; otherwise it returns a nonzero value.

▲ Remarks

The analysis model is automatically created as part of this function.

IMPORTANT NOTE: Your model must have a file path defined before running the analysis. If the model is opened from an existing file, a file path is defined. If the model is created from scratch, the File.Save function must be called with a file name before running the analysis. Saving the file creates the file path.

▲ Examples

[VB](#)

[Copy](#)

```
Public Sub Example()  
    Dim SapModel As cSapModel  
    Dim EtabsObject As cOAPI  
    Dim ret As Integer = -1
```

```
    'create ETABS object
```

```
    Dim myHelper as cHelper = New Helper

CSI API ETABS v1

cAnalyzeAddLanguageSpecificTextSet("LSTE623EEBD Method

Sets the design and response recovery options.

Namespace: ETABSv1

Assembly: ETABSv1 (in ETABSv1.dll) Version: 1.0.0.0 (1.24.0.0)

▲ Syntax

C#

VB

C++

F#

Copy

```
int SetDesignResponseOption(
    int NumberDesignThreads,
    int NumberResponseRecoveryThreads,
    int UseMemoryMappedFilesForResponseRecovery,
    bool ModelDifferencesOKWhenMergingResults
)
```

```
Function SetDesignResponseOption (
    NumberDesignThreads As Integer,
    NumberResponseRecoveryThreads As Integer,
    UseMemoryMappedFilesForResponseRecovery As Integer,
    ModelDifferencesOKWhenMergingResults As Boolean
) As Integer
```

```
Dim instance As cAnalyze
Dim NumberDesignThreads As Integer
Dim NumberResponseRecoveryThreads As Integer
Dim UseMemoryMappedFilesForResponseRecovery As Integer
Dim ModelDifferencesOKWhenMergingResults As Boolean
Dim returnValue As Integer
```

```
returnValue = instance.SetDesignResponseOption(NumberDesignThreads,
    NumberResponseRecoveryThreads,
    UseMemoryMappedFilesForResponseRecovery,
    ModelDifferencesOKWhenMergingResults)
```

```
int SetDesignResponseOption(
    int NumberDesignThreads,
    int NumberResponseRecoveryThreads,
    int UseMemoryMappedFilesForResponseRecovery,
    bool ModelDifferencesOKWhenMergingResults
)
```

```
abstract SetDesignResponseOption :
    NumberDesignThreads : int *
    NumberResponseRecoveryThreads : int *
    UseMemoryMappedFilesForResponseRecovery : int *
    ModelDifferencesOKWhenMergingResults : bool -> int
```

cAnalyzeAddLanguageSpecificTextSet("LSTE623EEBD_0?cpp=::|n026");SetDe

Parameters

NumberDesignThreads

Type: SystemInt32

Number of threads that design can use. Set to positive for user specified, non-positive for program determined.

NumberResponseRecoveryThreads

Type: SystemInt32

Number of threads that response recovery can use. Set to positive for user specified, non-positive for program determined.

UseMemoryMappedFilesForResponseRecovery

Type: SystemInt32

Flag for using memory mapped files for response recovery. Set to

◊ -1 = Do not use memory mapped files.

◊ 0 = Program determined.

◊ 1 = Use memory mapped files.

ModelDifferencesOKWhenMergingResults

Type: SystemBoolean

Flag for merging results in presence of any model differences. Set to true to enable merging of results from two models that are not identical, to false otherwise.

Return ValueType: Int32

Returns zero if the options are successfully set; otherwise it returns a nonzero value.

▲ Remarks

▲ Examples

CSI API ETABS v1

cAnalyzeAddLanguageSpecificTextSet("LST3863E913_0") Method

Sets the run flag for load cases.

Namespace: ETABSV1

Assembly: ETABSV1 (in ETABSV1.dll) Version: 1.0.0.0 (1.24.0.0)

Syntax

C#

VB

C++

F#

Copy

```
int SetRunCaseFlag(
    string Name,
    bool Run,
    bool All = false
)
```

```
Function SetRunCaseFlag (
    Name As String,
    Run As Boolean,
    All As Boolean = false
) As Integer
```

```
Dim instance As cAnalyze
Dim Name As String
Dim Run As Boolean
Dim All As Boolean
Dim returnValue As Integer
```

```
returnValue = instance.SetRunCaseFlag(Name,
    Run, All)
```

```
int SetRunCaseFlag(
    String^ Name,
    bool Run,
    bool All = false
)
```

```
abstract SetRunCaseFlag :
    Name : string *
    Run : bool *
    ?All : bool
(* Defaults:
    let _All = defaultArg All false
*)
-> int
```

Parameters

Name

Type:Â SystemString

The name of an existing load case that is to have its run flag set.

This item is ignored when the All item is True.

Run

Type:Â SystemBoolean

If this item is True, the specified load case is to be run.

All (Optional)

Type:Â SystemBoolean

If this item is True, the run flag is set as specified by the Run item for all load cases, and the Name item is ignored.

Return Value

Type:Â Int32

Returns zero if the flag is successfully set; otherwise it returns a nonzero value.

▲ Remarks

▲ Examples

VB

Copy

```
Public Sub Example()
    Dim SapModel As cSapModel
    Dim EtabsObject As cOAPI
    Dim ret As Integer = -1

    'create ETABS object
    Dim myHelper as cHelper = New Helper
    EtabsObject = myHelper.CreateObjectProgID("CSI.ETABS.API.ETABSObject")

    'start ETABS application
    ret = EtabsObject.ApplicationStart()

    'create SapModel object
    SapModel = EtabsObject.SapModel

    'initialize model
    ret = SapModel.InitializeNewModel()

    'create steel deck template model
    ret = SapModel.File.NewSteelDeck(4,12,12,4,4,24,24)

    'set load case run flag
    ret = SapModel.Analyze.SetRunCaseFlag("MODAL", False)

    'close ETABS
    EtabsObject.ApplicationExit(False)

    'clean up variables
    SapModel = Nothing
    EtabsObject = Nothing
End Sub
```

(* Defaults:
    let _StiffCase = defaultArg StiffCase ""
*)
-> int
```

cAnalyzeAddLanguageSpecificTextSet("LSTDF8FB267_0?cpp=::|nu336;SetSol

Parameters

SolverType

Type: SystemInt32

This is 0, 1 or 2, indicating the solver type.

- ◊ 0 = Standard solver
- ◊ 1 = Advanced solver
- ◊ 2 = Multi-threaded solver

SolverProcessType

Type: SystemInt32

This is 0, 1 or 2, indicating the process the analysis is run.

- ◊ 0 = Auto (program determined)
- ◊ 1 = GUI process
- ◊ 2 = Separate process

NumberParallelRuns

Type: SystemInt32

This is an integer not including -1.

- ◊ -Less than -1 = Auto parallel (use up to all physical cores - limited by license). Treated the same as 0.
- ◊ -1 = Illegal value; will return an error
- ◊ 0 = Auto parallel (use up to all physical cores)
- ◊ 1 = Serial
- ◊ Greater than 1 = User defined parallel (use up to this fixed number of cores - limited by license)

StiffCase (Optional)

Type: SystemString

The name of the load case used when outputting the mass and stiffness matrices to text files. If this item is blank, no matrices are output.

Return Value

Type: Int32

Returns zero if the options are successfully set; otherwise it returns a nonzero value.

▲Remarks

'''

▲Examples

VB

Copy

```
Public Sub Example()
    Dim SapModel As cSapModel
    Dim EtabsObject As cOAPI
    Dim ret As Integer = -1

    'create ETABS object
    Dim myHelper as cHelper = New Helper
    EtabsObject = myHelper.CreateObjectProgID("CSI.ETABS.API.ETABSObject")

    'start ETABS application
    ret = EtabsObject.ApplicationStart()

    'create SapModel object
    SapModel = EtabsObject.SapModel

    'initialize model
```

Introduction

```
ret = SapModel.InitializeNewModel()  
  
'create steel deck template model  
ret = SapModel.File.NewSteelDeck(4,12,12,4,4,24,24)  
  
'set model solver options  
ret = SapModel.Analyze.SetSolverOption_2(1, 1, 3, "DEAD")  
  
'close ETABS  
EtabsObject.ApplicationExit(False)  
  
'clean up variables  
SapModel = Nothing  
EtabsObject = Nothing  
End Sub
```

- ◊ -1 = Illegal value; will return an error
- ◊ 0 = Auto parallel (use up to all physical cores - limited by license)
- ◊ 1 = Serial
- ◊ Greater than 1 = User defined parallel (use up to this fixed number of cores - limited by license)

ResponseFileSizeMaxMB

Type: SystemInt32

The maximum size of a response file in MB before a new response file is created. Non-positive means program determined.

NumberAnalysisThreads

Type: SystemInt32

Number of threads that the analysis can use. Non-positive means program determined.

StiffCase (Optional)

Type: SystemString

The name of the load case used when outputting the mass and stiffness matrices to text files. If this item is blank, no matrices are output.

Return Value

Type: Int32

Returns zero if the options are successfully set; otherwise it returns a nonzero value.

Remarks

CSI API ETABS v1

cAreaObj Interface

Namespace: Â ETABSV1

Assembly: Â ETABSV1 (in ETABSV1.dll) Version: 1.0.0.0 (1.24.0.0)

▲ Syntax

C#

VB

C++

F#

Copy

```
public interface cAreaObj
```

```
Public Interface cAreaObj
```

```
Dim instance As cAreaObj
```

```
public interface class cAreaObj
```

```
type cAreaObj = interface end
```

The cAreaObj type exposes the following members.

▲ Methods

Â	Name	Description
⇒	<u>AddByCoord</u>	Adds a new area object, defining points at the specified coordinates.
⇒	<u>AddByPoint</u>	Adds a new area object whose defining points are specified by name.
⇒	<u>ChangeName</u>	
⇒	<u>Count</u>	
⇒	<u>Delete</u>	Deletes area objects.
⇒	<u>DeleteLoadTemperature</u>	
⇒	<u>DeleteLoadUniform</u>	Deletes the uniform load assignments to the specified area objects for the specified load pattern.
⇒	<u>DeleteLoadUniformToFrame</u>	
⇒	<u>DeleteLoadWindPressure</u>	
⇒	<u>DeleteMass</u>	
⇒	<u>DeleteModifiers</u>	
⇒	<u>DeleteSpring</u>	
⇒	<u>GetAllAreas</u>	Retrieves select data for all area objects in the model
⇒	<u>GetCurvedEdges</u>	Retrieves curve data for all edges of an area object
⇒	<u>GetDesignOrientation</u>	Retrieves the design orientation of an area object.
⇒	<u>GetDiaphragm</u>	Retrieves the diaphragm assignment to the specified area object

⇒ <u>GetEdgeConstraint</u>	
⇒ <u>GetElm</u>	
⇒ <u>GetGroupAssign</u>	Retrieves the groups to which an area object is assigned.
⇒ <u>GetGUID</u>	
⇒ <u>GetLabelFromName</u>	Retrieves the label and story for a unique area object name
⇒ <u>GetLabelNameList</u>	Retrieves the names and labels of all defined area objects.
⇒ <u>GetLoadTemperature</u>	Retrieves the temperature load assignments to area objects.
⇒ <u>GetLoadUniform</u>	Retrieves the uniform load assignments to area objects.
⇒ <u>GetLoadUniformToFrame</u>	Retrieves the uniform to frame load assignments to area objects.
⇒ <u>GetLoadWindPressure</u>	Retrieves the wind pressure load assignments to area objects.
⇒ <u>GetLocalAxes</u>	
⇒ <u>GetMass</u>	
⇒ <u>GetMaterialOverwrite</u>	
⇒ <u>GetModifiers</u>	
⇒ <u>GetNameFromLabel</u>	Retrieves the unique name of an area object, given the label and story level
⇒ <u>GetNameList</u>	Retrieves the names of all defined area objects.
⇒ <u>GetNameListOnStory</u>	Retrieves the names of the defined area objects on a given story.
⇒ <u>GetOffsets3</u>	
⇒ <u>GetOpening</u>	Retrieves whether the specified area object is an opening.
⇒ <u>GetPier</u>	Retrieves the pier label assignments of an area object
⇒ <u>GetPoints</u>	Retrieves the names of the point objects that define an area object.
⇒ <u>GetProperty</u>	Retrieves the area property assigned to an area object.
⇒ <u>GetRebarDataPier</u>	Retrieves rebar data for an area pier object
⇒ <u>GetRebarDataSpandrel</u>	Retrieves rebar data for an area spandrel object
⇒ <u>GetSelected</u>	
⇒ <u>GetSelectedEdge</u>	
⇒ <u>GetSpandrel</u>	Retrieves the Spandrel label assignments of an area object
⇒ <u>GetSpringAssignment</u>	Retrieves the named area spring property assignment for an area object
⇒ <u>GetTransformationMatrix</u>	

Introduction

⇒ <u>SetDiaphragm</u>	Assigns a diaphragm to a specified area object
⇒ <u>SetEdgeConstraint</u>	Makes generated edge constraint assignments to area objects.
⇒ <u>SetGroupAssign</u>	
⇒ <u>SetGUID</u>	
⇒ <u>SetLoadTemperature</u>	
⇒ <u>SetLoadUniform</u>	Assigns uniform loads to area objects.
⇒ <u>SetLoadUniformToFrame</u>	
⇒ <u>SetLoadWindPressure</u>	
⇒ <u>SetLocalAxes</u>	Assigns a local axis angle to area objects.
⇒ <u>SetMass</u>	
⇒ <u>SetMaterialOverwrite</u>	
⇒ <u>SetModifiers</u>	
⇒ <u>SetOpening</u>	Designates an area object(s) as an opening.
⇒ <u>SetPier</u>	Sets the pier label assignment of one or more area objects
⇒ <u>SetProperty</u>	Assigns an area property to area objects.
⇒ <u>SetSelected</u>	
⇒ <u>SetSelectedEdge</u>	
⇒ <u>SetSpandrel</u>	Sets the Spandrel label assignment of one or more area objects
⇒ <u>SetSpringAssignment</u>	Assigns an existing named area spring property to area objects

CSI API ETABS v1

cAreaObjAddLanguageSpecificTextSet("LSTFAF2997F_0") Method

Adds a new area object, defining points at the specified coordinates.

Namespace: ETABSV1

Assembly: ETABSV1 (in ETABSV1.dll) Version: 1.0.0.0 (1.24.0.0)

■ Syntax

C#

VB

C++

F#

Copy

```
int AddByCoord(
int NumberPoints,
ref double[] X,
ref double[] Y,
ref double[] Z,
ref string Name,
string PropName = "Default",
string UserName = "",
string CSys = "Global"
)
```

```
Function AddByCoord (
NumberPoints As Integer,
ByRef X As Double(),
ByRef Y As Double(),
ByRef Z As Double(),
ByRef Name As String,
    PropName As String = "Default",
    UserName As String = "",
    CSys As String = "Global"
) As Integer
```

```
Dim instance As cAreaObj
Dim NumberPoints As Integer
Dim X As Double()
Dim Y As Double()
Dim Z As Double()
Dim Name As String
Dim PropName As String
Dim UserName As String
Dim CSys As String
Dim returnValue As Integer
```

```
returnValue = instance.AddByCoord(NumberPoints,
X, Y, Z, Name, PropName, UserName, CSys)
```

```
int AddByCoord(
int NumberPoints,
array<double>^% X,
array<double>^% Y,
array<double>^% Z,
```

cAreaObjid="LSTFAF2997F_0"AddLanguageSpecificTextSet("LSTFAF2997F_0?cpp=::|nu376;AddBy

```

String^% Name,
String^ PropName = L"Default",
String^ UserName = L"",
String^ CSys = L"Global"
)

abstract AddByCoord :
    NumberPoints : int *
    X : float[] byref *
    Y : float[] byref *
    Z : float[] byref *
    Name : string byref *
    ?PropName : string *
    ?UserName : string *
    ?CSys : string
(* Defaults:
    let _PropName = defaultArg PropName "Default"
    let _UserName = defaultArg UserName ""
    let _CSys = defaultArg CSys "Global"
*)
-> int

```

Parameters

NumberPoints

Type:Â SystemInt32

The number of points in the area object.

X

Type:Â SystemDouble

This is the array of x coordinates for the corner points of the area object. The coordinates are in the coordinate system defined by the CSys item. The coordinates should be ordered to run clockwise or counter clockwise around the area object.

Y

Type:Â SystemDouble

This is the array of y coordinates for the corner points of the area object. The coordinates are in the coordinate system defined by the CSys item. The coordinates should be ordered to run clockwise or counter clockwise around the area object.

Z

Type:Â SystemDouble

This is the array of z coordinates for the corner points of the area object. The coordinates are in the coordinate system defined by the CSys item. The coordinates should be ordered to run clockwise or counter clockwise around the area object.

Name

Type:Â SystemString

This is the name that the program ultimately assigns to the area object. If no userName is specified, the program assigns a default name to the area object. If a userName is specified and that name is not used for another area object, the userName is assigned to the area object; otherwise a default name is assigned to the area object.

PropName (Optional)

Type:Â SystemString

This is Default, None or the name of a defined area property.

If it is Default, the program assigns a default area property to the area object. If it is None, no area property is assigned to the area object. If it is the name of a defined area property, that property is assigned to the area object.

UserName (Optional)

Type: SystemString

CSys (Optional)

Type: SystemString

The name of the coordinate system in which the area object point coordinates are defined.

Return Value

Type: Int32

Returns zero if the area object is successfully added, otherwise it returns a nonzero value.

▀ Remarks

▀ Examples

VB

Copy

```
Public Sub Example()
    Dim SapModel As cSapModel
    Dim EtabsObject As cOAPI
    Dim ret As Integer = -1
    Dim x() As Double
    Dim y() As Double
    Dim z() As Double
    Dim Name As String

    'create ETABS object
    Dim myHelper as cHelper = New Helper
    EtabsObject = myHelper.CreateObjectProgID("CSI.ETABS.API.ETABSObject")

    'start ETABS application
    ret = EtabsObject.ApplicationStart()

    'create SapModel object
    SapModel = EtabsObject.SapModel

    'initialize model
    ret = SapModel.InitializeNewModel()

    'create blank template model
    ret = SapModel.File.NewBlank()

    'add area object by coordinates
    ReDim x(5)
    ReDim y(5)
    ReDim z(5)
    x(0) = 50: y(0) = 0
    x(1) = 100: y(1) = 0
    x(2) = 150: y(2) = 40
    x(3) = 100: y(3) = 80
    x(4) = 50: y(4) = 80
    x(5) = 0: y(5) = 40
    ret = SapModel.AreaObj.AddByCoord(6, x, y, z, Name)
```

Introduction

```
'refresh view
    ret = SapModel.View.RefreshView(0, False)

'close ETABS
    EtabsObject.ApplicationExit(False)

'clean up variables
    SapModel = Nothing
    EtabsObject = Nothing

End Sub
```

CSI API ETABS v1

cAreaObjAddLanguageSpecificTextSet("LST5AC18E56_0") Method

Adds a new area object whose defining points are specified by name.

Namespace: ETABSv1

Assembly: ETABSv1 (in ETABSv1.dll) Version: 1.0.0.0 (1.24.0.0)

Syntax

C#

VB

C++

F#

Copy

```
int AddByPoint(
    int NumberPoints,
    ref string[] Point,
    ref string Name,
    string PropName = "Default",
    string UserName = ""
)
```

```
Function AddByPoint (
    NumberPoints As Integer,
    ByRef Point As String(),
    ByRef Name As String,
    PropName As String = "Default",
    UserName As String = ""
) As Integer
```

```
Dim instance As cAreaObj
Dim NumberPoints As Integer
Dim Point As String()
Dim Name As String
Dim PropName As String
Dim UserName As String
Dim returnValue As Integer
```

```
returnValue = instance.AddByPoint(NumberPoints,
    Point, Name, PropName, UserName)
```

```
int AddByPoint(
    int NumberPoints,
    array<String^>^% Point,
    String^% Name,
    String^ PropName = L"Default",
    String^ UserName = L""
)
```

```
abstract AddByPoint :
    NumberPoints : int *
    Point : string[] byref *
    Name : string byref *
    ?PropName : string *
    ?UserName : string
```

cAreaObjid="LST5AC18E56_0"AddLanguageSpecificTextSet("LST5AC18E56_0?cpp=::|nu380);AddBy

```
(* Defaults:
    let _PropName = defaultArg PropName "Default"
    let _UserName = defaultArg UserName ""
*)
-> int
```

Parameters

NumberPoints

Type: [SystemInt32](#)

The number of points in the area object.

Point

Type: [SystemString](#)

This is an array containing the names of the point objects that define the added area object. The point object names should be ordered to run clockwise or counter clockwise around the area object.

Name

Type: [SystemString](#)

This is the name that the program ultimately assigns to the area object. If no userName is specified, the program assigns a default name to the area object. If a userName is specified and that name is not used for another area object, the userName is assigned to the area object; otherwise a default name is assigned to the area object.

PropName (Optional)

Type: [SystemString](#)

This is Default, None or the name of a defined area property.

If it is Default, the program assigns a default area property to the area object. If it is None, no area property is assigned to the area object. If it is the name of a defined area property, that property is assigned to the area object.

UserName (Optional)

Type: [SystemString](#)

Return Value

Type: [Int32](#)

Returns zero if the area object is successfully added; otherwise it returns a nonzero value.

Remarks

Examples

VB

Copy

```
Public Sub Example()
    Dim SapModel As cSapModel
    Dim EtabsObject As cOAPI
    Dim ret As Integer = -1
    Dim Point() As String
    Dim Name As String

    'create ETABS object
    Dim myHelper as cHelper = New Helper
    EtabsObject = myHelper.CreateObjectProgID("CSI.ETABS.API.ETABSObject")

    'start ETABS application
```

Introduction

```
ret = EtabsObject.ApplicationStart()

'create SapModel object
SapModel = EtabsObject.SapModel

'initialize model
ret = SapModel.InitializeNewModel()

'create steel deck template model
ret = SapModel.File.NewSteelDeck(4, 12, 12, 4, 4, 24, 24)

'add area object by points
Redim Point(3)
Point(0) = "8"
Point(1) = "2"
Point(2) = "65"
Point(3) = "68"
ret = SapModel.AreaObj.AddByPoint(4, Point, Name)

'refresh view
ret = SapModel.View.RefreshView(0, False)

'close ETABS
EtabsObject.ApplicationExit(False)

'clean up variables
SapModel = Nothing
EtabsObject = Nothing

End Sub
```

CSI API ETABS v1

cAreaObjAddLanguageSpecificTextSet("LST1B61C519_0")

Method

Deletes area objects.

Namespace: ETABSv1

Assembly: ETABSv1 (in ETABSv1.dll) Version: 1.0.0.0 (1.24.0.0)

Syntax

C#

VB

C++

F#

Copy

```
int Delete(
    string Name,
    eItemType ItemType = eItemType.Objects
)
```

```
Function Delete (
    Name As String,
    ItemType As eItemType = eItemType.Objects
) As Integer
```

```
Dim instance As cAreaObj
Dim Name As String
Dim ItemType As eItemType
Dim returnValue As Integer
```

```
returnValue = instance.Delete(Name, ItemType)
```

```
int Delete(
    String^ Name,
    eItemType ItemType = eItemType::Objects
)
```

```
abstract Delete :
    Name : string *
    ?ItemType : eItemType
(* Defaults:
    let _ItemType = defaultArg ItemType eItemType.Objects
*)
-> int
```

Parameters

Name

Type: SystemString

The name of an existing area object or group, depending on the value of the ItemType item.

ItemType (Optional)

Type: ETABSv1eItemType

This is one of the following items in the eItemType enumeration:

cAreaObjid="LST1B61C519_0"AddLanguageSpecificTextSet("LST1B61C519_0?cpp=::|nu386;Delete

- ◇ Object = 0
- ◇ Group = 1
- ◇ SelectedObjects = 2

If this item is Objects, the area object specified by the Name item is deleted.

If this item is Group, all of the area objects in the group specified by the Name item are deleted.

If this item is SelectedObjects, all of the selected area objects are deleted, and the Name item is ignored.

Return Value

Type: Int32

Returns zero if the area objects are successfully deleted; otherwise it returns a nonzero value.

▲ Remarks

▲ Examples

VB

Copy

```
Public Sub Example()
    Dim SapModel As cSapModel
    Dim EtabsObject As cOAPI
    Dim ret As Integer = -1

    'create ETABS object
    Dim myHelper as cHelper = New Helper
    EtabsObject = myHelper.CreateObjectProgID("CSI.ETABS.API.ETABSObject")

    'start ETABS application
    ret = EtabsObject.ApplicationStart()

    'create SapModel object
    SapModel = EtabsObject.SapModel

    'initialize model
    ret = SapModel.InitializeNewModel()

    'create steel deck template model
    ret = SapModel.File.NewSteelDeck(4, 12, 12, 4, 4, 24, 24)

    'delete area object
    ret = SapModel.AreaObj.Delete("2")

    'refresh view
    ret = SapModel.View.RefreshView(0, False)

    'close ETABS
    EtabsObject.ApplicationExit(False)

    'clean up variables
    SapModel = Nothing
    EtabsObject = Nothing

End Sub
```

CSI API ETABS v1

cAreaObjAddLanguageSpecificTextSet("LSTABAC581B_0?cpp=::|n091");Delete

Method

Deletes the uniform load assignments to the specified area objects for the specified load pattern.

Namespace: $\hat{A}$ ETABSV1

Assembly: $\hat{A}$ ETABSV1 (in ETABSV1.dll) Version: 1.0.0.0 (1.24.0.0)

▲ Syntax

C#

VB

C++

F#

Copy

```
int DeleteLoadUniform(
    string Name,
    string LoadPat,
    eItemType ItemType = eItemType.Objects
)
```

```
Function DeleteLoadUniform (
    Name As String,
    LoadPat As String,
    ItemType As eItemType = eItemType.Objects
) As Integer
```

```
Dim instance As cAreaObj
Dim Name As String
Dim LoadPat As String
Dim ItemType As eItemType
Dim returnValue As Integer
```

```
returnValue = instance.DeleteLoadUniform(Name,
    LoadPat, ItemType)
```

```
int DeleteLoadUniform(
    String^ Name,
    String^ LoadPat,
    eItemType ItemType = eItemType::Objects
)
```

```
abstract DeleteLoadUniform :
    Name : string *
    LoadPat : string *
    ?ItemType : eItemType
(* Defaults:
    let _ItemType = defaultArg ItemType eItemType.Objects
*)
-> int
```

cAreaObjid="LSTABAC581B_0"AddLanguageSpecificTextSet("LSTABAC581B_0?cpp=::|n091");Delete

Parameters

Name

Type: SystemString

The name of an existing area object or group, depending on the value of the ItemType item.

LoadPat

Type: SystemString

The name of a defined load pattern.

ItemType (Optional)

Type: ETABSv1eItemType

This is one of the following items in the eItemType enumeration:

◊ Object = 0

◊ Group = 1

◊ SelectedObjects = 2

If this item is Objects, the load assignments are deleted for the area object specified by the Name item.

If this item is Group, the load assignments are deleted for all area objects in the group specified by the Name item.

If this item is SelectedObjects, the load assignments are deleted for all selected area objects, and the Name item is ignored.

Return ValueType: Int32

Returns zero if the load assignments are successfully deleted, otherwise it returns a nonzero value.

▲ Remarks

▲ Examples

CSI API ETABS v1

cAreaObjAddLanguageSpecificTextSet("LST834E121F_0") Method

Retrieves select data for all area objects in the model

Namespace: ETABSv1

Assembly: ETABSv1 (in ETABSv1.dll) Version: 1.0.0.0 (1.24.0.0)

Syntax

C#

VB

C++

F#

Copy

```
int GetAllAreas(
    ref int NumberNames,
    ref string[] MyName,
    ref eAreaDesignOrientation[] DesignOrientation,
    ref int NumberBoundaryPts,
    ref int[] PointDelimiter,
    ref string[] PointNames,
    ref double[] PointX,
    ref double[] PointY,
    ref double[] PointZ
)
```

```
Function GetAllAreas (
    ByRef NumberNames As Integer,
    ByRef MyName As String(),
    ByRef DesignOrientation As eAreaDesignOrientation(),
    ByRef NumberBoundaryPts As Integer,
    ByRef PointDelimiter As Integer(),
    ByRef PointNames As String(),
    ByRef PointX As Double(),
    ByRef PointY As Double(),
    ByRef PointZ As Double()
) As Integer
```

```
Dim instance As cAreaObj
Dim NumberNames As Integer
Dim MyName As String()
Dim DesignOrientation As eAreaDesignOrientation()
Dim NumberBoundaryPts As Integer
Dim PointDelimiter As Integer()
Dim PointNames As String()
Dim PointX As Double()
Dim PointY As Double()
Dim PointZ As Double()
Dim returnValue As Integer
```

```
returnValue = instance.GetAllAreas(NumberNames,
    MyName, DesignOrientation, NumberBoundaryPts,
    PointDelimiter, PointNames, PointX,
    PointY, PointZ)
```

```

int GetAllAreas(
int% NumberNames,
array<String^>^% MyName,
array<eAreaDesignOrientation>^% DesignOrientation,
int% NumberBoundaryPts,
array<int>^% PointDelimiter,
array<String^>^% PointNames,
array<double>^% PointX,
array<double>^% PointY,
array<double>^% PointZ
)

abstract GetAllAreas :
    NumberNames : int byref *

CSI API ETABS v1

cAreaObjAddLanguageSpecificTextSet("LST479396FD_0") Method

Retrieves curve data for all edges of an area object

Namespace: ETABSv1

Assembly: ETABSv1 (in ETABSv1.dll) Version: 1.0.0.0 (1.24.0.0)

■ Syntax

C#

VB

C++

F#

Copy

```
int GetCurvedEdges(
    string Name,
    ref int NumEdges,
    ref int[] CurveType,
    ref double[] Tension,
    ref int[] NumPoints,
    ref double[] gx,
    ref double[] gy,
    ref double[] gz
)
```

```
Function GetCurvedEdges (
    Name As String,
    ByRef NumEdges As Integer,
    ByRef CurveType As Integer(),
    ByRef Tension As Double(),
    ByRef NumPoints As Integer(),
    ByRef gx As Double(),
    ByRef gy As Double(),
    ByRef gz As Double()
) As Integer
```

```
Dim instance As cAreaObj
Dim Name As String
Dim NumEdges As Integer
Dim CurveType As Integer()
Dim Tension As Double()
Dim NumPoints As Integer()
Dim gx As Double()
Dim gy As Double()
Dim gz As Double()
Dim returnValue As Integer
```

```
returnValue = instance.GetCurvedEdges(Name,
    NumEdges, CurveType, Tension, NumPoints,
    gx, gy, gz)
```

```
int GetCurvedEdges(
    String^ Name,
    int% NumEdges,
    array<int>^% CurveType,
```

cAreaObjspan id="LST479396FD_0"AddLanguageSpecificTextSet("LST479396FD_0?cpp=::|nu-407;GetCur

```

array<double>^% Tension,
array<int>^% NumPoints,
array<double>^% gx,
array<double>^% gy,
array<double>^% gz
)

abstract GetCurvedEdges :
    Name : string *
    NumEdges : int byref *
    CurveType : int[] byref *
    Tension : float[] byref *
    NumPoints : int[] byref *
    gx : float[] byref *
    gy : float[] byref *
    gz : float[] byref -> int

```

Parameters

Name

Type:Â SystemString

The name of an existing area object with curved edges

NumEdges

Type:Â SystemInt32

The number of edges of the area object

CurveType

Type:Â SystemInt32

This is an array of size NumEdges. Contains the curve type for each edge, an integer from the following list:

- ◊ Straight = 0
- ◊ Circular Curve = 1
- ◊ Multilinear Curve = 2
- ◊ Bezier Curve = 3
- ◊ Spline Curve = 4

Tension

Type:Â SystemDouble

This is an array of size NumEdges. Used for spline, a value that specifies the amount that the curve bends between control points. Values greater than 1 produce unpredictable results

NumPoints

Type:Â SystemInt32

This is an array of size NumEdges. The number of points along the curve for each edge

gx

Type:Â SystemDouble

This array has a size equal to the sum of all the items in the NumPoints array. Contains the global x coordinates Use the values in the NumPoints array to keep track of which points apply to which curve.

gy

Type:Â SystemDouble

This array has a size equal to the sum of all the items in the NumPoints array. Contains the global y coordinates Use the values in the NumPoints array to keep track of which points apply to which curve.

gz

Type: SystemDouble

This array has a size equal to the sum of all the items in the NumPoints array. Contains the global z coordinates Use the values in the NumPoints array to keep track of which points apply to which curve.

Return Value

Type: Int32

Returns zero if the data is successfully retrieved, otherwise it returns a nonzero value

CSI API ETABS v1

cAreaObjAddLanguageSpecificTextSet("LSTEE272340_0")

Method

Retrieves the design orientation of an area object.

Namespace: ETABSv1

Assembly: ETABSv1 (in ETABSv1.dll) Version: 1.0.0.0 (1.24.0.0)

Syntax

C#

VB

C++

F#

Copy

```
int GetDesignOrientation(
    string Name,
    ref eAreaDesignOrientation DesignOrientation
)
```

```
Function GetDesignOrientation (
    Name As String,
    ByRef DesignOrientation As eAreaDesignOrientation
) As Integer
```

```
Dim instance As cAreaObj
Dim Name As String
Dim DesignOrientation As eAreaDesignOrientation
Dim returnValue As Integer
```

```
returnValue = instance.GetDesignOrientation(Name,
    DesignOrientation)
```

```
int GetDesignOrientation(
    String^ Name,
    eAreaDesignOrientation% DesignOrientation
)
```

```
abstract GetDesignOrientation :
    Name : string *
    DesignOrientation : eAreaDesignOrientation byref -> int
```

Parameters

Name

Type: SystemString

The name of a defined area object.

DesignOrientation

Type: ETABSv1eAreaDesignOrientation

This is one of the items in the eAreaDesignOrientation enumeration.

Return ValueType: Int32

▲ Remarks

▲ Examples

VB

Copy

```
Public Sub Example()
    Dim SapModel As cSapModel
    Dim EtabsObject As cOAPI
    Dim ret As Integer = -1
    Dim DesignOrientation As String

    'create ETABS object
    Dim myHelper as cHelper = New Helper
    EtabsObject = myHelper.CreateObjectProgID("CSI.ETABS.API.ETABSObject")

    'start ETABS application
    ret = EtabsObject.ApplicationStart()

    'create SapModel object
    SapModel = EtabsObject.SapModel

    'initialize model
    ret = SapModel.InitializeNewModel()

    'create steel deck template model
    ret = SapModel.File.NewSteelDeck(4, 12, 12, 4, 4, 24, 24)

    'get area property
    ret = SapModel.AreaObj.GetDesignOrientation("1", DesignOrientation)

    'close ETABS
    EtabsObject.ApplicationExit(False)

    'clean up variables
    SapModel = Nothing
    EtabsObject = Nothing

End Sub
```

CSI API ETABS v1

cAreaObjAddLanguageSpecificTextSet("LST9F3A69F0_0") Method

Retrieves the diaphragm assignment to the specified area object

Namespace: [ETABSv1](#)

Assembly: [ETABSv1](#) (in ETABSv1.dll) Version: 1.0.0.0 (1.24.0.0)

Syntax

[C#](#)

[VB](#)

[C++](#)

[F#](#)

[Copy](#)

```
int GetDiaphragm(
    string Name,
    ref string DiaphragmName
)
```

```
Function GetDiaphragm (
    Name As String,
    ByRef DiaphragmName As String
) As Integer
```

```
Dim instance As cAreaObj
Dim Name As String
Dim DiaphragmName As String
Dim returnValue As Integer
```

```
returnValue = instance.GetDiaphragm(Name,
    DiaphragmName)
```

```
int GetDiaphragm(
    String^ Name,
    String^% DiaphragmName
)
```

```
abstract GetDiaphragm :
    Name : string *
    DiaphragmName : string byref -> int
```

Parameters

Name

Type: [SystemString](#)

The name of a defined area object.

DiaphragmName

Type: [SystemString](#)

The name of the diaphragm assigned to the area object. This item is "None" if no diaphragm is assigned to the area object.

Return ValueType: Int32

Returns zero if the diaphragm is successfully retrieved; otherwise it returns a nonzero value.

▀ **Remarks**

▀ **Examples**

VB

Copy

```
Public Sub Example()
    Dim SapModel As cSapModel
    Dim EtabsObject As cOAPI
    Dim ret As Integer = -1
    Dim DiaphragmName As String

    'create ETABS object
    Dim myHelper as cHelper = New Helper
    EtabsObject = myHelper.CreateObjectProgID("CSI.ETABS.API.ETABSObject")

    'start ETABS application
    ret = EtabsObject.ApplicationStart()

    'create SapModel object
    SapModel = EtabsObject.SapModel

    'initialize model
    ret = SapModel.InitializeNewModel()

    'create steel deck template model
    ret = SapModel.File.NewSteelDeck(4, 12, 4, 4, 24, 24)

    'define a new diaphragm
    ret = SapModel.Diaphragm.SetDiaphragm("MyDiaph1A", SemiRigid:=True)

    'assign diaphragm to area
    ret = SapModel.AreaObj.SetDiaphragm("4", "MyDiaph1A")

    'get area diaphragm assignment
    ret = SapModel.AreaObj.GetDiaphragm("4", DiaphragmName)

    'close ETABS
    EtabsObject.ApplicationExit(False)

    'clean up variables
    SapModel = Nothing
    EtabsObject = Nothing
End Sub
```

CSI API ETABS v1

cAreaObjAddLanguageSpecificTextSet("LST6BE04EDC_0") Method

Retrieves the groups to which an area object is assigned.

Namespace: [ETABSV1](#)

Assembly: [ETABSV1](#) (in ETABSV1.dll) Version: 1.0.0.0 (1.24.0.0)

Syntax

[C#](#)

[VB](#)

[C++](#)

[F#](#)

[Copy](#)

```
int GetGroupAssign(
    string Name,
    ref int NumberGroups,
    ref string[] Groups
)
```

```
Function GetGroupAssign (
    Name As String,
    ByRef NumberGroups As Integer,
    ByRef Groups As String()
) As Integer
```

```
Dim instance As cAreaObj
Dim Name As String
Dim NumberGroups As Integer
Dim Groups As String()
Dim returnValue As Integer
```

```
returnValue = instance.GetGroupAssign(Name,
    NumberGroups, Groups)
```

```
int GetGroupAssign(
    String^ Name,
    int% NumberGroups,
    array<String^>^% Groups
)
```

```
abstract GetGroupAssign :
    Name : string *
    NumberGroups : int byref *
    Groups : string[] byref -> int
```

Parameters

Name

Type: [SystemString](#)

The name of an existing area object.

NumberGroups

cAreaObjspan id="LST6BE04EDC_0"AddLanguageSpecificTextSet("LST6BE04EDC_0?cpp=::|n=19");GetG

Type: SystemInt32

The number of group names retrieved.

Groups

Type: SystemString

This is an array of the names of the groups to which the area object is assigned.

Return Value

Type: Int32

Returns zero if the group assignments are successfully retrieved, otherwise it returns a nonzero value.

Remarks

Examples

VB

Copy

```
Public Sub Example()
    Dim SapModel As cSapModel
    Dim EtabsObject As cOAPI
    Dim ret As Integer = -1
    Dim NumberGroups As Integer
    Dim Groups() as String

    'create ETABS object

CSI API ETABS v1

cAreaObjAddLanguageSpecificTextSet("LSTDBD2DBC Method

Retrieves the names and labels of all defined area objects.

Namespace: ETABSv1

Assembly: ETABSv1 (in ETABSv1.dll) Version: 1.0.0.0 (1.24.0.0)

■ Syntax

C#

VB

C++

F#

Copy

```
int GetLabelNameList(
    ref int NumberNames,
    ref string[] MyName,
    ref string[] MyLabel,
    ref string[] MyStory
)
```

```
Function GetLabelNameList (
    ByRef NumberNames As Integer,
    ByRef MyName As String(),
    ByRef MyLabel As String(),
    ByRef MyStory As String()
) As Integer
```

```
Dim instance As cAreaObj
Dim NumberNames As Integer
Dim MyName As String()
Dim MyLabel As String()
Dim MyStory As String()
Dim returnValue As Integer
```

```
returnValue = instance.GetLabelNameList(NumberNames,
    MyName, MyLabel, MyStory)
```

```
int GetLabelNameList(
    int% NumberNames,
    array<String^>^% MyName,
    array<String^>^% MyLabel,
    array<String^>^% MyStory
)
```

```
abstract GetLabelNameList :
    NumberNames : int byref *
    MyName : string[] byref *
    MyLabel : string[] byref *
    MyStory : string[] byref -> int
```

Parameters**NumberNames**Type: SystemInt32

The number of area object names retrieved by the program.

MyNameType: SystemString

This is a one-dimensional array of area object names. The MyName array is created as a dynamic, zero-based, array by the API user:

```
Dim MyName() as String
```

The array is dimensioned to (NumberNames + 1) inside the program, filled with the names, and returned to the API user.

MyLabelType: SystemString

This is a one-dimensional array of area object labels. The MyLabel array is created as a dynamic, zero-based, array by the API user:

```
Dim MyLabel() as String
```

The array is dimensioned to (NumberNames + 1) inside the program, filled with the labels, and returned to the API user.

MyStoryType: SystemString

This is a one-dimensional array of the story levels of the area objects. The MyStory array is created as a dynamic, zero-based, array by the API user:

```
Dim MyStory() as String
```

The array is dimensioned to (NumberNames + 1) inside the program, filled with the story levels, and returned to the API user.

Return ValueType: Int32

Returns zero if the data is successfully retrieved, otherwise it returns nonzero.

▲ **Remarks**▲ **Examples**

VB

Copy

```
Public Sub Example()
    Dim SapModel As cSapModel
    Dim EtabsObject As cOAPI

CSI API ETABS v1

cAreaObjAddLanguageSpecificTextSet("LSTA737EC5C0") Method

Retrieves the temperature load assignments to area objects.

Namespace: ETABSv1

Assembly: ETABSv1 (in ETABSv1.dll) Version: 1.0.0.0 (1.24.0.0)

■ Syntax

C#

VB

C++

F#

Copy

```
int GetLoadTemperature(
    string Name,
    ref int NumberItems,
    ref string[] AreaName,
    ref string[] LoadPat,
    ref int[] MyType,
    ref double[] Value,
    ref string[] PatternName,
    eItemType ItemType = eItemType.Objects
)
```

```
Function GetLoadTemperature (
    Name As String,
    ByRef NumberItems As Integer,
    ByRef AreaName As String(),
    ByRef LoadPat As String(),
    ByRef MyType As Integer(),
    ByRef Value As Double(),
    ByRef PatternName As String(),
    ByRef ItemType As eItemType = eItemType.Objects
) As Integer
```

```
Dim instance As cAreaObj
Dim Name As String
Dim NumberItems As Integer
Dim AreaName As String()
Dim LoadPat As String()
Dim MyType As Integer()
Dim Value As Double()
Dim PatternName As String()
Dim ItemType As eItemType
Dim returnValue As Integer
```

```
returnValue = instance.GetLoadTemperature(Name,
    NumberItems, AreaName, LoadPat, MyType,
    Value, PatternName, ItemType)
```

```
int GetLoadTemperature(
    String^ Name,
    int% NumberItems,
    array<String^>^% AreaName,
```

cAreaObjspan id="LSTA737EC5C_0"AddLanguageSpecificTextSet("LSTA737EC5C_0?cpp=::|n430");GetLo

```

array<String>^% LoadPat,
array<int>^% MyType,
array<double>^% Value,
array<String>^% PatternName,
eItemType ItemType = eItemType::Objects
)

abstract GetLoadTemperature :
    Name : string *
    NumberItems : int byref *
    AreaName : string[] byref *
    LoadPat : string[] byref *
    MyType : int[] byref *
    Value : float[] byref *
    PatternName : string[] byref *
    ?ItemType : eItemType
(* Defaults:
    let _ItemType = defaultArg ItemType eItemType.Objects
*)
-> int

```

Parameters

Name

Type:Â SystemString

The name of an existing area object or group, depending on the value of the ItemType item.

NumberItems

Type:Â SystemInt32

The total number of temperature loads retrieved for the specified area objects.

AreaName

Type:Â SystemString

This is an array that includes the name of the area object associated with each temperature load.

LoadPat

Type:Â SystemString

This is an array that includes the name of the load pattern associated with each temperature load.

MyType

Type:Â SystemInt32

This is an array that includes either 1 or 3, indicating the type of temperature load.

◊ 1 = Temperature

◊ 3 = Temperature gradient along local 3 axis

Value

Type:Â SystemDouble

This is an array that includes the temperature load value. [T] for MyType = 1 and [T/L] for MyType= 3.

PatternName

Type:Â SystemString

This is an array that includes the joint pattern name, if any, used to specify the temperature load.

ItemType (Optional)

Type: ETABSv1eItemType

This is one of the following items in the eItemType enumeration:

◊ Object = 0

◊ Group = 1

◊ SelectedObjects = 2

If this item is Objects, the assignments are retrieved for the area object specified by the Name item.

If this item is Group, the assignments are retrieved for all area objects in the group specified by the Name item.

If this item is SelectedObjects, assignments are retrieved for is made to all selected area objects, and the Name item is ignored.

Return Value

Type: Int32

Returns zero if the load assignments are successfully retrieved; otherwise it returns a nonzero value.

    Dir : int[] byref *
    Value : float[] byref *
    ?ItemType : eItemType
(* Defaults:
    let _ItemType = defaultArg ItemType eItemType.Objects
*)
-> int

```

Parameters

Name

Type:Â SystemString

The name of an existing area object or group, depending on the value of the ItemType item.

NumberItems

Type:Â SystemInt32

The total number of uniform loads retrieved for the specified area objects.

AreaName

Type:Â SystemString

This is an array that includes the name of the area object associated with each uniform load.

LoadPat

Type:Â SystemString

This is an array that includes the name of the load pattern associated with each uniform load.

CSys

Type:Â SystemString

This is an array that includes the name of the coordinate system associated with each uniform load.

Dir

Type:Â SystemInt32

Value

Type:Â SystemDouble

The uniform load value. [F/L²]

ItemType (Optional)

Type:Â ETABSv1eItemType

This is one of the following items in the eItemType enumeration:

- ◊ Object = 0
- ◊ Group = 1
- ◊ SelectedObjects = 2

If this item is Objects, the assignments are retrieved for the area object specified by the Name item.

If this item is Group, the assignments are retrieved for all area objects in the group specified by the Name item.

If this item is SelectedObjects, assignments are retrieved for is made to all selected area objects, and the Name item is ignored.

Return Value

Type: Int32

Returns zero if the load assignments are successfully retrieved; otherwise it returns a nonzero value.

    DistType : int[] byref *
    ?ItemType : eItemType
(* Defaults:
    let _ItemType = defaultArg ItemType eItemType.Objects
*)
-> int

```

Parameters

Name

Type:Â SystemString

The name of an existing area object or group, depending on the value of the ItemType item.

NumberItems

Type:Â SystemInt32

The total number of uniform to frame loads retrieved for the specified area objects.

AreaName

Type:Â SystemString

This is an array that includes the name of the area object associated with each uniform to frame load.

LoadPat

Type:Â SystemString

This is an array that includes the name of the load pattern associated with each uniform to frame load.

CSys

Type:Â SystemString

This is an array that includes the name of the coordinate system associated with each uniform to frame load.

Dir

Type:Â SystemInt32

Value

Type:Â SystemDouble

The uniform load value. [F/L²]

DistType

Type: SystemInt32

This is either 1 or 2, indicating the load distribution type.

ItemType (Optional)

Type: ETABSv1eItemType

This is one of the following items in the eItemType enumeration:

◊ Object = 0

◊ Group = 1

◊ SelectedObjects = 2

If this item is Objects, the assignments are retrieved for the area object specified by the Name item.

If this item is Group, the assignments are retrieved for all area objects in the group specified by the Name item.

If this item is SelectedObjects, assignments are retrieved for is made to all selected area objects, and the Name item is ignored.

Return Value

Type: Int32

Returns zero if the load assignments are successfully retrieved; otherwise it returns a nonzero value.

    array<double>^% Cp,
```

cAreaObjspan id="LST66E250E0_0"AddLanguageSpecificTextSet("LST66E250E0_0?cpp=::|nu-4.4.0)GetLoa

```

eItemType ItemType = eItemType::Objects
)

abstract GetLoadWindPressure :
    Name : string *
    NumberItems : int byref *
    AreaName : string[] byref *
    LoadPat : string[] byref *
    MyType : int[] byref *
    Cp : float[] byref *
    ?ItemType : eItemType
(* Defaults:
    let _ItemType = defaultArg ItemType eItemType.Objects
*)
-> int

```

Parameters

Name

Type: SystemString

The name of an existing area object or group, depending on the value of the ItemType item.

NumberItems

Type: SystemInt32

The total number of wind pressure loads retrieved for the specified area objects.

AreaName

Type: SystemString

This is an array that includes the name of the area object associated with each wind pressure load.

LoadPat

Type: SystemString

This is an array that includes the name of the load pattern associated with each wind pressure load.

MyType

Type: SystemInt32

This is an array that includes either 1 or 2, indicating the wind pressure type.

1. Windward, pressure varies over height
2. Other, pressure is constant over height

Cp

Type: SystemDouble

This is an array that includes the wind pressure coefficient value.

ItemType (Optional)

Type: ETABSv1eItemType

This is one of the following items in the eItemType enumeration:

- ◊ Object = 0
- ◊ Group = 1
- ◊ SelectedObjects = 2

If this item is Objects, the assignments are retrieved for the area object specified by the Name item.

If this item is Group, the assignments are retrieved for all area objects in the group specified by the Name item.

If this item is SelectedObjects, assignments are retrieved for is made to all selected area objects, and the Name item is ignored.

Return Value

Type: Int32

Returns zero if the load assignments are successfully retrieved; it returns a nonzero value.

    String^% Name
)
```

```
abstract GetNameFromLabel :
    Label : string *
    Story : string *
    Name : string byref -> int
```

Parameters

Label

Type: SystemString

The area object label

Story

Type: SystemString

The area object story level

Name

Type: SystemString

The unique name of the area object

Return Value

Type: Int32

Returns zero if the data is successfully retrieved, otherwise it returns nonzero.

CSI API ETABS v1

cAreaObjAddLanguageSpecificTextSet("LSTC65908A8_0") Method

Retrieves the names of all defined area objects.

Namespace: [ETABSV1](#)

Assembly: [ETABSV1](#) (in ETABSV1.dll) Version: 1.0.0.0 (1.24.0.0)

Syntax

[C#](#)

[VB](#)

[C++](#)

[F#](#)

[Copy](#)

```
int GetNameList(
    ref int NumberNames,
    ref string[] MyName
)
```

```
Function GetNameList (
    ByRef NumberNames As Integer,
    ByRef MyName As String()
) As Integer
```

```
Dim instance As cAreaObj
Dim NumberNames As Integer
Dim MyName As String()
Dim returnValue As Integer
```

```
returnValue = instance.GetNameList(NumberNames,
    MyName)
```

```
int GetNameList(
    int% NumberNames,
    array<String^>^% MyName
)
```

```
abstract GetNameList :
    NumberNames : int byref *
    MyName : string[] byref -> int
```

Parameters

NumberNames

Type: [System.Int32](#)

The number of area object names retrieved by the program.

MyName

Type: [System.String](#)

This is a one-dimensional array of area object names. The MyName array is created as a dynamic, zero-based, array by the API user:

```
Dim MyName() as String
```

cAreaObjAddLanguageSpecificTextSet("LSTC65908A8_0?cpp=::|nu454;GetNar

The array is dimensioned to (NumberNames + 1) inside the ETABS program, filled with the names, and returned to the API user.

Return Value

Type: Int32

Returns zero if the names are successfully retrieved, otherwise it returns nonzero.

▲ **Remarks**

▲ **Examples**

VB

Copy

```
Public Sub Example()
    Dim SapModel As cSapModel
    Dim EtabsObject As cOAPI
    Dim ret As Integer = -1
    Dim NumberNames As Integer
    Dim MyName() As String

    'create ETABS object
    Dim myHelper as cHelper = New Helper
    EtabsObject = myHelper.CreateObjectProgID("CSI.ETABS.API.ETABSObject")

    'start ETABS application
    ret = EtabsObject.ApplicationStart()

    'create SapModel object
    SapModel = EtabsObject.SapModel

    'initialize model
    ret = SapModel.InitializeNewModel()

    'create steel deck template model
    ret = SapModel.File.NewSteelDeck(4, 12, 12, 4, 4, 24, 24)

    'get area object names
    ret = SapModel.AreaObj.GetNameList(NumberNames, MyName)

    'close ETABS
    EtabsObject.ApplicationExit(False)

    'clean up variables
    SapModel = Nothing
    EtabsObject = Nothing

End Sub
```

CSI API ETABS v1

cAreaObjAddLanguageSpecificTextSet("LST4AFDCEAE_0")

Method

Retrieves the names of the defined area objects on a given story.

Namespace: ETABSv1

Assembly: ETABSv1 (in ETABSv1.dll) Version: 1.0.0.0 (1.24.0.0)

Syntax

C#

VB

C++

F#

Copy

```
int GetNameListOnStory(
    string StoryName,
    ref int NumberNames,
    ref string[] MyName
)
```

```
Function GetNameListOnStory (
    StoryName As String,
    ByRef NumberNames As Integer,
    ByRef MyName As String()
) As Integer
```

```
Dim instance As cAreaObj
Dim StoryName As String
Dim NumberNames As Integer
Dim MyName As String()
Dim returnValue As Integer
```

```
returnValue = instance.GetNameListOnStory(StoryName,
    NumberNames, MyName)
```

```
int GetNameListOnStory(
    String^ StoryName,
    int% NumberNames,
    array<String^>^% MyName
)
```

```
abstract GetNameListOnStory :
    StoryName : string *
    NumberNames : int byref *
    MyName : string[] byref -> int
```

Parameters

StoryName

Type: SystemString

The name of an existing story.

NumberNames

cAreaObjid="LST4AFDCEAE_0"AddLanguageSpecificTextSet("LST4AFDCEAE_0?cpp=::|456.");GetN

Type: SystemInt32

The number of area object names retrieved by the program.

MyName

Type: SystemString

This is a one-dimensional array of area object names. The MyName array is created as a dynamic, zero-based, array by the API user:

```
Dim MyName() as String
```

The array is dimensioned to (NumberNames + 1) inside the ETABS program, filled with the names, and returned to the API user.

Return Value

Type: Int32

Returns zero if the names are successfully retrieved, otherwise it returns nonzero.

▲ Remarks

▲ Examples

VB

Copy

```
Public Sub Example()
    Dim SapModel As cSapModel
    Dim EtabsObject As cOAPI
    Dim ret As Integer = -1
    Dim NumberNames As Integer
    Dim MyName() As String

    'create ETABS object

CSI API ETABS v1

cAreaObjAddLanguageSpecificTextSet("LST2770883C_0") Method

Retrieves whether the specified area object is an opening.

Namespace: [ETABSV1](#)

Assembly: [ETABSV1](#) (in ETABSV1.dll) Version: 1.0.0.0 (1.24.0.0)

Syntax

[C#](#)

[VB](#)

[C++](#)

[F#](#)

[Copy](#)

```
int GetOpening(
    string Name,
    ref bool IsOpening
)
```

```
Function GetOpening (
    Name As String,
    ByRef IsOpening As Boolean
) As Integer
```

```
Dim instance As cAreaObj
Dim Name As String
Dim IsOpening As Boolean
Dim returnValue As Integer
```

```
returnValue = instance.GetOpening(Name,
    IsOpening)
```

```
int GetOpening(
    String^ Name,
    bool% IsOpening
)
```

```
abstract GetOpening :
    Name : string *
    IsOpening : bool byref -> int
```

Parameters

Name

Type: [SystemString](#)

The name of a defined area object.

IsOpening

Type: [SystemBoolean](#)

This item is True if the specified area object is an opening, otherwise it is False.

Return Value

Type: Int32

The function returns zero if the assignment is successfully retrieved; otherwise it returns a nonzero value.

▲ **Remarks**

▲ **Examples**

VB

Copy

```
Public Sub Example()
    Dim SapModel As cSapModel
    Dim EtabsObject As cOAPI
    Dim ret As Integer = -1

CSI API ETABS v1

cAreaObjAddLanguageSpecificTextSet("LST91839761_0") Method

Retrieves the pier label assignments of an area object

Namespace: [ETABSv1](#)

Assembly: [ETABSv1](#) (in ETABSv1.dll) Version: 1.0.0.0 (1.24.0.0)

Syntax

[C#](#)

[VB](#)

[C++](#)

[F#](#)

[Copy](#)

```
int GetPier(
    string Name,
    ref string PierName
)
```

```
Function GetPier (
    Name As String,
    ByRef PierName As String
) As Integer
```

```
Dim instance As cAreaObj
Dim Name As String
Dim PierName As String
Dim returnValue As Integer
```

```
returnValue = instance.GetPier(Name, PierName)
```

```
int GetPier(
    String^ Name,
    String^% PierName
)
```

```
abstract GetPier :
    Name : string *
    PierName : string byref -> int
```

Parameters

Name

Type: [SystemString](#)

The name of an existing area object

PierName

Type: [SystemString](#)

The name of the pier assignment, if any, or "None"

Return Value

Type: Int32

Returns zero if the assignment is successfully retrieved; otherwise it returns a nonzero value.

▲ **Remarks**

▲ **Examples**

VB

Copy

```
Public Sub Example()
    Dim SapModel As cSapModel
    Dim EtabsObject As cOAPI

CSI API ETABS v1

cAreaObjAddLanguageSpecificTextSet("LSTC43F8FE5_0") Method

Retrieves the area property assigned to an area object.

Namespace: [ETABSv1](#)

Assembly: [ETABSv1](#) (in ETABSv1.dll) Version: 1.0.0.0 (1.24.0.0)

▲ Syntax

[C#](#)

[VB](#)

[C++](#)

[F#](#)

[Copy](#)

```
int GetProperty(
    string Name,
    ref string PropName
)
```

```
Function GetProperty (
    Name As String,
    ByRef PropName As String
) As Integer
```

```
Dim instance As cAreaObj
Dim Name As String
Dim PropName As String
Dim returnValue As Integer
```

```
returnValue = instance.GetProperty(Name,
    PropName)
```

```
int GetProperty(
    String^ Name,
    String^% PropName
)
```

```
abstract GetProperty :
    Name : string *
    PropName : string byref -> int
```

Parameters

Name

Type: [SystemString](#)

The name of a defined area object.

PropName

Type: [SystemString](#)

The name of the area property assigned to the area object. This item is None if no area property is assigned to the area object.

Return ValueType: Int32

▲ Remarks

▲ Examples

VB

Copy

```
Public Sub Example()
    Dim SapModel As cSapModel
    Dim EtabsObject As cOAPI
    Dim ret As Integer = -1
    Dim PropName As String

    'create ETABS object
    Dim myHelper as cHelper = New Helper
    EtabsObject = myHelper.CreateObjectProgID("CSI.ETABS.API.ETABSObject")

    'start ETABS application
    ret = EtabsObject.ApplicationStart()

    BarSpacing : float[] byref *
    NumberBars : int[] byref *
    Confined : bool[] byref -> int
```

Parameters

Name

Type:Â SystemString

The name of an existing area object

NumberRebarLayers

Type:Â SystemInt32

LayerID

Type:Â SystemString

LayerType

Type:Â ETABSv1eWallSpandrelRebarLayerType

ClearCover

Type:Â SystemDouble

BarSizeIndex

Type:Â SystemInt32

BarArea

Type:Â SystemDouble

BarSpacing

Type:Â SystemDouble

NumberBars

Type:Â SystemInt32

Confined

Type:Â SystemBoolean

Return Value

Type: Int32

    Name As String,
    ByRef SpandrelName As String
) As Integer
```

```
Dim instance As cAreaObj
Dim Name As String
Dim SpandrelName As String
Dim returnValue As Integer
```

```
returnValue = instance.GetSpandrel(Name,
    SpandrelName)
```

```
int GetSpandrel(
    String^ Name,
    String^% SpandrelName
)
```

```
abstract GetSpandrel :
    Name : string *
    SpandrelName : string byref -> int
```

Parameters

Name

Type: [SystemString](#)

The name of an existing area object

SpandrelName

Type: [SystemString](#)

The name of the Spandrel assignment, if any, or "None"

Return Value

Type: Int32

Returns zero if the assignment is successfully retrieved; otherwise it returns a nonzero value.

▀ **Remarks**

▀ **Examples**

VB

Copy

```
Public Sub Example()
    Dim SapModel As cSapModel
    Dim EtabsObject As cOAPI
    Dim ret As Integer = -1
    Dim SpandrelName As String

    'create ETABS object

CSI API ETABS v1

cAreaObjAddLanguageSpecificTextSet("LST5061722_0")

Method

Assigns a diaphragm to a specified area object

Namespace: ETABSv1

Assembly: ETABSv1 (in ETABSv1.dll) Version: 1.0.0.0 (1.24.0.0)

Syntax

C#

VB

C++

F#

Copy

```
int SetDiaphragm(
    string Name,
    string DiaphragmName
)
```

```
Function SetDiaphragm (
    Name As String,
    DiaphragmName As String
) As Integer
```

```
Dim instance As cAreaObj
Dim Name As String
Dim DiaphragmName As String
Dim returnValue As Integer
```

```
returnValue = instance.SetDiaphragm(Name,
    DiaphragmName)
```

```
int SetDiaphragm(
    String^ Name,
    String^ DiaphragmName
)
```

```
abstract SetDiaphragm :
    Name : string *
    DiaphragmName : string -> int
```

Parameters

Name

Type: SystemString

The name of an existing area object

DiaphragmName

Type: SystemString

This the name of an existing diaphragm to be assigned to the specified area object. If it is "None", no diaphragm will be assigned to the area object.

Return ValueType: Int32

Returns zero if the diaphragm is successfully assigned; otherwise it returns a nonzero value.

▀ **Remarks**

▀ **Examples**

VB

Copy

```
Public Sub Example()
    Dim SapModel As cSapModel
    Dim EtabsObject As cOAPI
    Dim ret As Integer = -1
    Dim DiaphragmName As String

    'create ETABS object
    Dim myHelper as cHelper = New Helper
    EtabsObject = myHelper.CreateObjectProgID("CSI.ETABS.API.ETABSObject")

    'start ETABS application
    ret = EtabsObject.ApplicationStart()

    'create SapModel object
    SapModel = EtabsObject.SapModel

    'initialize model
    ret = SapModel.InitializeNewModel()

    'create steel deck template model
    ret = SapModel.File.NewSteelDeck(4, 12, 12, 4, 4, 24, 24)

    'define a new diaphragm
    ret = SapModel.Diaphragm.SetDiaphragm("MyDiaph1A", SemiRigid:=True)

    'assign diaphragm to area
    ret = SapModel.AreaObj.SetDiaphragm("4", "MyDiaph1A")

    'get area diaphragm assignment
    ret = SapModel.AreaObj.GetDiaphragm("4", DiaphragmName)

    'close ETABS
    EtabsObject.ApplicationExit(False)

    'clean up variables
    SapModel = Nothing
    EtabsObject = Nothing
End Sub
```

CSI API ETABS v1

cAreaObjAddLanguageSpecificTextSet("LSTC8D75288_0")

Method

Makes generated edge constraint assignments to area objects.

Namespace: [ETABSV1](#)

Assembly: [ETABSV1](#) (in ETABSV1.dll) Version: 1.0.0.0 (1.24.0.0)

Syntax

[C#](#)

[VB](#)

[C++](#)

[F#](#)

[Copy](#)

```
int SetEdgeConstraint(
    string Name,
    bool ConstraintExists,
    eItemType ItemType = eItemType.Objects
)
```

```
Function SetEdgeConstraint (
    Name As String,
    ConstraintExists As Boolean,
    ?ItemType As eItemType = eItemType.Objects
) As Integer
```

```
Dim instance As cAreaObj
Dim Name As String
Dim ConstraintExists As Boolean
Dim ItemType As eItemType
Dim returnValue As Integer
```

```
returnValue = instance.SetEdgeConstraint(Name,
    ConstraintExists, ItemType)
```

```
int SetEdgeConstraint(
    String^ Name,
    bool ConstraintExists,
    eItemType ItemType = eItemType::Objects
)
```

```
abstract SetEdgeConstraint :
    Name : string *
    ConstraintExists : bool *
    ?ItemType : eItemType
(* Defaults:
    let _ItemType = defaultArg ItemType eItemType.Objects
*)
-> int
```

Parameters

Name

Type:Â SystemString

The name of an existing area object or group, depending on the value of the ItemType item.

ConstraintExists

Type:Â SystemBoolean

This item is True if an automatic edge constraint is generated by the program for the area object in the analysis model.

ItemType (Optional)

Type:Â ETABSv1eItemType

This is one of the following items in the eItemType enumeration:

◊ Object = 0

◊ Group = 1

◊ SelectedObjects = 2

If this item is Objects, the assignment is made to the area object specified by the Name item.

If this item is Group, the assignment is made to all area objects in the group specified by the Name item.

If this item is SelectedObjects, assignment is made to all selected area objects, and the Name item is ignored.

Return Value

Type:Â Int32

Returns zero if the edge constraint option is successfully assigned; otherwise it returns a nonzero value.

▲ Remarks

▲ Examples

VB

Copy

```
Public Sub Example()
    Dim SapModel As cSapModel
    Dim EtabsObject As cOAPI
    Dim ret As Integer = -1

    'create ETABS object
    Dim myHelper as cHelper = New Helper
    EtabsObject = myHelper.CreateObjectProgID("CSI.ETABS.API.ETABSObject")

    'start ETABS application
    ret = EtabsObject.ApplicationStart()

    'create SapModel object
    SapModel = EtabsObject.SapModel

    'initialize model
    ret = SapModel.InitializeNewModel()

    'create steel deck template model
    ret = SapModel.File.NewSteelDeck(4, 12, 12, 4, 4, 24, 24)

    'assign auto edge constraint option
    ret = SapModel.AreaObj.SetEdgeConstraint("ALL", True, eItemType.Group)
    ret = SapModel.AreaObj.SetEdgeConstraint("2", False)
```

```
'close ETABS
  EtabsObject.ApplicationExit(False)

'clean up variables
  SapModel = Nothing
  EtabsObject = Nothing

End Sub
```

```

```
int SetLoadUniform(
    String^ Name,
    String^ LoadPat,
    double Value,
    int Dir,
    bool Replace = true,
    String^ CSys = L"Global",
```

cAreaObjspan id="LSTF06FCA4A_0"AddLanguageSpecificTextSet("LSTF06FCA4A_0?cpp=::|n59.1");SetLo

```

eItemType ItemType = eItemType::Objects
)

abstract SetLoadUniform :
  Name : string *
  LoadPat : string *
  Value : float *
  Dir : int *
  ?Replace : bool *
  ?CSys : string *
  ?ItemType : eItemType
(* Defaults:
  let _Replace = defaultArg Replace true
  let _CSys = defaultArg CSys "Global"
  let _ItemType = defaultArg ItemType eItemType.Objects
*)
-> int

```

Parameters

Name

Type: SystemString

The name of an existing area object or group, depending on the value of the ItemType item.

LoadPat

Type: SystemString

The name of a defined load pattern.

Value

Type: SystemDouble

The uniform load value. [F/L2]

Dir

Type: SystemInt32

Replace (Optional)

Type: SystemBoolean

If this item is True, all previous uniform loads, if any, assigned to the specified area object(s), in the specified load pattern, are deleted before making the new assignment.

CSys (Optional)

Type: SystemString

This is Local or the name of a defined coordinate system, indicating the coordinate system in which the uniform load is specified.

ItemType (Optional)

Type: ETABSv1eItemType

This is one of the following items in the eItemType enumeration:

◊ Object = 0

◊ Group = 1

◊ SelectedObjects = 2

If this item is Objects, the assignment is made to the area object specified by the Name item.

If this item is Group, the assignment is made to all area objects in the group specified by the Name item.

If this item is SelectedObjects, assignment is made to all selected area objects, and the Name item is ignored.

Return Value

Type: Int32

Returns zero if the loads are successfully assigned; otherwise it returns a nonzero value.

▲ Remarks

▲ Examples

VB

Copy

```
Public Sub Example()
    Dim SapModel As cSapModel
    Dim EtabsObject As cOAPI
    Dim ret As Integer = -1

    'create ETABS object
    Dim myHelper as cHelper = New Helper
    EtabsObject = myHelper.CreateObjectProgID("CSI.ETABS.API.ETABSObject")

    'start ETABS application
    ret = EtabsObject.ApplicationStart()

    'create SapModel object
    SapModel = EtabsObject.SapModel

    'initialize model
    ret = SapModel.InitializeNewModel()

    'create steel deck template model
    ret = SapModel.File.NewSteelDeck(4, 12, 12, 4, 4, 24, 24)

    'assign area object uniform loads
    ret = SapModel.AreaObj.SetLoadUniform("ALL", "DEAD", -0.01, 2, False, "Local", eItemType.Group)

    'refresh view
    ret = SapModel.View.RefreshView(0, False)

    'close ETABS
    EtabsObject.ApplicationExit(False)

    'clean up variables
    SapModel = Nothing
    EtabsObject = Nothing

End Sub
```

CSI API ETABS v1

cAreaObjAddLanguageSpecificTextSet("LST4C343407_0") Method

Assigns a local axis angle to area objects.

Namespace: [ETABSV1](#)

Assembly: [ETABSV1](#) (in ETABSV1.dll) Version: 1.0.0.0 (1.24.0.0)

Syntax

[C#](#)

[VB](#)

[C++](#)

[F#](#)

[Copy](#)

```
int SetLocalAxes(
    string Name,
    double Ang,
    eItemType ItemType = eItemType.Objects
)
```

```
Function SetLocalAxes (
    Name As String,
    Ang As Double,
    Optional ItemType As eItemType = eItemType.Objects
) As Integer
```

```
Dim instance As cAreaObj
Dim Name As String
Dim Ang As Double
Dim ItemType As eItemType
Dim returnValue As Integer
```

```
returnValue = instance.SetLocalAxes(Name,
    Ang, ItemType)
```

```
int SetLocalAxes(
    String^ Name,
    double Ang,
    eItemType ItemType = eItemType::Objects
)
```

```
abstract SetLocalAxes :
    Name : string *
    Ang : float *
    ?ItemType : eItemType
(* Defaults:
    let _ItemType = defaultArg ItemType eItemType.Objects
*)
-> int
```

Parameters

Name

Type:Â SystemString

The name of an existing area object or group, depending on the value of the ItemType item.

Ang

Type:Â SystemDouble

This is the angle that the local 1 and 2 axes are rotated about the positive local 3 axis from the default orientation. The rotation for a positive angle appears counter clockwise when the local +3 axis is pointing toward you. [deg]

ItemType (Optional)

Type:Â ETABSv1eItemType

This is one of the following items in the eItemType enumeration:

◊ Object = 0

◊ Group = 1

◊ SelectedObjects = 2

If this item is Objects, the assignment is made to the area object specified by the Name item.

If this item is Group, the assignment is made to all area objects in the group specified by the Name item.

If this item is SelectedObjects, assignment is made to all selected area objects, and the Name item is ignored.

Return Value

Type:Â Int32

Returns zero if the local axis angle is successfully assigned; otherwise it returns a nonzero value.

▲Remarks

▲Examples

VB

Copy

```
Public Sub Example()
    Dim SapModel As cSapModel
    Dim EtabsObject As cOAPI
    Dim ret As Integer = -1

    'create ETABS object
    Dim myHelper as cHelper = New Helper
    EtabsObject = myHelper.CreateObjectProgID("CSI.ETABS.API.ETABSObject")

    'start ETABS application
    ret = EtabsObject.ApplicationStart()

    'create SapModel object
    SapModel = EtabsObject.SapModel

    'initialize model
    ret = SapModel.InitializeNewModel()

    'create steel deck template model
    ret = SapModel.File.NewSteelDeck(4, 12, 12, 4, 4, 24, 24)

    'assign area object local axis angle
    ret = SapModel.AreaObj.SetLocalAxes("3", 30)
```

```
'close ETABS
  EtabsObject.ApplicationExit(False)

'clean up variables
  SapModel = Nothing
  EtabsObject = Nothing

End Sub
```

CSI API ETABS v1

cAreaObjAddLanguageSpecificTextSet("LST2CF890B_0") Method

Designates an area object(s) as an opening.

Namespace: [ETABSV1](#)

Assembly: [ETABSV1](#) (in ETABSV1.dll) Version: 1.0.0.0 (1.24.0.0)

Syntax

[C#](#)

[VB](#)

[C++](#)

[F#](#)

[Copy](#)

```
int SetOpening(
    string Name,
    bool IsOpening,
    eItemType ItemType = eItemType.Objects
)
```

```
Function SetOpening (
    Name As String,
    IsOpening As Boolean,
    ?ItemType As eItemType = eItemType.Objects
) As Integer
```

```
Dim instance As cAreaObj
Dim Name As String
Dim IsOpening As Boolean
Dim ItemType As eItemType
Dim returnValue As Integer
```

```
returnValue = instance.SetOpening(Name,
    IsOpening, ItemType)
```

```
int SetOpening(
    String^ Name,
    bool IsOpening,
    eItemType ItemType = eItemType::Objects
)
```

```
abstract SetOpening :
    Name : string *
    IsOpening : bool *
    ?ItemType : eItemType
(* Defaults:
    let _ItemType = defaultArg ItemType eItemType.Objects
*)
-> int
```

Parameters

Name

Type:Â SystemString

The name of an existing area object or group, depending on the value of the ItemType item.

IsOpening

Type:Â SystemBoolean

This item should be set to True if the specified area object(s) is to be an opening, otherwise it should be False.

ItemType (Optional)

Type:Â ETABSv1eItemType

This is one of the following items in the eItemType enumeration:

◊ Object = 0

◊ Group = 1

◊ SelectedObjects = 2

If this item is Objects, the assignment is made to the area object specified by the Name item.

If this item is Group, the assignment is made to all area objects in the group specified by the Name item.

If this item is SelectedObjects, the assignment is made to all selected area objects, and the Name item is ignored.

Return Value

Type:Â Int32

Returns zero if the opening is successfully assigned; otherwise it returns a nonzero value.

CSI API ETABS v1

cAreaObjAddLanguageSpecificTextSet("LST219D31B2_0")

Method

Sets the pier label assignment of one or more area objects

Namespace: [ETABSV1](#)

Assembly: [ETABSV1](#) (in ETABSV1.dll) Version: 1.0.0.0 (1.24.0.0)

Syntax

[C#](#)

[VB](#)

[C++](#)

[F#](#)

[Copy](#)

```
int SetPier(
    string Name,
    string PierName,
    eItemType ItemType = eItemType.Objects
)
```

```
Function SetPier (
    Name As String,
    PierName As String,
    ?ItemType As eItemType = eItemType.Objects
) As Integer
```

```
Dim instance As cAreaObj
Dim Name As String
Dim PierName As String
Dim ItemType As eItemType
Dim returnValue As Integer
```

```
returnValue = instance.SetPier(Name, PierName,
    ItemType)
```

```
int SetPier(
    String^ Name,
    String^ PierName,
    eItemType ItemType = eItemType::Objects
)
```

```
abstract SetPier :
    Name : string *
    PierName : string *
    ?ItemType : eItemType
(* Defaults:
    let _ItemType = defaultArg ItemType eItemType.Objects
*)
-> int
```

Parameters

Name

Type: SystemString

The name of an existing area object or group, depending on the value of the ItemType item.

PierName

Type: SystemString

The name of the pier assignment, or "None", to unset any assignment

ItemType (Optional)

Type: ETABSv1eItemType

This is one of the following items in the eItemType enumeration:

◊ Object = 0

◊ Group = 1

◊ SelectedObjects = 2

If this item is Objects, the assignment is made to the area object specified by the Name item.

If this item is Group, the assignment is made to all area objects in the group specified by the Name item.

If this item is SelectedObjects, assignment is made to all selected area objects, and the Name item is ignored.

Return Value

Type: Int32

Returns zero if the assignment is successful; otherwise it returns a nonzero value.

▲ Remarks

▲ Examples

VB

Copy

```
Public Sub Example()
    Dim SapModel As cSapModel
    Dim EtabsObject As cOAPI
    Dim ret As Integer = -1
    Dim PierName as String

    'create ETABS object
    Dim myHelper as cHelper = New Helper
    EtabsObject = myHelper.CreateObjectProgID("CSI.ETABS.API.ETABSObject")

    'start ETABS application
    ret = EtabsObject.ApplicationStart()

    'create SapModel object
    SapModel = EtabsObject.SapModel

    'initialize model
    ret = SapModel.InitializeNewModel()

    'create steel deck template model
    ret = SapModel.File.NewSteelDeck(4, 12, 4, 4, 24, 24)

    'define new pier label
    ret = SapModel.PierLabel.SetPier("MyPier")

    'set assignment
    ret = SapModel.AreaObj.SetPier("3", "MyPier")
```

Parameters

```
'get assignment
    ret = SapModel.AreaObj.GetPier("3", PierName)

'close ETABS
    EtabsObject.ApplicationExit(False)

'clean up variables
    SapModel = Nothing
    EtabsObject = Nothing

End Sub
```

CSI API ETABS v1

cAreaObjAddLanguageSpecificTextSet("LST4DD66AD4_0?cpp=::|n525");SetPr

Method

Assigns an area property to area objects.

Namespace: ETABSv1

Assembly: ETABSv1 (in ETABSv1.dll) Version: 1.0.0.0 (1.24.0.0)

■ Syntax

C#

VB

C++

F#

Copy

```
int SetProperty(
    string Name,
    string PropName,
    eItemType ItemType = eItemType.Objects
)
```

```
Function SetProperty (
    Name As String,
    PropName As String,
    ?ItemType As eItemType = eItemType.Objects
) As Integer
```

```
Dim instance As cAreaObj
Dim Name As String
Dim PropName As String
Dim ItemType As eItemType
Dim returnValue As Integer
```

```
returnValue = instance.SetProperty(Name,
    PropName, ItemType)
```

```
int SetProperty(
    String^ Name,
    String^ PropName,
    eItemType ItemType = eItemType::Objects
)
```

```
abstract SetProperty :
    Name : string *
    PropName : string *
    ?ItemType : eItemType
(* Defaults:
    let _ItemType = defaultArg ItemType eItemType.Objects
*)
-> int
```

Parameters

Name

cAreaObjid="LST4DD66AD4_0"AddLanguageSpecificTextSet("LST4DD66AD4_0?cpp=::|n525");SetPr

Type:Â SystemString

The name of an existing area object or group, depending on the value of the ItemType item.

PropName

Type:Â SystemString

This is None or the name of a area property to be assigned to the specified area object(s). None means that no property is assigned to the area object.

ItemType (Optional)

Type:Â ETABSv1eItemType

This is one of the following items in the eItemType enumeration:

◊ Object = 0

◊ Group = 1

◊ SelectedObjects = 2

If this item is Objects, the assignment is made to the area object specified by the Name item.

If this item is Group, the assignment is made to all area objects in the group specified by the Name item.

If this item is SelectedObjects, assignment is made to all selected area objects, and the Name item is ignored.

Return Value

Type:Â Int32

Returns zero if the property is successfully assigned; otherwise it returns a nonzero value.

▲ Remarks

▲ Examples

VB

Copy

```
Public Sub Example()
    Dim SapModel As cSapModel
    Dim EtabsObject As cOAPI
    Dim ret As Integer = -1

    'create ETABS object
    Dim myHelper as cHelper = New Helper
    EtabsObject = myHelper.CreateObjectProgID("CSI.ETABS.API.ETABSObject")

    'start ETABS application
    ret = EtabsObject.ApplicationStart()

    'create SapModel object
    SapModel = EtabsObject.SapModel

    'initialize model
    ret = SapModel.InitializeNewModel()

    'create steel deck template model
    ret = SapModel.File.NewSteelDeck(4, 12, 12, 4, 4, 24, 24)

    'set area property
    ret = SapModel.AreaObj.SetProperty("4", "None")
```

Introduction

```
'close ETABS
  EtabsObject.ApplicationExit(False)

'clean up variables
  SapModel = Nothing
  EtabsObject = Nothing

End Sub
```

CSI API ETABS v1

cAreaObjAddLanguageSpecificTextSet("LSTC2C4510B_0")

Method

Sets the Spandrel label assignment of one or more area objects

Namespace: ETABSv1

Assembly: ETABSv1 (in ETABSv1.dll) Version: 1.0.0.0 (1.24.0.0)

Syntax

C#

VB

C++

F#

Copy

```
int SetSpandrel(
    string Name,
    string SpandrelName,
    eItemType ItemType = eItemType.Objects
)
```

```
Function SetSpandrel (
    Name As String,
    SpandrelName As String,
    ?ItemType As eItemType = eItemType.Objects
) As Integer
```

```
Dim instance As cAreaObj
Dim Name As String
Dim SpandrelName As String
Dim ItemType As eItemType
Dim returnValue As Integer
```

```
returnValue = instance.SetSpandrel(Name,
    SpandrelName, ItemType)
```

```
int SetSpandrel(
    String^ Name,
    String^ SpandrelName,
    eItemType ItemType = eItemType::Objects
)
```

```
abstract SetSpandrel :
    Name : string *
    SpandrelName : string *
    ?ItemType : eItemType
(* Defaults:
    let _ItemType = defaultArg ItemType eItemType.Objects
*)
-> int
```

Parameters

Name

Type: SystemString

The name of an existing area object or group, depending on the value of the ItemType item.

SpandrelName

Type: SystemString

The name of the Spandrel assignment, or "None", to unset any assignment

ItemType (Optional)

Type: ETABSv1eItemType

This is one of the following items in the eItemType enumeration:

◊ Object = 0

◊ Group = 1

◊ SelectedObjects = 2

If this item is Objects, the assignment is made to the area object specified by the Name item.

If this item is Group, the assignment is made to all area objects in the group specified by the Name item.

If this item is SelectedObjects, assignment is made to all selected area objects, and the Name item is ignored.

Return Value

Type: Int32

Returns zero if the assignment is successful; otherwise it returns a nonzero value.

▲ Remarks

▲ Examples

VB

Copy

```
Public Sub Example()
    Dim SapModel As cSapModel
    Dim EtabsObject As cOAPI
    Dim ret As Integer = -1
    Dim SpandrelName as String

    'create ETABS object
    Dim myHelper as cHelper = New Helper
    EtabsObject = myHelper.CreateObjectProgID("CSI.ETABS.API.ETABSObject")

    'start ETABS application
    ret = EtabsObject.ApplicationStart()

    'create SapModel object
    SapModel = EtabsObject.SapModel

    'initialize model
    ret = SapModel.InitializeNewModel()

    'create steel deck template model
    ret = SapModel.File.NewSteelDeck(4, 12, 4, 4, 24, 24)

    'define new Spandrel label
    ret = SapModel.SpandrelLabel.SetSpandrel("MySpandrel")

    'set assignment
    ret = SapModel.AreaObj.SetSpandrel("3", "MySpandrel")
```

Parameters

Introduction

```
'get assignment
    ret = SapModel.AreaObj.GetSpandrel("3", SpandrelName)

'close ETABS
    EtabsObject.ApplicationExit(False)

'clean up variables
    SapModel = Nothing
    EtabsObject = Nothing

End Sub
```

CSI API ETABS v1

cAreaObjAddLanguageSpecificTextSet("LSTDAA74E5F0") Method

Assigns an existing named area spring property to area objects

Namespace: [ETABSv1](#)

Assembly: [ETABSv1](#) (in ETABSv1.dll) Version: 1.0.0.0 (1.24.0.0)

Syntax

[C#](#)

[VB](#)

[C++](#)

[F#](#)

[Copy](#)

```
int SetSpringAssignment(
    string Name,
    string SpringProp,
    eItemType ItemType = eItemType.Objects
)
```

```
Function SetSpringAssignment (
    Name As String,
    SpringProp As String,
    ?ItemType As eItemType = eItemType.Objects
) As Integer
```

```
Dim instance As cAreaObj
Dim Name As String
Dim SpringProp As String
Dim ItemType As eItemType
Dim returnValue As Integer
```

```
returnValue = instance.SetSpringAssignment(Name,
    SpringProp, ItemType)
```

```
int SetSpringAssignment(
    String^ Name,
    String^ SpringProp,
    eItemType ItemType = eItemType::Objects
)
```

```
abstract SetSpringAssignment :
    Name : string *
    SpringProp : string *
    ?ItemType : eItemType
(* Defaults:
    let _ItemType = defaultArg ItemType eItemType.Objects
*)
-> int
```

Parameters

Name

cAreaObjspan id="LSTDAA74E5F_0"AddLanguageSpecificTextSet("LSTDAA74E5F_0?cpp=::|n535");SetSp

Type: SystemString

The name of an existing area object or group depending on the value of the ItemType item.

SpringProp

Type: SystemString

The name of an existing area spring property

ItemType (Optional)

Type: ETABSv1eItemType

This is one of the following items in the eItemType enumeration:

◊ Object = 0

◊ Group = 1

◊ SelectedObjects = 2

If this item is Objects, the property assignment is made to the area object specified by the Name item.

If this item is Group, the property assignment is made to all area objects in the group specified by the Name item.

If this item is SelectedObjects, the property assignment is made to all selected area objects and the Name item is ignored.

Return Value

Type: Int32

Returns zero if the property is successfully assigned, otherwise it returns a nonzero value

▲ Remarks

▲ Examples

VB

Copy

```
Public Sub Example()
    Dim SapModel As cSapModel
    Dim EtabsObject As cOAPI
    Dim ret As Integer = -1
    Dim SpringProp As String

    'create ETABS object
    Dim myHelper as cHelper = New Helper
    EtabsObject = myHelper.CreateObjectProgID("CSI.ETABS.API.ETABSObject")

    'start ETABS application
    ret = EtabsObject.ApplicationStart()

    'create SapModel object
    SapModel = EtabsObject.SapModel

    'initialize model
    ret = SapModel.InitializeNewModel()

    'create steel deck template model
    ret = SapModel.File.NewSteelDeck(4, 12, 12, 4, 4, 24, 24)

    'define new spring property
    ret = SapModel.PropAreaSpring.SetAreaSpringProp("mySpringProp1", 0, 0, 100, 0)

    'assign property
```

Parameters

Introduction

```
ret = SapModel.AreaObj.SetSpringAssignment("1", "mySpringProp1")

'close ETABS
  EtabsObject.ApplicationExit(False)

'clean up variables
  SapModel = Nothing
  EtabsObject = Nothing

End Sub
```

Dim CSys As String()
Dim Ang As Double()
Dim returnValue As Integer
```

```
returnValue = instance.GetLoads(Name,
    NumberLoads, LoadType, LoadName,
```

Func, SF, Tf, At, CSys, Ang)

```
int GetLoads(
String^ Name,
int% NumberLoads,
array<String^>^% LoadType,
array<String^>^% LoadName,
array<String^>^% Func,
array<double>^% SF,
array<double>^% Tf,
array<double>^% At,
array<String^>^% CSys,
array<double>^% Ang
)
```

```
abstract GetLoads :
    Name : string *
    NumberLoads : int byref *
    LoadType : string[] byref *
    LoadName : string[] byref *
    Func : string[] byref *
    SF : float[] byref *
    Tf : float[] byref *
    At : float[] byref *
    CSys : string[] byref *
    Ang : float[] byref -> int
```

Parameters

Name

Type:Â SystemString

The name of an existing linear direct integration time history load case

NumberLoads

Type:Â SystemInt32

The number of loads assigned to the specified analysis case

LoadType

Type:Â SystemString

This is an array that includes Load or Accel, indicating the type of each load assigned to the load case

LoadName

Type:Â SystemString

This is an array that includes the name of each load assigned to the load case.

If the LoadType item is Load, this item is the name of a defined load pattern.

If the LoadType item is Accel, this item is U1, U2, U3, R1, R2 or R3, indicating the direction of the load.

Func

Type:Â SystemString

This is an array that includes the name of the time history function associated with each load

SF

Type:Â SystemDouble

This is an array that includes the scale factor of each load assigned to the load case. [L/s²] for U1 U2 and U3; otherwise unitless

Tf

Type: SystemDouble

This is an array that includes the time scale factor of each load assigned to the load case

At

Type: SystemDouble

This is an array that includes the arrival time of each load assigned to the load case

CSys

Type: SystemString

This is an array that includes the name of the coordinate system associated with each load. If this item is a blank string, the Global coordinate system is assumed.

This item applies only when the LoadType item is Accel.

Ang

Type: SystemDouble

This is an array that includes the angle between the acceleration local 1 axis and the +X-axis of the coordinate system specified by the CSys item. The rotation is about the Z-axis of the specified coordinate system. [deg]

Return Value

Type: Int32

Returns zero if the data is successfully retrieved; otherwise it returns a nonzero value

```

```
public interface class cCaseModalEigen
```

```
type cCaseModalEigen = interface end
```

The cCaseModalEigen type exposes the following members.

▲ Methods

▲	Name	Description
	GetInitialCase	This function retrieves the initial condition assumed for the specified load case.
	GetLoads	This function retrieves the load data for the specified load case.
	GetNumberModes	This function retrieves the number of modes requested for the specified load case.
	GetParameters	This function retrieves various parameters for the specified load case.
	SetCase	This function initializes a modal Eigen load case. If this function is called for an existing load case, all items for the case are reset to their default value.
	SetInitialCase	This function sets the initial condition for the specified load case.
	SetLoads	This function sets the load data for the specified load case.
	SetNumberModes	This function sets the number of modes requested for the specified load case.
	SetParameters	This function sets various parameters for the specified load case.

CSI API ETABS v1

cCaseModalEigenAddLanguageSpecificTextSet("LST5542BB3_0") Method

This function retrieves the initial condition assumed for the specified load case.

Namespace: ETABSv1

Assembly: ETABSv1 (in ETABSv1.dll) Version: 1.0.0.0 (1.24.0.0)

Syntax

C#

VB

C++

F#

Copy

```
int GetInitialCase(
    string Name,
    ref string InitialCase
)
```

```
Function GetInitialCase (
    Name As String,
    ByRef InitialCase As String
) As Integer
```

```
Dim instance As cCaseModalEigen
Dim Name As String
Dim InitialCase As String
Dim returnValue As Integer
```

```
returnValue = instance.GetInitialCase(Name,
    InitialCase)
```

```
int GetInitialCase(
    String^ Name,
    String^% InitialCase
)
```

```
abstract GetInitialCase :
    Name : string *
    InitialCase : string byref -> int
```

Parameters

Name

Type: SystemString

The name of an existing modal Eigen load case.

InitialCase

Type: SystemString

This is blank, None, or the name of an existing analysis case. This item specifies if the load case starts from zero initial conditions, that is, an unstressed state, or if it starts using the stiffness that occurs at the end of a nonlinear static or nonlinear direct integration time history load case.

If the specified initial case is a nonlinear static or nonlinear direct integration time history load case, the stiffness at the end of that case is used. If the initial case is anything else, zero initial conditions are assumed.

Return Value

Type: $\hat{A}$ [Int32](#)

Returns zero if the initial condition is successfully retrieved; otherwise it returns a nonzero value.

▲ [Remarks](#)

▲ [Examples](#)

VB

[Copy](#)

```
Public Sub Example()
    Dim SapModel As cSapModel
    Dim EtabsObject As cOAPI
    Dim ret As Integer = -1
    Dim InitialCase As String

    'create ETABS object
    Dim myHelper as cHelper = New Helper
    EtabsObject = myHelper.CreateObjectProgID("CSI.ETABS.API.ETABSObject")

    'start ETABS application
    ret = EtabsObject.ApplicationStart()

    'create SapModel object
    SapModel = EtabsObject.SapModel

    'initialize model
    ret = SapModel.InitializeNewModel()

    'create steel deck template model
    ret = SapModel.File.NewSteelDeck(4, 12, 12, 4, 4, 24, 24)

    'add static nonlinear load case
    ret = SapModel.LoadCases.StaticNonlinear.SetCase("SN1")

    'add modal Eigen load case
    ret = SapModel.LoadCases.ModalEigen.SetCase("LCASE1")

    'set initial condition
    ret = SapModel.LoadCases.ModalEigen.SetInitialCase("LCASE1", "SN1")

    'get initial condition
    ret = SapModel.LoadCases.ModalEigen.GetInitialCase("LCASE1", InitialCase)

    'close ETABS
    EtabsObject.ApplicationExit(False)

    'clean up variables
    SapModel = Nothing
    EtabsObject = Nothing
End Sub
```

Dim returnValue As Integer
```

```
returnValue = instance.GetLoads(Name,
    NumberLoads, LoadType, LoadName,
    TargetPar, StaticCorrect)
```

```
int GetLoads(
    String^ Name,
    int% NumberLoads,
    array<String^>^% LoadType,
    array<String^>^% LoadName,
    array<double>^% TargetPar,
    array<bool>^% StaticCorrect
)
```

abstract GetLoads :

cCaseModalEigenAddLanguageSpecificTextSet("LST60DD382A_0?579=::|nu=

```

Name : string *
NumberLoads : int byref *
LoadType : string[] byref *
LoadName : string[] byref *
TargetPar : float[] byref *
StaticCorrect : bool[] byref -> int

```

Parameters

Name

Type:Â SystemString

The name of an existing modal Eigen load case.

NumberLoads

Type:Â SystemInt32

The number of loads assigned to the specified analysis case.

LoadType

Type:Â SystemString

This is an array that includes Load, Accel or Link, indicating the type of each load assigned to the load case.

LoadName

Type:Â SystemString

This is an array that includes the name of each load assigned to the load case. If the LoadType item is Load, this item is the name of a defined load pattern. If the LoadType item is Accel, this item is UX, UY, UZ, RX, RY or RZ, indicating the direction of the load. If the LoadType item is Link, this item is not used.

TargetPar

Type:Â SystemDouble

This is an array that includes the target mass participation ratio.

StaticCorrect

Type:Â SystemBoolean

This is an array that includes either 0 or 1, indicating if static correction modes are to be calculated.

Return Value

Type:Â Int32

The function returns zero if the data is successfully retrieved; otherwise it returns a nonzero value.

Remarks

Examples

VB

Copy

```

Public Sub Example()
    Dim SapModel As cSapModel
    Dim EtabsObject As cOAPI
    Dim ret As Integer = -1
    Dim InitialCase As String
    Dim MyLoadType() As String
    Dim MyLoadName() As String
    Dim MyTargetPar() As Double
    Dim MyStaticCorrect() As Boolean
    Dim NumberLoads As Integer
    Dim LoadType() As String
    Dim LoadName() As String

```

Introduction

```
Dim TargetPar() As Double

CSI API ETABS v1

cCaseModalEigenAddLanguageSpecificTextSet("LST415FDF42_0?576") Method

This function retrieves the number of modes requested for the specified load case.

Namespace: [ETABSv1](#)

Assembly: [ETABSv1](#) (in ETABSv1.dll) Version: 1.0.0.0 (1.24.0.0)

Syntax

[C#](#)

[VB](#)

[C++](#)

[F#](#)

[Copy](#)

```
int GetNumberModes(
    string Name,
    ref int MaxModes,
    ref int MinModes
)
```

```
Function GetNumberModes (
    Name As String,
    ByRef MaxModes As Integer,
    ByRef MinModes As Integer
) As Integer
```

```
Dim instance As cCaseModalEigen
Dim Name As String
Dim MaxModes As Integer
Dim MinModes As Integer
Dim returnValue As Integer
```

```
returnValue = instance.GetNumberModes(Name,
    MaxModes, MinModes)
```

```
int GetNumberModes(
    String^ Name,
    int% MaxModes,
    int% MinModes
)
```

```
abstract GetNumberModes :
    Name : string *
    MaxModes : int byref *
    MinModes : int byref -> int
```

Parameters

Name

Type: [SystemString](#)

The name of an existing modal Eigen load case.

MaxModes

Type: SystemInt32

The maximum number of modes requested.

MinModes

Type: SystemInt32

The minimum number of modes requested.

Return Value

Type: Int32

The function returns zero if the number of modes is successfully retrieved; otherwise it returns a nonzero value.

CSI API ETABS v1

cCaseModalEigenAddLanguageSpecificTextSet("LST6300068B_0")

Method

This function retrieves various parameters for the specified load case.

Namespace: ETABSv1

Assembly: ETABSv1 (in ETABSv1.dll) Version: 1.0.0.0 (1.24.0.0)

Syntax

C#

VB

C++

F#

Copy

```
int GetParameters(
    string Name,
    ref double EigenShiftFreq,
    ref double EigenCutOff,
    ref double EigenTol,
    ref int AllowAutoFreqShift
)
```

```
Function GetParameters (
    Name As String,
    ByRef EigenShiftFreq As Double,
    ByRef EigenCutOff As Double,
    ByRef EigenTol As Double,
    ByRef AllowAutoFreqShift As Integer
) As Integer
```

```
Dim instance As cCaseModalEigen
Dim Name As String
Dim EigenShiftFreq As Double
Dim EigenCutOff As Double
Dim EigenTol As Double
Dim AllowAutoFreqShift As Integer
Dim returnValue As Integer
```

```
returnValue = instance.GetParameters(Name,
    EigenShiftFreq, EigenCutOff, EigenTol,
    AllowAutoFreqShift)
```

```
int GetParameters(
    String^ Name,
    double% EigenShiftFreq,
    double% EigenCutOff,
    double% EigenTol,
    int% AllowAutoFreqShift
)
```

```
abstract GetParameters :
    Name : string *
    EigenShiftFreq : float byref *
    EigenCutOff : float byref *
    EigenTol : float byref *
```

AllowAutoFreqShift : int byref -> int

Parameters

Name

Type:Â SystemString

The name of an existing modal Eigen load case.

EigenShiftFreq

Type:Â SystemDouble

The Eigenvalue shift frequency. [cyc/s]

EigenCutOff

Type:Â SystemDouble

The Eigencutoff frequency radius. [cyc/s]

EigenTol

Type:Â SystemDouble

The relative convergence tolerance for Eigenvalues.

AllowAutoFreqShift

Type:Â SystemInt32

This is either 0 or 1, indicating if automatic frequency shifting is allowed. 0 = Automatic frequency shifting is NOT allowed 1 = Automatic frequency shifting Is allowed

Return Value

Type:Â Int32

The function returns zero if the parameters are successfully retrieved; otherwise it returns a nonzero value.

CSI API ETABS v1

cCaseModalEigenAddLanguageSpecificTextSet("LSTC Method

This function initializes a modal Eigen load case. If this function is called for an existing load case, all items for the case are reset to their default value.

Namespace: ETABSV1

Assembly: ETABSV1 (in ETABSV1.dll) Version: 1.0.0.0 (1.24.0.0)

▲ Syntax

C#

VB

C++

F#

Copy

```
int SetCase(
    string Name
)
```

```
Function SetCase (
    Name As String
) As Integer
```

```
Dim instance As cCaseModalEigen
Dim Name As String
Dim returnValue As Integer
```

```
returnValue = instance.SetCase(Name)
```

```
int SetCase(
    String^ Name
)
```

```
abstract SetCase :
    Name : string -> int
```

Parameters

Name

Type: SystemString

The name of an existing or new load case. If this is an existing case, that case is modified; otherwise, a new case is added.

Return Value

Type: Int32

The function returns zero if the load case is successfully initialized; otherwise it returns a nonzero value.

▲ Remarks

▲ Examples

VB

CSI API ETABS v1

cCaseModalEigenAddLanguageSpecificTextSet("LST20079D90_0")

Method

This function sets the initial condition for the specified load case.

Namespace: ETABSv1

Assembly: ETABSv1 (in ETABSv1.dll) Version: 1.0.0.0 (1.24.0.0)

Syntax

C#

VB

C++

F#

Copy

```
int SetInitialCase(
    string Name,
    string InitialCase
)
```

```
Function SetInitialCase (
    Name As String,
    InitialCase As String
) As Integer
```

```
Dim instance As cCaseModalEigen
Dim Name As String
Dim InitialCase As String
Dim returnValue As Integer
```

```
returnValue = instance.SetInitialCase(Name,
    InitialCase)
```

```
int SetInitialCase(
    String^ Name,
    String^ InitialCase
)
```

```
abstract SetInitialCase :
    Name : string *
    InitialCase : string -> int
```

Parameters

Name

Type: SystemString

The name of an existing modal Eigen load case.

InitialCase

Type: SystemString

This is blank, None, or the name of an existing analysis case. This item specifies if the load case starts from zero initial conditions, that is, an unstressed state, or if it starts using the stiffness that occurs at the end of a nonlinear static or nonlinear direct integration time history load case.

If the specified initial case is a nonlinear static or nonlinear direct integration time history load case, the stiffness at the end of that case is used. If the initial case is anything else, zero initial conditions are assumed.

Return Value

Type: [Int32](#)

Returns zero if the initial condition is successfully retrieved; otherwise it returns a nonzero value.

▲ **Remarks**

▲ **Examples**

VB

[Copy](#)

```
Public Sub Example()
    Dim SapModel As cSapModel
    Dim EtabsObject As cOAPI
    Dim ret As Integer = -1
    Dim InitialCase As String

    'create ETABS object
    Dim myHelper as cHelper = New Helper
    EtabsObject = myHelper.CreateObjectProgID("CSI.ETABS.API.ETABSObject")

    'start ETABS application
    ret = EtabsObject.ApplicationStart()

    'create SapModel object
    SapModel = EtabsObject.SapModel

    'initialize model
    ret = SapModel.InitializeNewModel()

    'create steel deck template model
    ret = SapModel.File.NewSteelDeck(4, 12, 12, 4, 4, 24, 24)

    'add static nonlinear load case
    ret = SapModel.LoadCases.StaticNonlinear.SetCase("SN1")

    'add modal Eigen load case
    ret = SapModel.LoadCases.ModalEigen.SetCase("LCASE1")

    'set initial condition
    ret = SapModel.LoadCases.ModalEigen.SetInitialCase("LCASE1", "SN1")

    'close ETABS
    EtabsObject.ApplicationExit(False)

    'clean up variables
    SapModel = Nothing
    EtabsObject = Nothing

End Sub
```

Name : string *
NumberLoads : int *
LoadType : string[] byref *
LoadName : string[] byref *
TargetPar : float[] byref *
StaticCorrect : bool[] byref -> int

```

Parameters

Name

Type:Â SystemString

The name of an existing modal Eigen load case.

NumberLoads

Type:Â SystemInt32

The number of loads assigned to the specified analysis case.

LoadType

Type:Â SystemString

This is an array that includes Load, Accel or Link, indicating the type of each load assigned to the load case.

LoadName

Type:Â SystemString

This is an array that includes the name of each load assigned to the load case. If the LoadType item is Load, this item is the name of a defined load pattern. If the LoadType item is Accel, this item is UX, UY, UZ, RX, RY or RZ, indicating the direction of the load. If the LoadType item is Link, this item is not used.

TargetPar

Type:Â SystemDouble

This is an array that includes the target mass participation ratio.

StaticCorrect

Type:Â SystemBoolean

This is an array that includes either 0 or 1, indicating if static correction modes are to be calculated.

Return Value

Type:Â Int32

The function returns zero if the data is successfully set; otherwise it returns a nonzero value.

```

cCaseModalEigenspan id="LSTDD089042_0"AddLanguageSpecificTextSet("LSTDD089042_0?594=::|nu=.

AllowAutoFreqShift : int -> int

Parameters

Name

Type:Â SystemString

The name of an existing modal Eigen load case.

EigenShiftFreq

Type:Â SystemDouble

The Eigenvalue shift frequency. [cyc/s]

EigenCutOff

Type:Â SystemDouble

The Eigencutoff frequency radius. [cyc/s]

EigenTol

Type:Â SystemDouble

The relative convergence tolerance for Eigenvalues.

AllowAutoFreqShift

Type:Â SystemInt32

This is either 0 or 1, indicating if automatic frequency shifting is allowed. 0 = Automatic frequency shifting is NOT allowed 1 = Automatic frequency shifting Is allowed

Return Value

Type:Â Int32

The function returns zero if the parameters are successfully set; otherwise it returns a nonzero value.

    'start ETABS application
    ret = EtabsObject.ApplicationStart()

    'create SapModel object
    SapModel = EtabsObject.SapModel

    'initialize model
    ret = SapModel.InitializeNewModel()

    'create steel deck template model
    ret = SapModel.File.NewSteelDeck(4, 12, 12, 4, 4, 24, 24)

    'add modal Eigen load case
    ret = SapModel.LoadCases.ModalEigen.SetCase("LCASE1")

    'get load data
```

Parameters

Introduction

```
ret = mySapModel.LoadCases.ModalEigen.SetParameters("LCASE1", 0.05, 0.0001, 1E-10, 1)

'close ETABS
  EtabsObject.ApplicationExit(False)

'clean up variables
  SapModel = Nothing
  EtabsObject = Nothing

End Sub
```

    SF : float[] byref *
    Tf : float[] byref *
    At : float[] byref *
    CSys : string[] byref *
    Ang : float[] byref -> int
```

Parameters

Name

Type:Â SystemString

The name of an existing linear modal history analysis case

NumberLoads

Type:Â SystemInt32

The number of loads assigned to the specified analysis case

LoadType

Type:Â SystemString

This is an array that includes Load or Accel, indicating the type of each load assigned to the load case

LoadName

Type:Â SystemString

This is an array that includes the name of each load assigned to the load case.

If the LoadType item is Load, this item is the name of a defined load pattern.

If the LoadType item is Accel, this item is U1, U2, U3, R1, R2 or R3, indicating the direction of the load.

Func

Type:Â SystemString

This is an array that includes the name of the time history function associated with each load

SF

Type:Â SystemDouble

This is an array that includes the scale factor of each load assigned to the load case. [L/s²] for U1 U2 and U3; otherwise unitless

Tf

Type: SystemDouble

This is an array that includes the time scale factor of each load assigned to the load case

At

Type: SystemDouble

This is an array that includes the arrival time of each load assigned to the load case

CSys

Type: SystemString

This is an array that includes the name of the coordinate system associated with each load. If this item is a blank string, the Global coordinate system is assumed.

This item applies only when the LoadType item is Accel.

Ang

Type: SystemDouble

This is an array that includes the angle between the acceleration local 1 axis and the +X-axis of the coordinate system specified by the CSys item. The rotation is about the Z-axis of the specified coordinate system. [deg]

This item applies only when the LoadType item is Accel.

Return Value

Type: Int32

Returns zero if the data is successfully retrieved; otherwise it returns a nonzero value

CSI API ETABS v1

cCaseModalHistoryLinearAddLanguageSpecificTextSet Method

Initializes a linear modal history analysis case.

Namespace: ETABSv1

Assembly: ETABSv1 (in ETABSv1.dll) Version: 1.0.0.0 (1.24.0.0)

▲ Syntax

C#

VB

C++

F#

Copy

```
int SetCase(
    string Name
)
```

```
Function SetCase (
    Name As String
) As Integer
```

```
Dim instance As cCaseModalHistoryLinear
Dim Name As String
Dim returnValue As Integer
```

```
returnValue = instance.SetCase(Name)
```

```
int SetCase(
    String^ Name
)
```

```
abstract SetCase :
    Name : string -> int
```

Parameters

Name

Type: SystemString

The name of an existing or new load case. If this is an existing case, that case is modified; otherwise a new case is added.

Return Value

Type: Int32

Returns zero if the load case is successfully initialized; otherwise it returns a nonzero value.

▲ Remarks

If this function is called for an existing load case then all items for the case are reset to their default value.

▲ Examples

cCaseModalHistoryLinearid="LSTB7811A5_0"AddLanguageSpecificTextSet("LSTB7811A5_02cpp=::|

VB

Copy

```
Public Sub Example()
    Dim SapModel As cSapModel
    Dim EtabsObject As cOAPI
    Dim ret As Integer = -1

    'create ETABS object
    Dim myHelper as cHelper = New Helper
    EtabsObject = myHelper.CreateObjectProgID("CSI.ETABS.API.ETABSObject")

    'start ETABS application
    ret = EtabsObject.ApplicationStart()

    'create SapModel object
    SapModel = EtabsObject.SapModel

    'initialize model
    ret = SapModel.InitializeNewModel()

    'create steel deck template model
    ret = SapModel.File.NewSteelDeck(4,12,12,4,4,24,24)

    'add linear modal history load case
    ret = SapModel.LoadCases.ModHistLinear.SetCase("MHLCASE1")

    'close ETABS
    EtabsObject.ApplicationExit(False)

    'clean up variables
    SapModel = Nothing
    EtabsObject = Nothing
End Sub
```

    Ang : float[] byref -> int
```

Parameters

Name

Type:Â SystemString

The name of an existing nonlinear modal history analysis case

NumberLoads

Type:Â SystemInt32

The number of loads assigned to the specified analysis case

LoadType

Type:Â SystemString

This is an array that includes Load or Accel, indicating the type of each load assigned to the load case

LoadName

Type:Â SystemString

This is an array that includes the name of each load assigned to the load case.

If the LoadType item is Load, this item is the name of a defined load pattern.

If the LoadType item is Accel, this item is U1, U2, U3, R1, R2 or R3, indicating the direction of the load.

Func

Type:Â SystemString

This is an array that includes the name of the time history function associated with each load

SF

Type:Â SystemDouble

This is an array that includes the scale factor of each load assigned to the load case. [L/s²] for U1 U2 and U3; otherwise unitless

Tf

Type: SystemDouble

This is an array that includes the time scale factor of each load assigned to the load case

At

Type: SystemDouble

This is an array that includes the arrival time of each load assigned to the load case

CSys

Type: SystemString

This is an array that includes the name of the coordinate system associated with each load. If this item is a blank string, the Global coordinate system is assumed.

This item applies only when the LoadType item is Accel.

Ang

Type: SystemDouble

This is an array that includes the angle between the acceleration local 1 axis and the +X-axis of the coordinate system specified by the CSys item. The rotation is about the Z-axis of the specified coordinate system. [deg]

This item applies only when the LoadType item is Accel.

Return Value

Type: Int32

Returns zero if the data is successfully retrieved; otherwise it returns a nonzero value

CSI API ETABS v1

cCaseModalRitzAddLanguageSpecificTextSet("LST4CF24935_0?cpp645|nu=."); Method

This function retrieves the initial condition assumed for the specified load case.

Namespace: [ETABSv1](#)

Assembly: [ETABSv1](#) (in ETABSv1.dll) Version: 1.0.0.0 (1.24.0.0)

Syntax

[C#](#)

[VB](#)

[C++](#)

[F#](#)

[Copy](#)

```
int GetInitialCase(
    string Name,
    ref string InitialCase
)
```

```
Function GetInitialCase (
    Name As String,
    ByRef InitialCase As String
) As Integer
```

```
Dim instance As cCaseModalRitz
Dim Name As String
Dim InitialCase As String
Dim returnValue As Integer
```

```
returnValue = instance.GetInitialCase(Name,
    InitialCase)
```

```
int GetInitialCase(
    String^ Name,
    String^% InitialCase
)
```

```
abstract GetInitialCase :
    Name : string *
    InitialCase : string byref -> int
```

Parameters

Name

Type: [SystemString](#)

The name of an existing modal Ritz load case.

InitialCase

Type: [SystemString](#)

This is blank, None, or the name of an existing analysis case. This item specifies if the load case starts from zero initial conditions, that is, an unstressed state, or if it starts using the stiffness that occurs at the end of a nonlinear static or nonlinear direct integration time history load case.

cCaseModalRitzspan id="LST4CF24935_0"AddLanguageSpecificTextSet("LST4CF24935_0?cpp645|nu=.");

If the specified initial case is a nonlinear static or nonlinear direct integration time history load case, the stiffness at the end of that case is used. If the initial case is anything else, zero initial conditions are assumed.

Return Value

Type: [Int32](#)

Returns zero if the initial condition is successfully retrieved; otherwise it returns a nonzero value.

▲ Remarks

▲ Examples

VB

[Copy](#)

```
Public Sub Example()
    Dim SapModel As cSapModel
    Dim EtabsObject As cOAPI
    Dim ret As Integer = -1
    Dim InitialCase As String

    'create ETABS object
    Dim myHelper as cHelper = New Helper
    EtabsObject = myHelper.CreateObjectProgID("CSI.ETABS.API.ETABSObject")

    'start ETABS application
    ret = EtabsObject.ApplicationStart()

    'create SapModel object
    SapModel = EtabsObject.SapModel

    'initialize model
    ret = SapModel.InitializeNewModel()

    'create steel deck template model
    ret = SapModel.File.NewSteelDeck(4, 12, 12, 4, 4, 24, 24)

    'add static nonlinear load case
    ret = SapModel.LoadCases.StaticNonlinear.SetCase("SN1")

    'add modal Ritz load case
    ret = SapModel.LoadCases.ModalRitz.SetCase("LCASE1")

    'set initial condition
    ret = SapModel.LoadCases.ModalRitz.SetInitialCase("LCASE1", "SN1")

    'get initial condition
    ret = SapModel.LoadCases.ModalRitz.GetInitialCase("LCASE1", InitialCase)

    'close ETABS
    EtabsObject.ApplicationExit(False)

    'clean up variables
    SapModel = Nothing
    EtabsObject = Nothing
End Sub
```

LoadType : string[] byref *
LoadName : string[] byref *
RitzMaxCyc : int[] byref *
TargetPar : float[] byref -> int

```

Parameters

Name

Type:Â SystemString

The name of an existing modal Ritz load case.

NumberLoads

Type:Â SystemInt32

The number of loads assigned to the specified analysis case.

LoadType

Type:Â SystemString

This is an array that includes Load, Accel or Link, indicating the type of each load assigned to the load case.

LoadName

Type:Â SystemString

This is an array that includes the name of each load assigned to the load case. If the LoadType item is Load, this item is the name of a defined load pattern. If the LoadType item is Accel, this item is UX, UY, UZ, RX, RY or RZ, indicating the direction of the load. If the LoadType item is Link, this item is not used.

RitzMaxCyc

Type:Â SystemInt32

This is an array that includes the maximum number of generation cycles to be performed for the specified ritz starting vector. A value of 0 means there is no limit on the number of cycles.

TargetPar

Type:Â SystemDouble

This is an array that includes the target mass participation ratio.

Return Value

Type:Â Int32

The function returns zero if the data is successfully retrieved; otherwise it returns a nonzero value.

Remarks

Examples

VB

Copy

```

Public Sub Example()
    Dim SapModel As cSapModel

CSI API ETABS v1

cCaseModalRitzAddLanguageSpecificTextSet("LSTEFD39A95_0?comp25:|nu=.") Method

This function initializes a modal Ritz load case. If this function is called for an existing load case, all items for the case are reset to their default value.

Namespace: [ETABSv1](#)

Assembly: [ETABSv1](#) (in ETABSv1.dll) Version: 1.0.0.0 (1.24.0.0)

▲ Syntax

[C#](#)

[VB](#)

[C++](#)

[F#](#)

[Copy](#)

```
int SetCase(
    string Name
)
```

```
Function SetCase (
    Name As String
) As Integer
```

```
Dim instance As cCaseModalRitz
Dim Name As String
Dim returnValue As Integer
```

```
returnValue = instance.SetCase(Name)
```

```
int SetCase(
    String^ Name
)
```

```
abstract SetCase :
    Name : string -> int
```

Parameters

Name

Type: [SystemString](#)

The name of an existing or new load case. If this is an existing case, that case is modified; otherwise, a new case is added.

Return Value

Type: [Int32](#)

The function returns zero if the load case is successfully initialized; otherwise it returns a nonzero value.

▲ Remarks

▲ Examples

VB

cCaseModalRitzAddLanguageSpecificTextSet("LSTEFD39A95_0?comp25:|nu=.")

Copy

```

Public Sub Example()
    Dim SapModel As cSapModel
    Dim EtabsObject As cOAPI
    Dim ret As Integer = -1

    'create ETABS object
    Dim myHelper as cHelper = New Helper
    EtabsObject = myHelper.CreateObjectProgID("CSI.ETABS.API.ETABSObject")

    'start ETABS application
    ret = EtabsObject.ApplicationStart()

    'create SapModel object
    SapModel = EtabsObject.SapModel

    'initialize model
    ret = SapModel.InitializeNewModel()

    'create steel deck template model
    ret = SapModel.File.NewSteelDeck(4, 12, 12, 4, 4, 24, 24)

    'add modal Ritz load case
    ret = SapModel.LoadCases.ModalRitz.SetCase("LCASE1")

    'close ETABS
    EtabsObject.ApplicationExit(False)

    'clean up variables

CSI API ETABS v1

cCaseModalRitzAddLanguageSpecificTextSet("LSTE8929C76_0?cp627|nu=.") Method

This function sets the initial condition for the specified load case.

Namespace: [ETABSv1](#)

Assembly: [ETABSv1](#) (in ETABSv1.dll) Version: 1.0.0.0 (1.24.0.0)

▲ Syntax

[C#](#)

[VB](#)

[C++](#)

[F#](#)

[Copy](#)

```
int SetInitialCase(
    string Name,
    string InitialCase
)
```

```
Function SetInitialCase (
    Name As String,
    InitialCase As String
) As Integer
```

```
Dim instance As cCaseModalRitz
Dim Name As String
Dim InitialCase As String
Dim returnValue As Integer
```

```
returnValue = instance.SetInitialCase(Name,
    InitialCase)
```

```
int SetInitialCase(
    String^ Name,
    String^ InitialCase
)
```

```
abstract SetInitialCase :
    Name : string *
    InitialCase : string -> int
```

Parameters

Name

Type: [SystemString](#)

The name of an existing modal Ritz load case.

InitialCase

Type: [SystemString](#)

This is blank, None, or the name of an existing analysis case. This item specifies if the load case starts from zero initial conditions, that is, an unstressed state, or if it starts using the stiffness that occurs at the end of a nonlinear static or nonlinear direct integration time history load case.

cCaseModalRitzspan id="LSTE8929C76_0"AddLanguageSpecificTextSet("LSTE8929C76_0?cp627|nu=.")

If the specified initial case is a nonlinear static or nonlinear direct integration time history load case, the stiffness at the end of that case is used. If the initial case is anything else, zero initial conditions are assumed.

Return Value

Type: $\hat{A}$ [Int32](#)

Returns zero if the initial condition is successfully retrieved; otherwise it returns a nonzero value.

▲ [Remarks](#)

▲ [Examples](#)

VB

[Copy](#)

```
Public Sub Example()
    Dim SapModel As cSapModel
    Dim EtabsObject As cOAPI
    Dim ret As Integer = -1
    Dim InitialCase As String

    'create ETABS object
    Dim myHelper as cHelper = New Helper
    EtabsObject = myHelper.CreateObjectProgID("CSI.ETABS.API.ETABSObject")

    'start ETABS application
    ret = EtabsObject.ApplicationStart()

    'create SapModel object
    SapModel = EtabsObject.SapModel

    'initialize model
    ret = SapModel.InitializeNewModel()

    'create steel deck template model
    ret = SapModel.File.NewSteelDeck(4, 12, 12, 4, 4, 24, 24)

    'add static nonlinear load case
    ret = SapModel.LoadCases.StaticNonlinear.SetCase("SN1")

    'add modal Ritz load case
    ret = SapModel.LoadCases.ModalRitz.SetCase("LCASE1")

    'set initial condition
    ret = SapModel.LoadCases.ModalRitz.SetInitialCase("LCASE1", "SN1")

    'close ETABS
    EtabsObject.ApplicationExit(False)

    'clean up variables
    SapModel = Nothing
    EtabsObject = Nothing
End Sub

```

Name : string *
NumberLoads : int *
LoadType : string[] byref *
LoadName : string[] byref *
RitzMaxCyc : int[] byref *
TargetPar : float[] byref -> int

```

Parameters

Name

Type:Â SystemString

The name of an existing modal Ritz load case.

NumberLoads

Type:Â SystemInt32

The number of loads assigned to the specified analysis case.

LoadType

Type:Â SystemString

This is an array that includes Load, Accel or Link, indicating the type of each load assigned to the load case.

LoadName

Type:Â SystemString

This is an array that includes the name of each load assigned to the load case. If the LoadType item is Load, this item is the name of a defined load pattern. If the LoadType item is Accel, this item is UX, UY, UZ, RX, RY or RZ, indicating the direction of the load. If the LoadType item is Link, this item is not used.

RitzMaxCyc

Type:Â SystemInt32

This is an array that includes the maximum number of generation cycles to be performed for the specified ritz starting vector. A value of 0 means there is no limit on the number of cycles.

TargetPar

Type:Â SystemDouble

This is an array that includes the target mass participation ratio.

Return Value

Type:Â Int32

The function returns zero if the data is successfully set; otherwise it returns a nonzero value.

CSI API ETABS v1

cCaseResponseSpectrumAddLanguageSpecificTextSet Method

Namespace: ETABSv1

Assembly: ETABSv1 (in ETABSv1.dll) Version: 1.0.0.0 (1.24.0.0)

▲ Syntax

C#

VB

C++

F#

Copy

```
int GetDampOverrides(
    string Name,
    ref int NumberItems,
    ref int[] Mode,
    ref double[] Damp
)
```

```
Function GetDampOverrides (
    Name As String,
    ByRef NumberItems As Integer,
    ByRef Mode As Integer(),
    ByRef Damp As Double()
) As Integer
```

```
Dim instance As cCaseResponseSpectrum
Dim Name As String
Dim NumberItems As Integer
Dim Mode As Integer()
Dim Damp As Double()
Dim returnValue As Integer
```

```
returnValue = instance.GetDampOverrides(Name,
    NumberItems, Mode, Damp)
```

```
int GetDampOverrides(
    String^ Name,
    int% NumberItems,
    array<int>^% Mode,
    array<double>^% Damp
)
```

```
abstract GetDampOverrides :
    Name : string *
    NumberItems : int byref *
    Mode : int[] byref *
    Damp : float[] byref -> int
```

Parameters

Name

Type: SystemString

cCaseResponseSpectrumspan id="LST29703570_0"AddLanguageSpecificTextSet("LST29703570_30?cpp=

NumberItems

Type: SystemInt32

Mode

Type: SystemInt32

Damp

Type: SystemDouble

Return Value

Type: Int32

public interface class cCaseStaticLinear
```

```
type cCaseStaticLinear = interface end
```

The cCaseStaticLinear type exposes the following members.

▲ Methods

▲	Name	Description
➤	<u>GetInitialCase</u>	Retrieves the initial condition assumed for the specified load case.
➤	<u>GetLoads</u>	Retrieves the load data for the specified load case
➤	<u>SetCase</u>	Initializes a static linear load case.
➤	<u>SetInitialCase</u>	Sets the initial condition for the specified load case.
➤	<u>SetLoads</u>	Sets the load data for the specified analysis case.

CSI API ETABS v1

cCaseStaticLinearAddLanguageSpecificTextSet("LST7 Method

Retrieves the initial condition assumed for the specified load case.

Namespace: ETABSv1

Assembly: ETABSv1 (in ETABSv1.dll) Version: 1.0.0.0 (1.24.0.0)

Syntax

C#

VB

C++

F#

Copy

```
int GetInitialCase(
    string Name,
    ref string InitialCase
)
```

```
Function GetInitialCase (
    Name As String,
    ByRef InitialCase As String
) As Integer
```

```
Dim instance As cCaseStaticLinear
Dim Name As String
Dim InitialCase As String
Dim returnValue As Integer
```

```
returnValue = instance.GetInitialCase(Name,
    InitialCase)
```

```
int GetInitialCase(
    String^ Name,
    String^% InitialCase
)
```

```
abstract GetInitialCase :
    Name : string *
    InitialCase : string byref -> int
```

Parameters

Name

Type: SystemString

The name of an existing static linear load case.

InitialCase

Type: SystemString

This is blank, None, or the name of an existing analysis case. This item specifies if the load case starts from zero initial conditions, that is, an unstressed state, or if it starts using the stiffness that occurs at the end of a nonlinear static or nonlinear direct integration time history load case.

If the specified initial case is a nonlinear static or nonlinear direct integration time history load case, the stiffness at the end of that case is used. If the initial case is anything else, zero initial conditions are assumed.

Return Value

Type: $\hat{A}$ Int32

Returns zero if the initial condition is successfully retrieved; otherwise it returns a nonzero value.

▲ **Remarks**

▲ **Examples**

VB

Copy

```
Public Sub Example()
    Dim SapModel As cSapModel
    Dim EtabsObject As cOAPI
    Dim ret As Integer = -1
    Dim InitialCase As String

    'create ETABS object
    Dim myHelper as cHelper = New Helper
    EtabsObject = myHelper.CreateObjectProgID("CSI.ETABS.API.ETABSObject")

    'start ETABS application
    ret = EtabsObject.ApplicationStart()

    'create SapModel object
    SapModel = EtabsObject.SapModel

    'initialize model
    ret = SapModel.InitializeNewModel()

    'create steel deck template model
    ret = SapModel.File.NewSteelDeck(4, 12, 12, 4, 4, 24, 24)

    'get initial condition
    ret = SapModel.LoadCases.StaticLinear.GetInitialCase("DEAD", InitialCase)

    'close ETABS
    EtabsObject.ApplicationExit(False)

    'clean up variables
    SapModel = Nothing
    EtabsObject = Nothing
End Sub
```

```

cCaseStaticLinearspan id="LST4E7196BC_0"AddLanguageSpecificTextSet("LST4E7196BC_0?676=::|nu=.

SF : float[] byref -> int

Parameters

Name

Type:Â SystemString

The name of an existing static linear load case.

NumberLoads

Type:Â SystemInt32

The number of loads assigned to the specified analysis case.

LoadType

Type:Â SystemString

This is an array that includes either Load or Accel, indicating the type of each load assigned to the load case.

LoadName

Type:Â SystemString

This is an array that includes the name of each load assigned to the load case.

If the LoadType item is Load, this item is the name of a defined load pattern.

If the LoadType item is Accel, this item is UX, UY, UZ, RX, RY or RZ, indicating the direction of the load.

SF

Type:Â SystemDouble

This is an array that includes the scale factor of each load assigned to the load case. [L/s²] for Accel UX UY and UZ; otherwise unitless

Return Value

Type:Â Int32

Returns zero if the data is successfully retrieved; otherwise it returns a nonzero value.

▲Remarks

▲Examples

VB

Copy

```
Public Sub Example()
    Dim SapModel As cSapModel
    Dim EtabsObject As cOAPI
    Dim ret As Integer = -1
    Dim MyLoadType() As String
    Dim MyLoadName() As String
    Dim MySF() As Double
    Dim NumberLoads As Integer
    Dim LoadType() As String
    Dim LoadName() As String
    Dim SF() As Double

    'create ETABS object
    Dim myHelper as cHelper = New Helper
    EtabsObject = myHelper.CreateObjectProgID("CSI.ETABS.API.ETABSObject")

    'start ETABS application
    ret = EtabsObject.ApplicationStart()

    'create SapModel object
```

Parameters

Introduction

```
SapModel = EtabsObject.SapModel

'initialize model
ret = SapModel.InitializeNewModel()

'create steel deck template model
ret = SapModel.File.NewSteelDeck(4, 12, 12, 4, 4, 24, 24)

'add static linear load case
ret = SapModel.LoadCases.StaticLinear.SetCase("LCASE1")

'set load data
ReDim MyLoadType(1)
ReDim MyLoadName(1)
ReDim MySF(1)
MyLoadType(0) = "Load"
MyLoadName(0) = "DEAD"
MySF(0) = 0.7
MyLoadType(1) = "Accel"
MyLoadName(1) = "UZ"
MySF(1) = 1.2
ret = SapModel.LoadCases.StaticLinear.SetLoads("LCASE1", 2, MyLoadType, MyLoadName, MySF)

'get load data
ret = SapModel.LoadCases.StaticLinear.GetLoads("LCASE1", NumberLoads, LoadType, LoadName, SF)

'refresh view
ret = SapModel.View.RefreshView(0, False)

'close ETABS
EtabsObject.ApplicationExit(False)

CSI API ETABS v1

cCaseStaticLinearAddLanguageSpecificTextSet("LSTD Method

Initializes a static linear load case.

Namespace: [ETABSV1](#)

Assembly: [ETABSV1](#) (in ETABSV1.dll) Version: 1.0.0.0 (1.24.0.0)

▲ Syntax

[C#](#)

[VB](#)

[C++](#)

[F#](#)

[Copy](#)

```
int SetCase(
    string Name
)
```

```
Function SetCase (
    Name As String
) As Integer
```

```
Dim instance As cCaseStaticLinear
Dim Name As String
Dim returnValue As Integer
```

```
returnValue = instance.SetCase(Name)
```

```
int SetCase(
    String^ Name
)
```

```
abstract SetCase :
    Name : string -> int
```

Parameters

Name

Type: [SystemString](#)

The name of an existing or new load case. If this is an existing case, that case is modified; otherwise, a new case is added.

Return Value

Type: [Int32](#)

Returns zero if the load case is successfully initialized; otherwise it returns a nonzero value.

▲ Remarks

If this function is called for an existing load case, all items for the case are reset to their default value.

▲ Examples

CSI API ETABS v1

cCaseStaticNonlinearAddLanguageSpecificTextSet("LSTE0206169_0")

Method

Retrieves the load data for the specified load case

Namespace: [ETABSV1](#)

Assembly: [ETABSV1](#) (in ETABSV1.dll) Version: 1.0.0.0 (1.24.0.0)

Syntax

[C#](#)

[VB](#)

[C++](#)

[F#](#)

[Copy](#)

```
int GetLoads(
    string Name,
    ref int NumberLoads,
    ref string[] LoadType,
    ref string[] LoadName,
    ref double[] SF
)
```

```
Function GetLoads (
    Name As String,
    ByRef NumberLoads As Integer,
    ByRef LoadType As String(),
    ByRef LoadName As String(),
    ByRef SF As Double()
) As Integer
```

```
Dim instance As cCaseStaticNonlinear
Dim Name As String
Dim NumberLoads As Integer
Dim LoadType As String()
Dim LoadName As String()
Dim SF As Double()
Dim returnValue As Integer
```

```
returnValue = instance.GetLoads(Name,
    NumberLoads, LoadType, LoadName,
    SF)
```

```
int GetLoads(
    String^ Name,
    int% NumberLoads,
    array<String^>^% LoadType,
    array<String^>^% LoadName,
    array<double>^% SF
)
```

```
abstract GetLoads :
    Name : string *
    NumberLoads : int byref *
    LoadType : string[] byref *
    LoadName : string[] byref *
```

cCaseStaticNonlinearspan id="LSTE0206169_0"AddLanguageSpecificTextSet("LSTE0206169_0")

SF : float[] byref -> int

Parameters

Name

Type:Â SystemString

The name of an existing static nonlinear load case.

NumberLoads

Type:Â SystemInt32

The number of loads assigned to the specified analysis case.

LoadType

Type:Â SystemString

This is an array that includes either Load or Accel, indicating the type of each load assigned to the load case.

LoadName

Type:Â SystemString

This is an array that includes the name of each load assigned to the load case.

If the LoadType item is Load, this item is the name of a defined load pattern.

If the LoadType item is Accel, this item is UX, UY, UZ, RX, RY or RZ, indicating the direction of the load.

SF

Type:Â SystemDouble

This is an array that includes the scale factor of each load assigned to the load case. [L/s²] for Accel UX UY and UZ; otherwise unitless

Return Value

Type:Â Int32

Returns zero if the data is successfully retrieved; otherwise it returns a nonzero value.

▲Remarks

▲Examples

VB

Copy

```
Public Sub Example()
    Dim SapModel As cSapModel
    Dim EtabsObject As cOAPI
    Dim ret As Integer = -1
    Dim MyLoadType() As String
    Dim MyLoadName() As String
    Dim MySF() As Double
    Dim NumberLoads As Integer
    Dim LoadType() As String
    Dim LoadName() As String
    Dim SF() As Double

    'create ETABS object
    Dim myHelper as cHelper = New Helper
    EtabsObject = myHelper.CreateObjectProgID("CSI.ETABS.API.ETABSObject")

    'start ETABS application
    ret = EtabsObject.ApplicationStart()

    'create SapModel object
```

Introduction

```
SapModel = EtabsObject.SapModel

'initialize model
ret = SapModel.InitializeNewModel()

'create steel deck template model
ret = SapModel.File.NewSteelDeck(4, 12, 12, 4, 4, 24, 24)

'add static nonlinear load case
ret = SapModel.LoadCases.StaticNonlinear.SetCase("LCASE1")

'set load data
ReDim MyLoadType(1)
ReDim MyLoadName(1)
ReDim MySF(1)
MyLoadType(0) = "Load"
MyLoadName(0) = "DEAD"
MySF(0) = 0.7
MyLoadType(1) = "Accel"
MyLoadName(1) = "UZ"
MySF(1) = 1.2
ret = SapModel.LoadCases.StaticNonlinear.SetLoads("LCASE1", 2, MyLoadType, MyLoadName, MySF)

'get load data
ret = SapModel.LoadCases.StaticNonlinear.GetLoads("LCASE1", NumberLoads, LoadType, LoadName,

'refresh view
ret = SapModel.View.RefreshView(0, False)

'close ETABS
EtabsObject.ApplicationExit(False)

'clean up variables
SapModel = Nothing
EtabsObject = Nothing

End Sub
```

CSI API ETABS v1

cCaseStaticNonlinearAddLanguageSpecificTextSet("LSTFC716138_0") Method

Initializes a static nonlinear load case.

Namespace: [ETABSV1](#)

Assembly: [ETABSV1](#) (in ETABSV1.dll) Version: 1.0.0.0 (1.24.0.0)

▲ Syntax

[C#](#)

[VB](#)

[C++](#)

[F#](#)

[Copy](#)

```
int SetCase(
    string Name
)
```

```
Function SetCase (
    Name As String
) As Integer
```

```
Dim instance As cCaseStaticNonlinear
Dim Name As String
Dim returnValue As Integer
```

```
returnValue = instance.SetCase(Name)
```

```
int SetCase(
    String^ Name
)
```

```
abstract SetCase :
    Name : string -> int
```

Parameters

Name

Type: [SystemString](#)

The name of an existing or new load case. If this is an existing case, that case is modified; otherwise, a new case is added.

Return Value

Type: [Int32](#)

Returns zero if the load case is successfully initialized; otherwise it returns a nonzero value.

▲ Remarks

If this function is called for an existing load case, all items for the case are reset to their default value.

▲ Examples

cCaseStaticNonlinearAddLanguageSpecificTextSet("LSTFC716138_0")
pp=::|n

VB

Copy

```
Public Sub Example()
    Dim SapModel As cSapModel
    Dim EtabsObject As cOAPI
    Dim ret As Integer = -1

    'create ETABS object
    Dim myHelper as cHelper = New Helper
    EtabsObject = myHelper.CreateObjectProgID("CSI.ETABS.API.ETABSObject")

    'start ETABS application
    ret = EtabsObject.ApplicationStart()

    'create SapModel object
    SapModel = EtabsObject.SapModel

    'initialize model
    ret = SapModel.InitializeNewModel()

    'create steel deck template model
    ret = SapModel.File.NewSteelDeck(4, 12, 12, 4, 4, 24, 24)

    'add static nonlinear load case
    ret = SapModel.LoadCases.StaticNonlinear.SetCase("LCASE1")

    'refresh view
    ret = SapModel.View.RefreshView(0, False)

    'close ETABS
    EtabsObject.ApplicationExit(False)

    'clean up variables
    SapModel = Nothing

CSI API ETABS v1

cCaseStaticNonlinearAddLanguageSpecificTextSet("LSTBB55B511_0")

Method

Sets the geometric nonlinearity option for the specified load case.

Namespace: ETABSv1

Assembly: ETABSv1 (in ETABSv1.dll) Version: 1.0.0.0 (1.24.0.0)

Syntax

C#

VB

C++

F#

Copy

```
int SetGeometricNonlinearity(
    string Name,
    int NLGeomType
)
```

```
Function SetGeometricNonlinearity (
    Name As String,
    NLGeomType As Integer
) As Integer
```

```
Dim instance As cCaseStaticNonlinear
Dim Name As String
Dim NLGeomType As Integer
Dim returnValue As Integer
```

```
returnValue = instance.SetGeometricNonlinearity(Name,
    NLGeomType)
```

```
int SetGeometricNonlinearity(
    String^ Name,
    int NLGeomType
)
```

```
abstract SetGeometricNonlinearity :
    Name : string *
    NLGeomType : int -> int
```

Parameters

Name

Type: SystemString

The name of an existing static nonlinear load case.

NLGeomType

Type: SystemInt32

Return ValueType: Int32

Returns zero if the option is successfully set; otherwise it returns a nonzero value.

▲ **Remarks**▲ **Examples**

VB

Copy

```
Public Sub Example()
    Dim SapModel As cSapModel
    Dim EtabsObject As cOAPI
    Dim ret As Integer = -1

CSI API ETABS v1

cCaseStaticNonlinearAddLanguageSpecificTextSet("LST Method

Sets the load data for the specified analysis case.

Namespace: [ETABSv1](#)

Assembly: [ETABSv1](#) (in ETABSv1.dll) Version: 1.0.0.0 (1.24.0.0)

■ Syntax

[C#](#)

[VB](#)

[C++](#)

[F#](#)

[Copy](#)

```
int SetLoads(
    string Name,
    int NumberLoads,
    ref string[] LoadType,
    ref string[] LoadName,
    ref double[] SF
)
```

```
Function SetLoads (
    Name As String,
    NumberLoads As Integer,
    ByRef LoadType As String(),
    ByRef LoadName As String(),
    ByRef SF As Double()
) As Integer
```

```
Dim instance As cCaseStaticNonlinear
Dim Name As String
Dim NumberLoads As Integer
Dim LoadType As String()
Dim LoadName As String()
Dim SF As Double()
Dim returnValue As Integer
```

```
returnValue = instance.SetLoads(Name,
    NumberLoads, LoadType, LoadName,
    SF)
```

```
int SetLoads(
    String^ Name,
    int NumberLoads,
    array<String^>^% LoadType,
    array<String^>^% LoadName,
    array<double>^% SF
)
```

```
abstract SetLoads :
    Name : string *
    NumberLoads : int *
    LoadType : string[] byref *
    LoadName : string[] byref *
```

SF : float[] byref -> int

Parameters

Name

Type:Â SystemString

The name of an existing static nonlinear load case.

NumberLoads

Type:Â SystemInt32

The number of loads assigned to the specified analysis case.

LoadType

Type:Â SystemString

This is an array that includes either Load or Accel, indicating the type of each load assigned to the load case.

LoadName

Type:Â SystemString

This is an array that includes the name of each load assigned to the load case.

If the LoadType item is Load, this item is the name of a defined load pattern.

If the LoadType item is Accel, this item is UX, UY, UZ, RX, RY or RZ, indicating the direction of the load.

SF

Type:Â SystemDouble

This is an array that includes the scale factor of each load assigned to the load case. [L/s²] for Accel UX UY and UZ; otherwise unitless

Return Value

Type:Â Int32

Returns zero if the data is successfully set; otherwise it returns a nonzero value.

▲Remarks

▲Examples

VB

Copy

```
Public Sub Example()
    Dim SapModel As cSapModel
    Dim EtabsObject As cOAPI
    Dim ret As Integer = -1
    Dim MyLoadType() As String
    Dim MyLoadName() As String
    Dim MySF() As Double

    'create ETABS object
    Dim myHelper as cHelper = New Helper
    EtabsObject = myHelper.CreateObjectProgID("CSI.ETABS.API.ETABSObject")

    'start ETABS application
    ret = EtabsObject.ApplicationStart()

    'create SapModel object
    SapModel = EtabsObject.SapModel

    'initialize model
    ret = SapModel.InitializeNewModel()
```

Parameters

Introduction

```
'create steel deck template model
    ret = SapModel.File.NewSteelDeck(4, 12, 12, 4, 4, 24, 24)

'add static nonlinear load case
    ret = SapModel.LoadCases.StaticNonlinear.SetCase("LCASE1")

'set load data
    ReDim MyLoadType(1)
    ReDim MyLoadName(1)
    ReDim MySF(1)
    MyLoadType(0) = "Load"
    MyLoadName(0) = "DEAD"
    MySF(0) = 0.7
    MyLoadType(1) = "Accel"
    MyLoadName(1) = "UZ"
    MySF(1) = 1.2
    ret = SapModel.LoadCases.StaticNonlinear.SetLoads("LCASE1", 2, MyLoadType, MyLoadName, MySF)

'refresh view
    ret = SapModel.View.RefreshView(0, False)

'close ETABS
    EtabsObject.ApplicationExit(False)

'clean up variables
    SapModel = Nothing
    EtabsObject = Nothing

End Sub
```

    ObjectType : string[] byref *
    ObjectName : string[] byref *
    Age : int[] byref *
    MyType : string[] byref *
    MyName : string[] byref *
    SF : float[] byref -> int
```

Parameters

Name

Type:Â [SystemString](#)

The name of an existing static nonlinear staged load case

Stage

Type:Â [SystemInt32](#)

The stage in the specified load case for which data is requested. Stages are numbered sequentially starting from 1

NumberOperations

Type:Â [SystemInt32](#)

The number of operations in the specified stage

Operation

Type:Â [SystemInt32](#)

This is an array that includes 1, 2, 3, 4, 5, 6, 7, or 11, indicating an operation type.

- 1 Add structure
- 2 Remove structure
- 3 Load objects if new
- 4 Load objects
- 5 Change section properties
- 6 Change section property modifiers
- 7 Change releases
- 11 Change section properties and age

ObjectType

Type: SystemString

This is an array that includes the object type associated with the specified operation. The object type may be one of the following:

- ◇ Group
- ◇ Frame
- ◇ Cable
- ◇ Tendon
- ◇ Area
- ◇ Solid
- ◇ Link
- ◇ Point

The following list shows which object types are applicable to each operation type:

Operation = 1 (Add structure)	All object types
Operation = 2 (Remove structure)	All object types
Operation = 3 (Load objects if new)	All object types
Operation = 4 (Load objects)	All object types
Operation = 5 (Change section properties)	All object types except Point
Operation = 6 (Change section property modifiers)	Group, Frame, Cable, Area
Operation = 7 (Change releases)	Group, Frame
Operation = 11 (Change section properties and age)	All object types except Point

ObjectName

Type: SystemString

This is an array that includes the name of the object associated with the specified operation. This is the name of a Group, Frame object, Cable object, Tendon object, Area object, Solid object, Link object or Point object, depending on the ObjectType item

Age

Type: SystemInt32

This is an array that includes the age of the added structure, at the time it is added, in days. This item applies only to operations with Operation = 1.

MyType

Type: SystemString

This is an array that includes a load type or an object type, depending on what is specified for the Operation item. This item applies only to operations with Operation = 3, 4, 5, 6, 7, or 11.

When Operation = 3 or 4, this is an array that includes Load or Accel, indicating the load type of an added load.

When Operation = 5 or 11, and the ObjectType item is Group, this is an array that includes Frame, Cable, Tendon, Area, Solid or Link, indicating the object type for which the section property is changed.

When Operation = 6 and the ObjectType item is Group, this is an array that includes Frame, Cable or Area, indicating the object type for which the section

property modifiers are changed.

When Operation = 7 and the ObjectType item is Group, this is an array that includes Frame, indicating the object type for which the releases are changed.

When Operation = 5, 6, 7, or 11, and the ObjectType item is not Group and not Point, this item is ignored and the type is picked up from the ObjectType item.

MyName

Type: SystemString

This is an array that includes a load assignment or an object name, depending on what is specified for the Operation item. This item applies only to operations with Operation = 3, 4, 5, 6, 7, or 11.

When Operation = 3 or 4, this is an array that includes the name of the load assigned to the operation. If the associated MyType (load type) item is Load, this item is the name of a defined load pattern. If the associated MyType (load type) item is Accel, this item is UX, UY, UZ, RX, RY or RZ, indicating the direction of the load.

When Operation = 5 or 11, this is the name of a Frame, Cable, Tendon, Area, Solid or Link object, depending on the object type specified.

When Operation = 6, this is the name of a Frame, Cable or Area object, depending on the object type specified.

When Operation = 7, this is the name of a Frame object.

SF

Type: SystemDouble

This is an array that includes the scale factor for the load assigned to the operation, if any. [L/s²] for Accel UX UY and UZ; otherwise unitless

This item applies only to operations with Operation = 3 or 4.

Return Value

Type: Int32

Returns zero if the data is successfully retrieved; otherwise, it returns a nonzero value

Remarks

This function is obsolete and has been superseded by GetStageData_2(String, Int32, Int32, Int32, String, String, Double, String, String, Double) as of version 16.0.2. This function is maintained for backwards compatibility.

```

Parameters

Name

Type:Â [SystemString](#)

The name of an existing static nonlinear staged load case

Stage

Type:Â [SystemInt32](#)

The stage in the specified load case for which data is requested. Stages are numbered sequentially starting from 1

NumberOperations

Type:Â [SystemInt32](#)

The number of operations in the specified stage

Operation

Type:Â [SystemInt32](#)

This is an array that includes 1, 2, 3, 4, 5, 6, 7, or 11, indicating an operation type.

- 1 Add structure
- 2 Remove structure
- 3 Load objects if new
- 4 Load objects
- 5 Change section properties
- 6 Change section property modifiers
- 7 Change releases
- 11 Change section properties and age

ObjectType

Type: SystemString

This is an array that includes the object type associated with the specified operation. The object type may be one of the following:

- ◇ Group
- ◇ Frame
- ◇ Cable
- ◇ Tendon
- ◇ Area
- ◇ Solid
- ◇ Link
- ◇ Point

The following list shows which object types are applicable to each operation type:

Operation = 1 (Add structure)	All object types
Operation = 2 (Remove structure)	All object types
Operation = 3 (Load objects if new)	All object types
Operation = 4 (Load objects)	All object types
Operation = 5 (Change section properties)	All object types except Point
Operation = 6 (Change section property modifiers)	Group, Frame, Cable, Area
Operation = 7 (Change releases)	Group, Frame
Operation = 11 (Change section properties and age)	All object types except Point

ObjectName

Type: SystemString

This is an array that includes the name of the object associated with the specified operation. This is the name of a Group, Frame object, Cable object, Tendon object, Area object, Solid object, Link object or Point object, depending on the ObjectType item

Age

Type: SystemDouble

This is an array that includes the age of the added structure, at the time it is added, in days. This item applies only to operations with Operation = 1.

MyType

Type: SystemString

This is an array that includes a load type or an object type, depending on what is specified for the Operation item. This item applies only to operations with Operation = 3, 4, 5, 6, 7, or 11.

When Operation = 3 or 4, this is an array that includes Load or Accel, indicating the load type of an added load.

When Operation = 5 or 11, and the ObjectType item is Group, this is an array that includes Frame, Cable, Tendon, Area, Solid or Link, indicating the object type for which the section property is changed.

When Operation = 6 and the ObjectType item is Group, this is an array that includes Frame, Cable or Area, indicating the object type for which the section

property modifiers are changed.

When Operation = 7 and the ObjectType item is Group, this is an array that includes Frame, indicating the object type for which the releases are changed.

When Operation = 5, 6, 7, or 11, and the ObjectType item is not Group and not Point, this item is ignored and the type is picked up from the ObjectType item.

MyName

Type: SystemString

This is an array that includes a load assignment or an object name, depending on what is specified for the Operation item. This item applies only to operations with Operation = 3, 4, 5, 6, 7, or 11.

When Operation = 3 or 4, this is an array that includes the name of the load assigned to the operation. If the associated MyType (load type) item is Load, this item is the name of a defined load pattern. If the associated MyType (load type) item is Accel, this item is UX, UY, UZ, RX, RY or RZ, indicating the direction of the load.

When Operation = 5 or 11, this is the name of a Frame, Cable, Tendon, Area, Solid or Link object, depending on the object type specified.

When Operation = 6, this is the name of a Frame, Cable or Area object, depending on the object type specified.

When Operation = 7, this is the name of a Frame object.

SF

Type: SystemDouble

This is an array that includes the scale factor for the load assigned to the operation, if any. [L/s²] for Accel UX UY and UZ; otherwise unitless

This item applies only to operations with Operation = 3 or 4.

Return Value

Type: Int32

Returns zero if the data is successfully retrieved; otherwise, it returns a nonzero value

CSI API ETABS v1

cCaseStaticNonlinearStagedAddLanguageSpecificText Method

Retrieves the stage definition data for the specified load case

Namespace: ETABSv1

Assembly: ETABSv1 (in ETABSv1.dll) Version: 1.0.0.0 (1.24.0.0)

■ Syntax

C#

VB

C++

F#

Copy

```
int GetStageDefinitions_1(
    string Name,
    ref int NumberStages,
    ref int[] Duration,
    ref bool[] Output,
    ref string[] OutputName,
    ref string[] Comment
)
```

```
Function GetStageDefinitions_1 (
    Name As String,
    ByRef NumberStages As Integer,
    ByRef Duration As Integer(),
    ByRef Output As Boolean(),
    ByRef OutputName As String(),
    ByRef Comment As String()
) As Integer
```

```
Dim instance As cCaseStaticNonlinearStaged
Dim Name As String
Dim NumberStages As Integer
Dim Duration As Integer()
Dim Output As Boolean()
Dim OutputName As String()
Dim Comment As String()
Dim returnValue As Integer
```

```
returnValue = instance.GetStageDefinitions_1(Name,
    NumberStages, Duration, Output, OutputName,
    Comment)
```

```
int GetStageDefinitions_1(
    String^ Name,
    int% NumberStages,
    array<int>^% Duration,
    array<bool>^% Output,
    array<String>^% OutputName,
    array<String>^% Comment
)
```

```
abstract GetStageDefinitions_1 :
```

cCaseStaticNonlinearStagedspan id="LST5829E959_0"AddLanguageSpecificTextSet("LST5829E959_0?cp

```

Name : string *
NumberStages : int byref *
Duration : int[] byref *
Output : bool[] byref *
OutputName : string[] byref *
Comment : string[] byref -> int

```

Parameters

Name

Type:Â SystemString

The name of an existing static nonlinear staged load case

NumberStages

Type:Â SystemInt32

The number of stages defined for the specified load case

Duration

Type:Â SystemInt32

This is an array that includes the duration in days for each stage

Output

Type:Â SystemBoolean

This is an array that includes True or False, indicating if analysis output is to be saved for each stage

OutputName

Type:Â SystemString

This is an array that includes a user-specified output name for each stage

Comment

Type:Â SystemString

This is an array that includes a comment for each stage. The comment may be a blank string.

Return Value

Type:Â Int32

Returns zero if the data is successfully retrieved; otherwise it returns a nonzero value

Remarks

This function is obsolete and has been superseded by GetStageDefinitions_2(String, Int32, Double, Boolean, String, String) as of version 16.0.2. This function is maintained for backwards compatibility.

    array<String^>^% Comment
)
```

```
abstract GetStageDefinitions_2 :
```

cCaseStaticNonlinearStagedspan id="LSTF2FBA534_0"AddLanguageSpecificTextSet("LSTF2FBA534_0?c

```

Name : string *
NumberStages : int byref *
Duration : float[] byref *
Output : bool[] byref *
OutputName : string[] byref *
Comment : string[] byref -> int

```

Parameters

Name

Type: SystemString

The name of an existing static nonlinear staged load case

NumberStages

Type: SystemInt32

The number of stages defined for the specified load case

Duration

Type: SystemDouble

This is an array that includes the duration in days for each stage

Output

Type: SystemBoolean

This is an array that includes True or False, indicating if analysis output is to be saved for each stage

OutputName

Type: SystemString

This is an array that includes a user-specified output name for each stage

Comment

Type: SystemString

This is an array that includes a comment for each stage. The comment may be a blank string.

Return Value

Type: Int32

Returns zero if the data is successfully retrieved; otherwise it returns a nonzero value

CSI API ETABS v1

cCombo Interface

Namespace: $\hat{A}$ ETABSv1

Assembly: $\hat{A}$ ETABSv1 (in ETABSv1.dll) Version: 1.0.0.0 (1.24.0.0)

▀ Syntax

C#

VB

C++

F#

Copy

```
public interface cCombo
```

```
Public Interface cCombo
```

```
Dim instance As cCombo
```

```
public interface class cCombo
```

```
type cCombo = interface end
```

The cCombo type exposes the following members.

▀ Methods

$\hat{A}$	Name	Description
	<u>Add</u>	Adds a new load combination.
	<u>AddDesignDefaultCombos</u>	
	<u>Delete</u>	Deletes the specified load combination.
	<u>DeleteCase</u>	Deletes one load case or load combination from the list of cases included in the specified load combination.
	<u>GetCaseList</u>	Retrieves all load cases and response combinations included in the load combination specified by the Name item.
	<u>GetCaseList_1</u>	Retrieves all load cases and response combinations included in the load combination specified by the Name item.
	<u>GetNameList</u>	Retrieves the names of all defined response combinations.
	<u>GetTypeCombo</u>	Retrieves the combination type for specified load combination.
	<u>GetTypeOAPI</u>	
	<u>SetCaseList</u>	Adds or modifies one load case or response combination in the list of cases included in the load combination specified by the Name item.
	<u>SetCaseList_1</u>	Adds or modifies one load case or response combination in the list of cases included in the load

combination specified by the Name item.

CSI API ETABS v1

cComboAddLanguageSpecificTextSet("LSTA7C71E05_0")

Method

Adds a new load combination.

Namespace: ETABSv1

Assembly: ETABSv1 (in ETABSv1.dll) Version: 1.0.0.0 (1.24.0.0)

Syntax

C#

VB

C++

F#

Copy

```
int Add(
    string Name,
    int ComboType
)
```

```
Function Add (
    Name As String,
    ComboType As Integer
) As Integer
```

```
Dim instance As cCombo
Dim Name As String
Dim ComboType As Integer
Dim returnValue As Integer
```

```
returnValue = instance.Add(Name, ComboType)
```

```
int Add(
    String^ Name,
    int ComboType
)
```

```
abstract Add :
    Name : string *
    ComboType : int -> int
```

Parameters

Name

Type: SystemString

The name of a new load combination.

ComboType

Type: SystemInt32

This is 0, 1, 2, 3 or 4 indicating the load combination type.

◊ 0 = Linear Additive

◊ 1 = Envelope

◊ 2 = Absolute Additive

◊ 3 = SRSS

◇ 4 = Range Additive

Return Value

Type: Int32

Returns zero if the load combination is successfully added, otherwise it returns a nonzero value.

Remarks

The new load combination must have a different name from all other load combinations and all load cases. If the name is not unique, an error will be returned.

Examples

VB

Copy

```
Public Sub Example()
    Dim SapModel As cSapModel
    Dim EtabsObject As cOAPI
    Dim ret As Integer = -1

    'create ETABS object
    Dim myHelper as cHelper = New Helper
    EtabsObject = myHelper.CreateObjectProgID("CSI.ETABS.API.ETABSObject")

    'start ETABS application
    ret = EtabsObject.ApplicationStart()

    'create SapModel object
    SapModel = EtabsObject.SapModel

    'initialize model
    ret = SapModel.InitializeNewModel()

    'create steel deck template model
    ret = SapModel.File.NewSteelDeck(4,12,12,4,4,24,24)

    'add combo
    ret = SapModel.RespCombo.Add("COMB1", 1)

    'close ETABS
    EtabsObject.ApplicationExit(False)

    'clean up variables
    SapModel = Nothing
    EtabsObject = Nothing
End Sub
```

Dim returnValue As Integer
```

```
returnValue = instance.Delete(Name)
```

```
int Delete(
    String^ Name
)
```

```
abstract Delete :
    Name : string -> int
```

Parameters

Name

Type: [SystemString](#)

The name of an existing load combination.

Return Value

Type: [Int32](#)

Returns zero if the combination is successfully deleted, otherwise it returns a nonzero value.

▲ Remarks

▲ Examples

VB

[Copy](#)

```
Public Sub Example()
```

Introduction

```
Dim SapModel As cSapModel
Dim EtabsObject As cOAPI
Dim ret As Integer = -1

'create ETABS object
Dim myHelper as cHelper = New Helper
EtabsObject = myHelper.CreateObjectProgID("CSI.ETABS.API.ETABSObject")

'start ETABS application
ret = EtabsObject.ApplicationStart()

'create SapModel object
SapModel = EtabsObject.SapModel

'initialize model
ret = SapModel.InitializeNewModel()

'create steel deck template model
ret = SapModel.File.NewSteelDeck(4,12,12,4,4,24,24)

'add combo
ret = SapModel.RespCombo.Add("COMB1", 0)

'delete combo
ret = SapModel.RespCombo.Delete("COMB1")

'close ETABS
EtabsObject.ApplicationExit(False)

'clean up variables
SapModel = Nothing
EtabsObject = Nothing
End Sub
```

CSI API ETABS v1

cComboAddLanguageSpecificTextSet("LST261C687B_0") DeleteC

Method

Deletes one load case or load combination from the list of cases included in the specified load combination.

Namespace: ETABSv1

Assembly: ETABSv1 (in ETABSv1.dll) Version: 1.0.0.0 (1.24.0.0)

Syntax

C#

VB

C++

F#

Copy

```
int DeleteCase(
    string Name,
    eCNameType CNameType,
    string CName
)
```

```
Function DeleteCase (
    Name As String,
    CNameType As eCNameType,
    CName As String
) As Integer
```

```
Dim instance As cCombo
Dim Name As String
Dim CNameType As eCNameType
Dim CName As String
Dim returnValue As Integer
```

```
returnValue = instance.DeleteCase(Name,
    CNameType, CName)
```

```
int DeleteCase(
    String^ Name,
    eCNameType CNameType,
    String^ CName
)
```

```
abstract DeleteCase :
    Name : string *
    CNameType : eCNameType *
    CName : string -> int
```

Parameters

Name

Type: SystemString

The name of an existing load combination.

CNameType

Type: ETABSv1eCNameType

This is one of the following items in the eCNameType enumeration:

◊ LoadCase = 0

◊ LoadCombo = 1

This item indicates whether the CName item is an analysis case (LoadCase) or a load combination (LoadCombo).

CName

Type: SystemString

The name of the load case or load combination to be deleted from the specified combination.

Return Value

Type: Int32

Returns zero if the item is successfully deleted, otherwise it returns a nonzero value.

▲ Remarks

▲ Examples

VB

Copy

```
Public Sub Example()
    Dim SapModel As cSapModel
    Dim EtabsObject As cOAPI
    Dim ret As Integer = -1

CSI API ETABS v1

cComboAddLanguageSpecificTextSet("LST11E0ACC2_0")

Method

Retrieves all load cases and response combinations included in the load combination specified by the Name item.

Namespace: $\hat{A}$ ETABSV1

Assembly: $\hat{A}$ ETABSV1 (in ETABSV1.dll) Version: 1.0.0.0 (1.24.0.0)

■ Syntax

C#

VB

C++

F#

Copy

```
int GetCaseList(
    string Name,
    ref int NumberItems,
    ref eCNameType[] CNameType,
    ref string[] CName,
    ref double[] SF
)
```

```
Function GetCaseList (
    Name As String,
    ByRef NumberItems As Integer,
    ByRef CNameType As eCNameType(),
    ByRef CName As String(),
    ByRef SF As Double()
) As Integer
```

```
Dim instance As cCombo
Dim Name As String
Dim NumberItems As Integer
Dim CNameType As eCNameType()
Dim CName As String()
Dim SF As Double()
Dim returnValue As Integer
```

```
returnValue = instance.GetCaseList(Name,
    NumberItems, CNameType, CName, SF)
```

```
int GetCaseList(
    String^ Name,
    int% NumberItems,
    array<eCNameType>^% CNameType,
    array<String^>^% CName,
    array<double>^% SF
)
```

```
abstract GetCaseList :
    Name : string *
    NumberItems : int byref *
    CNameType : eCNameType[] byref *
    CName : string[] byref *
```

cCombospan id="LST11E0ACC2_0"AddLanguageSpecificTextSet("LST11E0ACC2_0?cpp=::|nu82");GetCas

SF : float[] byref -> int

Parameters

Name

Type:Â SystemString

The name of an existing load combination.

NumberItems

Type:Â SystemInt32

The total number of load cases and load combinations included in the load combination specified by the Name item.

CNameType

Type:Â ETABSv1eCNameType

This is one of the following items in the eCNameType enumeration:

◊ LoadCase = 0

◊ LoadCombo = 1

This item indicates whether the CName item is an analysis case (LoadCase) or a load combination (LoadCombo).

CName

Type:Â SystemString

This is an array of the names of the load cases or load combinations included in the load combination specified by the Name item.

SF

Type:Â SystemDouble

The scale factor multiplying the case or combination indicated by the CName item.

Return Value

Type:Â Int32

Returns zero if the data is successfully retrieved, otherwise it returns a nonzero value.

▲Remarks

▲Examples

VB

Copy

```
Public Sub Example()
    Dim SapModel As cSapModel
    Dim EtabsObject As cOAPI
    Dim ret As Integer = -1
    Dim NumberItems As Integer
    Dim CNameType() As eCNameType
    Dim CName() As String
    Dim SF() As Double

    'create ETABS object
    Dim myHelper as cHelper = New Helper
    EtabsObject = myHelper.CreateObjectProgID("CSI.ETABS.API.ETABSObject")

    'start ETABS application
    ret = EtabsObject.ApplicationStart()

    'create SapModel object
    SapModel = EtabsObject.SapModel

    'initialize model
```

Introduction

```
ret = SapModel.InitializeNewModel()  
  
'create steel deck template model  
ret = SapModel.File.NewSteelDeck(4,12,12,4,4,24,24)  
  
'add combo  
ret = SapModel.RespCombo.Add("COMB1", 0)  
  
'add load case to combo  
ret = SapModel.RespCombo.SetCaseList("COMB1", LoadCase, "DEAD", 1.4)  
  
'get all cases and combos included in combo COMB1  
ret = SapModel.RespCombo.GetCaseList("COMB1", NumberItems, CNameType, CName, SF)  
  
'close ETABS  
EtabsObject.ApplicationExit(False)  
  
'clean up variables  
SapModel = Nothing  
EtabsObject = Nothing  
End Sub
```

    CNameType : eCNameType[] byref *
    CName : string[] byref *
    ModeNumber : int[] byref *
    SF : float[] byref -> int

```

Parameters

Name

Type:Â [SystemString](#)

The name of an existing load combination.

NumberItems

Type:Â [SystemInt32](#)

The total number of load cases and load combinations included in the load combination specified by the Name item.

CNameType

Type:Â [ETABSv1eCNameType](#)

This is one of the following items in the [eCNameType](#) enumeration:

◊ LoadCase = 0

◊ LoadCombo = 1

This item indicates whether the CName item is an analysis case (LoadCase) or a load combination (LoadCombo).

CName

Type:Â [SystemString](#)

This is an array of the names of the load cases or load combinations included in the load combination specified by the Name item.

ModeNumber

Type:Â [SystemInt32](#)

The mode number for the case indicated by the CName item. This item applies when by the CNameType item is LoadCase and the type of load case specified by the CName item is either Modal or Buckling. Any other case type or combo returns a zero for this item.

SF

Type:Â [SystemDouble](#)

The scale factor multiplying the case or combination indicated by the CName item.

Return Value

Type:Â [Int32](#)

Returns zero if the data is successfully retrieved, otherwise it returns a nonzero value.

▲ Remarks

This function supercedes [GetCaseList\(String, Int32, eCNameType, String, Double\)](#)

▲ Examples

VB

Copy

```

Public Sub Example()
    Dim SapModel As cSapModel

CSI API ETABS v1

cComboAddLanguageSpecificTextSet("LSTC3CDC584_0") Method

Retrieves the names of all defined response combinations.

Namespace: ETABSv1

Assembly: ETABSv1 (in ETABSv1.dll) Version: 1.0.0.0 (1.24.0.0)

Syntax

C#

VB

C++

F#

Copy

```
int GetNameList(
    ref int NumberNames,
    ref string[] MyName
)
```

```
Function GetNameList (
    ByRef NumberNames As Integer,
    ByRef MyName As String()
) As Integer
```

```
Dim instance As cCombo
Dim NumberNames As Integer
Dim MyName As String()
Dim returnValue As Integer
```

```
returnValue = instance.GetNameList(NumberNames,
    MyName)
```

```
int GetNameList(
    int% NumberNames,
    array<String^>^% MyName
)
```

```
abstract GetNameList :
    NumberNames : int byref *
    MyName : string[] byref -> int
```

Parameters

NumberNames

Type: System.Int32

The number of load combination names retrieved by the program.

MyName

Type: System.String

This is a one-dimensional array of load combination names. The MyName array is created as a dynamic, zero-based, array by the API user:

```
Dim MyName() as String
```

The array is dimensioned to (NumberNames + 1) inside the ETABS program, filled with the names, and returned to the API user.

Return Value

Type: Int32

Returns zero if the names are successfully retrieved, otherwise it returns nonzero.

▲ **Remarks**

▲ **Examples**

VB

Copy

```
Public Sub Example()
    Dim SapModel As cSapModel
    Dim EtabsObject As cOAPI
    Dim ret As Integer = -1
    Dim NumberNames As Integer
    Dim MyName() As String

    'create ETABS object
    Dim myHelper as cHelper = New Helper
    EtabsObject = myHelper.CreateObjectProgID("CSI.ETABS.API.ETABSObject")

    'start ETABS application
    ret = EtabsObject.ApplicationStart()

    'create SapModel object
    SapModel = EtabsObject.SapModel

    'initialize model
    ret = SapModel.InitializeNewModel()

    'create steel deck template model
    ret = SapModel.File.NewSteelDeck(4,12,12,4,4,24,24)

    'add combos
    ret = SapModel.RespCombo.Add("COMB1", 0)
    ret = SapModel.RespCombo.Add("COMB2", 2)

    'get combo names
    ret = SapModel.RespCombo.GetNameList(NumberNames, MyName)

    'close ETABS
    EtabsObject.ApplicationExit(False)

    'clean up variables
    SapModel = Nothing
    EtabsObject = Nothing
End Sub
```

CSI API ETABS v1

cComboAddLanguageSpecificTextSet("LST5214D883_0")

Method

Retrieves the combination type for specified load combination.

Namespace: [ETABSV1](#)

Assembly: [ETABSV1](#) (in ETABSV1.dll) Version: 1.0.0.0 (1.24.0.0)

Syntax

[C#](#)

[VB](#)

[C++](#)

[F#](#)

[Copy](#)

```
int GetTypeCombo(
    string Name,
    ref int ComboType
)
```

```
Function GetTypeCombo (
    Name As String,
    ByRef ComboType As Integer
) As Integer
```

```
Dim instance As cCombo
Dim Name As String
Dim ComboType As Integer
Dim returnValue As Integer
```

```
returnValue = instance.GetTypeCombo(Name,
    ComboType)
```

```
int GetTypeCombo(
    String^ Name,
    int% ComboType
)
```

```
abstract GetTypeCombo :
    Name : string *
    ComboType : int byref -> int
```

Parameters

Name

Type: [SystemString](#)

The name of an existing load combination.

ComboType

Type: [SystemInt32](#)

This is 0, 1, 2, 3 or 4 indicating the load combination type.

◊ 0 = Linear Additive

◊ 1 = Envelope

◊ 2 = Absolute Additive

- ◇ 3 = SRSS
- ◇ 4 = Range Additive

Return Value

Type: Int32

Returns zero if the type is successfully retrieved, otherwise it returns a nonzero value.

▲ **Remarks**

▲ **Examples**

VB

Copy

```
Public Sub Example()
    Dim SapModel As cSapModel

CSI API ETABS v1

cComboAddLanguageSpecificTextSet("LST3DD12DC5_0")

Method

Adds or modifies one load case or response combination in the list of cases included in the load combination specified by the Name item.

Namespace: `ETABSv1`

Assembly: `ETABSv1 (in ETABSv1.dll)` Version: 1.0.0.0 (1.24.0.0)

Syntax

C#

VB

C++

F#

Copy

```
int SetCaseList(
    string Name,
    ref eCNameType CNameType,
    string CName,
    double SF
)
```

```
Function SetCaseList (
    Name As String,
    ByRef CNameType As eCNameType,
    CName As String,
    SF As Double
) As Integer
```

```
Dim instance As cCombo
Dim Name As String
Dim CNameType As eCNameType
Dim CName As String
Dim SF As Double
Dim returnValue As Integer
```

```
returnValue = instance.SetCaseList(Name,
    CNameType, CName, SF)
```

```
int SetCaseList(
    String^ Name,
    eCNameType% CNameType,
    String^ CName,
    double SF
)
```

```
abstract SetCaseList :
    Name : string *
    CNameType : eCNameType byref *
    CName : string *
    SF : float -> int
```

Parameters

Name

Type: SystemString

The name of an existing load combination.

CNameType

Type: ETABSv1eCNameTypeThis is one of the following items in the eCNameType enumeration:

◊ LoadCase = 0

◊ LoadCombo = 1

This item indicates whether the CName item is an analysis case (LoadCase) or a load combination (LoadCombo).

CName

Type: SystemString

The name of the load case or load combination to be added to or modified in the combination specified by the Name item. If the load case or combination already exists in the combination specified by the Name item, the scale factor is modified as indicated by the SF item for that load case or combination. If the analysis case or combination does not exist in the combination specified by the Name item, it is added.

SF

Type: SystemDouble

The scale factor multiplying the case or combination indicated by the CName item.

Return ValueType: Int32

Returns zero if the item is successfully added or modified, otherwise it returns a nonzero value.

▲ Remarks

▲ Examples

VB

Copy

```
Public Sub Example()
    Dim SapModel As cSapModel
    Dim EtabsObject As cOAPI
    Dim ret As Integer = -1

    'create ETABS object
    Dim myHelper as cHelper = New Helper
    EtabsObject = myHelper.CreateObjectProgID("CSI.ETABS.API.ETABSObject")

    'start ETABS application
    ret = EtabsObject.ApplicationStart()

    'create SapModel object
    SapModel = EtabsObject.SapModel

    'initialize model
    ret = SapModel.InitializeNewModel()

    'create steel deck template model
    ret = SapModel.File.NewSteelDeck(4,12,12,4,4,24,24)
```

Introduction

```
'add combo
    ret = SapModel.RespCombo.Add("COMB1", 0)

'add load case to combo
    ret = SapModel.RespCombo.SetCaseList("COMB1", eCNameType.LoadCase, "DEAD", 1.4)

'close ETABS
    EtabsObject.ApplicationExit(False)

'clean up variables
    SapModel = Nothing
    EtabsObject = Nothing
End Sub
```

SF : float -> int

Parameters

Name

Type: SystemString

The name of an existing load combination.

CNameType

Type: ETABSv1eCNameType

This is one of the following items in the eCNameType enumeration:

◊ LoadCase = 0

◊ LoadCombo = 1

This item indicates whether the CName item is an analysis case (LoadCase) or a load combination (LoadCombo).

CName

Type: SystemString

The name of the load case or load combination to be added to or modified in the combination specified by the Name item. If the load case or combination already exists in the combination specified by the Name item, the scale factor is modified as indicated by the SF item for that load case or combination. If the analysis case or combination does not exist in the combination specified by the Name item, it is added.

ModeNumber

Type: SystemInt32

The mode number for the case indicated by the CName item. This item applies when by the CNameType item is LoadCase and the type of load case specified by the CName item is either Modal or Buckling. Any other case type or combo should specify a zero for this item.

SF

Type: SystemDouble

The scale factor multiplying the case or combination indicated by the CName item.

Return Value

Type: Int32

Returns zero if the item is successfully added or modified, otherwise it returns a nonzero value.

Remarks

This function supercedes SetCaseList(String, eCNameType, String, Double)

Examples

VB

Copy

```
Public Sub Example()

CSI API ETABS v1

cConstraintAddLanguageSpecificTextSet("LST1CA3F5AA_0") Method

DEPRECATED. Defines a Diaphragm constraint.

Namespace: [ETABSv1](#)

Assembly: [ETABSv1](#) (in ETABSv1.dll) Version: 1.0.0.0 (1.24.0.0)

Syntax

[C#](#)

[VB](#)

[C++](#)

[F#](#)

[Copy](#)

```
int SetDiaphragm(
    string Name,
    eConstraintAxis Axis = eConstraintAxis.AutoAxis,
    string CSys = "Global"
)
```

```
Function SetDiaphragm (
    Name As String,
    Axis As eConstraintAxis = eConstraintAxis.AutoAxis,
    CSys As String = "Global"
) As Integer
```

```
Dim instance As cConstraint
Dim Name As String
Dim Axis As eConstraintAxis
Dim CSys As String
Dim returnValue As Integer
```

```
returnValue = instance.SetDiaphragm(Name,
    Axis, CSys)
```

```
int SetDiaphragm(
    String^ Name,
    eConstraintAxis Axis = eConstraintAxis::AutoAxis,
    String^ CSys = L"Global"
)
```

```
abstract SetDiaphragm :
    Name : string *
    ?Axis : eConstraintAxis *
    ?CSys : string
(* Defaults:
    let _Axis = defaultArg Axis eConstraintAxis.AutoAxis
    let _CSys = defaultArg CSys "Global"
*)
-> int
```

Parameters

Name

Type:Â SystemString

The name of a constraint.

Axis (Optional)

Type:Â ETABSv1eConstraintAxis

CSys (Optional)

Type:Â SystemString

The name of the coordinate system in which the constraint is defined.

Return ValueType:Â Int32

Returns zero if the constraint data is successfully added or modified, otherwise it returns a nonzero value.

▲ **Remarks**This function is DEPRECATED. Please refer to cDiaphragm.▲ **Examples**

VB

Copy

```
Public Sub Example()
    Dim SapModel As cSapModel
    Dim EtabsObject As cOAPI
    Dim ret As Integer = -1

    'create ETABS object
    Dim myHelper as cHelper = New Helper
    EtabsObject = myHelper.CreateObjectProgID("CSI.ETABS.API.ETABSObject")

    'start ETABS application
    ret = EtabsObject.ApplicationStart()

    'create SapModel object
    SapModel = EtabsObject.SapModel

    'initialize model
    ret = SapModel.InitializeNewModel()

    'create steel deck template model
    ret = SapModel.File.NewSteelDeck(4, 12, 12, 4, 4, 24, 24)

    'define a new constraint
    ret = SapModel.ConstraintDef.SetDiaphragm("Diaph1")

    'close ETABS
    EtabsObject.ApplicationExit(False)

    'clean up variables
    SapModel = Nothing
    EtabsObject = Nothing
End Sub
```

cDatabaseTables Interface

Namespace: $\hat{A}$ ETABSV1

Assembly: $\hat{A}$ ETABSV1 (in ETABSV1.dll) Version: 1.0.0.0 (1.24.0.0)

▲ Syntax

C#

VB

C++

F#

Copy

```
public interface cDatabaseTables
```

```
Public Interface cDatabaseTables
```

```
Dim instance As cDatabaseTables
```

```
public interface class cDatabaseTables
```

```
type cDatabaseTables = interface end
```

The cDatabaseTables type exposes the following members.

▲ Methods

$\hat{A}$

Name

Description

 ApplyEditedTables

Instructs the program to interactively import all tables in the list using the SetTableForEditing... functions.

 CancelTableEditing

Clears all tables that were stored in the table list using the SetTableForEditing... functions.

 GetAllFieldsInTable

Returns the available fields in a specified table.

 GetAllTables

Returns all of the tables along with their import status that are available in the model to fill the table.

 GetAvailableTables

Returns the tables that are currently available for editing.

 GetLoadCasesSelectedForDisplay

Returns a list of load cases that are selected for display.

 GetLoadCombinationsSelectedForDisplay

Returns a list of load combinations that are selected for display.

 GetLoadPatternsSelectedForDisplay

Returns a list of load patterns that are selected for display.

 GetObsoleteTableKeyList

Returns a list of obsolete table keys for the program.

 GetOutputOptionsForDisplay

Returns the database table output options for load cases.

 GetTableForDisplayArray

Returns data for a single table in a single array. If the table then no data is returned.

 GetTableForDisplayCSVFile

Returns data for a single table in a CSV file. If the table then no data is returned.

 GetTableForDisplayCSVString

Returns data for a single table in a CSV string. If the table then no data is returned.

 GetTableForDisplayXMLString

Returns data for a single table as XML in a single string. If the table then no data is returned.

⇒ <u>GetTableForEditingArray</u>	Returns a single table in a string array for inter
⇒ <u>GetTableForEditingCSVFile</u>	Returns a single table in a CSV file for interacti
⇒ <u>GetTableForEditingCSVString</u>	Returns a single table in a CSV-formatted string
⇒ <u>SetLoadCasesSelectedForDisplay</u>	Sets the load cases that are selected for table d

cDatabaseTablesAddLanguageSpecificTextSet("LST93 Method

Instructs the program to interactively import all of the tables stored in the table list using the SetTableForEditing... functions.

Namespace: ETABSv1

Assembly: ETABSv1 (in ETABSv1.dll) Version: 1.0.0.0 (1.24.0.0)

▲ Syntax

C#

VB

C++

F#

Copy

```
int ApplyEditedTables(
bool FillImportLog,
ref int NumFatalErrors,
ref int NumErrorMsgs,
ref int NumWarnMsgs,
ref int NumInfoMsgs,
ref string ImportLog
)
```

```
Function ApplyEditedTables (
FillImportLog As Boolean,
ByRef NumFatalErrors As Integer,
ByRef NumErrorMsgs As Integer,
ByRef NumWarnMsgs As Integer,
ByRef NumInfoMsgs As Integer,
ByRef ImportLog As String
) As Integer
```

```
Dim instance As cDatabaseTables
Dim FillImportLog As Boolean
Dim NumFatalErrors As Integer
Dim NumErrorMsgs As Integer
Dim NumWarnMsgs As Integer
Dim NumInfoMsgs As Integer
Dim ImportLog As String
Dim returnValue As Integer
```

```
returnValue = instance.ApplyEditedTables(FillImportLog,
NumFatalErrors, NumErrorMsgs, NumWarnMsgs,
NumInfoMsgs, ImportLog)
```

```
int ApplyEditedTables(
bool FillImportLog,
int% NumFatalErrors,
int% NumErrorMsgs,
int% NumWarnMsgs,
int% NumInfoMsgs,
String^% ImportLog
)
```

```

abstract ApplyEditedTables :
    FillImportLog : bool *
    NumFatalErrors : int byref *
    NumErrorMsgs : int byref *
    NumWarnMsgs : int byref *
    NumInfoMsgs : int byref *
    ImportLog : string byref -> int

```

Parameters

FillImportLog

Type: [SystemBoolean](#)

Input Item: Whether the ImportLog string should be filled. Please note that the import log may be very large.

NumFatalErrors

Type: [SystemInt32](#)

Returned Item: The number of fatal errors that occurred during the import

NumErrorMsgs

Type: [SystemInt32](#)

Returned Item: The number of error messages logged during the import

NumWarnMsgs

Type: [SystemInt32](#)

Returned Item: The number of warning messages logged during the import

NumInfoMsgs

Type: [SystemInt32](#)

Returned Item: The number of informational messages logged during the import

ImportLog

Type: [SystemString](#)

Returned Item: A string containing all messages logged during the import

Return Value

Type: [Int32](#)

Returns 0 if the function executes correctly, otherwise returns nonzero

Remarks

If the model is locked at the time this command is called then only tables that can be interactively imported when the model is locked will be imported.

IMPORTANT NOTE: Please save your model before calling this function. If a fatal error occurs, or this function returns nonzero, the model may be in a corrupted state and it is recommended that the user close the model without saving and reopen.

Parameters

TableKey

Type:Â [SystemString](#)

Input Item: The table key for the table for which the fields will be returned.

TableVersion

Type:Â [SystemInt32](#)

Returned Item: The version number of the specified table.

NumberFields

Type:Â [SystemInt32](#)

Returned Item: The number of available fields in the specified table.

FieldKey

Type:Â [SystemString](#)

Returned Item: A zero-based array of the field keys for the specified table.

FieldName

Type:Â [SystemString](#)

Returned Item: A zero-based array of the field names for the specified table.

Description

Type:Â [SystemString](#)

Returned Item: A zero-based array of the field descriptions for the specified table.

UnitsString

Type:Â [SystemString](#)

Returned Item: A zero-based array of the field units for the specified table.

IsImportable

Type:Â [SystemBoolean](#)

Returned Item: A zero-based array of whether the field is importable for the specified table.

Return Value

Type:Â [Int32](#)

Returns 0 if the function executes correctly, otherwise returns nonzero

```

cDatabaseTablesAddLanguageSpecificTextSet("LSTB2073819_0?cp=3;|nu=.")

```

ImportType : int[] byref *
IsEmpty : bool[] byref -> int

```

Parameters

NumberTables

Type: SystemInt32

Returned Item: The number of tables that are currently available for display.

TableKey

Type: SystemString

Returned Item: A zero-based array of the table keys for the available tables.

TableName

Type: SystemString

Returned Item: A zero-based array of the table names for the available tables.

ImportType

Type: SystemInt32

Returned Item: This is either 0, 1, 2 or 3 indicating the import type for the table.

0. not importable

1. importable but not interactively importable

2. importable and interactively importable when the model is unlocked

3. importable and interactively importable when the model is unlocked and locked

IsEmpty

Type: SystemBoolean

Returned Item: False means data is available in the model to fill the table. True means there is no data in the model to fill the table.

Return Value

Type: Int32

CSI API ETABS v1

cDatabaseTablesAddLanguageSpecificTextSet("LST27 Method

Returns a list of load cases that are selected for table display.

Namespace: ETABSv1

Assembly: ETABSv1 (in ETABSv1.dll) Version: 1.0.0.0 (1.24.0.0)

Syntax

C#

VB

C++

F#

Copy

```
int GetLoadCasesSelectedForDisplay(
    ref int NumberSelectedLoadCases,
    ref string[] LoadCaseList
)
```

```
Function GetLoadCasesSelectedForDisplay (
    ByRef NumberSelectedLoadCases As Integer,
    ByRef LoadCaseList As String()
) As Integer
```

```
Dim instance As cDatabaseTables
Dim NumberSelectedLoadCases As Integer
Dim LoadCaseList As String()
Dim returnValue As Integer
```

```
returnValue = instance.GetLoadCasesSelectedForDisplay(NumberSelectedLoadCases,
    LoadCaseList)
```

```
int GetLoadCasesSelectedForDisplay(
    int% NumberSelectedLoadCases,
    array<String^>% LoadCaseList
)
```

```
abstract GetLoadCasesSelectedForDisplay :
    NumberSelectedLoadCases : int byref *
    LoadCaseList : string[] byref -> int
```

Parameters

NumberSelectedLoadCases

Type: SystemInt32

Returned Item: The number of load cases selected for table display.

LoadCaseList

Type: SystemString

Returned Item: The zero-based list of load cases selected for table display.

Return Value

Type: Int32

Returns 0 if the function executes correctly, otherwise returns nonzero

Remarks

This list sets the load cases that are included when displaying analysis results.

CSI API ETABS v1

cDatabaseTablesAddLanguageSpecificTextSet("LST52 Method

Returns a list of obsolete table keys for the program.

Namespace: ETABSV1

Assembly: ETABSV1 (in ETABSV1.dll) Version: 1.0.0.0 (1.24.0.0)

■ Syntax

C#

VB

C++

F#

Copy

```
int GetObsoleteTableKeyList(
    ref int NumberTableKeys,
    ref string[] TableKeyList,
    ref string[] NotesList
)
```

```
Function GetObsoleteTableKeyList (
    ByRef NumberTableKeys As Integer,
    ByRef TableKeyList As String(),
    ByRef NotesList As String()
) As Integer
```

```
Dim instance As cDatabaseTables
Dim NumberTableKeys As Integer
Dim TableKeyList As String()
Dim NotesList As String()
Dim returnValue As Integer
```

```
returnValue = instance.GetObsoleteTableKeyList(NumberTableKeys,
    TableKeyList, NotesList)
```

```
int GetObsoleteTableKeyList(
    int% NumberTableKeys,
    array<String^>% TableKeyList,
    array<String^>% NotesList
)
```

```
abstract GetObsoleteTableKeyList :
    NumberTableKeys : int byref *
    TableKeyList : string[] byref *
    NotesList : string[] byref -> int
```

Parameters

NumberTableKeys

Type: System.Int32

Returned Item: The number of obsolete table keys.

TableKeyList

Type: SystemString

Returned Item: A zero-based list of obsolete table keys.

NotesList

Type: SystemString

Returned Item: A zero-based list of notes, one for each table key.

Return Value

Type: Int32

Returns 0 if the function executes correctly, otherwise returns nonzero

    MultistepStatic : int byref *
    NonlinearStatic : int byref *
    ModalHistory : int byref *
    DirectHistory : int byref *
    Combo : int byref -> int
```

Parameters

IsUserBaseReactionLocation
Type: System.Boolean

Returned Item: Indicates if the base reaction location is user specified instead of program determined.

UserBaseReactionX

Type:Â SystemDouble

Returned Item: The global X coordinate of the user specified base reaction location. This item only applies when the IsUserBaseReactionLocation item is True.

UserBaseReactionY

Type:Â SystemDouble

Returned Item: The global Y coordinate of the user specified base reaction location. This item only applies when the IsUserBaseReactionLocation item is True.

UserBaseReactionZ

Type:Â SystemDouble

Returned Item: The global Z coordinate of the user specified base reaction location. This item only applies when the IsUserBaseReactionLocation item is True.

IsAllModes

Type:Â SystemBoolean

Returned Item: Indicates if results are to be displayed for all modes of modal load cases.

StartMode

Type:Â SystemInt32

Returned Item: The first mode for which results are shown for modal load cases. This item only applies when the IsAllModes item is False.

EndMode

Type:Â SystemInt32

Returned Item: The last mode for which results are shown for modal load cases. This item only applies when the IsAllModes item is False.

IsAllBucklingModes

Type:Â SystemBoolean

Returned Item: Indicates if results are to be displayed for all modes of buckling load cases.

StartBucklingMode

Type:Â SystemInt32

Returned Item: The first mode for which results are shown for buckling load cases. This item only applies when the IsAllBucklingModes item is False.

EndBucklingMode

Type:Â SystemInt32

Returned Item: The last mode for which results are shown for buckling load cases. This item only applies when the IsAllBucklingModes item is False.

MultistepStatic

Type:Â SystemInt32

Returned Item: Indicates how multistep static load case results are displayed: 1=Envelopes, 2=Step-by-step, 3=Last Step.

NonlinearStatic

Type:Â SystemInt32

Returned Item: Indicates how nonlinear static load case results are displayed: 1=Envelopes, 2=Step-by-step, 3=Last Step.

ModalHistory

Type: SystemInt32

Returned Item: Indicates how multistep modal time history load case results are displayed: 1=Envelopes, 2=Step-by-step, 3=Last Step.

DirectHistory

Type: SystemInt32

Returned Item: Indicates how direct integration time load case results are displayed: 1=Envelopes, 2=Step-by-step, 3=Last Step.

Combo

Type: SystemInt32

Returned Item: Indicates how load combination results are displayed:
1=Envelopes, 2=Multiple Values If Possible.

Return Value

Type: Int32

Returns 0 if the function executes correctly, otherwise returns nonzero

CSI API ETABS v1

cDatabaseTablesAddLanguageSpecificTextSet("LST59 Method

Returns data for a single table in a single array. If there is nothing to be shown in the table then no data is returned.

Namespace: $\hat{A}$ ETABSV1

Assembly: $\hat{A}$ ETABSV1 (in ETABSV1.dll) Version: 1.0.0.0 (1.24.0.0)

Syntax

C#

VB

C++

F#

Copy

```
int GetTableForDisplayArray(
    string TableKey,
    ref string[] FieldKeyList,
    string GroupName,
    ref int TableVersion,
    ref string[] FieldsKeysIncluded,
    ref int NumberRecords,
    ref string[] TableData
)
```

```
Function GetTableForDisplayArray (
    TableKey As String,
    ByRef FieldKeyList As String(),
    GroupName As String,
    ByRef TableVersion As Integer,
    ByRef FieldsKeysIncluded As String(),
    ByRef NumberRecords As Integer,
    ByRef TableData As String()
) As Integer
```

```
Dim instance As cDatabaseTables
Dim TableKey As String
Dim FieldKeyList As String()
Dim GroupName As String
Dim TableVersion As Integer
Dim FieldsKeysIncluded As String()
Dim NumberRecords As Integer
Dim TableData As String()
Dim returnValue As Integer
```

```
returnValue = instance.GetTableForDisplayArray(TableKey,
    FieldKeyList, GroupName, TableVersion,
    FieldsKeysIncluded, NumberRecords,
    TableData)
```

```
int GetTableForDisplayArray(
    String^ TableKey,
    array<String^>^% FieldKeyList,
    String^ GroupName,
    int% TableVersion,
```

cDatabaseTablesid="LST5939D311_0"AddLanguageSpecificTextSet("LST5939D311_0?cp=879;|nu=.")

```
array<String>^% FieldsKeysIncluded,
int% NumberRecords,
array<String>^% TableData
)
```

```
abstract GetTableForDisplayArray :
    TableKey : string *
    FieldKeyList : string[] byref *
    GroupName : string *
    TableVersion : int byref *
    FieldsKeysIncluded : string[] byref *
    NumberRecords : int byref *
    TableData : string[] byref -> int
```

Parameters

TableKey

Type:Â SystemString

Input Item: The table key of the table for which data is requested.

FieldKeyList

Type:Â SystemString

Input Item: A zero-based array listing the field keys associated with the specified table for which data is requested.

GroupName

Type:Â SystemString

Input Item: The name of a group for which data will be returned.

TableVersion

Type:Â SystemInt32

Returned Item: The version number of the specified table.

FieldsKeysIncluded

Type:Â SystemString

Returned Item: A zero-based array listing the field keys associated with the specified table for which data is reported in the order it is reported in the TableData array. These are essentially the column headers of the data returned in TableData.

NumberRecords

Type:Â SystemInt32

Returned Item: The number of records of data returned for each field. This is essentially the number of rows of data.

TableData

Type:Â SystemString

Returned Item: A zero-based, one-dimensional array of the table data, excluding headers, returned row by row. The format of the data is explained below.

As an example, suppose there are three fields in the FieldsKeysIncluded array and the NumberRecords is five.

EXAMPLE Material Name	Type	Density
A992Fy50	Steel	490
4000Psi	Concrete	150
A615Gr60	Rebar	480
A416Gr270	Tendon	470

6061T6

Aluminum 170

The data is returned row by row, and items 0 thru 2 in this array would be the first row, items 3 thru 5 the second row, etc, and items 12 thru 14 the fifth row. Using the example of the table above, the returned array would look like this:
 {A992Fy50, Steel, 490, 4000Psi, Concrete, 150, A615Gr60, Rebar, 480, A416Gr270, Tendon, 470, 6061T6, Aluminum, 170}

Return Value

Type: `Int32`

Returns 0 if the function executes correctly, otherwise returns nonzero

Remarks

If the FieldKeyList array contains a single blank string the data will be provided for all fields. If the GroupName is All, or a blank string, then data will be returned for all applicable objects in the model.

CSI API ETABS v1

cDatabaseTablesAddLanguageSpecificTextSet("LST3B325081_0?cp=2;nu=.") Method

Returns data for a single table in a CSV file. If there is nothing to be shown in the table then no data is returned.

Namespace: ETABSv1

Assembly: ETABSv1 (in ETABSv1.dll) Version: 1.0.0.0 (1.24.0.0)

▲ Syntax

C#

VB

C++

F#

Copy

```
int GetTableForDisplayCSVFile(
    string TableKey,
    ref string[] FieldKeyList,
    string GroupName,
    ref int TableVersion,
    string csvFilePath,
    string sepChar = ",")
)
```

```
Function GetTableForDisplayCSVFile (
    TableKey As String,
    ByRef FieldKeyList As String(),
    GroupName As String,
    ByRef TableVersion As Integer,
    csvFilePath As String,
    Optional sepChar As String = ",",
    Optional returnVal As Integer
) As Integer
```

```
Dim instance As cDatabaseTables
Dim TableKey As String
Dim FieldKeyList As String()
Dim GroupName As String
Dim TableVersion As Integer
Dim csvFilePath As String
Dim sepChar As String
Dim returnValue As Integer
```

```
returnValue = instance.GetTableForDisplayCSVFile(TableKey,
    FieldKeyList, GroupName, TableVersion,
    csvFilePath, sepChar)
```

```
int GetTableForDisplayCSVFile(
    String^ TableKey,
    array<String^>^% FieldKeyList,
    String^ GroupName,
    int% TableVersion,
    String^ csvFilePath,
    String^ sepChar = L",")
)
```

```

abstract GetTableForDisplayCSVFile :
    TableKey : string *
    FieldKeyList : string[] byref *
    GroupName : string *
    TableVersion : int byref *
    csvFilePath : string *
    ?sepChar : string
(* Defaults:
    let _sepChar = defaultArg sepChar ", "
*)
-> int

```

Parameters

TableKey

Type: SystemString

Input Item: The table key of the table for which data is requested.

FieldKeyList

Type: SystemString

Input Item: A zero-based array listing the field keys associated with the specified table for which data is requested.

GroupName

Type: SystemString

Input Item: The name of a group for which data will be returned.

TableVersion

Type: SystemInt32

Returned Item: The version number of the specified table.

csvFilePath

Type: SystemString

Input Item: The fully-qualified path for the CSV file containing the table data.

sepChar (Optional)

Type: SystemString

Optional Input Item: The delimiter between data items, by default ","

Return Value

Type: Int32

Returns 0 if the function executes correctly, otherwise returns nonzero

Remarks

If the FieldKeyList array contains a single blank string the data will be provided for all fields. If the GroupName is All, or a blank string, then data will be returned for all applicable objects in the model.

    ByRef XMLTableData As String
) As Integer
```

```
Dim instance As cDatabaseTables
Dim TableKey As String
Dim FieldKeyList As String()
Dim GroupName As String
Dim IncludeSchema As Boolean
Dim TableVersion As Integer
Dim XMLTableData As String
Dim returnValue As Integer
```

```
returnValue = instance.GetTableForDisplayXMLString(TableKey,
    FieldKeyList, GroupName, IncludeSchema,
    TableVersion, XMLTableData)
```

```
int GetTableForDisplayXMLString(
    String^ TableKey,
    array<String^>^% FieldKeyList,
    String^ GroupName,
    bool IncludeSchema,
    int% TableVersion,
    String^% XMLTableData
)
```

```

abstract GetTableForDisplayXMLString :
    TableKey : string *
    FieldKeyList : string[] byref *
    GroupName : string *
    IncludeSchema : bool *
    TableVersion : int byref *
    XMLTableData : string byref -> int

```

Parameters

TableKey

Type: [SystemString](#)

Input Item: The table key of the table for which data is requested.

FieldKeyList

Type: [SystemString](#)

Input Item: A zero-based array listing the field keys associated with the specified table for which data is requested.

GroupName

Type: [SystemString](#)

Input Item: The name of a group for which data will be returned.

IncludeSchema

Type: [SystemBoolean](#)

Input Item: Flag indicating if the schema should be included with the table data.

TableVersion

Type: [SystemInt32](#)

Returned Item: The version number of the specified table.

XMLTableData

Type: [SystemString](#)

Returned Item: A string containing the XML data for the table

Return Value

Type: [Int32](#)

Returns 0 if the function executes correctly, otherwise returns nonzero

Remarks

If the FieldKeyList array contains a single blank string the data will be provided for all fields. If the GroupName is All, or a blank string, then data will be returned for all applicable objects in the model.

returnValue = instance.GetTableForEditingArray(TableKey,
    GroupName, TableVersion, FieldsKeysIncluded,
    NumberRecords, TableData)
```

```
int GetTableForEditingArray(
    String^ TableKey,
    String^ GroupName,
    int% TableVersion,
    array<String^>^% FieldsKeysIncluded,
    int% NumberRecords,
    array<String^>^% TableData
)
```

```
abstract GetTableForEditingArray :
```

cDatabaseTablesAddLanguageSpecificTextSet("LST849041B_0?cpp=888u=.");G

```

TableKey : string *
GroupName : string *
TableVersion : int byref *
FieldsKeysIncluded : string[] byref *
NumberRecords : int byref *
TableData : string[] byref -> int

```

Parameters

TableKey

Type: SystemString

Input Item: The table key for a table which will be interactively edited. The table must be one that can be interactively edited.

GroupName

Type: SystemString

Input Item: IMPORTANT NOTE: This parameter is not active in this release.

The name of a group for which data will be returned.

TableVersion

Type: SystemInt32

Returned Item: The version number of the specified table.

FieldsKeysIncluded

Type: SystemString

Returned Item: A zero-based array listing the field keys associated with the specified table for which data is reported in the order it is reported in the TableData array. These are essentially the column headers of the data returned in TableData.

NumberRecords

Type: SystemInt32

Returned Item: The number of records of data returned for each field. This is essentially the number of rows of data.

TableData

Type: SystemString

Returned Item: A zero-based, one-dimensional array of the table data, excluding headers, returned row by row. The format of the data is explained below.

As an example, suppose there are three fields in the FieldsKeysIncluded array and the NumberRecords is five.

EXAMPLE Material Name	Type	Density
A992Fy50	Steel	490
4000Psi	Concrete	150
A615Gr60	Rebar	480
A416Gr270	Tendon	470
6061T6	Aluminum	170

The data is returned row by row, and items 0 thru 2 in this array would be the first row, items 3 thru 5 the second row, etc, and items 12 thru 14 the fifth row. Using the example of the table above, the returned array would look like this: {A992Fy50, Steel, 490, 4000Psi, Concrete, 150, A615Gr60, Rebar, 480, A416Gr270, Tendon, 470, 6061T6, Aluminum, 170}

Return Value

Type: Int32

Returns 0 if the function executes correctly, otherwise returns nonzero

```

        ?sepChar : string
(* Defaults:
    let _sepChar = defaultArg sepChar ", "
*)
-> int

```

Parameters

TableKey

Type: SystemString

Input Item: The table key for a table which will be interactively edited. The table must be one that can be interactively edited.

GroupName

Type: SystemString

Input Item: IMPORTANT NOTE: This parameter is not active in this release.

The name of a group for which data will be returned.

TableVersion

Type: SystemInt32

Returned Item: The version number of the specified table.

csvFilePath

Type: SystemString

Input Item: The fully-qualified path for the CSV file containing the table data.

Only the importable fields are included in the table.

sepChar (Optional)

Type: SystemString

Optional Input Item: The delimiter between data items, by default ",",

Return Value

Type: Int32

Returns 0 if the function executes correctly, otherwise returns nonzero

CSI API ETABS v1

cDatabaseTablesAddLanguageSpecificTextSet("LSTC52E5A4F_0") Method

Sets the load cases that are selected for table display.

Namespace: [ETABSV1](#)

Assembly: [ETABSV1](#) (in ETABSV1.dll) Version: 1.0.0.0 (1.24.0.0)

▲ Syntax

[C#](#)

[VB](#)

[C++](#)

[F#](#)

[Copy](#)

```
int SetLoadCasesSelectedForDisplay(
    ref string[] LoadCaseList
)
```

```
Function SetLoadCasesSelectedForDisplay (
    ByRef LoadCaseList As String()
) As Integer
```

```
Dim instance As cDatabaseTables
Dim LoadCaseList As String()
Dim returnValue As Integer
```

```
returnValue = instance.SetLoadCasesSelectedForDisplay(LoadCaseList)
```

```
int SetLoadCasesSelectedForDisplay(
    array<String^>^% LoadCaseList
)
```

```
abstract SetLoadCasesSelectedForDisplay :
    LoadCaseList : string[] byref -> int
```

Parameters

LoadCaseList

Type: [SystemString](#)

Input Item: The zero-based list of load cases selected for table display.

Return Value

Type: [Int32](#)

Returns 0 if the function executes correctly, otherwise returns nonzero

▲ Remarks

This list sets the load cases that are included when displaying analysis results. If no load cases are to be selected then the LoadCaseList item should include a single blank string.

double UserBaseReactionY,
double UserBaseReactionZ,
bool IsAllModes,
int StartMode,
int EndMode,
bool IsAllBucklingModes,
int StartBucklingMode,
int EndBucklingMode,
int MultistepStatic,
int NonlinearStatic,
int ModalHistory,
int DirectHistory,
int Combo
)

abstract SetOutputOptionsForDisplay :
    IsUserBaseReactionLocation : bool *
    UserBaseReactionX : float *
    UserBaseReactionY : float *
    UserBaseReactionZ : float *
    IsAllModes : bool *
    StartMode : int *
    EndMode : int *
    IsAllBucklingModes : bool *
    StartBucklingMode : int *
    EndBucklingMode : int *
    MultistepStatic : int *
    NonlinearStatic : int *
    ModalHistory : int *
    DirectHistory : int *
    Combo : int -> int
```

Parameters

IsUserBaseReactionLocation
Type: SystemBoolean

Input Item: Indicates if the base reaction location is user specified instead of program determined.

UserBaseReactionX

Type:Â SystemDouble

Input Item: The global X coordinate of the user specified base reaction location. This item only applies when the IsUserBaseReactionLocation item is True.

UserBaseReactionY

Type:Â SystemDouble

Input Item: The global Y coordinate of the user specified base reaction location. This item only applies when the IsUserBaseReactionLocation item is True.

UserBaseReactionZ

Type:Â SystemDouble

Input Item: The global Z coordinate of the user specified base reaction location. This item only applies when the IsUserBaseReactionLocation item is True.

IsAllModes

Type:Â SystemBoolean

Input Item: Indicates if results are to be displayed for all modes of modal load cases.

StartMode

Type:Â SystemInt32

Input Item: The first mode for which results are shown for modal load cases. This item only applies when the IsAllModes item is False.

EndMode

Type:Â SystemInt32

Input Item: The last mode for which results are shown for modal load cases. This item only applies when the IsAllModes item is False.

IsAllBucklingModes

Type:Â SystemBoolean

Input Item: Indicates if results are to be displayed for all modes of buckling load cases.

StartBucklingMode

Type:Â SystemInt32

Input Item: The first mode for which results are shown for buckling load cases. This item only applies when the IsAllBucklingModes item is False.

EndBucklingMode

Type:Â SystemInt32

Input Item: The last mode for which results are shown for buckling load cases. This item only applies when the IsAllBucklingModes item is False.

MultistepStatic

Type:Â SystemInt32

Input Item: Indicates how multistep static load case results are displayed: 1=Envelopes, 2=Step-by-step, 3=Last Step.

NonlinearStatic

Type:Â SystemInt32

Input Item: Indicates how nonlinear static load case results are displayed: 1=Envelopes, 2=Step-by-step, 3=Last Step.

ModalHistory

Type:Â SystemInt32

Input Item: Indicates how multistep modal time history load case results are displayed: 1=Envelopes, 2=Step-by-step, 3=Last Step.

DirectHistory

Type: SystemInt32

Input Item: Indicates how direct integration time load case results are displayed: 1=Envelopes, 2=Step-by-step, 3=Last Step.

Combo

Type: SystemInt32

Returned Item: Indicates how load combination results are displayed: 1=Envelopes, 2=Multiple Values If Possible.

Return Value

Type: Int32

Returns 0 if the function executes correctly, otherwise returns nonzero

CSI API ETABS v1

cDatabaseTablesAddLanguageSpecificTextSet("LST2F99A871_0?cp=905;|nu=.") Method

Reads a table from a string array and adds it to a stored table list until either the ApplyEditedTables(Boolean, Int32, Int32, Int32, Int32, String) or CancelTableEditing command is issued.

Namespace: ETABSV1

Assembly: ETABSV1 (in ETABSV1.dll) Version: 1.0.0.0 (1.24.0.0)

Syntax

C#

VB

C++

F#

Copy

```
int SetTableForEditingArray(
    string TableKey,
    ref int TableVersion,
    ref string[] FieldsKeysIncluded,
    int NumberRecords,
    ref string[] TableData
)
```

```
Function SetTableForEditingArray (
    TableKey As String,
    ByRef TableVersion As Integer,
    ByRef FieldsKeysIncluded As String(),
    NumberRecords As Integer,
    ByRef TableData As String()
) As Integer
```

```
Dim instance As cDatabaseTables
Dim TableKey As String
Dim TableVersion As Integer
Dim FieldsKeysIncluded As String()
Dim NumberRecords As Integer
Dim TableData As String()
Dim returnValue As Integer
```

```
returnValue = instance.SetTableForEditingArray(TableKey,
    TableVersion, FieldsKeysIncluded,
    NumberRecords, TableData)
```

```
int SetTableForEditingArray(
    String^ TableKey,
    int% TableVersion,
    array<String^>^% FieldsKeysIncluded,
    int NumberRecords,
    array<String^>^% TableData
)
```

```
abstract SetTableForEditingArray :
    TableKey : string *
    TableVersion : int byref *
```

Introduction

```
FieldsKeysIncluded : string[] byref *  
NumberRecords : int *  
TableData : string[] byref -> int
```

Parameters

TableKey

Type: SystemString

Input Item: The table key for a table which has been interactively edited. The table must be one that can be interactively edited.

TableVersion

Type: SystemInt32

Returned Item: The version number of the specified table.

FieldsKeysIncluded

Type: SystemString

Input Item: A zero-based array listing the field keys associated with the specified table for which data is reported in the order it is reported in the TableData array. These are essentially the column headers of the data reported in TableData.

NumberRecords

Type: SystemInt32

Input Item: The number of records of data for each field. This is essentially the number of rows of data.

TableData

Type: SystemString

Input Item: A zero-based, one-dimensional array of the table data, excluding headers, reported row by row. See GetTableForDisplayArray(String,String,String,Int32,String,Int32,String) for a more detailed explanation of the data format.

Return Value

Type: Int32

Returns 0 if the function executes correctly, otherwise returns nonzero

Remarks

Here is an example of how to set the inputs:

```
TableKey = "EXAMPLE Material Table"
```

```
FieldsKeysIncluded = {"Material Name", "Material Type", "Density"}
```

```
NumberRecords = 5
```

```
TableData = {A992Fy50, Steel, 490, 4000Psi, Concrete, 150, A615Gr60, Rebar, 480,  
A416Gr270, Tendon, 470, 6061T6, Aluminum, 170}
```

Executing the function with these inputs would be equivalent to setting the following table interactively:

EXAMPLE Material Name	Type	Density
A992Fy50	Steel	490

Introduction

4000Psi	Concrete	150
A615Gr60	Rebar	480
A416Gr270	Tendon	470
6061T6	Aluminum	170

*)
```

cDatabaseTablesid="LST7CAD4A89_0"AddLanguageSpecificTextSet("LST7CAD4A89_0?006=::|nu=.

-> int

Parameters

TableKey

Type: SystemString

Input Item: The table key for a table which has been interactively edited. The table must be one that can be interactively edited.

TableVersion

Type: SystemInt32

Returned Item: The version number of the specified table.

csvFilePath

Type: SystemString

Input Item: The fully-qualified path for the CSV file containing the table data.

sepChar (Optional)

Type: SystemString

Optional Input Item: The delimiter between data items, by default "," . However, please note that this delimiter must match what is used in the csvFilePath file.

Return Value

Type: Int32

Returns 0 if the function executes correctly, otherwise returns nonzero

    String^% csvString,
    String^ sepChar = L",",
)
```

```
abstract SetTableForEditingCSVString :
    TableKey : string *
    TableVersion : int byref *
    csvString : string byref *
    ?sepChar : string
(* Defaults:
    let _sepChar = defaultArg sepChar " , "
*)
```

cDatabaseTablesspan id="LSTE0395D5_0"AddLanguageSpecificTextSet("LSTE0395D5_0?cpp9110u=.");S

-> int

Parameters

TableKey

Type: SystemString

Input Item: The table key for a table which has been interactively edited. The table must be one that can be interactively edited.

TableVersion

Type: SystemInt32

Returned Item: The version number of the specified table.

csvString

Type: SystemString

Input Item: A CSV-formatted string containing all the table data. Newline characters should be used to demarcate rows.

sepChar (Optional)

Type: SystemString

Optional Input Item: The delimiter between data items in the same row, by default ",". This delimiter must match what is used in the csvString.

Return Value

Type: Int32

Returns 0 if the function executes correctly, otherwise returns nonzero

CSI API ETABS v1

cDatabaseTablesAddLanguageSpecificTextSet("LST8B34CB36_0?012=::|nu=.") Method

Exports the specified tables to Excel.

Namespace: [ETABSv1](#)

Assembly: [ETABSv1](#) (in ETABSv1.dll) Version: 1.0.0.0 (1.24.0.0)

Syntax

[C#](#)

[VB](#)

[C++](#)

[F#](#)

[Copy](#)

```
int ShowTablesInExcel(
    ref string[] TableKeyList,
    int WindowHandle
)
```

```
Function ShowTablesInExcel (
    ByRef TableKeyList As String(),
    WindowHandle As Integer
) As Integer
```

```
Dim instance As cDatabaseTables
Dim TableKeyList As String()
Dim WindowHandle As Integer
Dim returnValue As Integer
```

```
returnValue = instance.ShowTablesInExcel(TableKeyList,
    WindowHandle)
```

```
int ShowTablesInExcel(
    array<String^>^% TableKeyList,
    int WindowHandle
)
```

```
abstract ShowTablesInExcel :
    TableKeyList : string[] byref *
    WindowHandle : int -> int
```

Parameters

TableKeyList

Type: [SystemString](#)

A zero-based array of the table keys for the tables to be included in the output.

WindowHandle

Type: [SystemInt32](#)

If a valid window handle is entered here Excel will be located in front of that window.

Return Value

Type: Int32

Returns 0 if the function executes correctly, otherwise returns nonzero

Remarks

Excel must be present on the computer for this function to work. If there is nothing to be shown in the table then no data is returned and Excel is not displayed.

CSI API ETABS v1

cDCoACI318_08_IBC2009AddLanguageSpecificTextSet Method

Retrieves the value of a concrete design overwrite item.

Namespace: ETABSv1

Assembly: ETABSv1 (in ETABSv1.dll) Version: 1.0.0.0 (1.24.0.0)

■ Syntax

C#

VB

C++

F#

Copy

```
int GetOverwrite(
    string Name,
    int Item,
    ref double Value,
    ref bool ProgDet
)
```

```
Function GetOverwrite (
    Name As String,
    Item As Integer,
    ByRef Value As Double,
    ByRef ProgDet As Boolean
) As Integer
```

```
Dim instance As cDCoACI318_08_IBC2009
Dim Name As String
Dim Item As Integer
Dim Value As Double
Dim ProgDet As Boolean
Dim returnValue As Integer
```

```
returnValue = instance.GetOverwrite(Name,
    Item, Value, ProgDet)
```

```
int GetOverwrite(
    String^ Name,
    int Item,
    double% Value,
    bool% ProgDet
)
```

```
abstract GetOverwrite :
    Name : string *
    Item : int *
    Value : float byref *
    ProgDet : bool byref -> int
```

Parameters

Name

Type: SystemString

The name of a frame object with a concrete frame design procedure.

Item

Type: SystemInt32

This is an integer between 1 and 12, inclusive, indicating the overwrite item considered.

1. Framing type
2. Live load reduction factor
3. Unbraced length ratio, Major
4. Unbraced length ratio, Minor
5. Effective length factor, K Major
6. Effective length factor, K Minor
7. Moment coefficient, Cm Major
8. Moment coefficient, Cm Minor
9. Nonsway moment factor, Db Major
10. Nonsway moment factor, Db Minor
11. Sway moment factor, Ds Major
12. Sway moment factor, Ds Minor

Value

Type: SystemDouble

The value of the considered overwrite item.

1. Framing type
 - 0 = Program Default
 - 1 = Sway special
 - 2 = Sway Intermediate
 - 3 = Sway Ordinary
 - 4 = Non-sway
2. Live load reduction factor

Value ≥ 0 ; 0 means use program determined value
3. Unbraced length ratio, Major

Value ≥ 0 ; 0 means use program determined value
4. Unbraced length ratio, Minor

Value ≥ 0 ; 0 means use program determined value
5. Effective length factor, K Major

Value ≥ 0 ; 0 means use program determined value
6. Effective length factor, K Minor

Value ≥ 0 ; 0 means use program determined value
7. Moment coefficient, Cm Major

Value ≥ 0 ; 0 means use program determined value
8. Moment coefficient, Cm Minor

Value ≥ 0 ; 0 means use program determined value

9. Nonsway moment factor, Db Major

Value ≥ 0 ; 0 means use program determined value

10. Nonsway moment factor, Db Minor

Value ≥ 0 ; 0 means use program determined value

11. Sway moment factor, Ds Major

Value ≥ 0 ; 0 means use program determined value

12. Sway moment factor, Ds Minor

Value ≥ 0 ; 0 means use program determined value

ProgDet

Type: SystemBoolean

If this item is True, the specified value is program determined.

Return ValueType: Int32

Returns zero if the item is successfully retrieved; otherwise it returns a nonzero value.

▲ Remarks

▲ Examples

VB

Copy

```
Public Sub Example()
    Dim SapModel As cSapModel
    Dim EtabsObject As cOAPI
    Dim ret As Integer = -1
    Dim Value As Double
    Dim ProgDet As Boolean

    'create ETABS object
    Dim myHelper as cHelper = New Helper
    EtabsObject = myHelper.CreateObjectProgID("CSI.ETABS.API.ETABSObject")

    'start ETABS application
    ret = EtabsObject.ApplicationStart()

    'create SapModel object
    SapModel = EtabsObject.SapModel

    'initialize model
    ret = SapModel.InitializeNewModel()

    'create steel deck template model
    ret = SapModel.File.NewSteelDeck(4, 12, 12, 4, 4, 24, 24)

    'create new concrete frame section property
    ret = SapModel.PropFrame.SetRectangle("R1", "4000Psi", 20, 12)

    'set frame section property
    ret = SapModel.FrameObj.SetSection("8", "R1")

    'set concrete design code
    ret = SapModel.DesignConcrete.SetCode("ACI 318-08/IBC 2009")

    'run analysis
```

Return Value

Introduction

```
System.IO.Directory.CreateDirectory("c:\CSI_API_temp")
ret = SapModel.File.Save("C:\CSI_API_temp\example.edb")
ret = SapModel.Analyze.RunAnalysis

'start concrete design
ret = SapModel.DesignConcrete.StartDesign()

'get overwrite item
ret = SapModel.DesignConcrete.ACI318_08_IBC2009.GetOverwrite("8", 1, Value, ProgDet)

'close ETABS
EtabsObject.ApplicationExit(False)

'clean up variables
SapModel = Nothing
EtabsObject = Nothing

End Sub
```

CSI API ETABS v1

cDCoACI318_08_IBC2009AddLanguageSpecificTextSet Method

Retrieves the value of a concrete design preference item.

Namespace: ETABSV1

Assembly: ETABSV1 (in ETABSV1.dll) Version: 1.0.0.0 (1.24.0.0)

■ Syntax

C#

VB

C++

F#

Copy

```
int GetPreference(
    int Item,
    ref double Value
)
```

```
Function GetPreference (
    Item As Integer,
    ByRef Value As Double
) As Integer
```

```
Dim instance As cDCoACI318_08_IBC2009
Dim Item As Integer
Dim Value As Double
Dim returnValue As Integer
```

```
returnValue = instance.GetPreference(Item,
    Value)
```

```
int GetPreference(
    int Item,
    double% Value
)
```

```
abstract GetPreference :
    Item : int *
    Value : float byref -> int
```

Parameters

Item

Type: SystemInt32

This is an integer between 1 and 13, inclusive, indicating the preference item considered.

1. Number of interaction curves
2. Number of interaction points
3. Consider minimum eccentricity
4. Seismic design category
5. Phi tension controlled

6. Phi compression controlled tied
7. Phi compression controlled spiral
8. Phi shear and/or torsion
9. Phi shear seismic
10. Phi joint shear
11. Pattern live load factor
12. Utilization factor limit
13. Multi-response case design

Value

Type: SystemDouble

The value of the considered preference item.

1. Number of interaction curves

Value ≥ 4 and divisible by 4

2. Number of interaction points

Value ≥ 5 and odd

3. Consider minimum eccentricity

0 = No

Any other value = Yes

4. Seismic design category

. 1 = A

. 2 = B

. 3 = C

. 4 = D

. 5 = E

. 6 = F

5. Phi tension controlled

Value > 0

6. Phi compression controlled tied

Value > 0

7. Phi compression controlled spiral

Value > 0

8. Phi shear and/or torsion

Value > 0

9. Phi shear seismic

Value > 0

10. Phi joint shear

Value > 0

11. Pattern live load factor

Value ≥ 0

12. Utilization factor limit

Value > 0

13. Multi-response case design

- 1 = Envelopes
- 2 = Step-by step
- 3 = Last step
- 4 = Envelopes - All
- 5 = Step-by step - All

Return Value

Type: Int32

Returns zero if the item is successfully retrieved; otherwise it returns a nonzero value.

▲ Remarks

▲ Examples

CSI API ETABS v1

cDCoACI318_08_IBC2009AddLanguageSpecificTextSet Method

Sets the value of a concrete design overwrite item.

Namespace: ETABSv1

Assembly: ETABSv1 (in ETABSv1.dll) Version: 1.0.0.0 (1.24.0.0)

■ Syntax

C#

VB

C++

F#

Copy

```
int SetOverwrite(
    string Name,
    int Item,
    double Value,
    eItemType ItemType = eItemType.Objects
)
```

```
Function SetOverwrite (
    Name As String,
    Item As Integer,
    Value As Double,
    ?ItemType As eItemType = eItemType.Objects
) As Integer
```

```
Dim instance As cDCoACI318_08_IBC2009
Dim Name As String
Dim Item As Integer
Dim Value As Double
Dim ItemType As eItemType
Dim returnValue As Integer
```

```
returnValue = instance.SetOverwrite(Name,
    Item, Value, ItemType)
```

```
int SetOverwrite(
    String^ Name,
    int Item,
    double Value,
    eItemType ItemType = eItemType::Objects
)
```

```
abstract SetOverwrite :
    Name : string *
    Item : int *
    Value : float *
    ?ItemType : eItemType
(* Defaults:
    let _ItemType = defaultArg ItemType eItemType.Objects
*)
-> int
```

Parameters**Name**

Type:Â SystemString

The name of an existing frame object or group, depending on the value of the ItemType item.

Item

Type:Â SystemInt32

This is an integer between 1 and 12, inclusive, indicating the overwrite item considered.

1. Framing type
2. Live load reduction factor
3. Unbraced length ratio, Major
4. Unbraced length ratio, Minor
5. Effective length factor, K Major
6. Effective length factor, K Minor
7. Moment coefficient, Cm Major
8. Moment coefficient, Cm Minor
9. Nonsway moment factor, Db Major
10. Nonsway moment factor, Db Minor
11. Sway moment factor, Ds Major
12. Sway moment factor, Ds Minor

Value

Type:Â SystemDouble

The value of the considered overwrite item.

1. Framing type
 - 0 = Program Default
 - 1 = Sway special
 - 2 = Sway Intermediate
 - 3 = Sway Ordinary
 - 4 = Non-sway
2. Live load reduction factor

Value >= 0; 0 means use program determined value

3. Unbraced length ratio, Major

Value >= 0; 0 means use program determined value

4. Unbraced length ratio, Minor

Value >= 0; 0 means use program determined value

5. Effective length factor, K Major

Value >= 0; 0 means use program determined value

6. Effective length factor, K Minor

Value >= 0; 0 means use program determined value

7. Moment coefficient, Cm Major

Value >= 0; 0 means use program determined value

8. Moment coefficient, Cm Minor

Introduction

Value ≥ 0 ; 0 means use program determined value

9. Nonsway moment factor, Db Major

Value ≥ 0 ; 0 means use program determined value

10. Nonsway moment factor, Db Minor

Value ≥ 0 ; 0 means use program determined value

11. Sway moment factor, Ds Major

Value ≥ 0 ; 0 means use program determined value

12. Sway moment factor, Ds Minor

Value ≥ 0 ; 0 means use program determined value

ItemType (Optional)

Type: $\hat{A}$ ETABSv1eItemType

This is one of the following items in the eItemType enumeration:

◊ Object = 0

◊ Group = 1

◊ SelectedObjects = 2

If this item is Objects, the assignment is made to the frame object specified by the Name item.

If this item is Group, the assignment is made to all frame objects in the group specified by the Name item.

If this item is SelectedObjects, the assignment is made to all selected frame objects and the Name item is ignored.

Return Value

Type: $\hat{A}$ Int32

Returns zero if the item is successfully set; otherwise it returns a nonzero value.

▲ Remarks

▲ Examples

VB

Copy

```
Public Sub Example()  
    Dim SapModel As cSapModel  
    Dim EtabsObject As cOAPI  
    Dim ret As Integer = -1  
  
    'create ETABS object  
    Dim myHelper as cHelper = New Helper  
    EtabsObject = myHelper.CreateObjectProgID("CSI.ETABS.API.ETABSObject")  
  
    'start ETABS application  
    ret = EtabsObject.ApplicationStart()  
  
    'create SapModel object  
    SapModel = EtabsObject.SapModel  
  
    'initialize model  
    ret = SapModel.InitializeNewModel()
```

Introduction

```
'create steel deck template model
  ret = SapModel.File.NewSteelDeck(4, 12, 12, 4, 4, 24, 24)

'create new concrete frame section property
  ret = SapModel.PropFrame.SetRectangle("R1", "4000Psi", 20, 12)

'set frame section property
  ret = SapModel.FrameObj.SetSection("8", "R1")

'set concrete design code
  ret = SapModel.DesignConcrete.SetCode("ACI 318-08/IBC 2009")

'set overwrite item
  ret = SapModel.DesignConcrete.ACI318_08_IBC2009.SetOverwrite("8", 1, 2)

'close ETABS

Dim Value As Double
Dim returnValue As Integer
```

```
returnValue = instance.SetPreference(Item,
    Value)
```

```
int SetPreference(
    int Item,
    double Value
)
```

```
abstract SetPreference :
    Item : int *
    Value : float -> int
```

Parameters

Item

Type: SystemInt32

This is an integer between 1 and 13, inclusive, indicating the preference item considered.

1. Number of interaction curves
2. Number of interaction points
3. Consider minimum eccentricity
4. Seismic design category
5. Phi tension controlled

6. Phi compression controlled tied
7. Phi compression controlled spiral
8. Phi shear and/or torsion
9. Phi shear seismic
10. Phi joint shear
11. Pattern live load factor
12. Utilization factor limit
13. Multi-response case design

Value

Type: SystemDouble

The value of the considered preference item.

1. Number of interaction curves

Value ≥ 4 and divisible by 4

2. Number of interaction points

Value ≥ 5 and odd

3. Consider minimum eccentricity

0 = No

Any other value = Yes

4. Seismic design category

- . 1 = A
- . 2 = B
- . 3 = C
- . 4 = D
- . 5 = E
- . 6 = F

5. Phi tension controlled

Value > 0

6. Phi compression controlled tied

Value > 0

7. Phi compression controlled spiral

Value > 0

8. Phi shear and/or torsion

Value > 0

9. Phi shear seismic

Value > 0

10. Phi joint shear

Value > 0

11. Pattern live load factor

Value ≥ 0

12. Utilization factor limit

Value > 0

13. Multi-response case design

- 1 = Envelopes
- 2 = Step-by step
- 3 = Last step
- 4 = Envelopes - All
- 5 = Step-by step - All

Return Value

Type: Int32

Returns zero if the item is successfully set; otherwise it returns a nonzero value.

▲ Remarks

CSI API ETABS v1

cDCoACI318_14AddLanguageSpecificTextSet("LST861 Method

Retrieves the value of a concrete design overwrite item.

Namespace: ETABSv1

Assembly: ETABSv1 (in ETABSv1.dll) Version: 1.0.0.0 (1.24.0.0)

▲ Syntax

C#

VB

C++

F#

Copy

```
int GetOverwrite(
    string Name,
    int Item,
    ref double Value,
    ref bool ProgDet
)
```

```
Function GetOverwrite (
    Name As String,
    Item As Integer,
    ByRef Value As Double,
    ByRef ProgDet As Boolean
) As Integer
```

```
Dim instance As cDCoACI318_14
Dim Name As String
Dim Item As Integer
Dim Value As Double
Dim ProgDet As Boolean
Dim returnValue As Integer
```

```
returnValue = instance.GetOverwrite(Name,
    Item, Value, ProgDet)
```

```
int GetOverwrite(
    String^ Name,
    int Item,
    double% Value,
    bool% ProgDet
)
```

```
abstract GetOverwrite :
    Name : string *
    Item : int *
    Value : float byref *
    ProgDet : bool byref -> int
```

Parameters

Name

Type: SystemString

The name of a frame object with a concrete frame design procedure.

Item

Type: SystemInt32

This is an integer between 1 and 13, inclusive, indicating the overwrite item considered.

1. Framing type
2. Live load reduction factor
3. Unbraced length ratio, Major
4. Unbraced length ratio, Minor
5. Effective length factor, K Major
6. Effective length factor, K Minor
7. Moment coefficient, Cm Major
8. Moment coefficient, Cm Minor
9. Nonsway moment factor, Db Major
10. Nonsway moment factor, Db Minor
11. Sway moment factor, Ds Major
12. Sway moment factor, Ds Minor
13. Consider Minimum Eccentricity

Value

Type: SystemDouble

The value of the considered overwrite item.

1. Framing type
 - 0 = Program Default
 - 1 = Sway special
 - 2 = Sway Intermediate
 - 3 = Sway Ordinary
 - 4 = Non-sway
2. Live load reduction factor

Value ≥ 0 ; 0 means use program determined value

3. Unbraced length ratio, Major

Value ≥ 0 ; 0 means use program determined value

4. Unbraced length ratio, Minor

Value ≥ 0 ; 0 means use program determined value

5. Effective length factor, K Major

Value ≥ 0 ; 0 means use program determined value

6. Effective length factor, K Minor

Value ≥ 0 ; 0 means use program determined value

7. Moment coefficient, Cm Major

Value ≥ 0 ; 0 means use program determined value

8. Moment coefficient, Cm Minor

Introduction

Value ≥ 0 ; 0 means use program determined value

9. Nonsway moment factor, Db Major

Value ≥ 0 ; 0 means use program determined value

10. Nonsway moment factor, Db Minor

Value ≥ 0 ; 0 means use program determined value

11. Sway moment factor, Ds Major

Value ≥ 0 ; 0 means use program determined value

12. Sway moment factor, Ds Minor

Value ≥ 0 ; 0 means use program determined value

13. Consider Minimum Eccentricity

0 = No

Any other value = Yes

ProgDet

Type: SystemBoolean

If this item is True, the specified value is program determined.

Return Value

Type: Int32

Returns zero if the item is successfully retrieved; otherwise it returns a nonzero value.

▲ Remarks

▲ Examples

VB

Copy

```
Public Sub Example()  
    Dim SapModel As cSapModel  
    Dim EtabsObject As cOAPI  
    Dim ret As Integer = -1  
    Dim Value As Double  
    Dim ProgDet As Boolean  
  
    'create ETABS object  
    Dim myHelper as cHelper = New Helper  
    EtabsObject = myHelper.CreateObjectProgID("CSI.ETABS.API.ETABSObject")  
  
    'start ETABS application  
    ret = EtabsObject.ApplicationStart()  
  
    'create SapModel object  
    SapModel = EtabsObject.SapModel  
  
    'initialize model  
    ret = SapModel.InitializeNewModel()  
  
    'create steel deck template model  
    ret = SapModel.File.NewSteelDeck(4, 12, 12, 4, 4, 24, 24)  
  
    'create new concrete frame section property  
    ret = SapModel.PropFrame.SetRectangle("R1", "4000Psi", 20, 12)
```

Return Value

Introduction

```
'set frame section property
    ret = SapModel.FrameObj.SetSection("8", "R1")

'set concrete design code
    ret = SapModel.DesignConcrete.SetCode("ACI 318-14")

'run analysis
    System.IO.Directory.CreateDirectory("c:\CSI_API_temp")
    ret = SapModel.File.Save("C:\CSI_API_temp\example.edb")
    ret = SapModel.Analyze.RunAnalysis

'start concrete design
    ret = SapModel.DesignConcrete.StartDesign()

'get overwrite item
    ret = SapModel.DesignConcrete.ACI318_14.GetOverwrite("8", 1, Value, ProgDet)

'close ETABS
    EtabsObject.ApplicationExit(False)

'clean up variables
    SapModel = Nothing
    EtabsObject = Nothing

End Sub
```

CSI API ETABS v1

cDcOACI318_14AddLanguageSpecificTextSet("LSTB3B90B08_0?cp=948:|nu=.")

Method

Retrieves the value of a concrete design preference item.

Namespace: [ETABSv1](#)

Assembly: [ETABSv1](#) (in ETABSv1.dll) Version: 1.0.0.0 (1.24.0.0)

Syntax

[C#](#)

[VB](#)

[C++](#)

[F#](#)

[Copy](#)

```
int GetPreference(
    int Item,
    ref double Value
)
```

```
Function GetPreference (
    Item As Integer,
    ByRef Value As Double
) As Integer
```

```
Dim instance As cDcOACI318_14
Dim Item As Integer
Dim Value As Double
Dim returnValue As Integer
```

```
returnValue = instance.GetPreference(Item,
    Value)
```

```
int GetPreference(
    int Item,
    double% Value
)
```

```
abstract GetPreference :
    Item : int *
    Value : float byref -> int
```

Parameters

Item

Type: [SystemInt32](#)

This is an integer between 1 and 18, inclusive, indicating the preference item considered.

1. Number of interaction curves
2. Number of interaction points
3. Consider minimum eccentricity
4. Design for B/C Capacity Ratio?
5. Seismic design category

6. Design System Omega0
7. Design System Rho
8. Design System Sds
9. Consider ICC_ESR 2017
10. Phi tension controlled
11. Phi compression controlled tied
12. Phi compression controlled spiral
13. Phi shear and/or torsion
14. Phi shear seismic
15. Phi joint shear
16. Pattern live load factor
17. Utilization factor limit
18. Multi-response case design

Value

Type: SystemDouble

The value of the considered preference item.

1. Number of interaction curves

Value ≥ 4 and divisible by 4

2. Number of interaction points

Value ≥ 5 and odd

3. Consider minimum eccentricity

0 = No

Any other value = Yes

4. Design for B/C Capacity Ratio?

1 = No

2 = Yes

5. Seismic design category

. 1 = A

. 2 = B

. 3 = C

. 4 = D

. 5 = E

. 6 = F

6. Design System Omega0

Value > 0

7. Design System Rho

Value > 0

8. Design System Sds

Value ≥ 0

9. Consider ICC_ESR 2017

1 = No

2 = Yes

10. Phi tension controlled

Value > 0

11. Phi compression controlled tied

Value > 0

12. Phi compression controlled spiral

Value > 0

13. Phi shear and/or torsion

Value > 0

14. Phi shear seismic

Value > 0

15. Phi joint shear

Value > 0

16. Pattern live load factor

Value >= 0

17. Utilization factor limit

Value > 0

18. Multi-response case design

- 1 = Envelopes
- 2 = Step-by step
- 3 = Last step
- 4 = Envelopes - All
- 5 = Step-by step - All

Return Value

Type: Int32

Returns zero if the item is successfully retrieved; otherwise it returns a nonzero value.

▲ Remarks

▲ Examples

VB

Copy

```
Public Sub Example()
    Dim SapModel As cSapModel
    Dim EtabsObject As cOAPI
    Dim ret As Integer = -1
    Dim Value As Double

    'create ETABS object
    Dim myHelper as cHelper = New Helper
    EtabsObject = myHelper.CreateObjectProgID("CSI.ETABS.API.ETABSObject")

    'start ETABS application
    ret = EtabsObject.ApplicationStart()
```

Introduction

```
'create SapModel object
  SapModel = EtabsObject.SapModel

'initialize model
  ret = SapModel.InitializeNewModel()

'create steel deck template model
  ret = SapModel.File.NewSteelDeck(4, 12, 12, 4, 4, 24, 24)

'create new concrete frame section property
  ret = SapModel.PropFrame.SetRectangle("R1", "4000Psi", 20, 12)

'set frame section property
  ret = SapModel.FrameObj.SetSection("8", "R1")

'set concrete design code
  ret = SapModel.DesignConcrete.SetCode("ACI 318-14")

'run analysis
  System.IO.Directory.CreateDirectory("c:\CSI_API_temp")
  ret = SapModel.File.Save("C:\CSI_API_temp\example.edb")
  ret = SapModel.Analyze.RunAnalysis

'start concrete design
  ret = SapModel.DesignConcrete.StartDesign()

'get preference item
  ret = SapModel.DesignConcrete.ACI318_14.GetPreference(2, Value)

'close ETABS
  EtabsObject.ApplicationExit(False)

'clean up variables
  SapModel = Nothing
  EtabsObject = Nothing

End Sub
```

CSI API ETABS v1

cDCoACI318_14AddLanguageSpecificTextSet("LST4F2506FD_0") Method

Sets the value of a concrete design overwrite item.

Namespace: [ETABSV1](#)

Assembly: [ETABSV1](#) (in ETABSV1.dll) Version: 1.0.0.0 (1.24.0.0)

▲ Syntax

[C#](#)

[VB](#)

[C++](#)

[F#](#)

[Copy](#)

```
int SetOverwrite(
    string Name,
    int Item,
    double Value,
    eItemType ItemType = eItemType.Objects
)
```

```
Function SetOverwrite (
    Name As String,
    Item As Integer,
    Value As Double,
    ?ItemType As eItemType = eItemType.Objects
) As Integer
```

```
Dim instance As cDCoACI318_14
Dim Name As String
Dim Item As Integer
Dim Value As Double
Dim ItemType As eItemType
Dim returnValue As Integer
```

```
returnValue = instance.SetOverwrite(Name,
    Item, Value, ItemType)
```

```
int SetOverwrite(
    String^ Name,
    int Item,
    double Value,
    eItemType ItemType = eItemType::Objects
)
```

```
abstract SetOverwrite :
    Name : string *
    Item : int *
    Value : float *
    ?ItemType : eItemType
(* Defaults:
    let _ItemType = defaultArg ItemType eItemType.Objects
*)
-> int
```

Parameters**Name**Type: SystemString

The name of an existing frame object or group, depending on the value of the ItemType

ItemType: SystemInt32

This is an integer between 1 and 13, inclusive, indicating the overwrite item considered.

1. Framing type
2. Live load reduction factor
3. Unbraced length ratio, Major
4. Unbraced length ratio, Minor
5. Effective length factor, K Major
6. Effective length factor, K Minor
7. Moment coefficient, Cm Major
8. Moment coefficient, Cm Minor
9. Nonsway moment factor, Db Major
10. Nonsway moment factor, Db Minor
11. Sway moment factor, Ds Major
12. Sway moment factor, Ds Minor
13. Consider Minimum Eccentricity

ValueType: SystemDouble

The value of the considered overwrite item.

1. Framing type
 - 0 = Program Default
 - 1 = Sway special
 - 2 = Sway Intermediate
 - 3 = Sway Ordinary
 - 4 = Non-sway
2. Live load reduction factor

Value ≥ 0 ; 0 means use program determined value

3. Unbraced length ratio, Major

Value ≥ 0 ; 0 means use program determined value

4. Unbraced length ratio, Minor

Value ≥ 0 ; 0 means use program determined value

5. Effective length factor, K Major

Value ≥ 0 ; 0 means use program determined value

6. Effective length factor, K Minor

Value ≥ 0 ; 0 means use program determined value

7. Moment coefficient, Cm Major

Value ≥ 0 ; 0 means use program determined value

8. Moment coefficient, Cm Minor

Introduction

Value ≥ 0 ; 0 means use program determined value

9. Nonsway moment factor, Db Major

Value ≥ 0 ; 0 means use program determined value

10. Nonsway moment factor, Db Minor

Value ≥ 0 ; 0 means use program determined value

11. Sway moment factor, Ds Major

Value ≥ 0 ; 0 means use program determined value

12. Sway moment factor, Ds Minor

Value ≥ 0 ; 0 means use program determined value

13. Consider Minimum Eccentricity

0 = No

Any other value = Yes

ItemType (Optional)

Type: $\hat{A}$ ETABSv1eItemType

This is one of the following items in the eItemType enumeration:

◇ Object = 0

◇ Group = 1

◇ SelectedObjects = 2

If this item is Objects, the overwrite is set for the frame object specified by the Name item.

If this item is Group, the overwrite is set for all frame objects in the group specified by the Name item.

If this item is SelectedObjects, the overwrite is set for all selected frame objects and the Name item is ignored.

Return Value

Type: $\hat{A}$ Int32

Returns zero if the item is successfully set; otherwise it returns a nonzero value.

▲ Remarks

▲ Examples

VB

Copy

```
Public Sub Example()  
    Dim SapModel As cSapModel  
    Dim EtabsObject As cOAPI  
    Dim ret As Integer = -1  
    Dim Value As Double  
    Dim ProgDet As Boolean  
  
    'create ETABS object  
    Dim myHelper as cHelper = New Helper  
    EtabsObject = myHelper.CreateObjectProgID("CSI.ETABS.API.ETABSObject")  
  
    'start ETABS application
```

Return Value

Introduction

```
ret = EtabsObject.ApplicationStart()

'create SapModel object
SapModel = EtabsObject.SapModel

'initialize model
ret = SapModel.InitializeNewModel()

'create steel deck template model
ret = SapModel.File.NewSteelDeck(4, 12, 12, 4, 4, 24, 24)

'create new concrete frame section property
ret = SapModel.PropFrame.SetRectangle("R1", "4000Psi", 20, 12)

'set frame section property
ret = SapModel.FrameObj.SetSection("8", "R1")

    int Item,
    double Value
)
```

```
abstract SetPreference :
    Item : int *
    Value : float -> int
```

Parameters

Item

Type: [SystemInt32](#)

This is an integer between 1 and 18, inclusive, indicating the preference item considered.

1. Number of interaction curves
2. Number of interaction points
3. Consider minimum eccentricity
4. Design for B/C Capacity Ratio?
5. Seismic design category

6. Design System Omega0
7. Design System Rho
8. Design System Sds
9. Consider ICC_ESR 2017
10. Phi tension controlled
11. Phi compression controlled tied
12. Phi compression controlled spiral
13. Phi shear and/or torsion
14. Phi shear seismic
15. Phi joint shear
16. Pattern live load factor
17. Utilization factor limit
18. Multi-response case design

Value

Type: SystemDouble

The value of the considered preference item.

1. Number of interaction curves

Value ≥ 4 and divisible by 4

2. Number of interaction points

Value ≥ 5 and odd

3. Consider minimum eccentricity

0 = No

Any other value = Yes

4. Design for B/C Capacity Ratio?

1 = No

2 = Yes

5. Seismic design category

. 1 = A

. 2 = B

. 3 = C

. 4 = D

. 5 = E

. 6 = F

6. Design System Omega0

Value > 0

7. Design System Rho

Value > 0

8. Design System Sds

Value ≥ 0

9. Consider ICC_ESR 2017

1 = No

2 = Yes

10. Phi tension controlled

Value > 0

11. Phi compression controlled tied

Value > 0

12. Phi compression controlled spiral

Value > 0

13. Phi shear and/or torsion

Value > 0

14. Phi shear seismic

Value > 0

15. Phi joint shear

Value > 0

16. Pattern live load factor

Value >= 0

17. Utilization factor limit

Value > 0

18. Multi-response case design

- 1 = Envelopes
- 2 = Step-by step
- 3 = Last step
- 4 = Envelopes - All
- 5 = Step-by step - All

Return Value

Type: Int32

Returns zero if the item is successfully set; otherwise it returns a nonzero value.

▲ Remarks

▲ Examples

VB

Copy

```
Public Sub Example()
    Dim SapModel As cSapModel
    Dim EtabsObject As cOAPI
    Dim ret As Integer = -1
    Dim Value As Double

    'create ETABS object
    Dim myHelper as cHelper = New Helper
    EtabsObject = myHelper.CreateObjectProgID("CSI.ETABS.API.ETABSObject")

    'start ETABS application
    ret = EtabsObject.ApplicationStart()
```

Introduction

```
'create SapModel object
  SapModel = EtabsObject.SapModel

'initialize model
  ret = SapModel.InitializeNewModel()

'create steel deck template model
  ret = SapModel.File.NewSteelDeck(4, 12, 12, 4, 4, 24, 24)

'create new concrete frame section property
  ret = SapModel.PropFrame.SetRectangle("R1", "4000Psi", 20, 12)

'set frame section property
  ret = SapModel.FrameObj.SetSection("8", "R1")

'set concrete design code
  ret = SapModel.DesignConcrete.SetCode("ACI 318-14")

'run analysis
  System.IO.Directory.CreateDirectory("c:\CSI_API_temp")
  ret = SapModel.File.Save("C:\CSI_API_temp\example.edb")
  ret = SapModel.Analyze.RunAnalysis

'start concrete design
  ret = SapModel.DesignConcrete.StartDesign()

'set preference item
  ret = SapModel.DesignConcrete.ACI318_14.SetPreference(2, 7)

'get preference item
  ret = SapModel.DesignConcrete.ACI318_14.GetPreference(2, Value)

'close ETABS
  EtabsObject.ApplicationExit(False)

'clean up variables
  SapModel = Nothing
  EtabsObject = Nothing

End Sub
```

CSI API ETABS v1

cDCoACI318_19AddLanguageSpecificTextSet("LST390 Method

Retrieves the value of a concrete design overwrite item.

Namespace: ETABSv1

Assembly: ETABSv1 (in ETABSv1.dll) Version: 1.0.0.0 (1.24.0.0)

■ Syntax

C#

VB

C++

F#

Copy

```
int GetOverwrite(
    string Name,
    int Item,
    ref double Value,
    ref bool ProgDet
)
```

```
Function GetOverwrite (
    Name As String,
    Item As Integer,
    ByRef Value As Double,
    ByRef ProgDet As Boolean
) As Integer
```

```
Dim instance As cDCoACI318_19
Dim Name As String
Dim Item As Integer
Dim Value As Double
Dim ProgDet As Boolean
Dim returnValue As Integer
```

```
returnValue = instance.GetOverwrite(Name,
    Item, Value, ProgDet)
```

```
int GetOverwrite(
    String^ Name,
    int Item,
    double% Value,
    bool% ProgDet
)
```

```
abstract GetOverwrite :
    Name : string *
    Item : int *
    Value : float byref *
    ProgDet : bool byref -> int
```

Parameters

Name

Type:Â SystemString

The name of a frame object with a concrete frame design procedure.

Item

Type:Â SystemInt32

This is an integer between 1 and 13, inclusive, indicating the overwrite item considered.

1. Framing type
2. Live load reduction factor
3. Unbraced length ratio, Major
4. Unbraced length ratio, Minor
5. Effective length factor, K Major
6. Effective length factor, K Minor
7. Moment coefficient, Cm Major
8. Moment coefficient, Cm Minor
9. Nonsway moment factor, Db Major
10. Nonsway moment factor, Db Minor
11. Sway moment factor, Ds Major
12. Sway moment factor, Ds Minor
13. Consider Minimum Eccentricity

Value

Type:Â SystemDouble

The value of the considered overwrite item.

1. Framing type
 - 0 = Program Default
 - 1 = Sway special
 - 2 = Sway Intermediate
 - 3 = Sway Ordinary
 - 4 = Non-sway
2. Live load reduction factor

Value ≥ 0 ; 0 means use program determined value

3. Unbraced length ratio, Major

Value ≥ 0 ; 0 means use program determined value

4. Unbraced length ratio, Minor

Value ≥ 0 ; 0 means use program determined value

5. Effective length factor, K Major

Value ≥ 0 ; 0 means use program determined value

6. Effective length factor, K Minor

Value ≥ 0 ; 0 means use program determined value

7. Moment coefficient, Cm Major

Value ≥ 0 ; 0 means use program determined value

8. Moment coefficient, Cm Minor

Introduction

Value ≥ 0 ; 0 means use program determined value

9. Nonsway moment factor, Db Major

Value ≥ 0 ; 0 means use program determined value

10. Nonsway moment factor, Db Minor

Value ≥ 0 ; 0 means use program determined value

11. Sway moment factor, Ds Major

Value ≥ 0 ; 0 means use program determined value

12. Sway moment factor, Ds Minor

Value ≥ 0 ; 0 means use program determined value

13. Consider Minimum Eccentricity

0 = No

Any other value = Yes

ProgDet

Type: SystemBoolean

If this item is True, the specified value is program determined.

Return Value

Type: Int32

Returns zero if the item is successfully retrieved; otherwise it returns a nonzero value.

▲ Remarks

▲ Examples

VB

Copy

```
Public Sub Example()  
    Dim SapModel As cSapModel  
    Dim EtabsObject As cOAPI  
    Dim ret As Integer = -1  
    Dim Value As Double  
    Dim ProgDet As Boolean  
  
    'create ETABS object  
    Dim myHelper as cHelper = New Helper  
    EtabsObject = myHelper.CreateObjectProgID("CSI.ETABS.API.ETABSObject")  
  
    'start ETABS application  
    ret = EtabsObject.ApplicationStart()  
  
    'create SapModel object  
    SapModel = EtabsObject.SapModel  
  
    'initialize model  
    ret = SapModel.InitializeNewModel()  
  
    'create steel deck template model  
    ret = SapModel.File.NewSteelDeck(4, 12, 12, 4, 4, 24, 24)  
  
    'create new concrete frame section property  
    ret = SapModel.PropFrame.SetRectangle("R1", "4000Psi", 20, 12)
```

Return Value

Introduction

```
'set frame section property
    ret = SapModel.FrameObj.SetSection("8", "R1")

'set concrete design code
    ret = SapModel.DesignConcrete.SetCode("ACI 318-19")

'run analysis
    System.IO.Directory.CreateDirectory("c:\CSI_API_temp")
    ret = SapModel.File.Save("C:\CSI_API_temp\example.edb")
    ret = SapModel.Analyze.RunAnalysis

'start concrete design
    ret = SapModel.DesignConcrete.StartDesign()

'get overwrite item
    ret = SapModel.DesignConcrete.ACI318_19.GetOverwrite("8", 1, Value, ProgDet)

'close ETABS
    EtabsObject.ApplicationExit(False)

'clean up variables
    SapModel = Nothing
    EtabsObject = Nothing

End Sub
```

CSI API ETABS v1

cDCoACI318_19AddLanguageSpecificTextSet("LST39A Method

Sets the value of a concrete design overwrite item.

Namespace: [ETABSv1](#)

Assembly: [ETABSv1](#) (in ETABSv1.dll) Version: 1.0.0.0 (1.24.0.0)

Syntax

[C#](#)

[VB](#)

[C++](#)

[F#](#)

[Copy](#)

```
int SetOverwrite(
    string Name,
    int Item,
    double Value,
    eItemType ItemType = eItemType.Objects
)
```

```
Function SetOverwrite (
    Name As String,
    Item As Integer,
    Value As Double,
    ?ItemType As eItemType = eItemType.Objects
) As Integer
```

```
Dim instance As cDCoACI318_19
Dim Name As String
Dim Item As Integer
Dim Value As Double
Dim ItemType As eItemType
Dim returnValue As Integer
```

```
returnValue = instance.SetOverwrite(Name,
    Item, Value, ItemType)
```

```
int SetOverwrite(
    String^ Name,
    int Item,
    double Value,
    eItemType ItemType = eItemType::Objects
)
```

```
abstract SetOverwrite :
    Name : string *
    Item : int *
    Value : float *
    ?ItemType : eItemType
(* Defaults:
    let _ItemType = defaultArg ItemType eItemType.Objects
*)
-> int
```

Parameters**Name**Type: SystemString

The name of an existing frame object or group, depending on the value of the ItemType

ItemType: SystemInt32

This is an integer between 1 and 13, inclusive, indicating the overwrite item considered.

1. Framing type
2. Live load reduction factor
3. Unbraced length ratio, Major
4. Unbraced length ratio, Minor
5. Effective length factor, K Major
6. Effective length factor, K Minor
7. Moment coefficient, Cm Major
8. Moment coefficient, Cm Minor
9. Nonsway moment factor, Db Major
10. Nonsway moment factor, Db Minor
11. Sway moment factor, Ds Major
12. Sway moment factor, Ds Minor
13. Consider Minimum Eccentricity

ValueType: SystemDouble

The value of the considered overwrite item.

1. Framing type
 - 0 = Program Default
 - 1 = Sway special
 - 2 = Sway Intermediate
 - 3 = Sway Ordinary
 - 4 = Non-sway
2. Live load reduction factor

Value ≥ 0 ; 0 means use program determined value

3. Unbraced length ratio, Major

Value ≥ 0 ; 0 means use program determined value

4. Unbraced length ratio, Minor

Value ≥ 0 ; 0 means use program determined value

5. Effective length factor, K Major

Value ≥ 0 ; 0 means use program determined value

6. Effective length factor, K Minor

Value ≥ 0 ; 0 means use program determined value

7. Moment coefficient, Cm Major

Value ≥ 0 ; 0 means use program determined value

8. Moment coefficient, Cm Minor

Introduction

Value ≥ 0 ; 0 means use program determined value

9. Nonsway moment factor, Db Major

Value ≥ 0 ; 0 means use program determined value

10. Nonsway moment factor, Db Minor

Value ≥ 0 ; 0 means use program determined value

11. Sway moment factor, Ds Major

Value ≥ 0 ; 0 means use program determined value

12. Sway moment factor, Ds Minor

Value ≥ 0 ; 0 means use program determined value

13. Consider Minimum Eccentricity

0 = No

Any other value = Yes

ItemType (Optional)

Type: $\hat{A}$ ETABSv1eItemType

This is one of the following items in the eItemType enumeration:

◇ Object = 0

◇ Group = 1

◇ SelectedObjects = 2

If this item is Objects, the overwrite is set for the frame object specified by the Name item.

If this item is Group, the overwrite is set for all frame objects in the group specified by the Name item.

If this item is SelectedObjects, the overwrite is set for all selected frame objects and the Name item is ignored.

Return Value

Type: $\hat{A}$ Int32

Returns zero if the item is successfully set; otherwise it returns a nonzero value.

CSI API ETABS v1

cDcOACI318_19AddLanguageSpecificTextSet("LSTB220A303_0") Method

Sets the value of a concrete design preference item.

Namespace: [ETABSv1](#)

Assembly: [ETABSv1](#) (in ETABSv1.dll) Version: 1.0.0.0 (1.24.0.0)

▲ Syntax

[C#](#)

[VB](#)

[C++](#)

[F#](#)

[Copy](#)

```
int SetPreference(
    int Item,
    double Value
)
```

```
Function SetPreference (
    Item As Integer,
    Value As Double
) As Integer
```

```
Dim instance As cDcOACI318_19
Dim Item As Integer
Dim Value As Double
Dim returnValue As Integer
```

```
returnValue = instance.SetPreference(Item,
    Value)
```

```
int SetPreference(
    int Item,
    double Value
)
```

```
abstract SetPreference :
    Item : int *
    Value : float -> int
```

Parameters

Item

Type: [System.Int32](#)

This is an integer between 1 and 18, inclusive, indicating the preference item considered.

1. Number of interaction curves
2. Number of interaction points
3. Consider minimum eccentricity
4. Design for B/C Capacity Ratio?
5. Seismic design category

6. Design System Omega0
7. Design System Rho
8. Design System Sds
9. Consider ICC_ESR 2017
10. Phi tension controlled
11. Phi compression controlled tied
12. Phi compression controlled spiral
13. Phi shear and/or torsion
14. Phi shear seismic
15. Phi joint shear
16. Pattern live load factor
17. Utilization factor limit
18. Multi-response case design

Value

Type: SystemDouble

The value of the considered preference item.

1. Number of interaction curves

Value ≥ 4 and divisible by 4

2. Number of interaction points

Value ≥ 5 and odd

3. Consider minimum eccentricity

0 = No

Any other value = Yes

4. Design for B/C Capacity Ratio?

1 = No

2 = Yes

5. Seismic design category

. 1 = A

. 2 = B

. 3 = C

. 4 = D

. 5 = E

. 6 = F

6. Design System Omega0

Value > 0

7. Design System Rho

Value > 0

8. Design System Sds

Value ≥ 0

9. Consider ICC_ESR 2017

1 = No

2 = Yes

10. Phi tension controlled

Value > 0

11. Phi compression controlled tied

Value > 0

12. Phi compression controlled spiral

Value > 0

13. Phi shear and/or torsion

Value > 0

14. Phi shear seismic

Value > 0

15. Phi joint shear

Value > 0

16. Pattern live load factor

Value >= 0

17. Utilization factor limit

Value > 0

18. Multi-response case design

- 1 = Envelopes
- 2 = Step-by step
- 3 = Last step
- 4 = Envelopes - All
- 5 = Step-by step - All

Return Value

Type: Int32

Returns zero if the item is successfully set; otherwise it returns a nonzero value.

▲ Remarks

▲ Examples

VB

Copy

```
Public Sub Example()
    Dim SapModel As cSapModel
    Dim EtabsObject As cOAPI
    Dim ret As Integer = -1
    Dim Value As Double

    'create ETABS object
    Dim myHelper as cHelper = New Helper
    EtabsObject = myHelper.CreateObjectProgID("CSI.ETABS.API.ETABSObject")

    'start ETABS application
    ret = EtabsObject.ApplicationStart()
```

Introduction

```
'create SapModel object
  SapModel = EtabsObject.SapModel

'initialize model
  ret = SapModel.InitializeNewModel()

'create steel deck template model
  ret = SapModel.File.NewSteelDeck(4, 12, 12, 4, 4, 24, 24)

'create new concrete frame section property
  ret = SapModel.PropFrame.SetRectangle("R1", "4000Psi", 20, 12)

'set frame section property
  ret = SapModel.FrameObj.SetSection("8", "R1")

'set concrete design code
  ret = SapModel.DesignConcrete.SetCode("ACI 318-19")

'run analysis
  System.IO.Directory.CreateDirectory("c:\CSI_API_temp")
  ret = SapModel.File.Save("C:\CSI_API_temp\example.edb")
  ret = SapModel.Analyze.RunAnalysis

'start concrete design
  ret = SapModel.DesignConcrete.StartDesign()

'set preference item
  ret = SapModel.DesignConcrete.ACI318_19.SetPreference(2, 7)

'get preference item
  ret = SapModel.DesignConcrete.ACI318_19.GetPreference(2, Value)

'close ETABS
  EtabsObject.ApplicationExit(False)

'clean up variables
  SapModel = Nothing
  EtabsObject = Nothing

End Sub
```

CSI API ETABS v1

cDCoAS_3600_2018AddLanguageSpecificTextSet("LST22447370_0") Method

Retrieves the value of a concrete design overwrite item.

Namespace: ETABSv1

Assembly: ETABSv1 (in ETABSv1.dll) Version: 1.0.0.0 (1.24.0.0)

■ Syntax

C#

VB

C++

F#

Copy

```
int GetOverwrite(
    string Name,
    int Item,
    ref double Value,
    ref bool ProgDet
)
```

```
Function GetOverwrite (
    Name As String,
    Item As Integer,
    ByRef Value As Double,
    ByRef ProgDet As Boolean
) As Integer
```

```
Dim instance As cDCoAS_3600_2018
Dim Name As String
Dim Item As Integer
Dim Value As Double
Dim ProgDet As Boolean
Dim returnValue As Integer
```

```
returnValue = instance.GetOverwrite(Name,
    Item, Value, ProgDet)
```

```
int GetOverwrite(
    String^ Name,
    int Item,
    double% Value,
    bool% ProgDet
)
```

```
abstract GetOverwrite :
    Name : string *
    Item : int *
    Value : float byref *
    ProgDet : bool byref -> int
```

Parameters

Name

Type: SystemString

The name of a frame object with a concrete frame design procedure.

Item

Type: SystemInt32

This is an integer between 1 and 12, inclusive, indicating the overwrite item considered.

1. Framing type
2. Live load reduction factor
3. Unbraced length ratio, Major
4. Unbraced length ratio, Minor
5. Effective length factor, K Major
6. Effective length factor, K Minor
7. Moment coefficient, Cm Major
8. Moment coefficient, Cm Minor
9. Nonsway moment factor, Db Major
10. Nonsway moment factor, Db Minor
11. Sway moment factor, Ds Major
12. Sway moment factor, Ds Minor

Value

Type: SystemDouble

The value of the considered overwrite item.

1. Framing type
 - 0 = Program Default
 - 1 = Sway Intermediate
 - 2 = Sway Ordinary
 - 3 = Non-sway
2. Live load reduction factor

Value ≥ 0 ; 0 means use program determined value

3. Unbraced length ratio, Major

Value ≥ 0 ; 0 means use program determined value

4. Unbraced length ratio, Minor

Value ≥ 0 ; 0 means use program determined value

5. Effective length factor, K Major

Value ≥ 0 ; 0 means use program determined value

6. Effective length factor, K Minor

Value ≥ 0 ; 0 means use program determined value

7. Moment coefficient, Cm Major

Value ≥ 0 ; 0 means use program determined value

8. Moment coefficient, Cm Minor

Value ≥ 0 ; 0 means use program determined value

9. Nonsway moment factor, Db Major

Introduction

Value ≥ 0 ; 0 means use program determined value

10. Nonsway moment factor, Db Minor

Value ≥ 0 ; 0 means use program determined value

11. Sway moment factor, Ds Major

Value ≥ 0 ; 0 means use program determined value

12. Sway moment factor, Ds Minor

Value ≥ 0 ; 0 means use program determined value

ProgDet

Type: SystemBoolean

If this item is True, the specified value is program determined.

Return Value

Type: Int32

Returns zero if the item is successfully retrieved; otherwise it returns a nonzero value.

CSI API ETABS v1

cDCoAS_3600_2018AddLanguageSpecificTextSet("LST541EB62C_0") Method

Retrieves the value of a concrete design preference item.

Namespace: ETABSv1

Assembly: ETABSv1 (in ETABSv1.dll) Version: 1.0.0.0 (1.24.0.0)

■ Syntax

C#

VB

C++

F#

Copy

```
int GetPreference(
    int Item,
    ref double Value
)
```

```
Function GetPreference (
    Item As Integer,
    ByRef Value As Double
) As Integer
```

```
Dim instance As cDCoAS_3600_2018
Dim Item As Integer
Dim Value As Double
Dim returnValue As Integer
```

```
returnValue = instance.GetPreference(Item,
    Value)
```

```
int GetPreference(
    int Item,
    double% Value
)
```

```
abstract GetPreference :
    Item : int *
    Value : float byref -> int
```

Parameters

Item

Type: SystemInt32

This is an integer between 1 and 11, inclusive, indicating the preference item considered.

1. Number of interaction curves
2. Number of interaction points
3. Consider minimum eccentricity
4. Phi tension controlled
5. Phi compression controlled tied

6. Phi shear and/or torsion
7. Phi shear seismic
8. Phi joint shear
9. Pattern live load factor
10. Utilization factor limit
11. Multi-response case design

Value

Type: SystemDouble

The value of the considered preference item.

1. Number of interaction curves

Value ≥ 4 and divisible by 4

2. Number of interaction points

Value ≥ 5 and odd

3. Consider minimum eccentricity

0 = No

Any other value = Yes

4. Phi tension controlled

Value > 0

5. Phi compression controlled tied

Value > 0

6. Phi shear and/or torsion

Value > 0

7. Phi shear seismic

Value > 0

8. Phi joint shear

Value > 0

9. Pattern live load factor

Value ≥ 0

10. Utilization factor limit

Value > 0

11. Multi-response case design

- 1 = Envelopes
- 2 = Step-by step
- 3 = Last step
- 4 = Envelopes - All
- 5 = Step-by step - All

Return Value

Type: Int32

Returns zero if the item is successfully retrieved; otherwise it returns a nonzero value.

CSI API ETABS v1

cDCoAS_3600_2018AddLanguageSpecificTextSet("LST14181EAD_0") Method

Sets the value of a concrete design overwrite item.

Namespace: ETABSv1

Assembly: ETABSv1 (in ETABSv1.dll) Version: 1.0.0.0 (1.24.0.0)

Syntax

C#

VB

C++

F#

Copy

```
int SetOverwrite(
    string Name,
    int Item,
    double Value,
    eItemType ItemType = eItemType.Objects
)
```

```
Function SetOverwrite (
    Name As String,
    Item As Integer,
    Value As Double,
    ?ItemType As eItemType = eItemType.Objects
) As Integer
```

```
Dim instance As cDCoAS_3600_2018
Dim Name As String
Dim Item As Integer
Dim Value As Double
Dim ItemType As eItemType
Dim returnValue As Integer
```

```
returnValue = instance.SetOverwrite(Name,
    Item, Value, ItemType)
```

```
int SetOverwrite(
    String^ Name,
    int Item,
    double Value,
    eItemType ItemType = eItemType::Objects
)
```

```
abstract SetOverwrite :
    Name : string *
    Item : int *
    Value : float *
    ?ItemType : eItemType
(* Defaults:
    let _ItemType = defaultArg ItemType eItemType.Objects
*)
-> int
```

Parameters**Name**Type: SystemString

The name of an existing frame object or group, depending on the value of the ItemType

ItemType: SystemInt32

This is an integer between 1 and 12, inclusive, indicating the overwrite item considered.

1. Framing type
2. Live load reduction factor
3. Unbraced length ratio, Major
4. Unbraced length ratio, Minor
5. Effective length factor, K Major
6. Effective length factor, K Minor
7. Moment coefficient, Cm Major
8. Moment coefficient, Cm Minor
9. Nonsway moment factor, Db Major
10. Nonsway moment factor, Db Minor
11. Sway moment factor, Ds Major
12. Sway moment factor, Ds Minor

ValueType: SystemDouble

The value of the considered overwrite item.

1. Framing type
 - 0 = Program Default
 - 1 = Sway Intermediate
 - 2 = Sway Ordinary
 - 3 = Non-sway
2. Live load reduction factor

Value ≥ 0 ; 0 means use program determined value

3. Unbraced length ratio, Major

Value ≥ 0 ; 0 means use program determined value

4. Unbraced length ratio, Minor

Value ≥ 0 ; 0 means use program determined value

5. Effective length factor, K Major

Value ≥ 0 ; 0 means use program determined value

6. Effective length factor, K Minor

Value ≥ 0 ; 0 means use program determined value

7. Moment coefficient, Cm Major

Value ≥ 0 ; 0 means use program determined value

8. Moment coefficient, Cm Minor

Value ≥ 0 ; 0 means use program determined value

9. Nonsway moment factor, Db Major

Value ≥ 0 ; 0 means use program determined value

10. Nonsway moment factor, Db Minor

Value ≥ 0 ; 0 means use program determined value

11. Sway moment factor, Ds Major

Value ≥ 0 ; 0 means use program determined value

12. Sway moment factor, Ds Minor

Value ≥ 0 ; 0 means use program determined value

ItemType (Optional)

Type: $\hat{A}$ ETABSv1eItemType

This is one of the following items in the eItemType enumeration:

◊ Object = 0

◊ Group = 1

◊ SelectedObjects = 2

If this item is Objects, the overwrite is set for the frame object specified by the Name item.

If this item is Group, the overwrite is set for all frame objects in the group specified by the Name item.

If this item is SelectedObjects, the overwrite is set for all selected frame objects and the Name item is ignored.

Return Value

Type: $\hat{A}$ Int32

Returns zero if the item is successfully retrieved; otherwise it returns a nonzero value.

CSI API ETABS v1

cDCoEurocode_2_2004AddLanguageSpecificTextSet("Method

Retrieves the value of a concrete design overwrite item.

Namespace: [ETABSv1](#)

Assembly: [ETABSv1](#) (in ETABSv1.dll) Version: 1.0.0.0 (1.24.0.0)

▲ Syntax

[C#](#)

[VB](#)

[C++](#)

[F#](#)

[Copy](#)

```
int GetOverwrite(
    string Name,
    int Item,
    ref double Value,
    ref bool ProgDet
)
```

```
Function GetOverwrite (
    Name As String,
    Item As Integer,
    ByRef Value As Double,
    ByRef ProgDet As Boolean
) As Integer
```

```
Dim instance As cDCoEurocode_2_2004
Dim Name As String
Dim Item As Integer
Dim Value As Double
Dim ProgDet As Boolean
Dim returnValue As Integer
```

```
returnValue = instance.GetOverwrite(Name,
    Item, Value, ProgDet)
```

```
int GetOverwrite(
    String^ Name,
    int Item,
    double% Value,
    bool% ProgDet
)
```

```
abstract GetOverwrite :
    Name : string *
    Item : int *
    Value : float byref *
    ProgDet : bool byref -> int
```

Parameters

Name

Type:Â SystemString

The name of a frame object with a concrete frame design procedure.

Item

Type:Â SystemInt32

This is an integer between 1 and 27, inclusive, indicating the overwrite item considered.

1. Framing type
2. Live load reduction factor
3. Unbraced length ratio, Major
4. Unbraced length ratio, Minor
5. Effective length factor, Beta Major (columns only)
6. Effective length factor, Beat Minor (columns only)
7. Moment coefficient, Cm Major (not used)
8. Moment coefficient, Cm Minor (not used)
9. Nonsway moment factor, Db Major (not used)
10. Nonsway moment factor, Db Minor (not used)
11. Sway moment factor, Ds Major (not used)
12. Sway moment factor, Ds Minor (not used)
13. Correction factor depending on axial load in Nominal Curvature method, Kr Major (columns only)
14. Factor accounting for creep in Nominal Curvature method, KPhi Major (columns only)
16. Correction factor depending on axial load in Nominal Curvature method, Kr Minor (columns only)
17. Factor accounting for creep in Nominal Curvature method, KPhi Minor (columns only)
18. Coefficient depending on the distribution of first-order moment in both Nominal Stiffness and Nominal Curvature methods, c Major (columns only)
19. Coefficient depending on the distribution of first-order moment in both Nominal Stiffness and Nominal Curvature methods, c Minor (columns only)
20. Factor for contribution of reinforcement, Ks Major (columns only)
21. Ignore the benefit of Pu for beam design? (beams only)
22. Factor for contribution of reinforcement, Ks Minor (columns only)
23. Factor for effects of cracking, creep etc, Kc Major (columns only)
24. Factor for effects of cracking, creep etc, Kc Minor (columns only)
25. Effective creep coefficient, Phief (columns only)
26. Consider torsion (beams only)
27. Consider minimum eccentricity (columns only)

Value

Type:Â SystemDouble

The value of the considered overwrite item.

1. Framing type
 - 0 = Program Determined
 - 1 = DC High
 - 2 = DC Medium
 - 3 = DC Low

- 4 = Secondary
- 2. Live load reduction factor
 - Value ≥ 0 ; 0 means use program determined value
- 3. Unbraced length ratio, Major
 - Value ≥ 0 ; 0 means use program determined value
- 4. Unbraced length ratio, Minor
 - Value ≥ 0 ; 0 means use program determined value
- 5. Effective length factor, Beta Major
 - Value ≥ 0 ; 0 means use program determined value
- 6. Effective length factor, Beta Minor
 - Value ≥ 0 ; 0 means use program determined value
- 7. Moment coefficient, Cm Major
 - Value ≥ 0 ; 0 means use program determined value
- 8. Moment coefficient, Cm Minor
 - Value ≥ 0 ; 0 means use program determined value
- 9. Nonsway moment factor, Db Major
 - Value ≥ 0 ; 0 means use program determined value
- 10. Nonsway moment factor, Db Minor
 - Value ≥ 0 ; 0 means use program determined value
- 11. Sway moment factor, Ds Major
 - Value ≥ 0 ; 0 means use program determined value
- 12. Sway moment factor, Ds Minor
 - Value ≥ 0 ; 0 means use program determined value
- 13. Correction factor depending on axial load in Nominal Curvature method, Kr Major
 - Value ≥ 0 ; 0 means use program determined value
- 14. Factor accounting for creep in Nominal Curvature method, KPhi Major
 - Value ≥ 0 ; 0 means use program determined value
- 16. Correction factor depending on axial load in Nominal Curvature method, Kr Minor
 - Value ≥ 0 ; 0 means use program determined value
- 17. Factor accounting for creep in Nominal Curvature method, KPhi Minor
 - Value ≥ 0 ; 0 means use program determined value
- 18. Coefficient depending on the distribution of first-order moment in both Nominal Stiffness and Nominal Curvature methods, c Major
 - Value ≥ 0 ; 0 means use program determined value

Introduction

Value ≥ 0 ; 0 means use program determined value

19. Coefficient depending on the distribution of first-order moment in both Nominal Stiffness and Nominal Curvature methods, c Minor

Value ≥ 0 ; 0 means use program determined value

20. Factor for contribution of reinforcement, Ks Major

Value ≥ 0 ; 0 means use program determined value

21. Ignore the benefit of Pu for beam design?

· 0 = No

· Any other value = Yes

22. Factor for contribution of reinforcement, Ks Minor

Value ≥ 0 ; 0 means use program determined value

23. Factor for effects of cracking, creep etc, Kc Major

Value ≥ 0 ; 0 means use program determined value

24. Factor for effects of cracking, creep etc, Kc Minor

Value ≥ 0 ; 0 means use program determined value

25. Effective creep coefficient, Phief

Value ≥ 0 ; 0 means use program determined value

26. Consider torsion

· 0 = No

· Any other value = Yes

27. Consider minimum eccentricity

· 0 = No

· Any other value = Yes

ProgDet

Type: System.Boolean

If this item is True, the specified value is program determined.

Return Value

Type: Int32

Returns zero if the item is successfully retrieved; otherwise it returns a nonzero value.

▲ Remarks

▲ Examples

VB

Copy

```
Public Sub Example()  
    Dim SapModel As cSapModel  
    Dim EtabsObject As cOAPI  
    Dim ret As Integer = -1  
    Dim Value As Double  
    Dim ProgDet As Boolean  
  
    'create ETABS object  
    Dim myHelper as cHelper = New Helper  
    EtabsObject = myHelper.CreateObjectProgID("CSI.ETABS.API.ETABSObject")  
  
    'start ETABS application
```

Return Value

Introduction

```
ret = EtabsObject.ApplicationStart()

'create SapModel object
SapModel = EtabsObject.SapModel

'initialize model
ret = SapModel.InitializeNewModel()

'create steel deck template model
ret = SapModel.File.NewSteelDeck(4, 12, 12, 4, 4, 24, 24)

'create new concrete frame section property
ret = SapModel.PropFrame.SetRectangle("R1", "4000Psi", 20, 12)

'set frame section property
ret = SapModel.FrameObj.SetSection("8", "R1")

'set concrete design code
ret = SapModel.DesignConcrete.SetCode("Eurocode 2-2004")

'run analysis
System.IO.Directory.CreateDirectory("c:\CSI_API_temp")
ret = SapModel.File.Save("C:\CSI_API_temp\example.edb")
ret = SapModel.Analyze.RunAnalysis

'start concrete design
ret = SapModel.DesignConcrete.StartDesign()

'get overwrite item
ret = SapModel.DesignConcrete.Eurocode_2_2004.GetOverwrite("8", 1, Value, ProgDet)

'close ETABS
EtabsObject.ApplicationExit(False)

'clean up variables
SapModel = Nothing
EtabsObject = Nothing

End Sub
```

    int Item,
    double% Value
)
```

```
abstract GetPreference :
    Item : int *
    Value : float byref -> int
```

Parameters

Item

Type: [SystemInt32](#)

This is an integer between 1 and 31, inclusive, indicating the preference item considered.

1. Country
2. Combos equation
3. Second order method
4. Number of interaction curves
5. Number of interaction points

6. Consider minimum eccentricity
7. Theta0
8. Gamma steel
9. Gamma concrete
10. AlphaCC
11. AlphaCT
12. AlphaLCC
13. AlphaLCT
14. Pattern live load factor
15. Utilization factor limit
16. Multi-response case design
17. Reliability class
18. Gamma concrete modulus
19. Consider torsion
20. Design for B/C capacity ratio
21. Ignore Beneficial Pu for Beam Design?
22. User defined allowable PT stresses
23. Concrete Strength Ratio at Transfer $f_{ck}(t) / f_{ck}$
24. Transfer: Top Fiber Tensile Stress / $f_{ctm}(t)$
25. Transfer: Bottom Fiber Tensile Stress / $f_{ctm}(t)$
26. Transfer: Extreme Fiber Compressive Stress / $f_{ck}(t)$
27. Final: Top Fiber Tensile Stress / f_{ctm}
28. Final: Bottom Fiber Tensile Stress / f_{ctm}
29. Final: Extreme Fiber Compressive Stress / f_{ck}
30. Sustained: Extreme Fiber Compressive Stress / f_{ck}
31. Sustained: Fraction of Live Load Considered

Value

Type: SystemDouble

The value of the considered preference item.

1. Country
 - . 1 = CEN Default
 - . 2 = Denmark
 - . 3 = Finland
 - . 4 = Germany
 - . 5 = Ireland
 - . 6 = Norway
 - . 7 = Poland
 - . 8 = Portugal
 - . 9 = Singapore
 - . 10 = Slovenia
 - . 11 = Swedent
 - . 12 = United Kingdom
2. Combos equation
 - . 1 = Eq. 6.10
 - . 2 = Max of Eqs. 6.10a and 6.10b
3. Second order method
 - . 1 = Nominal stiffness
 - . 2 = Nominal curvature
 - . 3 = None
4. Number of interaction curves

Value ≥ 4 and divisible by 4
5. Number of interaction points

Value ≥ 5 and odd
6. Consider minimum eccentricity

0 = No

Any other value = Yes
7. Theta0

Value > 0
8. Gamma steel

Value > 0
9. Gamma concrete

Value > 0
10. AlphaCC

Value > 0
11. AlphaCT

Value > 0
12. AlphaLCC

Value > 0
13. AlphaLCT

Value > 0
14. Pattern live load factor

Value ≥ 0
15. Utilization factor limit

Value > 0
16. Multi-response case design
· 1 = Envelopes
· 2 = Step-by step
· 3 = Last step
· 4 = Envelopes - All
· 5 = Step-by step - All

17. Reliability class
· 1 = Class 1
· 2 = Class 2
· 3 = Class 3

18. Gamma concrete modulus

Value > 0
19. Consider torsion
· 0 = No

Introduction

- Any other value = Yes
- 20. Design for B/C capacity ratio
 - 0 = No
 - Any other value = Yes
- 21. Ignore the benefit of Pu for beam design?
 - 0 = No
 - Any other value = Yes
- 22. User defined allowable PT stresses
 - 0 = No
 - Any other value = Yes
- 23. Concrete Strength Ratio at Transfer $f_{ck}(t) / f_{ck}$

Value > 0

- 24. Transfer: Top Fiber Tensile Stress / $f_{ctm}(t)$

Value > 0

- 25. Transfer: Bottom Fiber Tensile Stress / $f_{ctm}(t)$

Value > 0

- 26. Transfer: Extreme Fiber Compressive Stress / $f_{ck}(t)$

Value > 0

- 27. Final: Top Fiber Tensile Stress / f_{ctm}

Value > 0

- 28. Final: Bottom Fiber Tensile Stress / f_{ctm}

Value > 0

- 29. Final: Extreme Fiber Compressive Stress / f_{ck}

Value > 0

- 30. Sustained: Extreme Fiber Compressive Stress / f_{ck}

Value > 0

- 31. Sustained: Fraction of Live Load Considered

Value > 0

Return Value

Type: Int32

Returns zero if the item is successfully retrieved; otherwise it returns a nonzero value.

▲ Remarks

▲ Examples

VB

Copy

```
Public Sub Example()  
    Dim SapModel As cSapModel  
    Dim EtabsObject As cOAPI  
    Dim ret As Integer = -1  
    Dim Value As Double
```

Introduction

```
'create ETABS object
    Dim myHelper as cHelper = New Helper
    EtabsObject = myHelper.CreateObjectProgID("CSI.ETABS.API.ETABSObject")

'start ETABS application
    ret = EtabsObject.ApplicationStart()

    int Item,
    double Value,
    eItemType ItemType = eItemType::Objects
)
```

```
abstract SetOverwrite :
    Name : string *
    Item : int *
    Value : float *
    ?ItemType : eItemType
(* Defaults:
    let _ItemType = defaultArg ItemType eItemType.Objects
*)
-> int
```

cDCoEurocode_2_2004AddLanguageSpecificTextSet("LSTBA958138_0?cpp=::

Parameters**Name**Type: SystemString

The name of an existing frame object or group, depending on the value of the ItemType

ItemType: SystemInt32

This is an integer between 1 and 27, inclusive, indicating the overwrite item considered.

1. Framing type
2. Live load reduction factor
3. Unbraced length ratio, Major
4. Unbraced length ratio, Minor
5. Effective length factor, Beta Major (columns only)
6. Effective length factor, Beta Minor (columns only)
7. Moment coefficient, Cm Major (not used)
8. Moment coefficient, Cm Minor (not used)
9. Nonsway moment factor, Db Major (not used)
10. Nonsway moment factor, Db Minor (not used)
11. Sway moment factor, Ds Major (not used)
12. Sway moment factor, Ds Minor (not used)
13. Correction factor depending on axial load in Nominal Curvature method, Kr Major (columns only)
14. Factor accounting for creep in Nominal Curvature method, KPhi Major (columns only)
16. Correction factor depending on axial load in Nominal Curvature method, Kr Minor (columns only)
17. Factor accounting for creep in Nominal Curvature method, KPhi Minor (columns only)
18. Coefficient depending on the distribution of first-order moment in both Nominal Stiffness and Nominal Curvature methods, c Major (columns only)
19. Coefficient depending on the distribution of first-order moment in both Nominal Stiffness and Nominal Curvature methods, c Minor (columns only)
20. Factor for contribution of reinforcement, Ks Major (columns only)
21. Ignore the benefit of Pu for beam design? (beams only)
22. Factor for contribution of reinforcement, Ks Minor (columns only)
23. Factor for effects of cracking, creep etc, Kc Major (columns only)
24. Factor for effects of cracking, creep etc, Kc Minor (columns only)
25. Effective creep coefficient, Phief (columns only)
26. Consider torsion (beams only)
27. Consider minimum eccentricity (columns only)

ValueType: SystemDouble

The value of the considered overwrite item.

1. Framing type
 - 0 = Program Determined
 - 1 = DC High
 - 2 = DC Medium

Introduction

- 3 = DC Low
- 4 = Secondary
- 2. Live load reduction factor

Value ≥ 0 ; 0 means use program determined value
- 3. Unbraced length ratio, Major

Value ≥ 0 ; 0 means use program determined value
- 4. Unbraced length ratio, Minor

Value ≥ 0 ; 0 means use program determined value
- 5. Effective length factor, Beta Major

Value ≥ 0 ; 0 means use program determined value
- 6. Effective length factor, Beta Minor

Value ≥ 0 ; 0 means use program determined value
- 7. Moment coefficient, Cm Major

Value ≥ 0 ; 0 means use program determined value
- 8. Moment coefficient, Cm Minor

Value ≥ 0 ; 0 means use program determined value
- 9. Nonsway moment factor, Db Major

Value ≥ 0 ; 0 means use program determined value
- 10. Nonsway moment factor, Db Minor

Value ≥ 0 ; 0 means use program determined value
- 11. Sway moment factor, Ds Major

Value ≥ 0 ; 0 means use program determined value
- 12. Sway moment factor, Ds Minor

Value ≥ 0 ; 0 means use program determined value
- 13. Correction factor depending on axial load in Nominal Curvature method, Kr Major

Value ≥ 0 ; 0 means use program determined value
- 14. Factor accounting for creep in Nominal Curvature method, KPhi Major

Value ≥ 0 ; 0 means use program determined value
- 15. Correction factor depending on axial load in Nominal Curvature method, Kr Minor

Value ≥ 0 ; 0 means use program determined value
- 16. Factor accounting for creep in Nominal Curvature method, KPhi Minor

Value ≥ 0 ; 0 means use program determined value
- 17. Coefficient depending on the distribution of first-order moment in both Nominal Stiffness and Nominal Curvature methods, c Major

Introduction

Value ≥ 0 ; 0 means use program determined value

18. Coefficient depending on the distribution of first-order moment in both Nominal Stiffness and Nominal Curvature methods, c Minor

Value ≥ 0 ; 0 means use program determined value

19. Factor for contribution of reinforcement, Ks Major

Value ≥ 0 ; 0 means use program determined value

20. Ignore the benefit of Pu for beam design?

· 0 = No

· Any other value = Yes

21. Factor for contribution of reinforcement, Ks Minor

Value ≥ 0 ; 0 means use program determined value

22. Factor for effects of cracking, creep etc, Kc Major

Value ≥ 0 ; 0 means use program determined value

23. Factor for effects of cracking, creep etc, Kc Minor

Value ≥ 0 ; 0 means use program determined value

24. Effective creep coefficient, Phief

Value ≥ 0 ; 0 means use program determined value

25. Consider torsion

· 0 = No

· Any other value = Yes

26. Consider minimum eccentricity

· 0 = No

· Any other value = Yes

ItemType (Optional)

Type: $\hat{A}$ ETABSv1eItemType

This is one of the following items in the eItemType enumeration:

◇ Object = 0

◇ Group = 1

◇ SelectedObjects = 2

If this item is Objects, the overwrite is set for the frame object specified by the Name item.

If this item is Group, the overwrite is set for all frame objects in the group specified by the Name item.

If this item is SelectedObjects, the overwrite is set for all selected frame objects and the Name item is ignored.

Return Value

Type: $\hat{A}$ Int32

Returns zero if the item is successfully set; otherwise it returns a nonzero value.

▲ Remarks

▲ Examples

VB

Return Value

Copy

```

Public Sub Example()
    Dim SapModel As cSapModel
    Dim EtabsObject As cOAPI
    Dim ret As Integer = -1

```

```
int SetPreference(
    int Item,
    double Value
)
```

```
abstract SetPreference :
    Item : int *
    Value : float -> int
```

Parameters

Item

Type: SystemInt32

This is an integer between 1 and 31, inclusive, indicating the preference item considered.

1. Country
2. Combos equation
3. Second order method
4. Number of interaction curves
5. Number of interaction points

6. Consider minimum eccentricity
7. Theta0
8. Gamma steel
9. Gamma concrete
10. AlphaCC
11. AlphaCT
12. AlphaLCC
13. AlphaLCT
14. Pattern live load factor
15. Utilization factor limit
16. Multi-response case design
17. Reliability class
18. Gamma concrete modulus
19. Consider torsion
20. Design for B/C capacity ratio
21. Ignore Beneficial Pu for Beam Design?
22. User defined allowable PT stresses
23. Concrete Strength Ratio at Transfer $f_{ck}(t) / f_{ck}$
24. Transfer: Top Fiber Tensile Stress / $f_{ctm}(t)$
25. Transfer: Bottom Fiber Tensile Stress / $f_{ctm}(t)$
26. Transfer: Extreme Fiber Compressive Stress / $f_{ck}(t)$
27. Final: Top Fiber Tensile Stress / f_{ctm}
28. Final: Bottom Fiber Tensile Stress / f_{ctm}
29. Final: Extreme Fiber Compressive Stress / f_{ck}
30. Sustained: Extreme Fiber Compressive Stress / f_{ck}
31. Sustained: Fraction of Live Load Considered

Value

Type: SystemDouble

The value of the considered preference item.

1. Country
 - . 1 = CEN Default
 - . 2 = Denmark
 - . 3 = Finland
 - . 4 = Germany
 - . 5 = Ireland
 - . 6 = Norway
 - . 7 = Poland
 - . 8 = Portugal
 - . 9 = Singapore
 - . 10 = Slovenia
 - . 11 = Sweden
 - . 12 = United Kingdom
2. Combos equation
 - . 1 = Eq. 6.10
 - . 2 = Max of Eqs. 6.10a and 6.10b
3. Second order method
 - . 1 = Nominal stiffness
 - . 2 = Nominal curvature
 - . 3 = None
4. Number of interaction curves

Value ≥ 4 and divisible by 4
5. Number of interaction points

Value ≥ 5 and odd
6. Consider minimum eccentricity

0 = No

Any other value = Yes
7. Theta0

Value > 0
8. Gamma steel

Value > 0
9. Gamma concrete

Value > 0

Value > 0
11. AlphaCT

Value > 0
12. AlphaLCC

Value > 0
13. AlphaLCT

Value > 0
14. Pattern live load factor

Value ≥ 0
15. Utilization factor limit

Value > 0
16. Multi-response case design
· 1 = Envelopes
· 2 = Step-by step
· 3 = Last step
· 4 = Envelopes - All
· 5 = Step-by step - All

17. Reliability class
· 1 = Class 1
· 2 = Class 2
· 3 = Class 3

18. Gamma concrete modulus

Value > 0
19. Consider torsion
· 0 = No

Introduction

- Any other value = Yes
- 20. Design for B/C capacity ratio
 - 0 = No
 - Any other value = Yes
- 21. Ignore the benefit of Pu for beam design?
 - 0 = No
 - Any other value = Yes
- 22. User defined allowable PT stresses
 - 0 = No
 - Any other value = Yes
- 23. Concrete Strength Ratio at Transfer $f_{ck}(t) / f_{ck}$

Value > 0

- 24. Transfer: Top Fiber Tensile Stress / $f_{ctm}(t)$

Value > 0

- 25. Transfer: Bottom Fiber Tensile Stress / $f_{ctm}(t)$

Value > 0

- 26. Transfer: Extreme Fiber Compressive Stress / $f_{ck}(t)$

Value > 0

- 27. Final: Top Fiber Tensile Stress / f_{ctm}

Value > 0

- 28. Final: Bottom Fiber Tensile Stress / f_{ctm}

Value > 0

- 29. Final: Extreme Fiber Compressive Stress / f_{ck}

Value > 0

- 30. Sustained: Extreme Fiber Compressive Stress / f_{ck}

Value > 0

- 31. Sustained: Fraction of Live Load Considered

Value > 0

Return Value

Type: $\hat{A}$ Int32

Returns zero if the item is successfully set; otherwise it returns a nonzero value.

CSI API ETABS v1

cDColIndian_IS_456_2000AddLanguageSpecificTextSet Method

Retrieves the value of a concrete design overwrite item.

Namespace: [ETABSV1](#)

Assembly: [ETABSV1](#) (in ETABSV1.dll) Version: 1.0.0.0 (1.24.0.0)

■ Syntax

[C#](#)

[VB](#)

[C++](#)

[F#](#)

[Copy](#)

```
int GetOverwrite(
    string Name,
    int Item,
    ref double Value,
    ref bool ProgDet
)
```

```
Function GetOverwrite (
    Name As String,
    Item As Integer,
    ByRef Value As Double,
    ByRef ProgDet As Boolean
) As Integer
```

```
Dim instance As cDColIndian_IS_456_2000
Dim Name As String
Dim Item As Integer
Dim Value As Double
Dim ProgDet As Boolean
Dim returnValue As Integer
```

```
returnValue = instance.GetOverwrite(Name,
    Item, Value, ProgDet)
```

```
int GetOverwrite(
    String^ Name,
    int Item,
    double% Value,
    bool% ProgDet
)
```

```
abstract GetOverwrite :
    Name : string *
    Item : int *
    Value : float byref *
    ProgDet : bool byref -> int
```

Parameters

Name

Type:Â SystemString

The name of a frame object with a concrete frame design procedure.

Item

Type:Â SystemInt32

This is an integer between 1 and 21, inclusive, indicating the overwrite item considered.

1. Framing type
2. Live load reduction factor
3. Unbraced length ratio, Major
4. Unbraced length ratio, Minor
5. Effective length factor sway, K Major
6. Effective length factor sway, K Minor
7. Moment coefficient, Cm Major
8. Moment coefficient, Cm Minor
9. Nonsway moment factor, Db Major
10. Nonsway moment factor, Db Minor
11. Sway moment factor, Ds Major
12. Sway moment factor, Ds Minor
13. Top rebar area of a beam at the left end (I-end)
14. Bottom rebar area of a beam at the left end (I-end)
15. Top rebar area of a beam at the right end (J-end)
16. Bottom rebar area of a beam at the right end (J-end)
17. Effective length factor braced, K Major
18. Effective length factor braced, K Minor
19. Q Factor in Global X Dir
20. Q Factor in Global Y Dir
21. Consider Minimum Eccentricity

Value

Type:Â SystemDouble

The value of the considered overwrite item.

1. Framing type
 - 0 = Program Default
 - 1 = Ductile
 - 2 = Ordinary
 - 3 = Non-sway
2. Live load reduction factor

Value >= 0; 0 means use program determined value

3. Unbraced length ratio, Major

Value >= 0; 0 means use program determined value

4. Unbraced length ratio, Minor

Value >= 0; 0 means use program determined value

5. Effective length factor sway, K Major

Value >= 0; 0 means use program determined value

6. Effective length factor sway, K Minor

Introduction

Value ≥ 0 ; 0 means use program determined value

7. Moment coefficient, Cm Major

Value ≥ 0 ; 0 means use program determined value

8. Moment coefficient, Cm Minor

Value ≥ 0 ; 0 means use program determined value

9. Nonsway moment factor, Db Major

Value ≥ 0 ; 0 means use program determined value

10. Nonsway moment factor, Db Minor

Value ≥ 0 ; 0 means use program determined value

11. Sway moment factor, Ds Major

Value ≥ 0 ; 0 means use program determined value

12. Sway moment factor, Ds Minor

Value ≥ 0 ; 0 means use program determined value

13. Top rebar area of a beam at the left end (I-end)

Value ≥ 0 ; 0 means use program determined value

14. Bottom rebar area of a beam at the left end (I-end)

Value ≥ 0 ; 0 means use program determined value

15. Top rebar area of a beam at the right end (J-end)

Value ≥ 0 ; 0 means use program determined value

16. Bottom rebar area of a beam at the right end (J-end)

Value ≥ 0 ; 0 means use program determined value

17. Effective length factor braced, K Major

Value ≥ 0 ; 0 means use program determined value

18. Effective length factor braced, K Minor

Value ≥ 0 ; 0 means use program determined value

19. Q Factor in Global X Dir

Value ≥ 0 ; 0 means use program determined value

20. Q Factor in Global Y Dir

Value ≥ 0 ; 0 means use program determined value

21. Consider Minimum Eccentricity

0 = No

Any other value = Yes

ProgDet

Type: System.Boolean

If this item is True, the specified value is program determined.

Return Value

Type: Int32

Returns zero if the item is successfully retrieved; otherwise it returns a nonzero value.

CSI API ETABS v1

cDColIndian_IS_456_2000AddLanguageSpecificTextSet Method

Retrieves the value of a concrete design preference item.

Namespace: ETABSv1

Assembly: ETABSv1 (in ETABSv1.dll) Version: 1.0.0.0 (1.24.0.0)

■ Syntax

C#

VB

C++

F#

Copy

```
int GetPreference(
    int Item,
    ref double Value
)
```

```
Function GetPreference (
    Item As Integer,
    ByRef Value As Double
) As Integer
```

```
Dim instance As cDColIndian_IS_456_2000
Dim Item As Integer
Dim Value As Double
Dim returnValue As Integer
```

```
returnValue = instance.GetPreference(Item,
    Value)
```

```
int GetPreference(
    int Item,
    double% Value
)
```

```
abstract GetPreference :
    Item : int *
    Value : float byref -> int
```

Parameters

Item

Type: SystemInt32

This is an integer between 1 and 8, inclusive, indicating the preference item considered.

1. Number of interaction curves
2. Number of interaction points
3. Consider minimum eccentricity
4. Gamma steel
5. Gamma concrete

- 6. Pattern live load factor
- 7. Utilization factor limit
- 8. Multi-response case design

Value

Type: SystemDouble

The value of the considered preference item.

- 1. Number of interaction curves

Value ≥ 4 and divisible by 4

- 2. Number of interaction points

Value ≥ 5 and odd

- 3. Consider minimum eccentricity

0 = No

Any other value = Yes

- 4. Gamma steel

Value > 0

- 5. Gamma concrete

Value > 0

- 6. Pattern live load factor

Value ≥ 0

- 7. Utilization factor limit

Value > 0

- 8. Multi-response case design
 - 1 = Envelopes
 - 2 = Step-by step
 - 3 = Last step
 - 4 = Envelopes - All
 - 5 = Step-by step - All

Return Value

Type: Int32

Returns zero if the item is successfully retrieved; otherwise it returns a nonzero value.

CSI API ETABS v1

cDColIndian_IS_456_2000AddLanguageSpecificTextSet Method

Sets the value of a concrete design overwrite item.

Namespace: ETABSv1

Assembly: ETABSv1 (in ETABSv1.dll) Version: 1.0.0.0 (1.24.0.0)

■ Syntax

C#

VB

C++

F#

Copy

```
int SetOverwrite(
    string Name,
    int Item,
    double Value,
    eItemType ItemType = eItemType.Objects
)
```

```
Function SetOverwrite (
    Name As String,
    Item As Integer,
    Value As Double,
    ?ItemType As eItemType = eItemType.Objects
) As Integer
```

```
Dim instance As cDColIndian_IS_456_2000
Dim Name As String
Dim Item As Integer
Dim Value As Double
Dim ItemType As eItemType
Dim returnValue As Integer
```

```
returnValue = instance.SetOverwrite(Name,
    Item, Value, ItemType)
```

```
int SetOverwrite(
    String^ Name,
    int Item,
    double Value,
    eItemType ItemType = eItemType::Objects
)
```

```
abstract SetOverwrite :
    Name : string *
    Item : int *
    Value : float *
    ?ItemType : eItemType
(* Defaults:
    let _ItemType = defaultArg ItemType eItemType.Objects
*)
-> int
```

Parameters**Name**Type:Â SystemString

The name of an existing frame object or group, depending on the value of the ItemType

ItemType:Â SystemInt32

This is an integer between 1 and 21, inclusive, indicating the overwrite item considered.

1. Framing type
2. Live load reduction factor
3. Unbraced length ratio, Major
4. Unbraced length ratio, Minor
5. Effective length factor sway, K Major
6. Effective length factor sway, K Minor
7. Moment coefficient, Cm Major
8. Moment coefficient, Cm Minor
9. Nonsway moment factor, Db Major
10. Nonsway moment factor, Db Minor
11. Sway moment factor, Ds Major
12. Sway moment factor, Ds Minor
13. Top rebar area of a beam at the left end (I-end)
14. Bottom rebar area of a beam at the left end (I-end)
15. Top rebar area of a beam at the right end (J-end)
16. Bottom rebar area of a beam at the right end (J-end)
17. Effective length factor braced, K Major
18. Effective length factor braced, K Minor
19. Q Factor in Global X Dir
20. Q Factor in Global Y Dir
21. Consider Minimum Eccentricity

ValueType:Â SystemDouble

The value of the considered overwrite item.

1. Framing type
 - 0 = Program Default
 - 1 = Ductile
 - 2 = Ordinary
 - 3 = Non-sway
2. Live load reduction factor

Value >= 0; 0 means use program determined value

3. Unbraced length ratio, Major

Value >= 0; 0 means use program determined value

4. Unbraced length ratio, Minor

Value >= 0; 0 means use program determined value

5. Effective length factor sway, K Major

Value >= 0; 0 means use program determined value

Introduction

6. Effective length factor sway, K Minor

Value ≥ 0 ; 0 means use program determined value

7. Moment coefficient, Cm Major

Value ≥ 0 ; 0 means use program determined value

8. Moment coefficient, Cm Minor

Value ≥ 0 ; 0 means use program determined value

9. Nonsway moment factor, Db Major

Value ≥ 0 ; 0 means use program determined value

10. Nonsway moment factor, Db Minor

Value ≥ 0 ; 0 means use program determined value

11. Sway moment factor, Ds Major

Value ≥ 0 ; 0 means use program determined value

12. Sway moment factor, Ds Minor

Value ≥ 0 ; 0 means use program determined value

13. Top rebar area of a beam at the left end (I-end)

Value ≥ 0 ; 0 means use program determined value

14. Bottom rebar area of a beam at the left end (I-end)

Value ≥ 0 ; 0 means use program determined value

15. Top rebar area of a beam at the right end (J-end)

Value ≥ 0 ; 0 means use program determined value

16. Bottom rebar area of a beam at the right end (J-end)

Value ≥ 0 ; 0 means use program determined value

17. Effective length factor braced, K Major

Value ≥ 0 ; 0 means use program determined value

18. Effective length factor braced, K Minor

Value ≥ 0 ; 0 means use program determined value

19. Q Factor in Global X Dir

Value ≥ 0 ; 0 means use program determined value

20. Q Factor in Global Y Dir

Value ≥ 0 ; 0 means use program determined value

21. Consider Minimum Eccentricity

0 = No

Any other value = Yes

ItemType (Optional)

Type: ETABSv1eItemType

This is one of the following items in the eItemType enumeration:

- ◊ Object = 0
- ◊ Group = 1
- ◊ SelectedObjects = 2

If this item is Objects, the overwrite is set for the frame object specified by the Name item.

If this item is Group, the overwrite is set for all frame objects in the group specified by the Name item.

If this item is SelectedObjects, the overwrite is set for all selected frame objects and the Name item is ignored.

Return Value

Type: Int32

Returns zero if the item is successfully set; otherwise it returns a nonzero value.

CSI API ETABS v1

cDColIndian_IS_456_2000AddLanguageSpecificTextSet Method

Sets the value of a concrete design preference item.

Namespace: ETABSv1

Assembly: ETABSv1 (in ETABSv1.dll) Version: 1.0.0.0 (1.24.0.0)

■ Syntax

C#

VB

C++

F#

Copy

```
int SetPreference(
    int Item,
    double Value
)
```

```
Function SetPreference (
    Item As Integer,
    Value As Double
) As Integer
```

```
Dim instance As cDColIndian_IS_456_2000
Dim Item As Integer
Dim Value As Double
Dim returnValue As Integer
```

```
returnValue = instance.SetPreference(Item,
    Value)
```

```
int SetPreference(
    int Item,
    double Value
)
```

```
abstract SetPreference :
    Item : int *
    Value : float -> int
```

Parameters

Item

Type: SystemInt32

This is an integer between 1 and 8, inclusive, indicating the preference item considered.

1. Number of interaction curves
2. Number of interaction points
3. Consider minimum eccentricity
4. Gamma steel
5. Gamma concrete

- 6. Pattern live load factor
- 7. Utilization factor limit
- 8. Multi-response case design

Value

Type: SystemDouble

The value of the considered preference item.

- 1. Number of interaction curves

Value ≥ 4 and divisible by 4

- 2. Number of interaction points

Value ≥ 5 and odd

- 3. Consider minimum eccentricity

0 = No

Any other value = Yes

- 4. Gamma steel

Value > 0

- 5. Gamma concrete

Value > 0

- 6. Pattern live load factor

Value ≥ 0

- 7. Utilization factor limit

Value > 0

- 8. Multi-response case design
 - 1 = Envelopes
 - 2 = Step-by step
 - 3 = Last step
 - 4 = Envelopes - All
 - 5 = Step-by step - All

Return Value

Type: Int32

Returns zero if the item is successfully set; otherwise it returns a nonzero value.

Dim Value As Double
Dim ProgDet As Boolean
Dim returnValue As Integer
```

```
returnValue = instance.GetOverwrite(Name,
    Item, Value, ProgDet)
```

```
int GetOverwrite(
    String^ Name,
    int Item,
    double% Value,
    bool% ProgDet
)
```

```
abstract GetOverwrite :
    Name : string *
    Item : int *
    Value : float byref *
    ProgDet : bool byref -> int
```

Parameters

Name

Type:Â SystemString

The name of a frame object with a concrete frame design procedure.

Item

Type:Â SystemInt32

This is an integer between 1 and 27, inclusive, indicating the overwrite item considered.

1. Framing type
2. Live load reduction factor
3. Unbraced length ratio, Major
4. Unbraced length ratio, Minor
5. Effective length factor, Beta Major (columns only)
6. Effective length factor, Beat Minor (columns only)
7. Moment coefficient, Cm Major (not used)
8. Moment coefficient, Cm Minor (not used)
9. Nonsway moment factor, Db Major (not used)
10. Nonsway moment factor, Db Minor (not used)
11. Sway moment factor, Ds Major (not used)
12. Sway moment factor, Ds Minor (not used)
13. Correction factor depending on axial load in Nominal Curvature method, Kr Major (columns only)
14. Factor accounting for creep in Nominal Curvature method, KPhi Major (columns only)
16. Correction factor depending on axial load in Nominal Curvature method, Kr Minor (columns only)
17. Factor accounting for creep in Nominal Curvature method, KPhi Minor (columns only)
18. Coefficient depending on the distribution of first-order moment in both Nominal Stiffness and Nominal Curvature methods, c Major (columns only)
19. Coefficient depending on the distribution of first-order moment in both Nominal Stiffness and Nominal Curvature methods, c Minor (columns only)
20. Factor for contribution of reinforcement, Ks Major (columns only)
21. Factor for contribution of reinforcement, Ks Minor (columns only)
22. Factor for effects of cracking, creep etc, Kc Major (columns only)
23. Factor for effects of cracking, creep etc, Kc Minor (columns only)
24. Effective creep coefficient, Phief (columns only)
25. Ignore the benefit of Pu for beam design? (beams only)
26. Consider torsion (beams only)
27. Consider minimum eccentricity (columns only)

Value

Type:Â SystemDouble

The value of the considered overwrite item.

1. Framing type
 - 0 = Program Determined
 - 1 = DC High
 - 2 = DC Low
 - 3 = Secondary

Introduction

2. Live load reduction factor

Value ≥ 0 ; 0 means use program determined value

3. Unbraced length ratio, Major

Value ≥ 0 ; 0 means use program determined value

4. Unbraced length ratio, Minor

Value ≥ 0 ; 0 means use program determined value

5. Effective length factor, Beta Major

Value ≥ 0 ; 0 means use program determined value

6. Effective length factor, Beta Minor

Value ≥ 0 ; 0 means use program determined value

7. Moment coefficient, Cm Major

Value ≥ 0 ; 0 means use program determined value

8. Moment coefficient, Cm Minor

Value ≥ 0 ; 0 means use program determined value

9. Nonsway moment factor, Db Major

Value ≥ 0 ; 0 means use program determined value

10. Nonsway moment factor, Db Minor

Value ≥ 0 ; 0 means use program determined value

11. Sway moment factor, Ds Major

Value ≥ 0 ; 0 means use program determined value

12. Sway moment factor, Ds Minor

Value ≥ 0 ; 0 means use program determined value

13. Correction factor depending on axial load in Nominal Curvature method, Kr Major

Value ≥ 0 ; 0 means use program determined value

14. Factor accounting for creep in Nominal Curvature method, KPhi Major

Value ≥ 0 ; 0 means use program determined value

15. Correction factor depending on axial load in Nominal Curvature method, Kr Minor

Value ≥ 0 ; 0 means use program determined value

16. Factor accounting for creep in Nominal Curvature method, KPhi Minor

Value ≥ 0 ; 0 means use program determined value

17. Coefficient depending on the distribution of first-order moment in both Nominal Stiffness and Nominal Curvature methods, c Major

Value ≥ 0 ; 0 means use program determined value

Introduction

18. Coefficient depending on the distribution of first-order moment in both Nominal Stiffness and Nominal Curvature methods, c Minor

Value ≥ 0 ; 0 means use program determined value

19. Factor for contribution of reinforcement, Ks Major

Value ≥ 0 ; 0 means use program determined value

20. Factor for contribution of reinforcement, Ks Minor

Value ≥ 0 ; 0 means use program determined value

21. Factor for effects of cracking, creep etc, Kc Major

Value ≥ 0 ; 0 means use program determined value

22. Factor for effects of cracking, creep etc, Kc Minor

Value ≥ 0 ; 0 means use program determined value

23. Effective creep coefficient, Phief

Value ≥ 0 ; 0 means use program determined value

24. Ignore the benefit of Pu for beam design?

· 0 = No

· Any other value = Yes

25. Consider torsion

· 0 = No

· Any other value = Yes

26. Consider minimum eccentricity

· 0 = No

· Any other value = Yes

ProgDet

Type: System.Boolean

If this item is True, the specified value is program determined.

Return Value

Type: Int32

Returns zero if the item is successfully retrieved; otherwise it returns a nonzero value.

▲ Remarks

▲ Examples

VB

Copy

```
Public Sub Example()  
    Dim SapModel As cSapModel  
    Dim EtabsObject As cOAPI  
    Dim ret As Integer = -1  
    Dim Value As Double  
    Dim ProgDet As Boolean  
  
    'create ETABS object

    Value : float *
    ?ItemType : eItemType
(* Defaults:
    let _ItemType = defaultArg ItemType eItemType.Objects
*)
-> int
```

Parameters**Name**Type: SystemString

The name of an existing frame object or group, depending on the value of the ItemType

ItemType: SystemInt32

This is an integer between 1 and 27, inclusive, indicating the overwrite item considered.

1. Framing type
2. Live load reduction factor
3. Unbraced length ratio, Major
4. Unbraced length ratio, Minor
5. Effective length factor, Beta Major (columns only)
6. Effective length factor, Beta Minor (columns only)
7. Moment coefficient, Cm Major (not used)
8. Moment coefficient, Cm Minor (not used)
9. Nonsway moment factor, Db Major (not used)
10. Nonsway moment factor, Db Minor (not used)
11. Sway moment factor, Ds Major (not used)
12. Sway moment factor, Ds Minor (not used)
13. Correction factor depending on axial load in Nominal Curvature method, Kr Major (columns only)
14. Factor accounting for creep in Nominal Curvature method, KPhi Major (columns only)
16. Correction factor depending on axial load in Nominal Curvature method, Kr Minor (columns only)
17. Factor accounting for creep in Nominal Curvature method, KPhi Minor (columns only)
18. Coefficient depending on the distribution of first-order moment in both Nominal Stiffness and Nominal Curvature methods, c Major (columns only)
19. Coefficient depending on the distribution of first-order moment in both Nominal Stiffness and Nominal Curvature methods, c Minor (columns only)
20. Factor for contribution of reinforcement, Ks Major (columns only)
21. Factor for contribution of reinforcement, Ks Minor (columns only)
22. Factor for effects of cracking, creep etc, Kc Major (columns only)
23. Factor for effects of cracking, creep etc, Kc Minor (columns only)
24. Effective creep coefficient, Phief (columns only)
25. Ignore the benefit of Pu for beam design? (beams only)
26. Consider torsion (beams only)
27. Consider minimum eccentricity (columns only)

ValueType: SystemDouble

The value of the considered overwrite item.

1. Framing type
 - 0 = Program Determined
 - 1 = DC High
 - 2 = DC Low

- 3 = Secondary
- 2. Live load reduction factor
 - Value ≥ 0 ; 0 means use program determined value
- 3. Unbraced length ratio, Major
 - Value ≥ 0 ; 0 means use program determined value
- 4. Unbraced length ratio, Minor
 - Value ≥ 0 ; 0 means use program determined value
- 5. Effective length factor, Beta Major
 - Value ≥ 0 ; 0 means use program determined value
- 6. Effective length factor, Beta Minor
 - Value ≥ 0 ; 0 means use program determined value
- 7. Moment coefficient, Cm Major
 - Value ≥ 0 ; 0 means use program determined value
- 8. Moment coefficient, Cm Minor
 - Value ≥ 0 ; 0 means use program determined value
- 9. Nonsway moment factor, Db Major
 - Value ≥ 0 ; 0 means use program determined value
- 10. Nonsway moment factor, Db Minor
 - Value ≥ 0 ; 0 means use program determined value
- 11. Sway moment factor, Ds Major
 - Value ≥ 0 ; 0 means use program determined value
- 12. Sway moment factor, Ds Minor
 - Value ≥ 0 ; 0 means use program determined value
- 13. Correction factor depending on axial load in Nominal Curvature method, Kr Major
 - Value ≥ 0 ; 0 means use program determined value
- 14. Factor accounting for creep in Nominal Curvature method, KPhi Major
 - Value ≥ 0 ; 0 means use program determined value
- 15. Correction factor depending on axial load in Nominal Curvature method, Kr Minor
 - Value ≥ 0 ; 0 means use program determined value
- 16. Factor accounting for creep in Nominal Curvature method, KPhi Minor
 - Value ≥ 0 ; 0 means use program determined value
- 17. Coefficient depending on the distribution of first-order moment in both Nominal Stiffness and Nominal Curvature methods, c Major
 - Value ≥ 0 ; 0 means use program determined value

Introduction

Value ≥ 0 ; 0 means use program determined value

18. Coefficient depending on the distribution of first-order moment in both Nominal Stiffness and Nominal Curvature methods, c Minor

Value ≥ 0 ; 0 means use program determined value

19. Factor for contribution of reinforcement, Ks Major

Value ≥ 0 ; 0 means use program determined value

20. Factor for contribution of reinforcement, Ks Minor

Value ≥ 0 ; 0 means use program determined value

21. Factor for effects of cracking, creep etc, Kc Major

Value ≥ 0 ; 0 means use program determined value

22. Factor for effects of cracking, creep etc, Kc Minor

Value ≥ 0 ; 0 means use program determined value

23. Effective creep coefficient, Phief

Value ≥ 0 ; 0 means use program determined value

24. Ignore the benefit of Pu for beam design?

- 0 = No
- Any other value = Yes

25. Consider torsion

- 0 = No
- Any other value = Yes

26. Consider minimum eccentricity

- 0 = No
- Any other value = Yes

ItemType (Optional)

Type: $\hat{A}$ ETABSv1eItemType

This is one of the following items in the eItemType enumeration:

- ◊ Object = 0
- ◊ Group = 1
- ◊ SelectedObjects = 2

If this item is Objects, the overwrite is set for the frame object specified by the Name item.

If this item is Group, the overwrite is set for all frame objects in the group specified by the Name item.

If this item is SelectedObjects, the overwrite is set for all selected frame objects and the Name item is ignored.

Return Value

Type: $\hat{A}$ Int32

Returns zero if the item is successfully set; otherwise it returns a nonzero value.

▲ Remarks

▲ Examples

VB

Return Value

Copy

```

Public Sub Example()
    Dim SapModel As cSapModel

CSI API ETABS v1

cDCoMexican_RCDF_2017AddLanguageSpecificTextSet

Method

Retrieves the value of a concrete design overwrite item.

Namespace: ETABSv1

Assembly: ETABSv1 (in ETABSv1.dll) Version: 1.0.0.0 (1.24.0.0)

■ Syntax

C#

VB

C++

F#

Copy

```
int GetOverwrite(
    string Name,
    int Item,
    ref double Value,
    ref bool ProgDet
)
```

```
Function GetOverwrite (
    Name As String,
    Item As Integer,
    ByRef Value As Double,
    ByRef ProgDet As Boolean
) As Integer
```

```
Dim instance As cDCoMexican_RCDF_2017
Dim Name As String
Dim Item As Integer
Dim Value As Double
Dim ProgDet As Boolean
Dim returnValue As Integer
```

```
returnValue = instance.GetOverwrite(Name,
    Item, Value, ProgDet)
```

```
int GetOverwrite(
    String^ Name,
    int Item,
    double% Value,
    bool% ProgDet
)
```

```
abstract GetOverwrite :
    Name : string *
    Item : int *
    Value : float byref *
    ProgDet : bool byref -> int
```

Parameters

Name

Type:Â SystemString

The name of a frame object with a concrete frame design procedure.

Item

Type:Â SystemInt32

This is an integer between 1 and 13, inclusive, indicating the overwrite item considered.

1. Framing type
2. Live load reduction factor
3. Unbraced length ratio, Major
4. Unbraced length ratio, Minor
5. Effective length factor, K Major
6. Effective length factor, K Minor
7. Moment coefficient, Cm Major
8. Moment coefficient, Cm Minor
9. Nonsway moment factor, Db Major
10. Nonsway moment factor, Db Minor
11. Sway moment factor, Ds Major
12. Sway moment factor, Ds Minor
13. Consider Minimum Eccentricity

Value

Type:Â SystemDouble

The value of the considered overwrite item.

1. Framing type
 - 0 = Program Default
 - 1 = Sway special
 - 2 = Sway Intermediate
 - 3 = Sway Ordinary
 - 4 = Non-sway
2. Live load reduction factor

Value >= 0; 0 means use program determined value

3. Unbraced length ratio, Major

Value >= 0; 0 means use program determined value

4. Unbraced length ratio, Minor

Value >= 0; 0 means use program determined value

5. Effective length factor, K Major

Value >= 0; 0 means use program determined value

6. Effective length factor, K Minor

Value >= 0; 0 means use program determined value

7. Moment coefficient, Cm Major

Value >= 0; 0 means use program determined value

8. Moment coefficient, Cm Minor

Introduction

Value ≥ 0 ; 0 means use program determined value

9. Nonsway moment factor, Db Major

Value ≥ 0 ; 0 means use program determined value

10. Nonsway moment factor, Db Minor

Value ≥ 0 ; 0 means use program determined value

11. Sway moment factor, Ds Major

Value ≥ 0 ; 0 means use program determined value

12. Sway moment factor, Ds Minor

Value ≥ 0 ; 0 means use program determined value

13. Consider Minimum Eccentricity

0 = No

Any other value = Yes

ProgDet

Type: SystemBoolean

If this item is True, the specified value is program determined.

Return Value

Type: Int32

Returns zero if the item is successfully retrieved; otherwise it returns a nonzero value.

CSI API ETABS v1

cDCoMexican_RCDF_2017AddLanguageSpecificTextSet

Method

Retrieves the value of a concrete design preference item.

Namespace: ETABSv1

Assembly: ETABSv1 (in ETABSv1.dll) Version: 1.0.0.0 (1.24.0.0)

▲ Syntax

C#

VB

C++

F#

Copy

```
int GetPreference(
    int Item,
    ref double Value
)
```

```
Function GetPreference (
    Item As Integer,
    ByRef Value As Double
) As Integer
```

```
Dim instance As cDCoMexican_RCDF_2017
Dim Item As Integer
Dim Value As Double
Dim returnValue As Integer
```

```
returnValue = instance.GetPreference(Item,
    Value)
```

```
int GetPreference(
    int Item,
    double% Value
)
```

```
abstract GetPreference :
    Item : int *
    Value : float byref -> int
```

Parameters

Item

Type: SystemInt32

This is an integer between 1 and 12, inclusive, indicating the preference item considered.

1. Number of interaction curves
2. Number of interaction points
3. Consider minimum eccentricity
4. Design for B/C Capacity Ratio?
5. Phi bending

6. Phi tension
7. Phi compression controlled tied
8. Phi compression controlled spiral
9. Phi shear and/or torsion
10. Pattern live load factor
11. Utilization factor limit
12. Multi-response case design

Value

Type: SystemDouble

The value of the considered preference item.

1. Number of interaction curves

Value ≥ 4 and divisible by 4

2. Number of interaction points

Value ≥ 5 and odd

3. Consider minimum eccentricity

0 = No

Any other value = Yes

4. Design for B/C Capacity Ratio?

1 = No

2 = Yes

5. Phi bending

Value > 0

6. Phi tension

Value > 0

7. Phi compression controlled tied

Value > 0

8. Phi compression controlled spiral

Value > 0

9. Phi shear and/or torsion

Value > 0

10. Pattern live load factor

Value ≥ 0

11. Utilization factor limit

Value > 0

12. Multi-response case design

- 1 = Envelopes
- 2 = Step-by step
- 3 = Last step

- 4 = Envelopes - All
- 5 = Step-by step - All

Return Value

Type: Int32

Returns zero if the item is successfully retrieved; otherwise it returns a nonzero value.

CSI API ETABS v1

cDCoMexican_RCDF_2017AddLanguageSpecificTextSet

Method

Sets the value of a concrete design overwrite item.

Namespace: ETABSv1

Assembly: ETABSv1 (in ETABSv1.dll) Version: 1.0.0.0 (1.24.0.0)

■ Syntax

C#

VB

C++

F#

Copy

```
int SetOverwrite(
    string Name,
    int Item,
    double Value,
    eItemType ItemType = eItemType.Objects
)
```

```
Function SetOverwrite (
    Name As String,
    Item As Integer,
    Value As Double,
    ItemType As eItemType = eItemType.Objects
) As Integer
```

```
Dim instance As cDCoMexican_RCDF_2017
Dim Name As String
Dim Item As Integer
Dim Value As Double
Dim ItemType As eItemType
Dim returnValue As Integer
```

```
returnValue = instance.SetOverwrite(Name,
    Item, Value, ItemType)
```

```
int SetOverwrite(
    String^ Name,
    int Item,
    double Value,
    eItemType ItemType = eItemType::Objects
)
```

```
abstract SetOverwrite :
    Name : string *
    Item : int *
    Value : float *
    ?ItemType : eItemType
(* Defaults:
    let _ItemType = defaultArg ItemType eItemType.Objects
*)
-> int
```

Parameters**Name**Type: SystemString

The name of an existing frame object or group, depending on the value of the ItemType

ItemType: SystemInt32

This is an integer between 1 and 13, inclusive, indicating the overwrite item considered.

1. Framing type
2. Live load reduction factor
3. Unbraced length ratio, Major
4. Unbraced length ratio, Minor
5. Effective length factor, K Major
6. Effective length factor, K Minor
7. Moment coefficient, Cm Major
8. Moment coefficient, Cm Minor
9. Nonsway moment factor, Db Major
10. Nonsway moment factor, Db Minor
11. Sway moment factor, Ds Major
12. Sway moment factor, Ds Minor
13. Consider Minimum Eccentricity

ValueType: SystemDouble

The value of the considered overwrite item.

1. Framing type
 - 0 = Program Default
 - 1 = Sway special
 - 2 = Sway Intermediate
 - 3 = Sway Ordinary
 - 4 = Non-sway
2. Live load reduction factor

Value ≥ 0 ; 0 means use program determined value

3. Unbraced length ratio, Major

Value ≥ 0 ; 0 means use program determined value

4. Unbraced length ratio, Minor

Value ≥ 0 ; 0 means use program determined value

5. Effective length factor, K Major

Value ≥ 0 ; 0 means use program determined value

6. Effective length factor, K Minor

Value ≥ 0 ; 0 means use program determined value

7. Moment coefficient, Cm Major

Value ≥ 0 ; 0 means use program determined value

8. Moment coefficient, Cm Minor

Value ≥ 0 ; 0 means use program determined value

9. Nonsway moment factor, Db Major

Value ≥ 0 ; 0 means use program determined value

10. Nonsway moment factor, Db Minor

Value ≥ 0 ; 0 means use program determined value

11. Sway moment factor, Ds Major

Value ≥ 0 ; 0 means use program determined value

12. Sway moment factor, Ds Minor

Value ≥ 0 ; 0 means use program determined value

13. Consider Minimum Eccentricity

0 = No

Any other value = Yes

ItemType (Optional)

Type: $\hat{A}$ ETABSv1eItemType

This is one of the following items in the eItemType enumeration:

◊ Object = 0

◊ Group = 1

◊ SelectedObjects = 2

If this item is Objects, the overwrite is set for the frame object specified by the Name item.

If this item is Group, the overwrite is set for all frame objects in the group specified by the Name item.

If this item is SelectedObjects, the overwrite is set for all selected frame objects and the Name item is ignored.

Return Value

Type: $\hat{A}$ Int32

Returns zero if the item is successfully set; otherwise it returns a nonzero value.

CSI API ETABS v1

cDConcSlabACI318_14AddLanguageSpecificTextSet("I Method

Retrieves the value of a concrete slab design preference item

Namespace: ETABSv1

Assembly: ETABSv1 (in ETABSv1.dll) Version: 1.0.0.0 (1.24.0.0)

■ Syntax

C#

VB

C++

F#

Copy

```
int GetPreference(
    int Item,
    ref string textValue,
    ref double numericValue
)
```

```
Function GetPreference (
    Item As Integer,
    ByRef textValue As String,
    ByRef numericValue As Double
) As Integer
```

```
Dim instance As cDConcSlabACI318_14
Dim Item As Integer
Dim textValue As String
Dim numericValue As Double
Dim returnValue As Integer
```

```
returnValue = instance.GetPreference(Item,
    textValue, numericValue)
```

```
int GetPreference(
    int Item,
    String^% textValue,
    double% numericValue
)
```

```
abstract GetPreference :
    Item : int *
    textValue : string byref *
    numericValue : float byref -> int
```

Parameters

Item

Type: SystemInt32

This is an integer between 1 and 21, inclusive, indicating the preference item considered

1. The resistance factor Phi (tension controlled)

cDConcSlabACI318_14id="LST2E27A186_0"AddLanguageSpecificTextSet("LST2E27A186_19?cpp=::

Introduction

2. The resistance factor Φ (compression controlled)
3. The resistance factor Φ (shear)
4. The clear cover for the top non-prestressed reinforcement [L]
5. The clear cover for the bottom non-prestressed reinforcement [L]
6. The name of the reinforcement bar that is the preferred rebar for non-prestressed reinforcement
7. This is either A or B indicating the design strip layer that represents the inner slab rebar layer
8. The top CGS of the tendon [L]
9. The bottom CGS of the tendon in exterior bays [L]
10. The bottom CGS of the tendon in interior bays [L]
11. This is either One Way or Two Way indicating the slab type assumed when calculating the required minimum reinforcing for the slab
12. Indicates if the allowable PT stresses are user defined
13. The concrete strength ratio at transfer used when calculating initial stresses
14. The top fiber tensile stress ratio used when calculating initial stresses
15. The bottom fiber tensile stress ratio used when calculating initial stresses
16. The extreme fiber compressive stress ratio used when calculating initial stresses
17. The top fiber tensile stress ratio used when calculating final stresses
18. The bottom fiber tensile stress ratio used when calculating final stresses
19. The extreme fiber compressive stress ratio used when calculating final stresses
20. The extreme fiber compressive stress ratio used when calculating sustained stresses
21. The fraction of live load considered used when calculating sustained stresses

textValue

Type: SystemString

If the indicated Item is a text value, this argument will be filled, and numericValue should be ignored

numericValue

Type: SystemDouble

If the indicated Item is a number, this argument will be filled, and textValue will be blank

Return Value

Type: Int32

Returns zero if the item is successfully retrieved; otherwise it returns a nonzero value

CSI API ETABS v1

cDCoSP63133302011AddLanguageSpecificTextSet("LS Method

Retrieves the value of a concrete design overwrite item.

Namespace: ETABSv1

Assembly: ETABSv1 (in ETABSv1.dll) Version: 1.0.0.0 (1.24.0.0)

■ Syntax

C#

VB

C++

F#

Copy

```
int GetOverwrite(
    string Name,
    int Item,
    ref double Value,
    ref bool ProgDet
)
```

```
Function GetOverwrite (
    Name As String,
    Item As Integer,
    ByRef Value As Double,
    ByRef ProgDet As Boolean
) As Integer
```

```
Dim instance As cDCoSP63133302011
Dim Name As String
Dim Item As Integer
Dim Value As Double
Dim ProgDet As Boolean
Dim returnValue As Integer
```

```
returnValue = instance.GetOverwrite(Name,
    Item, Value, ProgDet)
```

```
int GetOverwrite(
    String^ Name,
    int Item,
    double% Value,
    bool% ProgDet
)
```

```
abstract GetOverwrite :
    Name : string *
    Item : int *
    Value : float byref *
    ProgDet : bool byref -> int
```

Parameters

Name

Type: SystemString

The name of a frame object with a concrete frame design procedure.

Item

Type: SystemInt32

This is an integer between 1 and 22, inclusive, indicating the overwrite item considered.

1. Framing type (beams and columns)
2. Live load reduction factor (beams and columns)
3. Unbraced length ratio, Major (beams and columns)
4. Unbraced length ratio, Minor (beams and columns)
5. Effective length factor, K Major (columns only)
6. Effective length factor, K Minor (columns only)
7. Moment amplification factor, Eta Major (columns only)
8. Moment amplification factor, Eta Minor (columns only)
9. Gammab3 for column (columns only)
10. Gammab3 for beam (beams only)
11. Consider torsion (beams only)
12. $(q_{sw}, 1 * Z_1) / (R_s * A_s, 1)$ (beams only)
13. Corner rebar fraction top (beams only)
14. Corner rebar fraction bottom (beams only)
15. Consider minimum eccentricity (columns only)
16. Consider crack analysis (beams only)
17. Crack width limit full load, $a_{crc,ult}$ [mm] (beams only)
18. Crack width limit long term, $a_{crc,l,ult}$ [mm] (beams only)
19. Longitudinal rebar size top (beams only)
20. Longitudinal rebar size bottom (beams only)
21. Ignore beneficial P_u for beam design (beams only)
22. Is longitudinal rebar ribbed (beams only)

Value

Type: SystemDouble

The value of the considered overwrite item.

1. Framing type
 - 0 = Program Default
 - 1 = Sway
 - 2 = NonSway
2. Live load reduction factor
 - Value ≥ 0 ; 0 means use program determined value
3. Unbraced length ratio, Major
 - Value ≥ 0 ; 0 means use program determined value
4. Unbraced length ratio, Minor
 - Value ≥ 0 ; 0 means use program determined value
5. Effective length factor, K Major
 - Value ≥ 0 ; 0 means use program determined value
6. Effective length factor, K Minor
 - Value ≥ 0 ; 0 means use program determined value

Introduction

Value ≥ 0 ; 0 means use program determined value

7. Moment amplification factor, Eta Major

Value ≥ 0 ; 0 means use program determined value

8. Moment amplification factor, Eta Minor

Value ≥ 0 ; 0 means use program determined value

9. Gammab3 for column

Value ≥ 0 ; 0 means use program determined value

10. Gammab3 for beam

Value ≥ 0 ; 0 means use program determined value

11. Consider torsion

· 0 = No

· Any other value = Yes

12. $(q_{sw,1} * Z_1) / (R_s * A_{s,1})$

Value ≥ 0 ; 0 means use program determined value

13. Corner rebar fraction top

Value ≥ 0 ; 0 means use program determined value

14. Corner rebar fraction bottom

Value ≥ 0 ; 0 means use program determined value

15. Consider minimum eccentricity

· 0 = No

· Any other value = Yes

16. Consider crack analysis

· 0 = No

· Any other value = Yes

17. Crack Width Limit Full Load, $a_{crc,ult}$ [mm]

Value ≥ 0 ; 0 means use program determined value

18. Crack Width Limit Long Term, $a_{crc,l,ult}$ [mm]

Value ≥ 0 ; 0 means use program determined value

19. Longitudinal Rebar Size Top

Value is the index in the list of the rebar defined in the Reinforcing Bar Sizes form

20. Longitudinal Rebar Size Bottom

Value is the index in the list of the rebar defined in the Reinforcing Bar Sizes form

21. Ignore Beneficial Pu for Beam Design

· 0 = No

· Any other value = Yes

22. Is Longitudinal Rebar Ribbed

· 0 = No

· Any other value = Yes

ProgDet

Type: SystemBoolean

If this item is True, the specified value is program determined.

Return Value

Type: Int32

Returns zero if the item is successfully retrieved; otherwise it returns a nonzero value.

▲ Remarks

▲ Examples

CSI API ETABS v1

cDCoSP63133302011AddLanguageSpecificTextSet("LS Method

Retrieves the value of a concrete design preference item.

Namespace: ETABSv1

Assembly: ETABSv1 (in ETABSv1.dll) Version: 1.0.0.0 (1.24.0.0)

■ Syntax

C#

VB

C++

F#

Copy

```
int GetPreference(
    int Item,
    ref double Value
)
```

```
Function GetPreference (
    Item As Integer,
    ByRef Value As Double
) As Integer
```

```
Dim instance As cDCoSP63133302011
Dim Item As Integer
Dim Value As Double
Dim returnValue As Integer
```

```
returnValue = instance.GetPreference(Item,
    Value)
```

```
int GetPreference(
    int Item,
    double% Value
)
```

```
abstract GetPreference :
    Item : int *
    Value : float byref -> int
```

Parameters

Item

Type: SystemInt32

This is an integer between 1 and 47, inclusive, indicating the preference item considered.

1. Multi-response case design
2. Number of interaction curves
3. Number of interaction points
4. Consider minimum eccentricity
5. Consider torsion

6. $(q_{sw,1} \cdot Z_1) / (R_s \cdot A_s,1)$
7. Corner rebar fraction top
8. Corner rebar fraction bottom
9. Relative Humidity (%)
10. Moisture Content (fraction)
11. Γ_b
12. Γ_{bt}
13. Γ_{b1} Short Term
14. Γ_{b1} Long Term
15. Γ_{b2}
16. Γ_{b3} Beams
17. Γ_{b3} Columns
18. Γ_{b4}
19. Γ_{b5}
20. Γ_S
21. Γ_{S1}
22. Pattern Live Load Factor
23. Utilization Factor Limit
24. Live Load Duration Factor
25. Snow Load Duration Factor
26. Reliability Factor, Γ_n
27. Seismic Factor, $m_{tr,strength}$
28. Seismic Factor, $m_{tr,shear}$
29. Site Seismicity
31. Ignore Beneficial P_u for Beam Design
32. Consider Crack Analysis
33. Crack Width Limit Full Load, $a_{crc,ult}$ (mm)
34. Crack Width Limit Long Term, $a_{crc,l,ult}$ (mm)
35. Longitudinal Rebar Size Top
36. Longitudinal Rebar Size Bottom
37. Is Longitudinal Rebar Ribbed
38. User Defined Allowable PT Stresses
39. Concrete Strength Ratio at Transfer f'_{ci} / f'_c
40. Transfer: Top Fiber Tensile Stress / $f'_{ci}^{(1/2)}$
41. Transfer: Bottom Fiber Tensile Stress / $f'_{ci}^{(1/2)}$
42. Transfer: Extreme Fiber Compressive Stress / f'_{ci}
43. Final: Top Fiber Tensile Stress / $f'_c^{(1/2)}$
44. Final: Bottom Fiber Tensile Stress / $f'_c^{(1/2)}$
45. Final: Extreme Fiber Compressive Stress / f'_c
46. Sustained: Extreme Fiber Compressive Stress / f'_c
47. Sustained: Fraction of Live Load Considered

Value

Type: SystemDouble

The value of the considered preference item.

1. Multi-response case design
 - 1 = Envelopes
 - 2 = Step-by-Step
 - 3 = Last Step
 - 4 = Envelope -- All
 - 5 = Step-by-Step -- All
2. Number of interaction curves

Value ≥ 4 and divisible by 4
 3. Number of interaction points

Value ≥ 5 and odd
 4. Consider minimum eccentricity
 · 0 = No
 · Any other value = Yes
 5. Consider torsion
 · 0 = No
 · Any other value = Yes
 6. $(q_{sw,1} \cdot Z_1) / (R_s \cdot A_{s,1})$

Value > 0
 7. Corner rebar fraction top

Value > 0
 8. Corner rebar fraction bottom

Value > 0
 9. Relative Humidity (%)

Value > 0
 10. Moisture Content (fraction)

Value > 0
 11. Γ_b

Value > 0
 12. Γ_{bt}

Value > 0
 13. Γ_{b1} Short Term

Value > 0
 14. Γ_{b1} Long Term

Value > 0
 15. Γ_{b2}

Value > 0
 16. Γ_{b3} Beams

Value > 0
 17. Γ_{b3} Columns

Value > 0
 18. Γ_{b4}

Value > 0
 19. Γ_{b5}

- Value > 0
20. Gamma_b4
- Value > 0
21. Gamma_S
- Value > 0
22. Gamma_S1
- Value > 0
23. Pattern Live Load Factor
- Value > 0
24. Utilization Factor Limit
- Value > 0
25. Live Load Duration Factor
- Value > 0
26. Snow Load Duration Factor
- Value > 0
27. Reliability Factor, Gamma_n
- Value > 0
28. Seismic Factor, m_tr,strength
- Value > 0
29. Seismic Factor, m_tr,shear
- Value > 0
30. Site Seismicity
 · 1 = Site Seismicity 9
 · 2 = Site Seismicity 8
 · 3 = Site Seismicity 7
 · 4 = Non-seismic
31. Ignore Beneficial Pu for Beam Design
 · 0 = No
 · Any other value = Yes
32. Consider Crack Analysis
 · 0 = No
 · Any other value = Yes
33. Crack Width Limit Full Load, a_crc,ult (mm)
- Value > 0
34. Crack Width Limit Long Term, a_crc,l,ult (mm)
- Value > 0
35. Longitudinal Rebar Size Top

Introduction

Value is the index in the list of the rebar defined in the Reinforcing Bar Sizes form

36. Longitudinal Rebar Size Bottom

Value is the index in the list of the rebar defined in the Reinforcing Bar Sizes form

37. Is Longitudinal Rebar Ribbed

- 0 = No
- Any other value = Yes

38. User Defined Allowable PT Stresses

- 0 = No
- Any other value = Yes

39. Concrete Strength Ratio at Transfer f'_{ci} / f'_c

Value > 0

40. Transfer: Top Fiber Tensile Stress / $f'_{ci}^{(1/2)}$

Value > 0

41. Transfer: Bottom Fiber Tensile Stress / $f'_{ci}^{(1/2)}$

Value > 0

42. Transfer: Extreme Fiber Compressive Stress / f'_{ci}

Value > 0

43. Final: Top Fiber Tensile Stress / $f'_c^{(1/2)}$

Value > 0

44. Final: Bottom Fiber Tensile Stress / $f'_c^{(1/2)}$

Value > 0

45. Final: Extreme Fiber Compressive Stress / f'_c

Value > 0

46. Sustained: Extreme Fiber Compressive Stress / f'_c

Value > 0

47. Sustained: Fraction of Live Load Considered

Value > 0

Return Value

Type: Int32

Returns zero if the item is successfully retrieved; otherwise it returns a nonzero value.

▲ Remarks

▲ Examples

VB

CSI API ETABS v1

cDCoSP63133302011AddLanguageSpecificTextSet("LS Method

Sets the value of a concrete design overwrite item.

Namespace: ETABSv1

Assembly: ETABSv1 (in ETABSv1.dll) Version: 1.0.0.0 (1.24.0.0)

■ Syntax

C#

VB

C++

F#

Copy

```
int SetOverwrite(
    string Name,
    int Item,
    double Value,
    eItemType ItemType = eItemType.Objects
)
```

```
Function SetOverwrite (
    Name As String,
    Item As Integer,
    Value As Double,
    ?ItemType As eItemType = eItemType.Objects
) As Integer
```

```
Dim instance As cDCoSP63133302011
Dim Name As String
Dim Item As Integer
Dim Value As Double
Dim ItemType As eItemType
Dim returnValue As Integer
```

```
returnValue = instance.SetOverwrite(Name,
    Item, Value, ItemType)
```

```
int SetOverwrite(
    String^ Name,
    int Item,
    double Value,
    eItemType ItemType = eItemType::Objects
)
```

```
abstract SetOverwrite :
    Name : string *
    Item : int *
    Value : float *
    ?ItemType : eItemType
(* Defaults:
    let _ItemType = defaultArg ItemType eItemType.Objects
*)
-> int
```

Parameters**Name**

Type: SystemString

The name of an existing frame object or group, depending on the value of the ItemType item.

Item

Type: SystemInt32

This is an integer between 1 and 22, inclusive, indicating the overwrite item considered.

1. Framing type (beams and columns)
2. Live load reduction factor (beams and columns)
3. Unbraced length ratio, Major (beams and columns)
4. Unbraced length ratio, Minor (beams and columns)
5. Effective length factor, K Major (columns only)
6. Effective length factor, K Minor (columns only)
7. Moment amplification factor, Eta Major (columns only)
8. Moment amplification factor, Eta Minor (columns only)
9. Gammab3 for column (columns only)
10. Gammab3 for beam (beams only)
11. Consider torsion (beams only)
12. $(q_{sw}, 1 * Z_1) / (R_s * A_s, 1)$ (beams only)
13. Corner rebar fraction top (beams only)
14. Corner rebar fraction bottom (beams only)
15. Consider minimum eccentricity (columns only)
16. Consider crack analysis (beams only)
17. Crack width limit full load, $a_{crc,ult}$ [mm] (beams only)
18. Crack width limit long term, $a_{crc,l,ult}$ [mm] (beams only)
19. Longitudinal rebar size top (beams only)
20. Longitudinal rebar size bottom (beams only)
21. Ignore beneficial P_u for beam design (beams only)
22. Is longitudinal rebar ribbed (beams only)

Value

Type: SystemDouble

The value of the considered overwrite item.

1. Framing type
 - 0 = Program Default
 - 1 = Sway
 - 2 = NonSway
2. Live load reduction factor

Value ≥ 0 ; 0 means use program determined value
3. Unbraced length ratio, Major

Value ≥ 0 ; 0 means use program determined value
4. Unbraced length ratio, Minor

Value ≥ 0 ; 0 means use program determined value
5. Effective length factor, K Major

Value ≥ 0 ; 0 means use program determined value

6. Effective length factor, K Minor

Value ≥ 0 ; 0 means use program determined value

7. Moment amplification factor, Eta Major

Value ≥ 0 ; 0 means use program determined value

8. Moment amplification factor, Eta Minor

Value ≥ 0 ; 0 means use program determined value

9. Gammab3 for column

Value ≥ 0 ; 0 means use program determined value

10. Gammab3 for beam

Value ≥ 0 ; 0 means use program determined value

11. Consider torsion

· 0 = No

· Any other value = Yes

12. $(q_{sw,1} \cdot Z_1) / (R_s \cdot A_s, 1)$

Value ≥ 0 ; 0 means use program determined value

13. Corner rebar fraction top

Value ≥ 0 ; 0 means use program determined value

14. Corner rebar fraction bottom

Value ≥ 0 ; 0 means use program determined value

15. Consider minimum eccentricity

· 0 = No

· Any other value = Yes

16. Consider crack analysis

· 0 = No

· Any other value = Yes

17. Crack Width Limit Full Load, $a_{crc,ult}$ [mm]

Value ≥ 0 ; 0 means use program determined value

18. Crack Width Limit Long Term, $a_{crc,l,ult}$ [mm]

Value ≥ 0 ; 0 means use program determined value

19. Longitudinal Rebar Size Top

Value is the index in the list of the rebar defined in the Reinforcing Bar Sizes form

20. Longitudinal Rebar Size Bottom

Value is the index in the list of the rebar defined in the Reinforcing Bar Sizes form

21. Ignore Beneficial Pu for Beam Design

· 0 = No

· Any other value = Yes

22. Is Longitudinal Rebar Ribbed

- 0 = No
- Any other value = Yes

ItemType (Optional)

Type: $\hat{A}$ ETABSv1eItemType

This is one of the following items in the eItemType enumeration:

- ◊ Object = 0
- ◊ Group = 1
- ◊ SelectedObjects = 2

If this item is Objects, the assignment is made to the frame object specified by the Name item.

If this item is Group, the assignment is made to all frame objects in the group specified by the Name item.

If this item is SelectedObjects, the assignment is made to all selected frame objects and the Name item is ignored.

Return Value

Type: $\hat{A}$ Int32

Returns zero if the item is successfully set; otherwise it returns a nonzero value.

▲ Remarks

▲ Examples

VB

Copy

```
Public Sub Example()
    Dim SapModel As cSapModel
    Dim EtabsObject As cOAPI

CSI API ETABS v1

cDCoTS_500_2000_R2018AddLanguageSpecificTextSet Method

Retrieves the value of a concrete design overwrite item.

Namespace: ETABSv1

Assembly: ETABSv1 (in ETABSv1.dll) Version: 1.0.0.0 (1.24.0.0)

■ Syntax

C#

VB

C++

F#

Copy

```
int GetOverwrite(
    string Name,
    int Item,
    ref double Value,
    ref bool ProgDet
)
```

```
Function GetOverwrite (
    Name As String,
    Item As Integer,
    ByRef Value As Double,
    ByRef ProgDet As Boolean
) As Integer
```

```
Dim instance As cDCoTS_500_2000_R2018
Dim Name As String
Dim Item As Integer
Dim Value As Double
Dim ProgDet As Boolean
Dim returnValue As Integer
```

```
returnValue = instance.GetOverwrite(Name,
    Item, Value, ProgDet)
```

```
int GetOverwrite(
    String^ Name,
    int Item,
    double% Value,
    bool% ProgDet
)
```

```
abstract GetOverwrite :
    Name : string *
    Item : int *
    Value : float byref *
    ProgDet : bool byref -> int
```

Parameters

Name

Type: SystemString

The name of a frame object with a concrete frame design procedure.

Item

Type: SystemInt32

This is an integer between 1 and 13, inclusive, indicating the overwrite item considered.

1. Framing type
2. Live load reduction factor
3. Unbraced length ratio, Major
4. Unbraced length ratio, Minor
5. Effective length factor, K Major
6. Effective length factor, K Minor
7. Moment coefficient, Cm Major
8. Moment coefficient, Cm Minor
9. Nonsway moment factor, Db Major
10. Nonsway moment factor, Db Minor
11. Sway moment factor, Ds Major
12. Sway moment factor, Ds Minor
13. Consider Minimum Eccentricity

Value

Type: SystemDouble

The value of the considered overwrite item.

1. Framing type
 - 0 = Program Default
 - 1 = High Ductile
 - 2 = Nominal Ductile
 - 3 = Ordinary
 - 4 = Non-sway
2. Live load reduction factor

Value >= 0; 0 means use program determined value
3. Unbraced length ratio, Major

Value >= 0; 0 means use program determined value
4. Unbraced length ratio, Minor

Value >= 0; 0 means use program determined value
5. Effective length factor, K Major

Value >= 0; 0 means use program determined value
6. Effective length factor, K Minor

Value >= 0; 0 means use program determined value
7. Moment coefficient, Cm Major

Value >= 0; 0 means use program determined value
8. Moment coefficient, Cm Minor

Value >= 0; 0 means use program determined value

Introduction

Value ≥ 0 ; 0 means use program determined value

9. Nonsway moment factor, Db Major

Value ≥ 0 ; 0 means use program determined value

10. Nonsway moment factor, Db Minor

Value ≥ 0 ; 0 means use program determined value

11. Sway moment factor, Ds Major

Value ≥ 0 ; 0 means use program determined value

12. Sway moment factor, Ds Minor

Value ≥ 0 ; 0 means use program determined value

13. Consider Minimum Eccentricity

0 = No

Any other value = Yes

ProgDet

Type: SystemBoolean

If this item is True, the specified value is program determined.

Return Value

Type: Int32

Returns zero if the item is successfully retrieved; otherwise it returns a nonzero value.

CSI API ETABS v1

cDCoTS_500_2000_R2018AddLanguageSpecificTextSet

Method

Retrieves the value of a concrete design preference item.

Namespace: ETABSV1

Assembly: ETABSV1 (in ETABSV1.dll) Version: 1.0.0.0 (1.24.0.0)

▲ Syntax

C#

VB

C++

F#

Copy

```
int GetPreference(
    int Item,
    ref double Value
)
```

```
Function GetPreference (
    Item As Integer,
    ByRef Value As Double
) As Integer
```

```
Dim instance As cDCoTS_500_2000_R2018
Dim Item As Integer
Dim Value As Double
Dim returnValue As Integer
```

```
returnValue = instance.GetPreference(Item,
    Value)
```

```
int GetPreference(
    int Item,
    double% Value
)
```

```
abstract GetPreference :
    Item : int *
    Value : float byref -> int
```

Parameters

Item

Type: SystemInt32

This is an integer between 1 and 9, inclusive, indicating the preference item considered.

1. Number of interaction curves
2. Number of interaction points
3. Consider minimum eccentricity
4. Design for B/C Capacity Ratio?
5. Gamma steel

- 6. Gamma concrete
- 7. Pattern live load factor
- 8. Utilization factor limit
- 9. Multi-response case design

Value

Type: SystemDouble

The value of the considered preference item.

- 1. Number of interaction curves

Value ≥ 4 and divisible by 4

- 2. Number of interaction points

Value ≥ 5 and odd

- 3. Consider minimum eccentricity

0 = No

Any other value = Yes

- 4. Design for B/C Capacity Ratio?

1 = No

2 = Yes

- 5. Gamma steel

Value > 0

- 6. Gamma concrete

Value > 0

- 7. Pattern live load factor

Value ≥ 0

- 8. Utilization factor limit

Value > 0

- 9. Multi-response case design

- 1 = Envelopes
- 2 = Step-by step
- 3 = Last step
- 4 = Envelopes - All
- 5 = Step-by step - All

Return Value

Type: Int32

Returns zero if the item is successfully retrieved; otherwise it returns a nonzero value.

CSI API ETABS v1

cDCoTS_500_2000_R2018AddLanguageSpecificTextSet Method

Sets the value of a concrete design overwrite item.

Namespace: ETABSv1

Assembly: ETABSv1 (in ETABSv1.dll) Version: 1.0.0.0 (1.24.0.0)

■ Syntax

C#

VB

C++

F#

Copy

```
int SetOverwrite(
    string Name,
    int Item,
    double Value,
    eItemType ItemType = eItemType.Objects
)
```

```
Function SetOverwrite (
    Name As String,
    Item As Integer,
    Value As Double,
    ?ItemType As eItemType = eItemType.Objects
) As Integer
```

```
Dim instance As cDCoTS_500_2000_R2018
Dim Name As String
Dim Item As Integer
Dim Value As Double
Dim ItemType As eItemType
Dim returnValue As Integer
```

```
returnValue = instance.SetOverwrite(Name,
    Item, Value, ItemType)
```

```
int SetOverwrite(
    String^ Name,
    int Item,
    double Value,
    eItemType ItemType = eItemType::Objects
)
```

```
abstract SetOverwrite :
    Name : string *
    Item : int *
    Value : float *
    ?ItemType : eItemType
(* Defaults:
    let _ItemType = defaultArg ItemType eItemType.Objects
*)
-> int
```

Parameters**Name**Type:Â SystemString

The name of an existing frame object or group, depending on the value of the ItemType

ItemType:Â SystemInt32

This is an integer between 1 and 13, inclusive, indicating the overwrite item considered.

1. Framing type
2. Live load reduction factor
3. Unbraced length ratio, Major
4. Unbraced length ratio, Minor
5. Effective length factor, K Major
6. Effective length factor, K Minor
7. Moment coefficient, Cm Major
8. Moment coefficient, Cm Minor
9. Nonsway moment factor, Db Major
10. Nonsway moment factor, Db Minor
11. Sway moment factor, Ds Major
12. Sway moment factor, Ds Minor
13. Consider Minimum Eccentricity

ValueType:Â SystemDouble

The value of the considered overwrite item.

1. Framing type
 - 0 = Program Default
 - 1 = High Ductile
 - 2 = Nominal Ductile
 - 3 = Ordinary
 - 4 = Non-sway
2. Live load reduction factor

Value >= 0; 0 means use program determined value
3. Unbraced length ratio, Major

Value >= 0; 0 means use program determined value
4. Unbraced length ratio, Minor

Value >= 0; 0 means use program determined value
5. Effective length factor, K Major

Value >= 0; 0 means use program determined value
6. Effective length factor, K Minor

Value >= 0; 0 means use program determined value
7. Moment coefficient, Cm Major

Value >= 0; 0 means use program determined value
8. Moment coefficient, Cm Minor

Value >= 0; 0 means use program determined value

Introduction

Value ≥ 0 ; 0 means use program determined value

9. Nonsway moment factor, Db Major

Value ≥ 0 ; 0 means use program determined value

10. Nonsway moment factor, Db Minor

Value ≥ 0 ; 0 means use program determined value

11. Sway moment factor, Ds Major

Value ≥ 0 ; 0 means use program determined value

12. Sway moment factor, Ds Minor

Value ≥ 0 ; 0 means use program determined value

13. Consider Minimum Eccentricity

0 = No

Any other value = Yes

ItemType (Optional)

Type: $\hat{A}$ ETABSv1eItemType

This is one of the following items in the eItemType enumeration:

◊ Object = 0

◊ Group = 1

◊ SelectedObjects = 2

If this item is Objects, the overwrite is set for the frame object specified by the Name item.

If this item is Group, the overwrite is set for all frame objects in the group specified by the Name item.

If this item is SelectedObjects, the overwrite is set for all selected frame objects and the Name item is ignored.

Return Value

Type: $\hat{A}$ Int32

Returns zero if the item is successfully set; otherwise it returns a nonzero value.

    int Item,
    double Value
)
```

```
Function SetPreference (
    Item As Integer,
    Value As Double
) As Integer
```

```
Dim instance As cDCoTS_500_2000_R2018
Dim Item As Integer
Dim Value As Double
Dim returnValue As Integer
```

```
returnValue = instance.SetPreference(Item,
    Value)
```

```
int SetPreference(
    int Item,
    double Value
)
```

```
abstract SetPreference :
    Item : int *
    Value : float -> int
```

Parameters

Item

Type: SystemInt32

This is an integer between 1 and 9, inclusive, indicating the preference item considered.

1. Number of interaction curves
2. Number of interaction points
3. Consider minimum eccentricity
4. Design for B/C Capacity Ratio?
5. Gamma steel

- 6. Gamma concrete
- 7. Pattern live load factor
- 8. Utilization factor limit
- 9. Multi-response case design

Value

Type: SystemDouble

The value of the considered preference item.

- 1. Number of interaction curves

Value ≥ 4 and divisible by 4

- 2. Number of interaction points

Value ≥ 5 and odd

- 3. Consider minimum eccentricity

0 = No

Any other value = Yes

- 4. Design for B/C Capacity Ratio?

1 = No

2 = Yes

- 5. Gamma steel

Value > 0

- 6. Gamma concrete

Value > 0

- 7. Pattern live load factor

Value ≥ 0

- 8. Utilization factor limit

Value > 0

- 9. Multi-response case design

- 1 = Envelopes
- 2 = Step-by step
- 3 = Last step
- 4 = Envelopes - All
- 5 = Step-by step - All

Return Value

Type: Int32

Returns zero if the item is successfully set; otherwise it returns a nonzero value.

CSI API ETABS v1

cDesignCompositeBeamAddLanguageSpecificTextSet(

Method

Retrieves the composite beam design code.

Namespace: ETABSv1

Assembly: ETABSv1 (in ETABSv1.dll) Version: 1.0.0.0 (1.24.0.0)

▲ Syntax

C#

VB

C++

F#

Copy

```
int GetCode(
    ref string CodeName
)
```

```
Function GetCode (
    ByRef CodeName As String
) As Integer
```

```
Dim instance As cDesignCompositeBeam
Dim CodeName As String
Dim returnValue As Integer
```

```
returnValue = instance.GetCode(CodeName)
```

```
int GetCode(
    String^% CodeName
)
```

```
abstract GetCode :
    CodeName : string byref -> int
```

Parameters

CodeName

Type: SystemString

This is one of the following composite beam design code names.

- ◇ AISC 360-10
- ◇ AISC 360-05
- ◇ BS 5950-1990
- ◇ Chinese 2010
- ◇ CSA S16-14
- ◇ CSA S16-09
- ◇ Eurocode 4-2004

Return Value

Type: Int32

Returns zero if the code is successfully retrieved; otherwise it returns a nonzero value

▲ **Remarks**

▲ **Examples**

VB

Copy

```
Public Sub Example()
    Dim SapModel As cSapModel
    Dim EtabsObject As cOAPI
    Dim ret As Integer = -1
    Dim CodeName As String

    'create ETABS object
    Dim myHelper as cHelper = New Helper
    EtabsObject = myHelper.CreateObjectProgID("CSI.ETABS.API.ETABSObject")

    'start ETABS application
    ret = EtabsObject.ApplicationStart()

    'create SapModel object
    SapModel = EtabsObject.SapModel

    'initialize model
    ret = SapModel.InitializeNewModel()

    'create steel deck template model
    ret = SapModel.File.NewSteelDeck(4, 12, 12, 4, 4, 24, 24)

    'get composite beam design code
    ret = SapModel.DesignCompositeBeam.GetCode(CodeName)

    'close ETABS
    EtabsObject.ApplicationExit(False)

    'clean up variables
    SapModel = Nothing
    EtabsObject = Nothing

End Sub
```

CSI API ETABS v1

cDesignCompositeBeamAddLanguageSpecificTextSet Method

This function determines if the composite beam design results are available.

Namespace: ETABSv1

Assembly: ETABSv1 (in ETABSv1.dll) Version: 1.0.0.0 (1.24.0.0)

▲ Syntax

C#

VB

C++

F#

Copy

```
bool GetResultsAvailable()
```

```
Function GetResultsAvailable As Boolean
```

```
Dim instance As cDesignCompositeBeam
```

```
Dim returnValue As Boolean
```

```
returnValue = instance.GetResultsAvailable()
```

```
bool GetResultsAvailable()
```

```
abstract GetResultsAvailable : unit -> bool
```

Return Value

Type: Boolean

Returns True if the composite beam design results are available, otherwise it returns False.

▲ Remarks

▲ Examples

VB

Copy

```
Public Sub Example()
    Dim SapModel As cSapModel
    Dim EtabsObject As cOAPI
    Dim ret As Integer = -1
    Dim ResultsAvailable as Boolean

    'create ETABS object
    Dim myHelper as cHelper = New Helper
    EtabsObject = myHelper.CreateObjectProgID("CSI.ETABS.API.ETABSObject")

    'start ETABS application
    ret = EtabsObject.ApplicationStart()

    'create SapModel object
    SapModel = EtabsObject.SapModel

    'initialize model
```

cDesignCompositeBeamsAddLanguageSpecificTextSet("LST80EEE392_0?cpp=

Introduction

```
ret = SapModel.InitializeNewModel()

'create steel deck template model
ret = SapModel.File.NewSteelDeck(4, 12, 12, 4, 4, 24, 24)

'run analysis
System.IO.Directory.CreateDirectory("c:\CSI_API_temp")
ret = SapModel.File.Save("C:\CSI_API_temp\example.edb")
ret = SapModel.Analyze.RunAnalysis

'start steel design
ret = SapModel.DesignCompositeBeam.StartDesign()

'check if design results are available
ResultsAvailable = SapModel.DesignCompositeBeam.GetResultsAvailable

'close ETABS
EtabsObject.ApplicationExit(False)

'clean up variables
SapModel = Nothing
EtabsObject = Nothing
End Sub
```

CSI API ETABS v1

cDesignCompositeBeamAddLanguageSpecificTextSet Method

Sets the composite beam design code.

Namespace: ETABSv1

Assembly: ETABSv1 (in ETABSv1.dll) Version: 1.0.0.0 (1.24.0.0)

Syntax

C#

VB

C++

F#

Copy

```
int SetCode(
    string CodeName
)
```

```
Function SetCode (
    CodeName As String
) As Integer
```

```
Dim instance As cDesignCompositeBeam
Dim CodeName As String
Dim returnValue As Integer
```

```
returnValue = instance.SetCode(CodeName)
```

```
int SetCode(
    String^ CodeName
)
```

```
abstract SetCode :
    CodeName : string -> int
```

Parameters

CodeName

Type: SystemString

This is one of the following composite beam design code names.

- ◇ AISC 360-10
- ◇ AISC 360-05
- ◇ BS 5950-1990
- ◇ Chinese 2010
- ◇ CSA S16-14
- ◇ CSA S16-09
- ◇ Eurocode 4-2004

Return Value

Type: Int32

Returns zero if the code is successfully set; otherwise it returns a nonzero value.

▲ **Remarks**

▲ **Examples**

VB

Copy

```
Public Sub Example()
    Dim SapModel As cSapModel
    Dim EtabsObject As cOAPI
    Dim ret As Integer = -1
    Dim CodeName As String

    'create ETABS object
    Dim myHelper as cHelper = New Helper
    EtabsObject = myHelper.CreateObjectProgID("CSI.ETABS.API.ETABSObject")

    'start ETABS application
    ret = EtabsObject.ApplicationStart()

    'create SapModel object
    SapModel = EtabsObject.SapModel

    'initialize model
    ret = SapModel.InitializeNewModel()

    'create steel deck template model
    ret = SapModel.File.NewSteelDeck(4, 12, 12, 4, 4, 24, 24)

    'set composite beam design code
    ret = SapModel.DesignCompositeBeam.SetCode("Eurocode 3-2005")

    'close ETABS
    EtabsObject.ApplicationExit(False)

    'clean up variables
    SapModel = Nothing
    EtabsObject = Nothing

End Sub
```

CSI API ETABS v1

cDesignCompositeBeamAddLanguageSpecificTextSet Method

Starts the composite beam design.

Namespace: [ETABSv1](#)

Assembly: [ETABSv1](#) (in ETABSv1.dll) Version: 1.0.0.0 (1.24.0.0)

▲ Syntax

[C#](#)

[VB](#)

[C++](#)

[F#](#)

[Copy](#)

```
int StartDesign()
```

```
Function StartDesign As Integer
```

```
Dim instance As cDesignCompositeBeam
```

```
Dim returnValue As Integer
```

```
returnValue = instance.StartDesign()
```

```
int StartDesign()
```

```
abstract StartDesign : unit -> int
```

Return Value

Type: [Int32](#)

Returns zero if the composite beam design is successfully started; otherwise it returns a nonzero value.

▲ Remarks

The function will fail if no composite beam frame objects are present. It will also fail if analysis results are not available.

▲ Examples

[VB](#)

[Copy](#)

```
Public Sub Example()
```

```
    Dim SapModel As cSapModel
```

```
    Dim EtabsObject As cOAPI
```

```
    Dim ret As Integer = -1
```

```
'create ETABS object
```

```
    Dim myHelper as cHelper = New Helper
```

```
    EtabsObject = myHelper.CreateObjectProgID("CSI.ETABS.API.ETABSObject")
```

```
'start ETABS application
```

```
    ret = EtabsObject.ApplicationStart()
```

```
'create SapModel object
```

```
    SapModel = EtabsObject.SapModel
```

cDesignCompositeBeams id="LSTCA01F4A3_0"AddLanguageSpecificTextSet("LSTCA01F4A3_0?cpp=

Introduction

```
'initialize model
    ret = SapModel.InitializeNewModel()

'create steel deck template model
    ret = SapModel.File.NewSteelDeck(4, 12, 12, 4, 4, 24, 24)

'create new concrete frame section property
    ret = SapModel.PropFrame.SetRectangle("R1", "4000Psi", 20, 12)

'set frame section property
    ret = SapModel.FrameObj.SetSection("8", "R1")

	<u>TS_500_2000_R2018</u>	

Top

▲ Methods

Â	Name	Description
	<u>GetCode</u>	Retrieves the concrete design code.
	<u>GetDesignSection</u>	Retrieves the design section for a specified concrete frame object
	<u>GetRebarPrefsBeam</u>	Retrieves data from the Rebar Selection Rules for Beams

Introduction

- ⇒ [GetRebarPrefsColumn](#) Retrieves data from the Rebar Selection Rules for Columns
- ⇒ [GetResultsAvailable](#) This function determines if the concrete frame design results are available.
- ⇒ [GetSeismicFramingType](#)
- ⇒ [GetSummaryResultsBeam](#) Retrieves beam summary results for concrete design.
- ⇒ [GetSummaryResultsBeam_2](#)
- ⇒ [GetSummaryResultsColumn](#) Retrieves column summary results for concrete design
- ⇒ [GetSummaryResultsJoint](#)
- ⇒ [SetCode](#) Sets the concrete design code.
- ⇒ [SetDesignSection](#) Modifies the design section for all specified frame objects that have a concrete frame design procedure
- ⇒ [StartDesign](#) Starts the concrete frame design.

CSI API ETABS v1

cDesignConcrete Methods

The cDesignConcrete type exposes the following members.

Methods

	Name	Description
◆	<u>GetCode</u>	Retrieves the concrete design code.
◆	<u>GetDesignSection</u>	Retrieves the design section for a specified concrete frame object
◆	<u>GetRebarPrefsBeam</u>	Retrieves data from the Rebar Selection Rules for Beams
◆	<u>GetRebarPrefsColumn</u>	Retrieves data from the Rebar Selection Rules for Columns
◆	<u>GetResultsAvailable</u>	This function determines if the concrete frame design results are available.
◆	<u>GetSeismicFramingType</u>	
◆	<u>GetSummaryResultsBeam</u>	Retrieves beam summary results for concrete design.
◆	<u>GetSummaryResultsBeam_2</u>	
◆	<u>GetSummaryResultsColumn</u>	Retrieves column summary results for concrete design
◆	<u>GetSummaryResultsJoint</u>	
◆	<u>SetCode</u>	Sets the concrete design code.
◆	<u>SetDesignSection</u>	Modifies the design section for all specified frame objects that have a concrete frame design procedure
◆	<u>StartDesign</u>	Starts the concrete frame design.

CSI API ETABS v1

cDesignConcreteAddLanguageSpecificTextSet("LST87 Method

Retrieves the concrete design code.

Namespace: ETABSv1

Assembly: ETABSv1 (in ETABSv1.dll) Version: 1.0.0.0 (1.24.0.0)

Syntax

C#

VB

C++

F#

Copy

```
int GetCode(
    ref string CodeName
)
```

```
Function GetCode (
    ByRef CodeName As String
) As Integer
```

```
Dim instance As cDesignConcrete
Dim CodeName As String
Dim returnValue As Integer
```

```
returnValue = instance.GetCode(CodeName)
```

```
int GetCode(
    String^% CodeName
)
```

```
abstract GetCode :
    CodeName : string byref -> int
```

Parameters

CodeName

Type: SystemString

This is one of the following concrete design code names.

- ◇ ACI 318-14
- ◇ ACI 318-11
- ◇ ACI 318-08
- ◇ AS 3600-2018
- ◇ AS 3600-09
- ◇ BS 8110-97
- ◇ Chinese 2010
- ◇ CSA A23.3-14
- ◇ CSA A23.3-04
- ◇ Eurocode 2-2004
- ◇ Hong Kong CP 2013

◇ IS 456:2000
 ◇ Italian NTC 2008
 ◇ KBC 2016
 ◇ KBC 2009
 ◇ Mexican RCDF 2017
 ◇ Mexican RCDF 2004
 ◇ NZS 3101:2006
 ◇ Singapore CP 65:99
 ◇ SP 63.13330.2012
 ◇ TS 500-2000(R2018)
 ◇ TS 500-2000
 ◇ TCVN 5574:2012

Return Value

Type: Int32

Returns zero if the code is successfully retrieved; otherwise it returns a nonzero value.

▲ Remarks

▲ Examples

VB

Copy

```
Public Sub Example()
    Dim SapModel As cSapModel
    Dim EtabsObject As cOAPI
    Dim ret As Integer = -1
    Dim CodeName As String

    'create ETABS object
    Dim myHelper as cHelper = New Helper
    EtabsObject = myHelper.CreateObjectProgID("CSI.ETABS.API.ETABSObject")

    'start ETABS application
    ret = EtabsObject.ApplicationStart()

    'create SapModel object
    SapModel = EtabsObject.SapModel

    'initialize model
    ret = SapModel.InitializeNewModel()

    'create steel deck template model
    ret = SapModel.File.NewSteelDeck(4, 12, 12, 4, 4, 24, 24)

    'get concrete design code
    ret = SapModel.DesignConcrete.GetCode(CodeName)

    'close ETABS
    EtabsObject.ApplicationExit(False)

    'clean up variables
    SapModel = Nothing
    EtabsObject = Nothing

End Sub
```

CSI API ETABS v1

cDesignConcreteAddLanguageSpecificTextSet("LST43037CB_0") Method

Retrieves the design section for a specified concrete frame object

Namespace: ETABSv1

Assembly: ETABSv1 (in ETABSv1.dll) Version: 1.0.0.0 (1.24.0.0)

Syntax

C#

VB

C++

F#

Copy

```
int GetDesignSection(
    string Name,
    ref string PropName
)
```

```
Function GetDesignSection (
    Name As String,
    ByRef PropName As String
) As Integer
```

```
Dim instance As cDesignConcrete
Dim Name As String
Dim PropName As String
Dim returnValue As Integer
```

```
returnValue = instance.GetDesignSection(Name,
    PropName)
```

```
int GetDesignSection(
    String^ Name,
    String^% PropName
)
```

```
abstract GetDesignSection :
    Name : string *
    PropName : string byref -> int
```

Parameters

Name

Type: SystemString

The name of a frame object with a concrete frame design procedure

PropName

Type: SystemString

The name of the design section for the specified frame object

Return ValueType: Int32

Returns zero if the section is successfully retrieved; otherwise it returns a nonzero value

▲ Remarks

▲ Examples

VB

Copy

```
Public Sub Example()

```

```
returnValue = instance.GetRebarPrefsBeam(Item,
    Value)
```

```
int GetRebarPrefsBeam(
    int Item,
    String^% Value
)
```

```
abstract GetRebarPrefsBeam :
    Item : int *
    Value : string byref -> int
```

Parameters

Item

Type: [SystemInt32](#)

An integer value corresponding to the data to be retrieved, from the following list

1. Non-Seismic Smallest Longitudinal Bar Size Top
2. Non-Seismic Largest Longitudinal Bar Size Top
3. Non-Seismic Preferred Longitudinal Bar Size Top
4. Non-Seismic Min Number of Bars Top
5. Non-Seismic Smallest Longitudinal Bar Size Bottom

Introduction

6. Non-Seismic Largest Longitudinal Bar Size Bottom
7. Non-Seismic Preferred Longitudinal Bar Size Bottom
8. Non-Seismic Min Number of Bars Bottom
9. Non-Seismic Smallest Stirrup Bar Size
10. Non-Seismic Largest Stirrup Bar Size
11. Non-Seismic Stirrup Min Spacing
12. Non-Seismic Stirrup Max Spacing
13. Seismic Smallest Longitudinal Bar Size Top
14. Seismic Largest Longitudinal Bar Size Top
15. Seismic Preferred Longitudinal Bar Size Top
16. Seismic Min Number of Bars Top
17. Seismic Smallest Longitudinal Bar Size Bottom
18. Seismic Largest Longitudinal Bar Size Bottom
19. Seismic Preferred Longitudinal Bar Size Bottom
20. Seismic Min Number of Bars Bottom
21. Seismic Smallest Stirrup Bar Size
22. Seismic Largest Stirrup Bar Size
23. Seismic Stirrup Min Spacing
24. Seismic Stirrup Max Spacing

Value

Type: SystemString

The retrieved data; note that numerical values are converted to String

Return Value

Type: Int32

Returns zero if the data is successfully retrieved; otherwise returns non-zero

▲ Remarks

▲ Examples

VB

Copy

```
Public Sub Example()  
    Dim SapModel As cSapModel  
    Dim EtabsObject As cOAPI  
    Dim ret As Integer = -1

*)  
-> int
```

Parameters

Name

Type:Â SystemString

The name of an existing frame object or group, depending on the value of the ItemType item.

NumberItems

Type:Â SystemInt32

The number of frame objects for which results are obtained.

FrameName

Type:Â SystemString

This is an array that includes each frame object name for which results are obtained.

Location

Type:Â SystemDouble

This is an array that includes the distance from the I-end of the frame object to the location where the results are reported. [L]

TopCombo

Type:Â SystemString

This is an array that includes the name of the design combination for which the controlling top longitudinal rebar area for flexure occurs. A combination name followed by (Sp) indicates that the design loads were obtained by applying special, code-specific multipliers to all or part of the specified design load combination, or that the design was based on the capacity of other objects (or other design locations for the same object).

TopArea

Type:Â SystemDouble

This is an array that includes the total top longitudinal rebar area required for the flexure at the specified location. It does not include the area of steel required for torsion. [L2]

BotCombo

Type:Â SystemString

This is an array that includes the name of the design combination for which the controlling bottom longitudinal rebar area for flexure occurs. A combination name followed by (Sp) indicates that the design loads were obtained by applying special, code-specific, multipliers to all or part of the specified design load combination, or that the design was based on the capacity of other objects (or other design locations for the same object).

BotArea

Type:Â SystemDouble

This is an array that includes the total bottom longitudinal rebar area required for the flexure at the specified location. It does not include the area of steel required for torsion. [L2]

VMajorCombo

Type:Â SystemString

VMajorArea

Type: SystemDouble

TLCombo

Type: SystemString

This is an array that includes the name of the design combination for which the controlling longitudinal rebar area for torsion occurs. A combination name followed by (Sp) indicates that the design loads were obtained by applying special, code-specific, multipliers to all or part of the specified design load combination, or that the design was based on the capacity of other objects (or other design locations for the same object).

TlArea

Type: SystemDouble

This is an array that includes the total longitudinal rebar area required for torsion. [L2]

TTCombo

Type: SystemString

This is an array that includes the name of the design combination for which the controlling transverse reinforcing for torsion occurs. A combination name followed by (Sp) indicates that the design loads were obtained by applying special, code-specific, multipliers to all or part of the specified design load combination, or that the design was based on the capacity of other objects (or other design locations for the same object).

TTArea

Type: SystemDouble

This is an array that includes the required area of transverse torsional shear reinforcing per unit length along the frame object for torsion at the specified location. [L2/L]

ErrorSummary

Type: SystemString

This is an array that includes the design error messages for the frame object, if any.

WarningSummary

Type: SystemString

This is an array that includes the design warning messages for the frame object, if any.

ItemType (Optional)

Type: ETABSv1eItemType

This is one of the following items in the eItemType enumeration:

- ◊ Object = 0
- ◊ Group = 1
- ◊ SelectedObjects = 2

If this item is Objects, the design results are retrieved for the frame object specified by the Name item.

If this item is Group, the design results are retrieved for all frame objects in the group specified by the Name item.

If this item is SelectedObjects, the design results are retrieved for all selected frame objects, and the Name item is ignored.

Return Value

Type: Int32

Returns zero if the results are successfully retrieved; otherwise it returns a nonzero value.

▲ **Remarks**

Note that torsional design is only included for some codes.

▲ **Examples**

VB

Copy

```
Public Sub Example()
    Dim SapModel As cSapModel

    PMMCombo : string[] byref *
    PMMArea : float[] byref *
    PMMRatio : float[] byref *
    VMajorCombo : string[] byref *
    AVMajor : float[] byref *
    VMinorCombo : string[] byref *
    AVMinor : float[] byref *
    ErrorSummary : string[] byref *
    WarningSummary : string[] byref *
    ?ItemType : eItemType
(* Defaults:
    let _ItemType = defaultArg ItemType eItemType.Objects
*)
-> int
```

Parameters**Name**

Type:Â SystemString

The name of an existing frame object or group, depending on the value of the ItemType item.

NumberItems

Type:Â SystemInt32

The number of frame objects for which results are obtained.

FrameName

Type:Â SystemString

This is an array that includes each frame object name for which results are obtained.

MyOption

Type:Â SystemInt32

This is an array that includes 1 or 2, indicating the design option for each frame object

1. Check

2. Design

Location

Type:Â SystemDouble

This is an array that includes the distance from the I-end of the frame object to the location where the results are reported. [L]

PMMCombo

Type:Â SystemString

This is an array that includes the name of the design combination for which the controlling PMM ratio or rebar area occurs. A combination name followed by (Sp) indicates that the design loads were obtained by applying special, code-specific multipliers to all or part of the specified design load combination, or that the design was based on the capacity of other objects (or other design locations for the same object).

PMMArea

Type:Â SystemDouble

This is an array that includes the total longitudinal rebar area required for the axial force plus biaxial moment (PMM) design at the specified location. [L2]

This item applies only when MyOption = 2 (design).

PMMRatio

Type:Â SystemDouble

This is an array that includes the axial force plus biaxial moment (PMM) stress ratio at the specified location

This item applies only when MyOption = 1 (check).

VMajorCombo

Type:Â SystemString

This is an array that includes the name of the design combination for which the controlling major shear occurs.

AVMajor

Type:Â SystemDouble

This is an array that includes the required area of transverse shear reinforcing per unit length along the frame object for major shear at the specified location.

[L2/L]

VMinorCombo

Type:Â SystemString

This is an array that includes the name of the design combination for which the controlling minor shear occurs.

AVMinor

Type:Â SystemDouble

This is an array that includes the required area of transverse shear reinforcing per unit length along the frame object for minor shear at the specified location.

[L2/L]

ErrorSummary

Type:Â SystemString

This is an array that includes the design error messages for the frame object, if any.

WarningSummary

Type:Â SystemString

This is an array that includes the design warning messages for the frame object, if any.

ItemType (Optional)

Type:Â ETABSv1eItemType

This is one of the following items in the eItemType enumeration:

- ◊ Object = 0

- ◊ Group = 1

- ◊ SelectedObjects = 2

If this item is Objects, the design results are retrieved for the frame object specified by the Name item.

If this item is Group, the design results are retrieved for all frame objects in the group specified by the Name item.

If this item is SelectedObjects, the design results are retrieved for all selected frame objects, and the Name item is ignored.

Return Value

Type:Â Int32

Returns zero if the results are successfully retrieved; otherwise it returns a nonzero value

CSI API ETABS v1

cDesignConcreteAddLanguageSpecificTextSet("LST69D05DBD_0") Method

Sets the concrete design code.

Namespace: ETABSv1

Assembly: ETABSv1 (in ETABSv1.dll) Version: 1.0.0.0 (1.24.0.0)

Syntax

C#

VB

C++

F#

Copy

```
int SetCode(
    string CodeName
)
```

```
Function SetCode (
    CodeName As String
) As Integer
```

```
Dim instance As cDesignConcrete
Dim CodeName As String
Dim returnValue As Integer
```

```
returnValue = instance.SetCode(CodeName)
```

```
int SetCode(
    String^ CodeName
)
```

```
abstract SetCode :
    CodeName : string -> int
```

Parameters

CodeName

Type: SystemString

This is one of the following concrete design code names.

- ◇ ACI 318-14
- ◇ ACI 318-11
- ◇ ACI 318-08
- ◇ AS 3600-2018
- ◇ AS 3600-09
- ◇ BS 8110-97
- ◇ Chinese 2010
- ◇ CSA A23.3-14
- ◇ CSA A23.3-04
- ◇ Eurocode 2-2004
- ◇ Hong Kong CP 2013

- ◇ IS 456:2000
- ◇ Italian NTC 2008
- ◇ KBC 2016
- ◇ KBC 2009
- ◇ Mexican RCDF 2017
- ◇ Mexican RCDF 2004
- ◇ NZS 3101:2006
- ◇ Singapore CP 65:99
- ◇ SP 63.13330.2012
- ◇ TS 500-2000(R2018)
- ◇ TS 500-2000
- ◇ TCVN 5574:2012

Return Value

Type: Int32

Returns zero if the code is successfully set; otherwise it returns a nonzero value.

▲ Remarks

▲ Examples

VB

Copy

```
Public Sub Example()
    Dim SapModel As cSapModel
    Dim EtabsObject As cOAPI
    Dim ret As Integer = -1

    'create ETABS object
    Dim myHelper as cHelper = New Helper
    EtabsObject = myHelper.CreateObjectProgID("CSI.ETABS.API.ETABSObject")

    'start ETABS application
    ret = EtabsObject.ApplicationStart()

    'create SapModel object
    SapModel = EtabsObject.SapModel

    'initialize model
    ret = SapModel.InitializeNewModel()

    'create steel deck template model
    ret = SapModel.File.NewSteelDeck(4, 12, 12, 4, 4, 24, 24)

    'create new concrete frame section property
    ret = SapModel.PropFrame.SetRectangle("R1", "4000Psi", 20, 12)

    'set frame section property
    ret = SapModel.FrameObj.SetSection("8", "R1")

    'set concrete design code
    ret = SapModel.DesignConcrete.SetCode("ACI 318-08/IBC 2009")

    'close ETABS
    EtabsObject.ApplicationExit(False)

    'clean up variables
    SapModel = Nothing

CSI API ETABS v1

cDesignConcreteAddLanguageSpecificTextSet("LST4E6DFF58_0?cpe::|nu=")

Method

Modifies the design section for all specified frame objects that have a concrete frame design procedure

Namespace: Â ETABSv1

Assembly: Â ETABSv1 (in ETABSv1.dll) Version: 1.0.0.0 (1.24.0.0)

Syntax

C#

VB

C++

F#

Copy

```
int SetDesignSection(
    string Name,
    string PropName,
    bool LastAnalysis,
    eItemType ItemType = eItemType.Objects
)
```

```
Function SetDesignSection (
    Name As String,
    PropName As String,
    LastAnalysis As Boolean,
    ?ItemType As eItemType = eItemType.Objects
) As Integer
```

```
Dim instance As cDesignConcrete
Dim Name As String
Dim PropName As String
Dim LastAnalysis As Boolean
Dim ItemType As eItemType
Dim returnValue As Integer
```

```
returnValue = instance.SetDesignSection(Name,
    PropName, LastAnalysis, ItemType)
```

```
int SetDesignSection(
    String^ Name,
    String^ PropName,
    bool LastAnalysis,
    eItemType ItemType = eItemType::Objects
)
```

```
abstract SetDesignSection :
    Name : string *
    PropName : string *
    LastAnalysis : bool *
    ?ItemType : eItemType
(* Defaults:
    let _ItemType = defaultArg ItemType eItemType.Objects
*)
-> int
```

cDesignConcreteAddLanguageSpecificTextSet("LST4E6DFF58_0?cpe::|nu=")

Parameters**Name**Type: SystemString

The name of an existing frame object or group, depending on the value of the ItemType item

PropNameType: SystemString

The name of an existing frame section property to be used as the design section for the specified frame objects. This item applies only when LastAnalysis = False

LastAnalysisType: SystemBoolean

If this item is True, the design section for the specified frame objects is reset to the last analysis section for the frame object. If it is False, the design section is set to that specified by PropName

ItemType (Optional)Type: ETABSv1eItemType

This is one of the following items in the eItemType enumeration:

◊ Object = 0

◊ Group = 1

◊ SelectedObjects = 2

If this item is Objects, the assignment is made to the frame object specified by the Name item.

If this item is Group, the assignment is made to all frame objects in the group specified by the Name item.

If this item is SelectedObjects, the assignment is made to all selected frame objects and the Name item is ignored.

Return ValueType: Int32

Returns zero if the design section is successfully modified; otherwise it returns a nonzero value

Remarks**Examples**

VB

Copy

```
Public Sub Example()
    Dim SapModel As cSapModel
    Dim EtabsObject As cOAPI
    Dim ret As Integer = -1

    'create ETABS object
    Dim myHelper as cHelper = New Helper
    EtabsObject = myHelper.CreateObjectProgID("CSI.ETABS.API.ETABSObject")

    'start ETABS application
    ret = EtabsObject.ApplicationStart()

    'create SapModel object
```

Introduction

```
SapModel = EtabsObject.SapModel

'initialize model
ret = SapModel.InitializeNewModel()

ret = SapModel.File.NewGridOnly(1, 10, 10, 2, 2, 10, 10)

'create new concrete frame section properties
ret = SapModel.PropFrame.SetRectangle("R1", "4000Psi", 20, 12)
ret = SapModel.PropFrame.SetRectangle("R2", "4000Psi", 20, 16)

'create a concrete column
Dim FrameName1 As String
ret = SapModel.FrameObj.AddByCoord(0, 0, 0, 0, 0, 10, FrameName1, "R1")

'run analysis
ret = SapModel.File.Save("C:\ETABSAPI\example.edb")
ret = SapModel.Analyze.RunAnalysis

'start concrete design
ret = SapModel.DesignConcrete.StartDesign

'get design section
Dim PropName As String
ret = SapModel.DesignConcrete.GetDesignSection(FrameName1, PropName)

'set design section
ret = SapModel.DesignConcrete.SetDesignSection(FrameName1, "R2", False)

ret = SapModel.DesignConcrete.GetDesignSection(FrameName1, PropName)

'close ETABS
EtabsObject.ApplicationExit(False)

'clean up variables
SapModel = Nothing
EtabsObject = Nothing

End Sub
```

CSI API ETABS v1

cDesignConcreteAddLanguageSpecificTextSet("LSTA56FCC24_0") Method

Starts the concrete frame design.

Namespace: [ETABSv1](#)

Assembly: [ETABSv1](#) (in ETABSv1.dll) Version: 1.0.0.0 (1.24.0.0)

▲ Syntax

[C#](#)

[VB](#)

[C++](#)

[F#](#)

[Copy](#)

```
int StartDesign()
```

```
Function StartDesign As Integer
```

```
Dim instance As cDesignConcrete
```

```
Dim returnValue As Integer
```

```
returnValue = instance.StartDesign()
```

```
int StartDesign()
```

```
abstract StartDesign : unit -> int
```

Return Value

Type: [Int32](#)

Returns zero if the concrete frame design is successfully started; otherwise it returns a nonzero value.

▲ Remarks

The function will fail if no concrete frame objects are present. It also will fail if analysis results are not available.

▲ Examples

VB

[Copy](#)

```
Public Sub Example()
```

```
    Dim SapModel As cSapModel
```

```

CSI API ETABS v1

cDesignConcreteSlabAddLanguageSpecificTextSet("LST Method

Starts the concrete slab design.

Namespace: ETABSv1

Assembly: ETABSv1 (in ETABSv1.dll) Version: 1.0.0.0 (1.24.0.0)

▲ Syntax

C#

VB

C++

F#

Copy

```
int StartSlabDesign()
```

```
Function StartSlabDesign As Integer
```

```
Dim instance As cDesignConcreteSlab
```

```
Dim returnValue As Integer
```

```
returnValue = instance.StartSlabDesign()
```

```
int StartSlabDesign()
```

```
abstract StartSlabDesign : unit -> int
```

Return Value

Type: Int32

Returns zero if the concrete slab design is successfully started; otherwise it returns a nonzero value.

▲ Remarks

This function designs slab strips, individual finite elements, and checks for punching shear, if concrete slabs are present. The function will fail if analysis results are not available.

    M3 : float[] byref *
    ?ItemType : eItemType
(* Defaults:
    let _ItemType = defaultArg ItemType eItemType.Objects
*)
-> int
```

Parameters

Name

Type:Â SystemString

The name of an existing frame object or group, depending on the value of the ItemType item.

NumberResults

Type:Â SystemInt32

The number of results, this is the length of all output arrays

FrameName

Type:Â SystemString

The frame name associated with each result

ComboName

Type:Â SystemString

The load combination for which the results are reported

Station

- Type: SystemDouble
The location, measured from the I-end of the frame object, where the results are reported [L]
- P
Type: SystemDouble
The design axial force in the frame object local 1-axis direction [F]
- V2
Type: SystemDouble
The design shear force in the frame object local 2-axis direction [F]
- V3
Type: SystemDouble
The design shear force in the frame object local 3-axis direction [F]
- T
Type: SystemDouble
The design torsional moment about the frame object local 1-axis [FL]
- M2
Type: SystemDouble
The design bending moment about the frame object local 2-axis [FL]
- M3
Type: SystemDouble
The design bending moment about the frame object local 3-axis [FL]
- ItemType (Optional)
Type: ETABSv1eItemType
This is one of the following items in the eItemType enumeration:
 ◊ Object = 0
 ◊ Group = 1
 ◊ SelectedObjects = 2
 If this item is Objects, results are retrieved for the frame object specified by the Name item.

 If this item is Group, results are retrieved for all frame objects in the group specified by the Name item.

 If this item is SelectedObjects, results are retrieved for all selected frame objects and the Name item is ignored.

Return Value

Type: Int32
Returns zero if the results are successfully retrieved, otherwise it returns a nonzero value.

- ItemType (Optional)
Type: ETABSv1eItemType
This is one of the following items in the eItemType enumeration:
 ◊ Object = 0
 ◊ Group = 1
 ◊ SelectedObjects = 2
 If this item is Objects, results are retrieved for the frame object specified by the Name item.

 If this item is Group, results are retrieved for all frame objects in the group specified by the Name item.

 If this item is SelectedObjects, results are retrieved for all selected frame objects and the Name item is ignored.

Return Value

Type: Int32
Returns zero if the results are successfully retrieved, otherwise it returns a nonzero value.

    M3 : float[] byref *
    ?ItemType : eItemType
(* Defaults:
    let _ItemType = defaultArg ItemType eItemType.Objects
*)
-> int
```

Parameters

Name

Type:Â SystemString

The name of an existing frame object or group, depending on the value of the ItemType item.

NumberResults

Type:Â SystemInt32

The number of results, this is the length of all output arrays

FrameName

Type:Â SystemString

The frame name associated with each result

ComboName

Type:Â SystemString

The load combination for which the results are reported

Station

- Type: SystemDouble
The location, measured from the I-end of the frame object, where the results are reported [L]
- P
Type: SystemDouble
The design axial force in the frame object local 1-axis direction [F]
- V2
Type: SystemDouble
The design shear force in the frame object local 2-axis direction [F]
- V3
Type: SystemDouble
The design shear force in the frame object local 3-axis direction [F]
- T
Type: SystemDouble
The design torsional moment about the frame object local 1-axis [FL]
- M2
Type: SystemDouble
The design bending moment about the frame object local 2-axis [FL]
- M3
Type: SystemDouble
The design bending moment about the frame object local 3-axis [FL]
- ItemType (Optional)
Type: ETABSv1eItemType
This is one of the following items in the eItemType enumeration:
 ◊ Object = 0
 ◊ Group = 1
 ◊ SelectedObjects = 2
 If this item is Objects, results are retrieved for the frame object specified by the Name item.

 If this item is Group, results are retrieved for all frame objects in the group specified by the Name item.

 If this item is SelectedObjects, results are retrieved for all selected frame objects and the Name item is ignored.

Return Value

Type: Int32
Returns zero if the results are successfully retrieved, otherwise it returns a nonzero value.

array<double>^% P,
array<double>^% V2,
array<double>^% V3,
array<double>^% T,
array<double>^% M2,
array<double>^% M3
)

abstract PierDesignForces :
    InputPierLabel : string *
    InputStoryName : string *
    NumberResults : int byref *
    Story : string[] byref *
    PierLabel : string[] byref *
    ComboName : string[] byref *
    Location : string[] byref *
    P : float[] byref *
    V2 : float[] byref *
    V3 : float[] byref *
    T : float[] byref *
    M2 : float[] byref *
    M3 : float[] byref -> int
```

Parameters

InputPierLabel

Type:Â SystemString

The name of an existing pier label on the story specified by InputStoryName. If this is left blank, results will be retrieved for all pier labels on the story.

InputStoryName

Type:Â SystemString

The name of an existing story for which to retrieve pier design forces. If this is left blank, results will be retrieved for all stories.

NumberResults

Type:Â SystemInt32

The number of results, this is the length of all output arrays

Story

	Type:Â <u>SystemString</u>
	The story at which the pier exists
PierLabel	
	Type:Â <u>SystemString</u>
	The label of the pier
ComboName	
	Type:Â <u>SystemString</u>
	The load combination for which the results are reported
Location	
	Type:Â <u>SystemString</u>
	The location where the results are reported
P	
	Type:Â <u>SystemDouble</u>
	The design axial force in the pier object local 1-axis direction [F]
V2	
	Type:Â <u>SystemDouble</u>
	The design shear force in the pier object local 2-axis direction [F]
V3	
	Type:Â <u>SystemDouble</u>
	The design shear force in the pier object local 3-axis direction [F]
T	
	Type:Â <u>SystemDouble</u>
	The design torsional moment about the pier object local 1-axis [FL]
M2	
	Type:Â <u>SystemDouble</u>
	The design bending moment about the pier object local 2-axis [FL]
M3	
	Type:Â <u>SystemDouble</u>
	The design bending moment about the pier object local 3-axis [FL]

Return ValueType:Â Int32

Returns zero if the results are successfully retrieved, otherwise it returns a nonzero value.

▲ **Remarks**

To retrieve results for all pier labels on all stories, leave both InputPierLabel and InputStoryName blank.

    V3 : float[] byref *
    T : float[] byref *
    M2 : float[] byref *
    M3 : float[] byref -> int
```

Parameters

InputSpandrelLabel

Type: [SystemString](#)

The name of an existing spandrel label on the story specified by InputStoryName. If this is left blank, results will be retrieved for all spandrel labels on the story.

InputStoryName

Type: [SystemString](#)

The name of an existing story for which to retrieve spandrel design forces. If this is left blank, results will be retrieved for all stories.

NumberResults

Type: [SystemInt32](#)

The number of results, this is the length of all output arrays

Story

	Type:Â <u>SystemString</u>
	The story at which the spandrel exists
SpandrelLabel	Type:Â <u>SystemString</u>
	The label of the spandrel
ComboName	Type:Â <u>SystemString</u>
	The load combination for which the results are reported
Location	Type:Â <u>SystemString</u>
	The location where the results are reported
P	Type:Â <u>SystemDouble</u>
	The design axial force in the spandrel object local 1-axis direction [F]
V2	Type:Â <u>SystemDouble</u>
	The design shear force in the spandrel object local 2-axis direction [F]
V3	Type:Â <u>SystemDouble</u>
	The design shear force in the spandrel object local 3-axis direction [F]
T	Type:Â <u>SystemDouble</u>
	The design torsional moment about the spandrel object local 1-axis [FL]
M2	Type:Â <u>SystemDouble</u>
	The design bending moment about the spandrel object local 2-axis [FL]
M3	Type:Â <u>SystemDouble</u>
	The design bending moment about the spandrel object local 3-axis [FL]

Return ValueType:Â Int32

Returns zero if the results are successfully retrieved, otherwise it returns a nonzero value.

▲ **Remarks**

To retrieve results for all spandrel labels on all stories, leave both InputSpandrelLabel and InputStoryName blank.

CSI API ETABS v1

cDesignShearWallAddLanguageSpecificTextSet("LST35AD2166_0") Method

Retrieves data from the Rebar Selection Rules for Wall Piers

Namespace: [ETABSv1](#)

Assembly: [ETABSv1](#) (in ETABSv1.dll) Version: 1.0.0.0 (1.24.0.0)

Syntax

[C#](#)

[VB](#)

[C++](#)

[F#](#)

[Copy](#)

```
int GetRebarPrefsPier(
    int Item,
    ref string Value
)
```

```
Function GetRebarPrefsPier (
    Item As Integer,
    ByRef Value As String
) As Integer
```

```
Dim instance As cDesignShearWall
Dim Item As Integer
Dim Value As String
Dim returnValue As Integer
```

```
returnValue = instance.GetRebarPrefsPier(Item,
    Value)
```

```
int GetRebarPrefsPier(
    int Item,
    String^% Value
)
```

```
abstract GetRebarPrefsPier :
    Item : int *
    Value : string byref -> int
```

Parameters

Item

Type: [System.Int32](#)

An integer value corresponding to the data to be retrieved, from the following list

1. Vertical Bars - Unconfined Zones - Smallest Bar Size
2. Vertical Bars - Unconfined Zones - Largest Bar Size
3. Vertical Bars - Unconfined Zones - Preferred Corner/Joint Bar Size
4. Vertical Bars - Unconfined Zones - Preferred Middle Bar Size
5. Vertical Bars - Unconfined Zones - Minimum Spacing of Bars

cDesignShearWallspan id="LST35AD2166_0"AddLanguageSpecificTextSet("LST35AD2166_0")

Introduction

6. Vertical Bars - Unconfined Zones - Maximum Spacing of Bars
7. Vertical Bars - Confined Zones - Smallest Bar Size
8. Vertical Bars - Confined Zones - Largest Bar Size
9. Vertical Bars - Confined Zones - Preferred Corner/Joint Bar Size
10. Vertical Bars - Confined Zones - Preferred Middle Bar Size
11. Vertical Bars - Confined Zones - Minimum Spacing of Bars
12. Vertical Bars - Confined Zones - Maximum Spacing of Bars
13. Transverse Bars - Unconfined Zones - Smallest Bar Size
14. Transverse Bars - Unconfined Zones - Largest Bar Size
15. Transverse Bars - Unconfined Zones - Preferred Bar Size
16. Transverse Bars - Unconfined Zones - Minimum Spacing of Bars
17. Transverse Bars - Unconfined Zones - Maximum Spacing of Bars
18. Transverse Bars - Unconfined Zones - Preferred Bar Arrangement
19. Transverse Bars - Confined Zones - Smallest Bar Size
20. Transverse Bars - Confined Zones - Largest Bar Size
21. Transverse Bars - Confined Zones - Preferred Bar Size
22. Transverse Bars - Confined Zones - Minimum Spacing of Bars
23. Transverse Bars - Confined Zones - Maximum Spacing of Bars
24. Transverse Bars - Confined Zones - Preferred Bar Arrangement

Value

Type: SystemString

The retrieved data; note that numerical values are converted to String

If the Item is one of the Preferred Bar Arrangement options, then this value will be an integer from the following list:

1. Straight
2. UAndStraight
3. Hoops

Return Value

Type: Int32

Returns zero if the data is successfully retrieved; otherwise returns non-zero

CSI API ETABS v1

cDesignShearWallAddLanguageSpecificTextSet("LST5 Method

Retrieves data from the Rebar Selection Rules for Wall Spandrels

Namespace: ETABSv1

Assembly: ETABSv1 (in ETABSv1.dll) Version: 1.0.0.0 (1.24.0.0)

■ Syntax

C#

VB

C++

F#

Copy

```
int GetRebarPrefsSpandrel(
    int Item,
    ref string Value
)
```

```
Function GetRebarPrefsSpandrel (
    Item As Integer,
    ByRef Value As String
) As Integer
```

```
Dim instance As cDesignShearWall
Dim Item As Integer
Dim Value As String
Dim returnValue As Integer
```

```
returnValue = instance.GetRebarPrefsSpandrel(Item,
    Value)
```

```

    int Item,
    String^% Value
)
```

```
abstract GetRebarPrefsSpandrel :
    Item : int *
    Value : string byref -> int
```

Parameters

Item

Type: SystemInt32

An integer value corresponding to the data to be retrieved, from the following list

1. Horizontal Top/Bottom Bars - Smallest bar size
2. Horizontal Top/Bottom Bars - Largest bar size
3. Horizontal Top/Bottom Bars - Preferred bar size
4. Horizontal Web Bars - Bar size
5. Horizontal Web Bars - Minimum Spacing of Bars

Introduction

6. Horizontal Web Bars - Maximum Spacing of Bars
7. Vertical Bars/Ties - Stirrup Bar size
8. Vertical Bars/Ties - Minimum Spacing of Bars
9. Vertical Bars/Ties - Maximum Spacing of Bars
10. Diagonal Bars - Smallest bar size
11. Diagonal Bars - Largest bar size
12. Diagonal Bars - Preferred bar size
13. Diagonal Bar Ties - Stirrup bar size
14. Diagonal Bar Ties - Minimum Spacing of ties
15. Diagonal Bar Ties - Maximum Spacing of ties

Value

Type: SystemString

The retrieved data; note that numerical values are converted to String

Return Value

Type: Int32

Returns zero if the data is successfully retrieved; otherwise returns non-zero

CSI API ETABS v1

cDesignSteel Methods

The cDesignSteel type exposes the following members.

Methods

Â	Name	Description
⇒	<u>DeleteResults</u>	
⇒	<u>GetCode</u>	Retrieves the steel design code.
⇒	<u>GetComboDeflection</u>	
⇒	<u>GetComboStrength</u>	
⇒	<u>GetDesignSection</u>	
⇒	<u>GetGroup</u>	
⇒	<u>GetResultsAvailable</u>	This function determines if the steel frame design results are available.
⇒	<u>GetSummaryResults</u>	
⇒	<u>GetSummaryResults_2</u>	DEPRECATED ; refer to <u>GetSummaryResults_3(String, Int32, String, eFrameDesignOrientation, String, String, String, Double, eItemType)</u>
⇒	<u>GetSummaryResults_3</u>	Retrieves steel frame design summary results
⇒	<u>GetTargetDispl</u>	
⇒	<u>GetTargetPeriod</u>	
⇒	<u>ResetOverwrites</u>	
⇒	<u>SetAutoSelectNull</u>	
⇒	<u>SetCode</u>	Sets the steel design code.
⇒	<u>SetComboDeflection</u>	
⇒	<u>SetComboStrength</u>	
⇒	<u>SetDesignSection</u>	
⇒	<u>SetGroup</u>	
⇒	<u>SetTargetDispl</u>	
⇒	<u>SetTargetPeriod</u>	
⇒	<u>StartDesign</u>	Starts the steel frame design.
⇒	<u>VerifyPassed</u>	
⇒	<u>VerifySections</u>

CSI API ETABS v1

cDesignSteelAddLanguageSpecificTextSet("LST9D423C97_0?cpp=1370=.");Get

Method

Retrieves the steel design code.

Namespace: ETABSv1

Assembly: ETABSv1 (in ETABSv1.dll) Version: 1.0.0.0 (1.24.0.0)

Syntax

C#

VB

C++

F#

Copy

```
int GetCode(
    ref string CodeName
)
```

```
Function GetCode (
    ByRef CodeName As String
) As Integer
```

```
Dim instance As cDesignSteel
Dim CodeName As String
Dim returnValue As Integer
```

```
returnValue = instance.GetCode(CodeName)
```

```
int GetCode(
    String^% CodeName
)
```

```
abstract GetCode :
    CodeName : string byref -> int
```

Parameters

CodeName

Type: SystemString

For ETABS, this is one of the following steel design code names.

- ◇ AISC 360-10
- ◇ AISC 360-05
- ◇ AISC LRFD 93
- ◇ AISC ASD 89
- ◇ AS 4100-1998
- ◇ BS 5950-2000
- ◇ Chinese 2010
- ◇ Chinese 2018
- ◇ CSA S16-14
- ◇ CSA S16-09
- ◇ Eurocode 3-2005

- ◇ IS 800:2007
- ◇ Italian NTC 2018
- ◇ Italian NTC 2008
- ◇ KBC 2009
- ◇ NZS 3404:1997
- ◇ SP 16.13330.2017

Return Value

Type: Int32

Returns zero if the code is successfully retrieved; otherwise it returns a nonzero value

▲ **Remarks**

▲ **Examples**

VB

Copy

```
Public Sub Example()
    Dim SapModel As cSapModel
    Dim EtabsObject As cOAPI
    Dim ret As Integer = -1
    Dim CodeName As String

    'create ETABS object
    Dim myHelper as cHelper = New Helper
    EtabsObject = myHelper.CreateObjectProgID("CSI.ETABS.API.ETABSObject")

    'start ETABS application
    ret = EtabsObject.ApplicationStart()

    'create SapModel object
    SapModel = EtabsObject.SapModel

    'initialize model
    ret = SapModel.InitializeNewModel()

    'create steel deck template model
    ret = SapModel.File.NewSteelDeck(4, 12, 12, 4, 4, 24, 24)

    'get steel design code
    ret = SapModel.DesignSteel.GetCode(CodeName)

    'close ETABS
    EtabsObject.ApplicationExit(False)

    'clean up variables
    SapModel = Nothing
    EtabsObject = Nothing

End Sub
```

CSI API ETABS v1

cDesignSteelAddLanguageSpecificTextSet("LST2446B779_0?cpp=1384-");Get

Method

This function determines if the steel frame design results are available.

Namespace: ETABSv1

Assembly: ETABSv1 (in ETABSv1.dll) Version: 1.0.0.0 (1.24.0.0)

■ Syntax

C#

VB

C++

F#

Copy

```
bool GetResultsAvailable()
```

```
Function GetResultsAvailable As Boolean
```

```
Dim instance As cDesignSteel
```

```
Dim returnValue As Boolean
```

```
returnValue = instance.GetResultsAvailable()
```

```
bool GetResultsAvailable()
```

```
abstract GetResultsAvailable : unit -> bool
```

Return Value

Type: Boolean

Returns True if the steel frame design results are available, otherwise it returns False.

■ Remarks

■ Examples

VB

Copy

```
Public Sub Example()
    Dim SapModel As cSapModel
    Dim EtabsObject As cOAPI
    Dim ret As Integer = -1
    Dim ResultsAvailable as Boolean

    'create ETABS object
    Dim myHelper as cHelper = New Helper
    EtabsObject = myHelper.CreateObjectProgID("CSI.ETABS.API.ETABSObject")

    'start ETABS application
    ret = EtabsObject.ApplicationStart()

    'create SapModel object
    SapModel = EtabsObject.SapModel

    'initialize model
    ret = SapModel.InitializeNewModel()
```

cDesignSteelspan id="LST2446B779_0"AddLanguageSpecificTextSet("LST2446B779_0?cpp=1384-");Get

Introduction

```
'create steel deck template model
    ret = SapModel.File.NewSteelDeck(4, 12, 12, 4, 4, 24, 24)

'run analysis
    System.IO.Directory.CreateDirectory("c:\CSI_API_temp")
    ret = SapModel.File.Save("C:\CSI_API_temp\example.edb")
    ret = SapModel.Analyze.RunAnalysis

'start steel design
    ret = SapModel.DesignSteel.StartDesign()

'check if design results are available
    ResultsAvailable = SapModel.DesignSteel.GetResultsAvailable

'close ETABS
    EtabsObject.ApplicationExit(False)

'clean up variables
    SapModel = Nothing
    EtabsObject = Nothing
End Sub
```

    VMinCombo : string[] byref *
    VMinRatio : float[] byref *
    ?ItemType : eItemType
(* Defaults:
    let _ItemType = defaultArg ItemType eItemType.Objects
*)
```

-> int

Parameters

Name

Type:Â SystemString

The name of an existing frame object or group, depending on the value of the ItemType argument.

NumberItems

Type:Â SystemInt32

The number of results, this is the length of all output arrays

FrameName

Type:Â SystemString

The frame object unique name associated with each result

FrameType

Type:Â ETABSv1eFrameDesignOrientation

The type of each frame object, a value from eFrameDesignOrientation enumeration, either Column , Beam , Brace , Other , or Null

DesignSect

Type:Â SystemString

The design section of each frame object

Status

Type:Â SystemString

The design status

PMMCombo

Type:Â SystemString

The load combination for which the PMM ratio is reported

PMMRatio

Type:Â SystemDouble

The controlling PMM ratio for the frame object

PRatio

Type:Â SystemDouble

The axial component of the controlling PMM ratio

MMajRatio

Type:Â SystemDouble

The major axis bending component of the controlling PMM ratio

MMinRatio

Type:Â SystemDouble

The minor axis bending component of the controlling PMM ratio

VMajCombo

Type:Â SystemString

The load combination for which the major direction shear ratio is reported

VMajRatio

Type:Â SystemDouble

The controlling major direction shear ratio for the frame object

VMinCombo

Type:Â SystemString

The load combination for which the minor direction shear ratio is reported

VMinRatio

Type:Â SystemDouble

The controlling minor direction shear ratio for the frame object

Item Type (Optional)

Type: $\hat{A}$ ETABSv1eItemTypeThis is one of the following items in the eItemType enumeration:

- 0. Object
- 1. Group
- 2. SelectedObjects

If this item is Objects, results are retrieved for the frame object specified by the Name item.

If this item is Group, results are retrieved for all frame objects in the group specified by the Name item.

If this item is SelectedObjects, results are retrieved for all selected frame objects and the Name item is ignored.

Return ValueType: $\hat{A}$ Int32

Returns zero if the results are successfully retrieved, otherwise it returns a nonzero value.

▲ Remarks

The function will fail if no steel frame objects are present. It will also fail if analysis results are not available.

▲ Examples

VB

Copy

```
Public Sub Example()
    Dim SapModel As cSapModel
    Dim EtabsObject As cOAPI
    Dim ret As Integer = -1

    'create ETABS object
    Dim myHelper as cHelper = New Helper
    EtabsObject = myHelper.CreateObjectProgID("CSI.ETABS.API.ETABSObject")

    'start ETABS application
    ret = EtabsObject.ApplicationStart()

    'create SapModel object
    SapModel = EtabsObject.SapModel

    'initialize model
    ret = SapModel.InitializeNewModel()

    'create steel deck template model
    ret = SapModel.File.NewSteelDeck(4, 12, 12, 4, 4, 24, 24)

    'set steel design code
    ret = SapModel.DesignSteel.SetCode("AISC 360-10")

    'run analysis
    System.IO.Directory.CreateDirectory("C:\CSI_API_temp")
    ret = SapModel.File.Save("C:\CSI_API_temp\example.edb")
    ret = SapModel.Analyze.RunAnalysis()

    'start steel design
```

Introduction

```

CSI API ETABS v1

cDesignSteelAddLanguageSpecificTextSet("LST827C419F_0") Method

Sets the steel design code.

Namespace: ETABSv1

Assembly: ETABSv1 (in ETABSv1.dll) Version: 1.0.0.0 (1.24.0.0)

■ Syntax

C#

VB

C++

F#

Copy

```
int SetCode(
    string CodeName
)
```

```
Function SetCode (
    CodeName As String
) As Integer
```

```
Dim instance As cDesignSteel
Dim CodeName As String
Dim returnValue As Integer
```

```
returnValue = instance.SetCode(CodeName)
```

```
int SetCode(
    String^ CodeName
)
```

```
abstract SetCode :
    CodeName : string -> int
```

Parameters

CodeName

Type: SystemString

For ETABS, this is one of the following steel design code names.

- ◇ AISC 360-10
- ◇ AISC 360-05
- ◇ AISC LRFD 93
- ◇ AISC ASD 89
- ◇ AS 4100-1998
- ◇ BS 5950-2000
- ◇ Chinese 2010
- ◇ Chinese 2018
- ◇ CSA S16-14
- ◇ CSA S16-09
- ◇ Eurocode 3-2005

- ◇ IS 800:2007
- ◇ Italian NTC 2018
- ◇ Italian NTC 2008
- ◇ KBC 2009
- ◇ NZS 3404:1997
- ◇ SP 16.13330.2017

Return Value

Type: Int32

Returns zero if the code is successfully set; otherwise it returns a nonzero value.

▲ **Remarks**

▲ **Examples**

VB

Copy

```
Public Sub Example()
    Dim SapModel As cSapModel
    Dim EtabsObject As cOAPI
    Dim ret As Integer = -1
    Dim CodeName As String

    'create ETABS object
    Dim myHelper as cHelper = New Helper
    EtabsObject = myHelper.CreateObjectProgID("CSI.ETABS.API.ETABSObject")

    'start ETABS application
    ret = EtabsObject.ApplicationStart()

    'create SapModel object
    SapModel = EtabsObject.SapModel

    'initialize model
    ret = SapModel.InitializeNewModel()

    'create steel deck template model
    ret = SapModel.File.NewSteelDeck(4, 12, 12, 4, 4, 24, 24)

    'set steel design code
    ret = SapModel.DesignSteel.SetCode("Eurocode 3-2005")

    'close ETABS
    EtabsObject.ApplicationExit(False)

    'clean up variables
    SapModel = Nothing
    EtabsObject = Nothing

End Sub
```

CSI API ETABS v1

cDesignSteelAddLanguageSpecificTextSet("LST9D0D7C38_0?cpp1410u=.");St Method

Starts the steel frame design.

Namespace: [ETABSv1](#)

Assembly: [ETABSv1](#) (in ETABSv1.dll) Version: 1.0.0.0 (1.24.0.0)

▲ Syntax

[C#](#)

[VB](#)

[C++](#)

[F#](#)

[Copy](#)

```
int StartDesign()
```

```
Function StartDesign As Integer
```

```
Dim instance As cDesignSteel
```

```
Dim returnValue As Integer
```

```
returnValue = instance.StartDesign()
```

```
int StartDesign()
```

```
abstract StartDesign : unit -> int
```

Return Value

Type: [Int32](#)

Returns zero if the steel frame design is successfully started; otherwise it returns a nonzero value.

▲ Remarks

The function will fail if no steel frame objects are present. It will also fail if analysis results are not available.

▲ Examples

[VB](#)

[Copy](#)

```
Public Sub Example()
```

```
    Dim SapModel As cSapModel
```

```
    Dim EtabsObject As cOAPI
```

```
    Dim ret As Integer = -1
```

```
'create ETABS object
```

```
    Dim myHelper as cHelper = New Helper
```

```
    EtabsObject = myHelper.CreateObjectProgID("CSI.ETABS.API.ETABSObject")
```

```
'start ETABS application
```

```
    ret = EtabsObject.ApplicationStart()
```

```
'create SapModel object
```

```
    SapModel = EtabsObject.SapModel
```

```
cDesignSteelspan id="LST9D0D7C38_0"AddLanguageSpecificTextSet("LST9D0D7C38_0?cpp1410u=.");St
```

Introduction

```
'initialize model
    ret = SapModel.InitializeNewModel()

'create steel deck template model
    ret = SapModel.File.NewSteelDeck(4, 12, 12, 4, 4, 24, 24)

'set steel design code
    ret = SapModel.DesignSteel.SetCode("AISC 360-10")

'run analysis
    System.IO.Directory.CreateDirectory("c:\CSI_API_temp")
    ret = SapModel.File.Save("C:\CSI_API_temp\example.edb")
    ret = SapModel.Analyze.RunAnalysis

'start steel design
    ret = SapModel.DesignSteel.StartDesign()

'close ETABS
    EtabsObject.ApplicationExit(False)

'clean up variables
    SapModel = Nothing
    EtabsObject = Nothing

End Sub
```

```
int ChangeName(
    String^ Name,
    String^ NewName
)
```

```
abstract ChangeName :
    Name : string *
    NewName : string -> int
```

Parameters

Name

Type: SystemString

The existing name of a defined Design Strip

NewName

Type: SystemString

The new name for the Design Strip

Return ValueType: Int32

Returns zero if the new name is successfully applied, otherwise it returns a nonzero value.

▀ **Remarks**

▀ **Examples**

VB

Copy

```
Public Sub Example()
    Dim SapModel As cSapModel
    Dim EtabsObject As cOAPI
    Dim ret As Integer = -1

    'create ETABS object
    Dim myHelper as cHelper = New Helper
    EtabsObject = myHelper.CreateObjectProgID("CSI.ETABS.API.ETABSObject")

    'start ETABS application
    ret = EtabsObject.ApplicationStart()

    'create SapModel object
    SapModel = EtabsObject.SapModel

    'initialize model
    ret = SapModel.InitializeNewModel()

    'create steel deck template model
    ret = SapModel.File.NewSteelDeck(4, 12, 12, 4, 4, 24, 24)

    'define new Design Strip with name "MyDesignStrip1A" ; currently not available in API

    'change DesignStrip name
    ret = SapModel.DesignConcreteSlab.DesignStrip.ChangeName("MyDesignStrip1A", "MyDesStrp2B")

    'close ETABS
    EtabsObject.ApplicationExit(False)

    'clean up variables
    SapModel = Nothing
    EtabsObject = Nothing

End Sub
```

    GlobalZ : float[] byref *
    WLeft : float[] byref *
    WRight : float[] byref *
    WLeft : float[] byref *
    WRight : float[] byref *
    AutoWiden : bool[] byref -> int
```

Parameters

Name

Type:Â SystemString

The name of an existing Design Strip

Point

Type:Â SystemString

The unique name of a point object along the polyline that defines the strip.

GlobalX

Type:Â SystemDouble

The global X coordinate of the specified point object.

GlobalY

Type:Â SystemDouble

The global Y coordinate of the specified point object.

GlobalZ

Type:Â SystemDouble

The global Z coordinate of the specified point object.

WLeft

Type:Â SystemDouble

The strip width left just before the specified point.

WRight

Type:Â SystemDouble

The strip width right just before the specified point.

WLeft

Type:Â SystemDouble

The strip width left just after the specified point.

WRight

Type: SystemDouble

The strip width right just after the specified point.

AutoWiden

Type: SystemBoolean

This is boolean indicating whether the Strip Width Option is set to Auto Widen Entire Strip (True), or User Specified Strip Segment Width (False)

Return Value

Type: Int32

Returns zero if the Design Strip is successfully retrieved, otherwise it returns a nonzero value.

▲ Remarks

    WRight : float[] byref *
    AutoWiden : bool[] byref -> int
```

Parameters

Name

Type: SystemString

The name of an existing Design Strip

DesignType

Type: SystemInt32

This is an integer indicating Strip Design Type

◇ None = 0

◇ Column Strip = 1

◇ Middle Strip = 2

Point

Type: SystemString

The unique name of a point object along the polyline that defines the strip.

GlobalX

Type: SystemDouble

The global X coordinate of the specified point object.

GlobalY

Type: SystemDouble

The global Y coordinate of the specified point object.

GlobalZ

Type: SystemDouble

The global Z coordinate of the specified point object.

WBLeft

Type: SystemDouble

The strip width left just before the specified point.

WBRight

Type: SystemDouble

The strip width right just before the specified point.

WALeft

Type: SystemDouble

The strip width left just after the specified point.

WARight

Type: SystemDouble

The strip width right just after the specified point.

AutoWiden

Type: SystemBoolean

This is boolean indicating whether the Strip Width Option is set to Auto Widen Entire Strip (True), or User Specified Strip Segment Width (False)

Return Value

Type: Int32

Returns zero if the Design Strip is successfully retrieved, otherwise it returns a nonzero value.

▲ Remarks

▲ Examples

VB

Copy

```
Public Sub Example()
    Dim SapModel As cSapModel

CSI API ETABS v1

cDesignStripAddLanguageSpecificTextSet("LST4E4392E1_0")

Method

Retrieves the names of all defined Design Strips

Namespace: ETABSv1

Assembly: ETABSv1 (in ETABSv1.dll) Version: 1.0.0.0 (1.24.0.0)

Syntax

C#

VB

C++

F#

Copy

```
int GetNameList(
    ref int NumberNames,
    ref string[] MyName
)
```

```
Function GetNameList (
    ByRef NumberNames As Integer,
    ByRef MyName As String()
) As Integer
```

```
Dim instance As cDesignStrip
Dim NumberNames As Integer
Dim MyName As String()
Dim returnValue As Integer
```

```
returnValue = instance.GetNameList(NumberNames,
    MyName)
```

```
int GetNameList(
    int% NumberNames,
    array<String^>^% MyName
)
```

```
abstract GetNameList :
    NumberNames : int byref *
    MyName : string[] byref -> int
```

Parameters

NumberNames

Type: System.Int32

The number of Design Strip names defined in the program

MyName

Type: System.String

This is a one-dimensional array of names. The MyName array is created as a dynamic, zero-based, array by the API user:

```
Dim MyName() as String
```

cDesignStripspan id="LST4E4392E1_0"AddLanguageSpecificTextSet("LST4E4392E1_0?cpp=1#1=.");GetL

Introduction

The array is dimensioned to (NumberNames + 1) inside the ETABS program, filled with the names, and returned to the API user.

Return Value

Type: Int32

Returns zero if the names are successfully retrieved, otherwise it returns nonzero.

▲ **Remarks**

▲ **Examples**

VB

Copy

```
Public Sub Example()  
    Dim SapModel As cSapModel  
    Dim EtabsObject As cOAPI  
    Dim ret As Integer = -1  
    Dim NumberNames As Integer  
    Dim MyName As String()  
  
    'create ETABS object  
    Dim myHelper as cHelper = New Helper  
    EtabsObject = myHelper.CreateObjectProgID("CSI.ETABS.API.ETABSObject")  
  
    'start ETABS application  
    ret = EtabsObject.ApplicationStart()  
  
    'create SapModel object  
    SapModel = EtabsObject.SapModel  
  
    'initialize model  
    ret = SapModel.InitializeNewModel()  
  
    'create steel deck template model  
    ret = SapModel.File.NewSteelDeck(4, 12, 12, 4, 4, 24, 24)  
  
    'define new Design Strip with name "MyDesignStrip1A" ; currently not available in API  
  
    'get names  
    ret = SapModel.DesignStrip.GetNameList(NumberNames, MyName)  
  
    'close ETABS  
    EtabsObject.ApplicationExit(False)  
  
    'clean up variables  
    SapModel = Nothing  
    EtabsObject = Nothing  
  
End Sub
```

CSI API ETABS v1

cDesignStripAddLanguageSpecificTextSet("LST455B7D1C_0")

Method

Sets the GUID of an existing strip

Namespace: ETABSv1

Assembly: ETABSv1 (in ETABSv1.dll) Version: 1.0.0.0 (1.24.0.0)

Syntax

C#

VB

C++

F#

Copy

```
int SetGUID(
    string Name,
    string GUID = ""
)
```

```
Function SetGUID (
    Name As String,
    GUID As String = ""
) As Integer
```

```
Dim instance As cDesignStrip
Dim Name As String
Dim GUID As String
Dim returnValue As Integer
```

```
returnValue = instance.SetGUID(Name, GUID)
```

```
int SetGUID(
    String^ Name,
    String^ GUID = L""
)
```

```
abstract SetGUID :
    Name : string *
    ?GUID : string
(* Defaults:
    let _GUID = defaultArg GUID ""
*)
-> int
```

Parameters

Name

Type: SystemString

The name of the strip

GUID (Optional)

Type: SystemString

The desired GUID for the strip. If this argument is left blank, the program will assign a new randomly-created GUID

cDesignStripspan id="LST455B7D1C_0"AddLanguageSpecificTextSet("LST455B7D1C_0?cpp1444=");Set

Return Value

Type: Int32

Returns zero if the function executes correctly, otherwise it returns a nonzero value.

    BarLength : float[] byref *
    BendingAngleStart : float[] byref *
    BendingAngleEnd : float[] byref *
    RebarSetGUID : string[] byref -> int
```

Parameters

Name

Type:Â SystemString

The name of an existing beam frame object

NumberRebarSets

Type:Â SystemInt32

Number of longitudinal rebar sets for this beam object

BarSizeName

Type:Â SystemString

Rebar designation

BarArea

Type:Â SystemDouble

Individual rebar area

NumberBars

Type:Â SystemInt32

Number of rebars in this set

Location

Type:Â SystemString

Location of this set of rebars - A, B, C, etc. (See picture for seismic/ non-seismic detailing)

ClearCover

Type:Â SystemDouble

Clear cover from top or bottom beam face to longitudinal rebar being specified

StartCoord1

Type:Â SystemDouble

Start of this set of rebars from start/end (depends on location) of beam object

BarLength

Type:Â SystemDouble

Length of bars from start point

BendingAngleStart

Type:Â SystemDouble

Bend angle if any at start of rebars

BendingAngleEnd

Type:Â SystemDouble

Bend angle if any at end of rebars

RebarSetGUID

Type:Â SystemString

The GUIDs of each of the rebar sets (could be duplicated for adjacent beam if rebars are continuous)

Return Value

Type:Â Int32

Returns zero if the rebar data is successfully retrieved; otherwise it returns a nonzero value.

    StartCoord1 : float[] byref *
    Spacing : float[] byref *
    Lengths : float[] byref *
    RebarSetGUID : string[] byref -> int
```

Parameters

Name

Type:Â SystemString

The name of an existing beam frame object

NumberRebarSets

Type:Â SystemInt32

Number of tie rebar sets for this beam object

BarSizeName

Type:Â SystemString

Rebar designation

BarArea

Type:Â SystemDouble

Individual rebar area

NumberLegs

Type:Â SystemDouble

Number of legs for ties in this set (legs are in the local 2 direction)

Location

Type:Â SystemString

Zone of this set of rebars - A, B, C, etc. (See picture for seismic/ non-seismic detailing)

ClearCover

Type: SystemDouble

Clear cover from beam face to ties being specified

StartCoord1

Type: SystemDouble

Start of this set of tie rebars from start/end (depends on location) of beam object

Spacing

Type: SystemDouble

Spacing of ties

Lengths

Type: SystemDouble

Length over which these tie bars are provided from start point

RebarSetGUID

Type: SystemString

The GUIDs of each of the rebar sets (could be duplicated for adjacent beam if rebars are continuous)

Return Value

Type: Int32

Returns zero if the rebar data is successfully retrieved; otherwise it returns a nonzero value.

    ByRef ClearCover As Double(),
    ByRef RebarSetGUID As String()
) As Integer
```

```
Dim instance As cDetailing
Dim Name As String
Dim NumberRebarSets As Integer
Dim BarSizeName As String()
Dim BarArea As Double()
Dim NumberCBars As Integer()
Dim NumberR3Bars As Integer()
Dim NumberR2Bars As Integer()
Dim Location As String()
Dim ClearCover As Double()
Dim RebarSetGUID As String()
Dim returnValue As Integer
```

```
returnValue = instance.GetColumnLongRebarData(Name,
    NumberRebarSets, BarSizeName, BarArea,
```

Introduction

NumberCBars, NumberR3Bars, NumberR2Bars,
Location, ClearCover, RebarSetGUID)

```
int GetColumnLongRebarData(  
String^ Name,  
int% NumberRebarSets,  
array<String^>^% BarSizeName,  
array<double>^% BarArea,  
array<int>^% NumberCBars,  
array<int>^% NumberR3Bars,  
array<int>^% NumberR2Bars,  
array<String^>^% Location,  
array<double>^% ClearCover,  
array<String^>^% RebarSetGUID  
)
```

```
abstract GetColumnLongRebarData :  
    Name : string *  
    NumberRebarSets : int byref *  
    BarSizeName : string[] byref *  
    BarArea : float[] byref *  
    NumberCBars : int[] byref *  
    NumberR3Bars : int[] byref *  
    NumberR2Bars : int[] byref *  
    Location : string[] byref *  
    ClearCover : float[] byref *  
    RebarSetGUID : string[] byref -> int
```

Parameters

Name

Type:Â SystemString

The name of an existing beam frame object

NumberRebarSets

Type:Â SystemInt32

Number of longitudinal rebar sets for this beam object

BarSizeName

Type:Â SystemString

Rebar designation

BarArea

Type:Â SystemDouble

Individual rebar area

NumberCBars

Type:Â SystemInt32

Total number of rebars in this set (for both circular or rectangular pattern)

NumberR3Bars

Type:Â SystemInt32

Number of rectangular pattern bars along 3 direction (per face including corner bars); zero for circular pattern

NumberR2Bars

Type:Â SystemInt32

Number of rectangular pattern bars along 2 direction (per face including corner bars); zero for circular pattern

Location

Type: SystemString

Location of this set of rebars - not currently used - left initialized to blank ""

ClearCover

Type: SystemDouble

Clear cover from face to longitudinal rebar being specified

RebarSetGUID

Type: SystemString

The GUIDs of each of the rebar sets

Return Value

Type: Int32

Returns zero if the rebar data is successfully retrieved; otherwise it returns a nonzero value.

    Spacing : float[] byref *
    Heights : float[] byref *
    RebarSetGUID : string[] byref -> int
```

Parameters

Name

Type:Â SystemString

The name of an existing beam frame object

NumberRebarSets

Type:Â SystemInt32

Number of tie rebar sets for this beam object

BarSizeName

Type:Â SystemString
Rebar designation

BarArea
Type:Â SystemDouble
Individual rebar area

Pattern
Type:Â SystemInt32
Rebar pattern - 1 - Rectangular, 2 - Circular

ConfineType
Type:Â SystemInt32
Confinement type - 1 - Ties, 2 - Spiral (Spiral only possible when Pattern is Circular)

NumberLegs2Dir
Type:Â SystemInt32
Number of legs for ties in this set along the local 2 direction)

NumberLegs3Dir
Type:Â SystemInt32
Number of legs for ties in this set along the local 3 direction)

Location
Type:Â SystemString
Zone of this set of rebars - A, B, C, etc. (See picture for seismic/ non-seismic detailing)

ClearCover
Type:Â SystemDouble
Clear cover from face to ties being specified

StartCoord1
Type:Â SystemDouble
Start of this set of tie rebars from start/end (depends on location) of column object

Spacing
Type:Â SystemDouble
Spacing of ties

Heights
Type:Â SystemDouble
Height over which these tie bars are provided from start point

RebarSetGUID
Type:Â SystemString
The GUIDs of each of the rebar sets (could be duplicated for adjacent beam if rebars are continuous)

Return Value

Type:Â Int32

Returns zero if the rebar data is successfully retrieved; otherwise it returns a nonzero value.

```

cDetailingspan id="LST63B28EF2_0"AddLanguageSpecificTextSet("LST63B28EF2_0?cpp=::int466;GetDe

Parameters

WallStackIndex

Type: SystemInt32

Wall Stack Index

GUID

Type: SystemString

Unique GUID assigned to the Wall Stack

TowerID

Type: SystemInt32

The index of Tower, in which this Stack belongs to. Taken from ETABS

NumberPiers

Type: SystemInt32

All Piers in the wall stack, on all floors

NumberSpandrels

Type: SystemInt32

Return Value

Type: Int32

Returns zero if the function is successful; otherwise it returns a nonzero value.

Parameters

```

BeamLineID
    Type:Â SystemString
ObjectUniqueNames
    Type:Â SystemString
NumberSpans
    Type:Â SystemInt32
SpanLength
    Type:Â SystemDouble
NumLongBars
    Type:Â SystemInt32
LongBarDiameter
    Type:Â SystemDouble
LongBarNotation
    Type:Â SystemString
LongBarStartDist
    Type:Â SystemDouble
LongBarStartBend
    Type:Â SystemInt32
LongBarEndBend
    Type:Â SystemInt32
LongBarLength
    Type:Â SystemDouble
LongBarNumLayers
    Type:Â SystemInt32
NumTieBars
    Type:Â SystemInt32
NumTieVertLegs
    Type:Â SystemInt32
TieBarDiameter
    Type:Â SystemDouble
TieBarNotation
    Type:Â SystemString
TieBarStartDist
    Type:Â SystemDouble
TieBarSpacing
    Type:Â SystemDouble
TieBarType

```

Type: SystemInt32

Return Value

Type: Int32

```

Parameters

ColumnStackID
Type:Â [SystemString](#)

ObjectUniqueNames
Type:Â [SystemString](#)

NumLongBarSets
Type:Â [SystemInt32](#)

NumLongBars
Type:Â [SystemInt32](#)

LongBarGUID
Type:Â [SystemString](#)

LongBarDiameter
Type:Â [SystemDouble](#)

LongBarNotation
Type:Â [SystemString](#)

LongBarStartDist
Type:Â [SystemDouble](#)

LongBarStartBend
Type:Â [SystemInt32](#)

LongBarEndBend

Type:Â SystemInt32
 LongBarLength
 Type:Â SystemDouble
 LongBarNumLayers
 Type:Â SystemInt32
 NumTieZones
 Type:Â SystemInt32
 TieBarZones
 Type:Â SystemString
 NumTieBars
 Type:Â SystemInt32
 NumTieHorLegs
 Type:Â SystemInt32
 NumTieVertLegs
 Type:Â SystemInt32
 TieBarGUID
 Type:Â SystemString
 TieBarDiameter
 Type:Â SystemDouble
 TieBarNotation
 Type:Â SystemString
 TieBarStartDist
 Type:Â SystemDouble
 TieBarSpacing
 Type:Â SystemDouble
 TieBarType
 Type:Â SystemInt32

Return Value

Type:Â Int32

CSI API ETABS v1

cDetailingAddLanguageSpecificTextSet("LSTFE601F20_0") Method

Detailing output of one slab on a particular floor

Namespace: ETABSV1

Assembly: ETABSV1 (in ETABSV1.dll) Version: 1.0.0.0 (1.24.0.0)

■ Syntax

C#

VB

C++

F#

Copy

```
int GetDetailedSlab_OneDetailingOutputInfo(
int DetailingOutputIndex,
ref string Guid_ETABS,
ref string Floor,
ref string StoryNameETABS,
ref double LevelZ,
ref int NumberStrips
)
```

```
Function GetDetailedSlab_OneDetailingOutputInfo (
DetailingOutputIndex As Integer,
ByRef Guid_ETABS As String,
ByRef Floor As String,
ByRef StoryNameETABS As String,
ByRef LevelZ As Double,
ByRef NumberStrips As Integer
) As Integer
```

```
Dim instance As cDetailing
Dim DetailingOutputIndex As Integer
Dim Guid_ETABS As String
Dim Floor As String
Dim StoryNameETABS As String
Dim LevelZ As Double
Dim NumberStrips As Integer
Dim returnValue As Integer
```

```
returnValue = instance.GetDetailedSlab_OneDetailingOutputInfo(DetailingOutputIndex,
Guid_ETABS, Floor, StoryNameETABS,
LevelZ, NumberStrips)
```

```
int GetDetailedSlab_OneDetailingOutputInfo(
int DetailingOutputIndex,
String% Guid_ETABS,
String% Floor,
String% StoryNameETABS,
double% LevelZ,
int% NumberStrips
)
```

abstract GetDetailedSlab_OneDetailingOutputInfo :

cDetailingspan id="LSTFE601F20_0"AddLanguageSpecificTextSet("LSTFE601F20_0?cpp=::int498;GetDet

```
DetailingOutputIndex : int *  
Guid_ETABS : string byref *  
Floor : string byref *  
StoryNameETABS : string byref *  
LevelZ : float byref *  
NumberStrips : int byref -> int
```

Parameters

DetailingOutputIndex

Type:Â [SystemInt32](#)

Detailing Output Index

Guid_ETABS

Type:Â [SystemString](#)

ETABS GUID

Floor

Type:Â [SystemString](#)

Floor ID in CSiDetail, based on ETABS story Name

StoryNameETABS

Type:Â [SystemString](#)

Story Name from ETABS

LevelZ

Type:Â [SystemDouble](#)

The reference Level of the slab where Design Strips lie

NumberStrips

Type:Â [SystemInt32](#)

Number of Strips present in current detailing output

Return Value

Type:Â [Int32](#)

Returns zero if the function is successful; otherwise it returns a nonzero value.

    TPLinePointIndex : int *  
    X : float byref *  
    Y : float byref *  
    Z : float byref -> int
```

Parameters

WallStackIndex

Type:Â SystemInt32
Wall Stack Index

PierIndex

Type:Â SystemInt32
Pier Output Index

DesignLegIndex

Type:Â SystemInt32
Design leg Index

TieBarIndex

Type:Â SystemInt32
Tie bar Index

TiePLineIndex

Type:Â SystemInt32
Tie Polyline Index

TPLinePointIndex

Type:Â SystemInt32
Tie Polyline Point Index

X

Type:Â SystemDouble
X coordinates

Y

Type:Â SystemDouble
Y coordinates

Z

Type:Â SystemDouble
Z coordinates

Return Value

Type: Int32

Returns zero if the function is successful; otherwise it returns a nonzero value.

```

Parameters

WallStackIndex
Type: System.Int32
Wall Stack Index

PierIndex
Type: System.Int32
Pier Output Index

DesignLegIndex

Type:Â SystemInt32
 Design leg Index

TieBarIndex
 Type:Â SystemInt32
 Tie bar Index

GUID
 Type:Â SystemString
 GUID

BarSize_Dia
 Type:Â SystemDouble
 Information about the size of Rebar Dia

BarSize_Area
 Type:Â SystemDouble
 Information about the size of Rebar Area

BarSize_Fy
 Type:Â SystemDouble
 Information about the size of Rebar Fy

BarSize_Notation
 Type:Â SystemString
 Information about the size of Rebar Notation

Spacing
 Type:Â SystemDouble
 Spacing of Tie, along the height

StartZ
 Type:Â SystemDouble
 Starting offset for placing the ties, along height, with respect to Design Leg Z Level

EndZ
 Type:Â SystemDouble
 Starting offset for placing the ties, along height, with respect to Design Leg Z Level

TieShape
 Type:Â SystemInt32
 Shape of the Tie Straight, JoggleSingle, JoggleDouble, Rectangular, Diamond, UEqual, UunEqual, Circle, Spiral, RectangularLapped 'Incident #16730, Rectangle90, Rectangle135, RectLap90 'Incident #16730, RectLap135 'Incident #16730, U90, U135, UandTie90, UandTie135, LTieWithLip, Circular

NumberOfTiePlines
 Type:Â SystemInt32
 Number of Polyline(s) of the Bar shapes, in Local Design Leg Coordinates

Return Value

Type:Â Int32

Returns zero if the function is successful; otherwise it returns a nonzero value.

```

Parameters

WallStackIndex

Type: SystemInt32

Wall Stack Index

PierIndex

Type: SystemInt32

Pier Output Index

DesignLegIndex

Type: SystemInt32

Design leg Index

VerticalBarIndex

Type: SystemInt32

Vertical Index

GUID

Type: SystemString

GUID

BarSizeFirst_Dia

Type: SystemDouble

Information about the first bar in bar group Dia

BarSizeFirst_Area

Type: SystemDouble

Information about the first bar in bar group Area

BarSizeFirst_Fy

Type: SystemDouble

Information about the first bar in bar group Fy

BarSizeFirst_Notation

Type: SystemString

Information about the first bar in bar group notation

BarSizeLast_Dia

Type: SystemDouble

Information about the last bar in bar group Dia

BarSizeLast_Area

Type: SystemDouble

Information about the last bar in bar group Area

BarSizeLast_Fy

Type: SystemDouble

Information about the last bar in bar group Fy

BarSizeLast_Notation

Type: SystemString

Information about the last bar in bar group notation

BarSizeOthers_Dia

Type: SystemDouble

Information about the other bar in bar group Dia

BarSizeOthers_Area

Type: SystemDouble

Information about the other bar in bar group Area

BarSizeOthers_Fy

Type: SystemDouble

Information about the other bar in bar group Fy

BarSizeOthers_Notation

Type:Â SystemString
 Information about the other bar in bar group notation

Number
 Type:Â SystemInt32
 Total number of bars in the group, including First and Last

StartX
 Type:Â SystemDouble
 Start distance of bar zone, with respect to first point of Design Leg centerline

StartY
 Type:Â SystemDouble
 Offset Y from the Design Leg centerline at first bar

EndX
 Type:Â SystemDouble
 End distance of bar zone, with respect to first point of Design Leg centerline

EndY
 Type:Â SystemDouble
 Offset Y from the Design Leg centerline at last bar

StartBarBend
 Type:Â SystemInt32
 The bar bend that applies at the start of the bars, at lower end. None, Cut, Curtail, Bend45, Bend90, Bend135, Bend180, Joggle

EndBarBend
 Type:Â SystemInt32
 The bar bend that applies at the end of the bars, at upper end.

OffsetZ
 Type:Â SystemDouble
 Vertical starting offset from Design Leg Z level

BarLength
 Type:Â SystemDouble
 the length of these bars, along height of the pier, above Offset Z

LocationCode
 Type:Â SystemInt32
 : 0 - vertical distributed, 1 - vertical confinement zone I, 2 - vertical confinement zone J,

Return Value

Type:Â Int32
 Returns zero if the function is successful; otherwise it returns a nonzero value.

Parameters

WallStackIndex

Type:Â SystemInt32

Wall Stack Index

PierIndex

Type:Â SystemInt32

Pier Output Index

DesignLegIndex

Type:Â SystemInt32

Design leg Index

GUID

Type:Â SystemString

GUID

PierLabel

Type:Â SystemString

Label of the Piersection in ETABS from which the Design Leg is taken

x1

Type:Â SystemDouble

Global Centerline of the Design Leg. Matching with ETABS Design leg data X1

y1

Type:Â SystemDouble

Global Centerline of the Design Leg. Matching with ETABS Design leg data Y1

z1

Type:Â SystemDouble

Global Centerline of the Design Leg. Matching with ETABS Design leg data Z1

x2

Type:Â SystemDouble

Global Centerline of the Design Leg. Matching with ETABS Design leg data X2

y2

Type:Â SystemDouble

Global Centerline of the Design Leg. Matching with ETABS Design leg data Y2

z2

Type:Â SystemDouble

Global Centerline of the Design Leg. Matching with ETABS Design leg data Z2

ZLevel

Type:Â SystemDouble

The reference Z level of Design Leg, in global coordinates

NumberVerticalBars

Type:Â SystemInt32

Number of Vertical Bars in Local Coordinates of Desig Leg

NumberHorizontalBars

Type:Â SystemInt32

Number of Horizontal Bars, in local coordinates of Design Leg

TotalAreaObjects

Type:Â SystemInt32

Total number of ETABS Area Objects

AreaObjectNames

Type:Â SystemString

ETABS Area Object Name

Return Value

Type: Int32

Returns zero if the function is successful; otherwise it returns a nonzero value.

cDetailingAddLanguageSpecificTextSet("LSTD940F426_0?cpp=::|nu537;GetDet

```
ETABSStoryName : string byref *  
NumberDesignLegs : int byref -> int
```

Parameters

WallStackIndex

Type: SystemInt32

Wall Stack Index

PierIndex

Type: SystemInt32

Pier Output Index

StoryID

Type: SystemInt32

CSiDetail Index of Story on which the pier lies, in the corresponding Tower

ETABSStoryName

Type: SystemString

The Story Name used in ETABS on which the pier lies, in the corresponding Tower

NumberDesignLegs

Type: SystemInt32

Number of Design Legs

Return Value

Type: Int32

Returns zero if the function is successful; otherwise it returns a nonzero value.

Parameters

WallStackIndex

Type: SystemInt32

Wall Stack Index

SpandrelIndex

Type: SystemInt32

Spandrel Output Index

LongBarIndex

Type: SystemInt32

Long bar index

BarSize_Dia

Type: SystemDouble

Information about the bar In bar group Dia

BarSize_Area

Type:Â SystemDouble
Information about the bar In bar group Area

BarSize_Fy
Type:Â SystemDouble
Information about the bar In bar group Fy

BarSize_Notation
Type:Â SystemString
Information about the bar In bar group Notation

NumberPoints
Type:Â SystemInt32
Number of Points

X
Type:Â SystemDouble
Coordinates of bar in local beam axis as defined in ETABS (X is along 1, Y is along 2, Z is along 3)

Y
Type:Â SystemDouble
Coordinates of bar in local beam axis as defined in ETABS (X is along 1, Y is along 2, Z is along 3)

Z
Type:Â SystemDouble
Coordinates of bar in local beam axis as defined in ETABS (X is along 1, Y is along 2, Z is along 3)

StartType
Type:Â SystemInt32
Represents Bar End Types, Cut, Ben90, Bend180, Bend135

EndType
Type:Â SystemInt32
Represents Bar End Types, Cut, Ben90, Bend180, Bend135

Return Value

Type:Â Int32
Returns zero if the function is successful; otherwise it returns a nonzero value.

    X1 : float byref *  
    X2 : float byref *  
    Spacing : float byref *  
    NumberLegs : int byref -> int
```

Parameters

WallStackIndex

Type: SystemInt32
Wall Stack Index

SpandrelIndex

Type: SystemInt32
Spandrel Output Index

StirrupsIndex

Type: SystemInt32
Long bar index

BarSize_Dia

Type: SystemDouble
Information about the bar In bar group Dia

BarSize_Area

Type: SystemDouble
Information about the bar In bar group Area

BarSize_Fy

Type: SystemDouble
Information about the bar In bar group Fy

BarSize_Notation

Type: SystemString
Information about the bar In bar group Notation

X1

Type: SystemDouble

Coordinates of bar start and End, in local beam axis as defined in ETABS

X2

Type: SystemDouble

Coordinates of bar start and End, in local beam axis as defined in ETABS

Spacing

Type: SystemDouble

Spacing

NumberLegs

Type: SystemInt32

Number of legs

Return Value

Type: Int32

Returns zero if the function is successful; otherwise it returns a nonzero value.

```

Parameters

WallStackIndex

Type: System.Int32

Wall Stack Index

SpandrelIndex

Type: System.Int32

Spandrel Output Index

GUID

Type: System.String

GUID

Name

Type: System.String

Name of Spandrel

Height

Type: System.Double

Spandrel Height

Width

Type: System.Double

Spandrel Width

Thickness

Type: System.Double

Spandrel Thickness

CoverLongBar

Type: System.Double

Cover for LongBar

CoverStirrups

Type: System.Double

Cover for Stirrup

x1

Type: System.Double

Global Centerline of Spandrel. Matching with ETABS Design leg data X1

y1

Type: System.Double

Global Centerline of Spandrel. Matching with ETABS Design leg data Y1

z1

Type: System.Double

Global Centerline of Spandrel. Matching with ETABS Design leg data Z1

x2

Type:Â SystemDouble
Global Centerline of Spandrel. Matching with ETABS Design leg data X2

y2
Type:Â SystemDouble
Global Centerline of Spandrel. Matching with ETABS Design leg data Y2

z2
Type:Â SystemDouble
Global Centerline of Spandrel. Matching with ETABS Design leg data Z2

NumberLongBars
Type:Â SystemInt32
Contains all Longitudinal Rebars in a beam

NumberStirrups
Type:Â SystemInt32
Represents one Zone of Stirrups with same size and spacing

TotalAreaObjects
Type:Â SystemInt32
Total number of ETABS Area Objects

AreaObjectNames
Type:Â SystemString
ETABS Area Object Name

Return Value

Type:Â Int32
Returns zero if the function is successful; otherwise it returns a nonzero value.

Parameters

DetailingOutputIndex
Type: System.Int32
Detailing Output Index

StripIndex
Type: System.Int32
Strip Index

DetailingRegionIndex

Type: SystemInt32
 Detailing region index

BottomRebarIndex
 Type: SystemInt32
 Bottom rebar index

GUID
 Type: SystemString
 GUID assigned by CSiDetail

PlaceCode
 Type: SystemString
 Place Code. A = Top Long Bar in Exterior Span. B = Top Short Bar in Exterior Span. C = Top Long Bar in Interior Span. D = Top Short Bar in Interior Span. E = Bottom Long Bar in Interior/Exterior Span. F = Bottom Short Bar in Interior/Exterior Span

Dia
 Type: SystemDouble
 Diameter of Bar

Size
 Type: SystemString
 Bar Designation, based on selected Rebar Set

Number
 Type: SystemInt32
 Total number of Bars of this type

StartDist
 Type: SystemDouble
 Start Location of the Bar, along X in local axis of region

EndDist
 Type: SystemDouble
 End Location of the Bar, along X in local axis of region

StartBend
 Type: SystemInt32
 Bend type at start of bar

EndBend
 Type: SystemInt32
 Bend type at end of of bar

Material
 Type: SystemString
 Material assigned to Slab

Return Value

Type: Int32
 Returns zero if the function is successful; otherwise it returns a nonzero value.

Type: System.Int32

Strip Index

DetailingRegionIndex

Type: System.Int32

Detailing region index

BottomRebarIndex

Type: System.Int32

Top rebar index

X1

Type: SystemDouble
Start point X of Extent CLine, Local wrt to Region

Y1
Type: SystemDouble
Start point y of Extent CLine, Local wrt to Region

X2
Type: SystemDouble
End point X of Extent CLine, Local wrt to Region

Y2
Type: SystemDouble
End point Y of Extent CLine, Local wrt to Region

WidthRight
Type: SystemDouble
Bar distribution Width, on right side of the extent centerline

WidthLeft
Type: SystemDouble
Bar distribution Width, on left side of the extent centerline

Z
Type: SystemDouble
Z value in Global Coordinates, of centerline of all rebar in the extent

ReqAst
Type: SystemDouble
Required area of reinforcement, as determined from ETABS

ProvAst
Type: SystemDouble
Provided area of reinforcement, as detailed

Return Value

Type: Int32
Returns zero if the function is successful; otherwise it returns a nonzero value.

CSI API ETABS v1

cDiaphragmAddLanguageSpecificTextSet("LSTBA408D Method

Changes the name of a defined diaphragm

Namespace: ETABSv1

Assembly: ETABSv1 (in ETABSv1.dll) Version: 1.0.0.0 (1.24.0.0)

Syntax

C#

VB

C++

F#

Copy

```
int ChangeName(
    string Name,
    string NewName
)
```

```
Function ChangeName (
    Name As String,
    NewName As String
) As Integer
```

```
Dim instance As cDiaphragm
Dim Name As String
Dim NewName As String
Dim returnValue As Integer
```

```
returnValue = instance.ChangeName(Name,
    NewName)
```

```
int ChangeName(
    String^ Name,
    String^ NewName
)
```

```
abstract ChangeName :
    Name : string *
    NewName : string -> int
```

Parameters

Name

Type: SystemString

The existing name of a defined diaphragm

NewName

Type: SystemString

The new name for the diaphragm

Return Value

Type: Int32

Returns zero if the new name is successfully applied, otherwise it returns a nonzero value.

▀ **Remarks**

▀ **Examples**

VB

Copy

```
Public Sub Example()
    Dim SapModel As cSapModel
    Dim EtabsObject As cOAPI
    Dim ret As Integer = -1

    'create ETABS object
    Dim myHelper as cHelper = New Helper
    EtabsObject = myHelper.CreateObjectProgID("CSI.ETABS.API.ETABSObject")

    'start ETABS application
    ret = EtabsObject.ApplicationStart()

    'create SapModel object
    SapModel = EtabsObject.SapModel

    'initialize model
    ret = SapModel.InitializeNewModel()

    'create steel deck template model
    ret = SapModel.File.NewSteelDeck(4, 12, 12, 4, 4, 24, 24)

    'define new diaphragm
    ret = SapModel.Diaphragm.SetDiaphragm("MyDiaphragm1A", SemiRigid:=True)

    'change diaphragm name
    ret = SapModel.Diaphragm.ChangeName("MyDiaphragm1A", "MyDiaph2B")

    'close ETABS
    EtabsObject.ApplicationExit(False)

    'clean up variables
    SapModel = Nothing
    EtabsObject = Nothing

End Sub
```

CSI API ETABS v1

cDiaphragmAddLanguageSpecificTextSet("LSTE8E16E Method

Retrieves the names of all defined diaphragms

Namespace: ETABSV1

Assembly: ETABSV1 (in ETABSV1.dll) Version: 1.0.0.0 (1.24.0.0)

■ Syntax

C#

VB

C++

F#

Copy

```
int GetNameList(
    ref int NumberNames,
    ref string[] MyName
)
```

```
Function GetNameList (
    ByRef NumberNames As Integer,
    ByRef MyName As String()
) As Integer
```

```
Dim instance As cDiaphragm
Dim NumberNames As Integer
Dim MyName As String()
Dim returnValue As Integer
```

```
returnValue = instance.GetNameList(NumberNames,
    MyName)
```

```
int GetNameList(
    int% NumberNames,
    array<String^>^% MyName
)
```

```
abstract GetNameList :
    NumberNames : int byref *
    MyName : string[] byref -> int
```

Parameters

NumberNames

Type: SystemInt32

The number of diaphragm names defined in the program

MyName

Type: SystemString

This is a one-dimensional array of names. The MyName array is created as a dynamic, zero-based, array by the API user:

```
Dim MyName() as String
```

Introduction

The array is dimensioned to (NumberNames + 1) inside the ETABS program, filled with the names, and returned to the API user.

Return Value

Type: Int32

Returns zero if the names are successfully retrieved, otherwise it returns nonzero.

▲ **Remarks**

▲ **Examples**

VB

Copy

```
Public Sub Example()  
    Dim SapModel As cSapModel  
    Dim EtabsObject As cOAPI  
    Dim ret As Integer = -1  
    Dim NumberNames As Integer  
    Dim MyName As String()  
  
    'create ETABS object  
    Dim myHelper as cHelper = New Helper  
    EtabsObject = myHelper.CreateObjectProgID("CSI.ETABS.API.ETABSObject")  
  
    'start ETABS application  
    ret = EtabsObject.ApplicationStart()  
  
    'create SapModel object  
    SapModel = EtabsObject.SapModel  
  
    'initialize model  
    ret = SapModel.InitializeNewModel()  
  
    'create steel deck template model  
    ret = SapModel.File.NewSteelDeck(4, 12, 12, 4, 4, 24, 24)  
  
    'define new diaphragm  
    ret = SapModel.Diaphragm.SetDiaphragm("MyDiaphragm1A", SemiRigid:=True)  
  
    'get names  
    ret = SapModel.Diaphragm.GetNameList(NumberNames, MyName)  
  
    'close ETABS  
    EtabsObject.ApplicationExit(False)  
  
    'clean up variables  
    SapModel = Nothing  
    EtabsObject = Nothing  
  
End Sub
```

CSI API ETABS v1

cDiaphragmAddLanguageSpecificTextSet("LST7B14B877_0?cpp=:1602.");SetD

Method

Adds a new diaphragm, or modifies an existing diaphragm

Namespace: [ETABSv1](#)

Assembly: [ETABSv1](#) (in ETABSv1.dll) Version: 1.0.0.0 (1.24.0.0)

Syntax

[C#](#)

[VB](#)

[C++](#)

[F#](#)

[Copy](#)

```
int SetDiaphragm(
    string Name,
    bool SemiRigid
)
```

```
Function SetDiaphragm (
    Name As String,
    SemiRigid As Boolean
) As Integer
```

```
Dim instance As cDiaphragm
Dim Name As String
Dim SemiRigid As Boolean
Dim returnValue As Integer
```

```
returnValue = instance.SetDiaphragm(Name,
    SemiRigid)
```

```
int SetDiaphragm(
    String^ Name,
    bool SemiRigid
)
```

```
abstract SetDiaphragm :
    Name : string *
    SemiRigid : bool -> int
```

Parameters

Name

Type: [SystemString](#)

This is the name of a diaphragm. If this is the name of an existing diaphragm, that diaphragm is modified, otherwise a new diaphragm is added.

SemiRigid

Type: [SystemBoolean](#)

This item is True if the diaphragm is to be semi-rigid, and False otherwise

Return Value

Type: Int32

Returns zero if the diaphragm is successfully added or modified, otherwise it returns a nonzero value.

▲ **Remarks**

▲ **Examples**

VB

Copy

```
Public Sub Example()
    Dim SapModel As cSapModel
    Dim EtabsObject As cOAPI
    Dim ret As Integer = -1
    Dim NumberNames As Integer
    Dim MyName As String()

    'create ETABS object
    Dim myHelper as cHelper = New Helper
    EtabsObject = myHelper.CreateObjectProgID("CSI.ETABS.API.ETABSObject")

    'start ETABS application
    ret = EtabsObject.ApplicationStart()

    'create SapModel object
    SapModel = EtabsObject.SapModel

    'initialize model
    ret = SapModel.InitializeNewModel()

    'create steel deck template model
    ret = SapModel.File.NewSteelDeck(4, 12, 12, 4, 4, 24, 24)

    'define new diaphragm
    ret = SapModel.Diaphragm.SetDiaphragm("MyDiaphragm1A", SemiRigid:=True)

    'close ETABS
    EtabsObject.ApplicationExit(False)

    'clean up variables
    SapModel = Nothing
    EtabsObject = Nothing

End Sub
```

CSI API ETABS v1

cDStAISC360_05_IBC2006AddLanguageSpecificTextSet Method

Retrieves the value of a steel design overwrite item.

Namespace: [ETABSv1](#)

Assembly: [ETABSv1](#) (in ETABSv1.dll) Version: 1.0.0.0 (1.24.0.0)

■ Syntax

[C#](#)

[VB](#)

[C++](#)

[F#](#)

[Copy](#)

```
int GetOverwrite(
    string Name,
    int Item,
    ref double Value,
    ref bool ProgDet
)
```

```
Function GetOverwrite (
    Name As String,
    Item As Integer,
    ByRef Value As Double,
    ByRef ProgDet As Boolean
) As Integer
```

```
Dim instance As cDStAISC360_05_IBC2006
Dim Name As String
Dim Item As Integer
Dim Value As Double
Dim ProgDet As Boolean
Dim returnValue As Integer
```

```
returnValue = instance.GetOverwrite(Name,
    Item, Value, ProgDet)
```

```
int GetOverwrite(
    String^ Name,
    int Item,
    double% Value,
    bool% ProgDet
)
```

```
abstract GetOverwrite :
    Name : string *
    Item : int *
    Value : float byref *
    ProgDet : bool byref -> int
```

Parameters

Name

Type: SystemString

The name of a frame object with a steel frame design procedure.

Item

Type: SystemInt32

This is an integer between 1 and 43, inclusive, indicating the overwrite item considered.

1. Framing type
2. Omega0
3. Consider deflection
4. Deflection check type
5. DL deflection limit, L/Value
6. SDL + LL deflection limit, L/Value
7. LL deflection limit, L/Value
8. Total load deflection limit, L/Value
9. Total camber limit, L/Value
10. DL deflection limit, absolute
11. SDL + LL deflection limit, absolute
12. LL deflection limit, absolute
13. Total load deflection limit, absolute
14. Total camber limit, absolute
15. Specified camber
16. Net area to total area ratio
17. Live load reduction factor
18. Unbraced length ratio, Major
19. Unbraced length ratio, Minor
20. Unbraced length ratio, Lateral Torsional Buckling
21. Effective length factor, K1 Major
22. Effective length factor, K1 Minor
23. Effective length factor, K2 Major
24. Effective length factor, K2 Minor
25. Effective length factor, K Lateral Torsional Buckling
26. Moment coefficient, Cm Major
27. Moment coefficient, Cm Minor
28. Bending coefficient, Cb
29. Nonsway moment factor, B1 Major
30. Nonsway moment factor, B1 Minor
31. Sway moment factor, B2 Major
32. Sway moment factor, B2 Minor
33. Reduce HSS thickness
34. HSS welding type
35. Yield stress, Fy
36. Expected to specified Fy ratio, Ry
37. Compressive capacity, Pnc
38. Tensile capacity, Pnt
39. Major bending capacity, Mn3
40. Minor bending capacity, Mn2
41. Major shear capacity, Vn2
42. Minor shear capacity, Vn3

43. Demand/capacity ratio limit

Value

Type: SystemDouble

The value of the considered overwrite item.

1. Framing type

- . 0 = Program Default
- . 1 = SMF
- . 2 = IMF
- . 3 = OMF
- . 4 = SCBF
- . 5 = OCBF
- . 6 = OCBFI
- . 7 = EBF

2. Omega0

Value ≥ 0 ; 0 means use a program determined value.

3. Consider deflection

- . 0 = Program Default
- . 1 = No
- . 2 = Yes

4. Deflection check type

- . 0 = Program Default
- . 1 = Ratio
- . 2 = Absolute
- . 3 = Both

5. DL deflection limit, L/Value

Value ≥ 0 ; 0 means no check for this item.

6. SDL + LL deflection limit, L/Value

Value ≥ 0 ; 0 means no check for this item.

7. LL deflection limit, L/Value

Value ≥ 0 ; 0 means no check for this item.

8. Total load deflection limit, L/Value

Value ≥ 0 ; 0 means no check for this item.

9. Total camber limit, L/Value

Value ≥ 0 ; 0 means no check for this item.

10. DL deflection limit, absolute

Value ≥ 0 ; 0 means no check for this item. [L]

11. SDL + LL deflection limit, absolute

Value ≥ 0 ; 0 means no check for this item. [L]

12. LL deflection limit, absolute

Value ≥ 0 ; 0 means no check for this item. [L]

13. Total load deflection limit, absolute

Introduction

Value ≥ 0 ; 0 means no check for this item. [L]

14. Total camber limit, absolute

Value ≥ 0 ; 0 means no check for this item. [L]

15. Specified camber

Value ≥ 0 . [L]

16. Net area to total area ratio

Value ≥ 0 ; 0 means use program default value.

17. Live load reduction factor

Value ≥ 0 ; 0 means use program determined value.

18. Unbraced length ratio, Major

Value ≥ 0 ; 0 means use program determined value.

19. Unbraced length ratio, Minor

Value ≥ 0 ; 0 means use program determined value.

20. Unbraced length ratio, Lateral Torsional Buckling

Value ≥ 0 ; 0 means use program determined value.

21. Effective length factor, K1 Major

Value ≥ 0 ; 0 means use program determined value.

22. Effective length factor, K1 Minor

Value ≥ 0 ; 0 means use program determined value.

23. Effective length factor, K2 Major

Value ≥ 0 ; 0 means use program determined value.

24. Effective length factor, K2 Minor

Value ≥ 0 ; 0 means use program determined value.

25. Effective length factor, K Lateral Torsional Buckling

Value ≥ 0 ; 0 means use program determined value.

26. Moment coefficient, Cm Major

Value ≥ 0 ; 0 means use program determined value.

27. Moment coefficient, Cm Minor

Value ≥ 0 ; 0 means use program determined value.

28. Bending coefficient, Cb

Value ≥ 0 ; 0 means use program determined value.

29. Nonsway moment factor, B1 Major

Value ≥ 0 ; 0 means use program determined value.

30. Nonsway moment factor, B1 Minor

Introduction

Value ≥ 0 ; 0 means use program determined value.

31. Sway moment factor, B2 Major

Value ≥ 0 ; 0 means use program determined value.

32. Sway moment factor, B2 Minor

Value ≥ 0 ; 0 means use program determined value.

33. Reduce HSS thickness

· 0 = Program Default

· 1 = No

· 2 = Yes

34. HSS welding type

· 0 = Program Default

· 1 = ERW

· 2 = SAW

35. Yield stress, Fy

Value ≥ 0 ; 0 means use program determined value. $[F/L^2]$

36. Expected to specified Fy ratio, Ry

Value ≥ 0 ; 0 means use program determined value.

37. Compressive capacity, Pnc

Value ≥ 0 ; 0 means use program determined value. $[F]$

38. Tensile capacity, Pnt

Value ≥ 0 ; 0 means use program determined value. $[F]$

39. Major bending capacity, Mn3

Value ≥ 0 ; 0 means use program determined value. $[FL]$

40. Minor bending capacity, Mn2

Value ≥ 0 ; 0 means use program determined value. $[FL]$

41. Major shear capacity, Vn2

Value ≥ 0 ; 0 means use program determined value. $[F]$

42. Minor shear capacity, Vn3

Value ≥ 0 ; 0 means use program determined value. $[F]$

43. Demand/capacity ratio limit

Value ≥ 0 ; 0 means use program determined value.

ProgDet

Type: SystemBoolean

If this item is True, the specified value is program determined.

Return Value

Type: Int32

Returns zero if the item is successfully retrieved; otherwise it returns a nonzero value.

▲ Remarks

Return Value

Examples

VB

Copy

```
Public Sub Example()
    Dim SapModel As cSapModel
    Dim EtabsObject As cOAPI
    Dim ret As Integer = -1
    Dim Value As Double
    Dim ProgDet As Boolean

    'create ETABS object
    Dim myHelper as cHelper = New Helper
    EtabsObject = myHelper.CreateObjectProgID("CSI.ETABS.API.ETABSObject")

    'start ETABS application
    ret = EtabsObject.ApplicationStart()

    'create SapModel object
    SapModel = EtabsObject.SapModel

    'initialize model
    ret = SapModel.InitializeNewModel()

    'create steel deck template model
    ret = SapModel.File.NewSteelDeck(4, 12, 12, 4, 4, 24, 24)

    'set steel design code
    ret = SapModel.DesignSteel.SetCode("AISC360-05/IBC2006")

    'run analysis
    System.IO.Directory.CreateDirectory("c:\CSI_API_temp")
    ret = SapModel.File.Save("C:\CSI_API_temp\example.edb")
    ret = SapModel.Analyze.RunAnalysis

    'start steel design
    ret = SapModel.DesignSteel.StartDesign

    'get overwrite item
    ret = SapModel.DesignSteel.AISC360_05_IBC2006.GetOverwrite("8", 1, Value, ProgDet)

    'close ETABS
    EtabsObject.ApplicationExit(False)

    'clean up variables
    SapModel = Nothing
    EtabsObject = Nothing

End Sub

CSI API ETABS v1

cDStAISC360_05_IBC2006AddLanguageSpecificTextSet

Method

Retrieves the value of a steel design preference item.

Namespace: ETABSv1

Assembly: ETABSv1 (in ETABSv1.dll) Version: 1.0.0.0 (1.24.0.0)

Syntax

C#

VB

C++

F#

Copy

```
int GetPreference(
    int Item,
    ref double Value
)
```

```
Function GetPreference (
    Item As Integer,
    ByRef Value As Double
) As Integer
```

```
Dim instance As cDStAISC360_05_IBC2006
Dim Item As Integer
Dim Value As Double
Dim returnValue As Integer
```

```
returnValue = instance.GetPreference(Item,
    Value)
```

```
int GetPreference(
    int Item,
    double% Value
)
```

```
abstract GetPreference :
    Item : int *
    Value : float byref -> int
```

Parameters

Item

Type: SystemInt32

This is an integer between 1 and 29, inclusive, indicating the preference item considered.

1. Framing type
2. Seismic design category
3. Design provision
4. Analysis method (Obsolete, replaced by 27, 28, and 29)
5. Notional load coefficient

6. Phi bending
7. Phi compression
8. Phi tension yielding
9. Phi tension fracture
10. Phi shear
11. Phi shear sort webbed rolled I
12. Phi torsion
13. Ignore seismic code
14. Ignore special seismic load
15. Doubler plate is plug welded
16. HSS welding type
17. Reduce HSS thickness
18. Consider deflection
19. DL deflection limit, L/Value
20. SDL + LL deflection limit, L/Value
21. LL deflection limit, L/Value
22. Total load deflection limit, L/Value
23. Total camber limit, L/Value
24. Pattern live load factor
25. Demand/capacity ratio limit
26. Multi-response case design
27. Analysis Method
28. Second Order Method
29. Stiffness Reduction Method

Value

Type: SystemDouble

The value of the considered preference item.

1. Framing type
 1. SMF
 2. IMF
 3. OMF
 4. SCBF
 5. OCBF
 6. OCBFI
 7. EBF
2. Seismic design category
 1. A
 2. B
 3. C
 4. D
 5. E
 6. F
3. Design provision
 1. LRFD
 2. ASD
4. Analysis method (Obsolete, replaced by 27, 28, and 29)
 1. Gen 2nd Order Elastic
 2. 2nd Order By Amp 1st Order
 3. Limited 1st Order Elastic
 4. DAM Gen 2nd Order Taub Variable
 5. DAM Gen 2nd Order Taub Fixed

Introduction

- 6. DAM Amp 1st Order Taub Variable
- 7. DAM Amp 1st Order Taub Fixed
- 5. Notional load coefficient

Value > 0

- 6. Phi bending

Value > 0

- 7. Phi compression

Value > 0

- 8. Phi tension yielding

Value > 0

- 9. Phi tension fracture

Value > 0

- 10. Phi shear

Value > 0

- 11. Phi shear sort webbed rolled I

Value > 0

- 12. Phi torsion

Value > 0

- 13. Ignore seismic code

0 = No

Any other value = Yes

- 14. Ignore special seismic load

0 = No

Any other value = Yes

- 15. Doubler plate is plug welded

0 = No

Any other value = Yes

- 16. HSS welding type

1. ERW

2. SAW

- 17. Reduce HSS thickness

0 = No

Any other value = Yes

- 18. Consider deflection

0 = No

Any other value = Yes

19. DL deflection limit, L/Value

Value > 0

20. SDL + LL deflection limit, L/Value

Value > 0

21. LL deflection limit, L/Value

Value > 0

22. Total load deflection limit, L/Value

Value > 0

23. Total camber limit, L/Value

Value > 0

24. Pattern live load factor

Value > 0

25. Demand/capacity ratio limit

Value > 0

26. Multi-response case design

1. Envelopes
2. Step-by-step
3. Last step
4. Envelopes -- All
5. Step-by-step -- All

27. Analysis Method

1. Direct Analysis
2. Effective Length
3. Limited 1st Order

28. Second Order Method

1. General 2nd Order
2. Amplified 1st Order

29. Stiffness Reduction Method

1. Tau-b variable
2. Tau-b Fixed
3. No Modification

Return Value

Type: Int32

Returns zero if the item is successfully retrieved; otherwise it returns a nonzero value.

-> int
```

Parameters**Name**

Type: SystemString

The name of an existing frame object or group, depending on the value of the ItemType item.

Item

Type: SystemInt32

This is an integer between 1 and 43, inclusive, indicating the overwrite item considered.

1. Framing type
2. Omega0
3. Consider deflection
4. Deflection check type
5. DL deflection limit, L/Value
6. SDL + LL deflection limit, L/Value
7. LL deflection limit, L/Value
8. Total load deflection limit, L/Value
9. Total camber limit, L/Value
10. DL deflection limit, absolute
11. SDL + LL deflection limit, absolute
12. LL deflection limit, absolute
13. Total load deflection limit, absolute
14. Total camber limit, absolute
15. Specified camber
16. Net area to total area ratio
17. Live load reduction factor
18. Unbraced length ratio, Major
19. Unbraced length ratio, Minor
20. Unbraced length ratio, Lateral Torsional Buckling
21. Effective length factor, K1 Major
22. Effective length factor, K1 Minor
23. Effective length factor, K2 Major
24. Effective length factor, K2 Minor
25. Effective length factor, K Lateral Torsional Buckling
26. Moment coefficient, Cm Major
27. Moment coefficient, Cm Minor
28. Bending coefficient, Cb
29. Nonsway moment factor, B1 Major
30. Nonsway moment factor, B1 Minor
31. Sway moment factor, B2 Major
32. Sway moment factor, B2 Minor
33. Reduce HSS thickness
34. HSS welding type
35. Yield stress, Fy
36. Expected to specified Fy ratio, Ry
37. Compressive capacity, Pnc
38. Tensile capacity, Pnt
39. Major bending capacity, Mn3
40. Minor bending capacity, Mn2
41. Major shear capacity, Vn2

- 42. Minor shear capacity, V_n3
- 43. Demand/capacity ratio limit

Value

Type: SystemDouble

The value of the considered overwrite item.

1. Framing type
 - . 0 = Program Default
 - . 1 = SMF
 - . 2 = IMF
 - . 3 = OMF
 - . 4 = SCBF
 - . 5 = OCBF
 - . 6 = OCBFI
 - . 7 = EBF
2. Omega0

Value ≥ 0 ; 0 means use a program determined value.

3. Consider deflection
 - . 0 = Program Default
 - . 1 = No
 - . 2 = Yes
4. Deflection check type
 - . 0 = Program Default
 - . 1 = Ratio
 - . 2 = Absolute
 - . 3 = Both
5. DL deflection limit, L/Value

Value ≥ 0 ; 0 means no check for this item.

6. SDL + LL deflection limit, L/Value

Value ≥ 0 ; 0 means no check for this item.

7. LL deflection limit, L/Value

Value ≥ 0 ; 0 means no check for this item.

8. Total load deflection limit, L/Value

Value ≥ 0 ; 0 means no check for this item.

9. Total camber limit, L/Value

Value ≥ 0 ; 0 means no check for this item.

10. DL deflection limit, absolute

Value ≥ 0 ; 0 means no check for this item. [L]

11. SDL + LL deflection limit, absolute

Value ≥ 0 ; 0 means no check for this item. [L]

12. LL deflection limit, absolute

Value ≥ 0 ; 0 means no check for this item. [L]

13. Total load deflection limit, absolute

Introduction

Value ≥ 0 ; 0 means no check for this item. [L]

14. Total camber limit, absolute

Value ≥ 0 ; 0 means no check for this item. [L]

15. Specified camber

Value ≥ 0 . [L]

16. Net area to total area ratio

Value ≥ 0 ; 0 means use program default value.

17. Live load reduction factor

Value ≥ 0 ; 0 means use program determined value.

18. Unbraced length ratio, Major

Value ≥ 0 ; 0 means use program determined value.

19. Unbraced length ratio, Minor

Value ≥ 0 ; 0 means use program determined value.

20. Unbraced length ratio, Lateral Torsional Buckling

Value ≥ 0 ; 0 means use program determined value.

21. Effective length factor, K1 Major

Value ≥ 0 ; 0 means use program determined value.

22. Effective length factor, K1 Minor

Value ≥ 0 ; 0 means use program determined value.

23. Effective length factor, K2 Major

Value ≥ 0 ; 0 means use program determined value.

24. Effective length factor, K2 Minor

Value ≥ 0 ; 0 means use program determined value.

25. Effective length factor, K Lateral Torsional Buckling

Value ≥ 0 ; 0 means use program determined value.

26. Moment coefficient, Cm Major

Value ≥ 0 ; 0 means use program determined value.

27. Moment coefficient, Cm Minor

Value ≥ 0 ; 0 means use program determined value.

28. Bending coefficient, Cb

Value ≥ 0 ; 0 means use program determined value.

29. Nonsway moment factor, B1 Major

Value ≥ 0 ; 0 means use program determined value.

30. Nonsway moment factor, B1 Minor

Introduction

Value ≥ 0 ; 0 means use program determined value.

31. Sway moment factor, B2 Major

Value ≥ 0 ; 0 means use program determined value.

32. Sway moment factor, B2 Minor

Value ≥ 0 ; 0 means use program determined value.

33. Reduce HSS thickness

· 0 = Program Default

· 1 = No

· 2 = Yes

34. HSS welding type

· 0 = Program Default

· 1 = ERW

· 2 = SAW

35. Yield stress, F_y

Value ≥ 0 ; 0 means use program determined value. $[F/L^2]$

36. Expected to specified F_y ratio, R_y

Value ≥ 0 ; 0 means use program determined value.

37. Compressive capacity, P_{nc}

Value ≥ 0 ; 0 means use program determined value. $[F]$

38. Tensile capacity, P_{nt}

Value ≥ 0 ; 0 means use program determined value. $[F]$

39. Major bending capacity, M_{n3}

Value ≥ 0 ; 0 means use program determined value. $[FL]$

40. Minor bending capacity, M_{n2}

Value ≥ 0 ; 0 means use program determined value. $[FL]$

41. Major shear capacity, V_{n2}

Value ≥ 0 ; 0 means use program determined value. $[F]$

42. Minor shear capacity, V_{n3}

Value ≥ 0 ; 0 means use program determined value. $[F]$

43. Demand/capacity ratio limit

Value ≥ 0 ; 0 means use program determined value.

ItemType (Optional)

Type: ETABSv1eItemType

This is one of the following items in the eItemType enumeration:

◇ Object = 0

◇ Group = 1

◇ SelectedObjects = 2

If this item is Objects, the assignment is made to the frame object specified by the Name item.

If this item is Group, the assignment is made to all frame objects in the group specified by the Name item.

If this item is SelectedObjects, the assignment is made to all selected frame objects and the Name item is ignored.

Return Value

Type: Int32

Returns zero if the item is successfully set; otherwise it returns a nonzero value.

▲ Remarks

▲ Examples

VB

Copy

```
Public Sub Example()
    Dim SapModel As cSapModel
    Dim EtabsObject As cOAPI
    Dim ret As Integer = -1
    Dim Value As Double
    Dim ProgDet As Boolean

    'create ETABS object
    Dim myHelper as cHelper = New Helper
    EtabsObject = myHelper.CreateObjectProgID("CSI.ETABS.API.ETABSObject")

    'start ETABS application
    ret = EtabsObject.ApplicationStart()

    'create SapModel object
    SapModel = EtabsObject.SapModel

    'initialize model
    ret = SapModel.InitializeNewModel()

    'create steel deck template model
    ret = SapModel.File.NewSteelDeck(4, 12, 12, 4, 4, 24, 24)

    'set steel design code
    ret = SapModel.DesignSteel.SetCode("AISC360-05/IBC2006")

    'set overwrite item
    ret = SapModel.DesignSteel.AISC360_05_IBC2006.SetOverwrite("8", 1, 7)

    'close ETABS
    EtabsObject.ApplicationExit(False)

    'clean up variables
    SapModel = Nothing
    EtabsObject = Nothing
End Sub
```

CSI API ETABS v1

cDStAISC360_05_IBC2006AddLanguageSpecificTextSet Method

Sets the value of a steel design preference item.

Namespace: ETABSv1

Assembly: ETABSv1 (in ETABSv1.dll) Version: 1.0.0.0 (1.24.0.0)

■ Syntax

C#

VB

C++

F#

Copy

```
int SetPreference(
    int Item,
    double Value
)
```

```
Function SetPreference (
    Item As Integer,
    Value As Double
) As Integer
```

```
Dim instance As cDStAISC360_05_IBC2006
Dim Item As Integer
Dim Value As Double
Dim returnValue As Integer
```

```
returnValue = instance.SetPreference(Item,
    Value)
```

```
int SetPreference(
    int Item,
    double Value
)
```

```
abstract SetPreference :
    Item : int *
    Value : float -> int
```

Parameters

Item

Type: SystemInt32

This is an integer between 1 and 29, inclusive, indicating the preference item considered.

1. Framing type
2. Seismic design category
3. Design provision
4. Analysis method (Obsolete, replaced by 27, 28, and 29)
5. Notional load coefficient

6. Phi bending
7. Phi compression
8. Phi tension yielding
9. Phi tension fracture
10. Phi shear
11. Phi shear sort webbed rolled I
12. Phi torsion
13. Ignore seismic code
14. Ignore special seismic load
15. Doubler plate is plug welded
16. HSS welding type
17. Reduce HSS thickness
18. Consider deflection
19. DL deflection limit, L/Value
20. SDL + LL deflection limit, L/Value
21. LL deflection limit, L/Value
22. Total load deflection limit, L/Value
23. Total camber limit, L/Value
24. Pattern live load factor
25. Demand/capacity ratio limit
26. Multi-response case design
27. Analysis Method
28. Second Order Method
29. Stiffness Reduction Method

Value

Type: SystemDouble

The value of the considered preference item.

1. Framing type
 1. SMF
 2. IMF
 3. OMF
 4. SCBF
 5. OCBF
 6. OCBFI
 7. EBF
2. Seismic design category
 1. A
 2. B
 3. C
 4. D
 5. E
 6. F
3. Design provision
 1. LRFD
 2. ASD
4. Analysis method (Obsolete, replaced by 27, 28, and 29)
 1. Gen 2nd Order Elastic
 2. 2nd Order By Amp 1st Order
 3. Limited 1st Order Elastic
 4. DAM Gen 2nd Order Taub Variable
 5. DAM Gen 2nd Order Taub Fixed

Introduction

- 6. DAM Amp 1st Order Taub Variable
- 7. DAM Amp 1st Order Taub Fixed
- 5. Notional load coefficient

Value > 0

- 6. Phi bending

Value > 0

- 7. Phi compression

Value > 0

- 8. Phi tension yielding

Value > 0

- 9. Phi tension fracture

Value > 0

- 10. Phi shear

Value > 0

- 11. Phi shear sort webbed rolled I

Value > 0

- 12. Phi torsion

Value > 0

- 13. Ignore seismic code

0 = No

Any other value = Yes

- 14. Ignore special seismic load

0 = No

Any other value = Yes

- 15. Doubler plate is plug welded

0 = No

Any other value = Yes

- 16. HSS welding type

1. ERW

2. SAW

- 17. Reduce HSS thickness

0 = No

Any other value = Yes

- 18. Consider deflection

0 = No

Any other value = Yes

19. DL deflection limit, L/Value

Value > 0

20. SDL + LL deflection limit, L/Value

Value > 0

21. LL deflection limit, L/Value

Value > 0

22. Total load deflection limit, L/Value

Value > 0

23. Total camber limit, L/Value

Value > 0

24. Pattern live load factor

Value > 0

25. Demand/capacity ratio limit

Value > 0

26. Multi-response case design

1. Envelopes
2. Step-by-step
3. Last step
4. Envelopes -- All
5. Step-by-step -- All

27. Analysis Method

1. Direct Analysis
2. Effective Length
3. Limited 1st Order

28. Second Order Method

1. General 2nd Order
2. Amplified 1st Order

29. Stiffness Reduction Method

1. Tau-b variable
2. Tau-b Fixed
3. No Modification

Return Value

Type: Int32

Returns zero if the item is successfully set; otherwise it returns a nonzero value.

CSI API ETABS v1

cDStCanadian_S16_09AddLanguageSpecificTextSet("L Method

Retrieves the value of a steel design overwrite item

Namespace: [ETABSv1](#)

Assembly: [ETABSv1](#) (in ETABSv1.dll) Version: 1.0.0.0 (1.24.0.0)

▲ Syntax

[C#](#)

[VB](#)

[C++](#)

[F#](#)

[Copy](#)

```
int GetOverwrite(
    string Name,
    int Item,
    ref double Value,
    ref bool ProgDet
)
```

```
Function GetOverwrite (
    Name As String,
    Item As Integer,
    ByRef Value As Double,
    ByRef ProgDet As Boolean
) As Integer
```

```
Dim instance As cDStCanadian_S16_09
Dim Name As String
Dim Item As Integer
Dim Value As Double
Dim ProgDet As Boolean
Dim returnValue As Integer
```

```
returnValue = instance.GetOverwrite(Name,
    Item, Value, ProgDet)
```

```
int GetOverwrite(
    String^ Name,
    int Item,
    double% Value,
    bool% ProgDet
)
```

```
abstract GetOverwrite :
    Name : string *
    Item : int *
    Value : float byref *
    ProgDet : bool byref -> int
```

Parameters

Name

Type: SystemString

The name of an existing frame object with a steel frame design procedure

Item

Type: SystemInt32

This is an integer between 1 and 39, inclusive, indicating the overwrite item considered

1. Framing type
2. Consider deflection
3. Deflection check type
4. DL deflection limit, L/Value
5. SDL + LL deflection limit, L/Value
6. LL deflection limit, L/Value
7. Total load deflection limit, L/Value
8. Total-camber limit, L/Value
9. DL deflection limit, absolute
10. SDL + LL deflection limit, absolute
11. LL deflection limit, absolute
12. Total load deflection limit, absolute
13. Total-camber limit, absolute
14. Specified camber
15. Net area to total area ratio
16. Live load reduction factor
17. Unbraced length ratio, Major
18. Unbraced length ratio, Minor LTB
19. Unbraced length ratio, Lateral Torsional Buckling
20. Effective length factor, K Major
21. Effective length factor, K Minor
22. Effective length factor, K LTB
23. Moment coefficient, Omega1 Major
24. Moment coefficient, Omega1 Minor
25. Bending coefficient, Omega2
26. Nonsway moment factor, U1 Major
27. Nonsway moment factor, U1 Minor
28. Sway moment factor, U2 Major
29. Sway moment factor, U2 Minor
30. Parameter for compressive resistance, n
31. Yield stress, Fy
32. Expected to specified Fy ratio, Ry
33. Compressive resistance, Cr
34. Tensile resistance, Tr
35. Major bending resistance, Mr3
36. Minor bending resistance, Mr2
37. Major shear resistance, Vr2
38. Minor shear resistance, Vr3
39. Demand/capacity ratio limit

Value

Type: SystemDouble

The value of the considered overwrite item

1. Framing type
 - **0** - As specified in preferences
 - **1** - Type LD MRF
 - **2** - Type MD MRF
 - **3** - Type D MRF
 - **4** - Type LD CBF(V)
 - **5** - Type LD CBF(TC)
 - **6** - Type LD CBF(TO)
 - **7** - Type LD CBF(OT)
 - **8** - Type MD CBF(V)
 - **9** - Type MD CBF(TC)
 - **10** - Type MD CBF(TO)
 - **11** - Type MD CBF(OT)
 - **12** - EBF
 - **13** - Cantilever Column
 - **14** - Conventional MF
 - **15** - Conventional BF

2. Consider deflection?
 - 0 = No
 - Any other value = Yes

3. Deflection check type
 - **0** - Program Determined
 - **1** - Ratio
 - **2** - Absolute
 - **3** - Both

4. DL deflection limit, L/Value

Value ≥ 0 ; 0 means no check for this item

5. SDL + LL deflection limit, L/Value

Value ≥ 0 ; 0 means no check for this item

6. LL deflection limit, L/Value

Value ≥ 0 ; 0 means no check for this item

7. Total load deflection limit, L/Value

Value ≥ 0 ; 0 means no check for this item

8. Total-camber limit, L/Value

Value ≥ 0 ; 0 means no check for this item

9. DL deflection limit, absolute

Value ≥ 0 ; 0 means no check for this item. [L]

10. SDL + LL deflection limit, absolute

Value ≥ 0 ; 0 means no check for this item. [L]

11. LL deflection limit, absolute

Value ≥ 0 ; 0 means no check for this item. [L]

12. Total load deflection limit, absolute

Introduction

Value ≥ 0 ; 0 means no check for this item. [L]

13. Total-camber limit, absolute

Value ≥ 0 ; 0 means no check for this item. [L]

14. Specified camber

Value ≥ 0 . [L]

15. Net area to total area ratio

Value ≥ 0 ; 0 means use program default value

16. Live load reduction factor

Value ≥ 0 ; 0 means use program determined value

17. Unbraced length ratio, Major

Value ≥ 0 ; 0 means use program determined value

18. Unbraced length ratio, Minor

Value ≥ 0 ; 0 means use program determined value

19. Unbraced length ratio, Lateral Torsional Buckling

Value ≥ 0 ; 0 means use program determined value

20. Effective length factor, K Major

Value ≥ 0 ; 0 means use program determined value

21. Effective length factor, K Minor

Value ≥ 0 ; 0 means use program determined value

22. Effective length factor, K LTB

Value ≥ 0 ; 0 means use program determined value

23. Moment coefficient, Omega1 Major

Value ≥ 0 ; 0 means use program determined value

24. Moment coefficient, Omega1 Minor

Value ≥ 0 ; 0 means use program determined value

25. Moment coefficient, Omega2

Value ≥ 0 ; 0 means use program determined value

26. Nonsway moment factor, U1 Major

Value ≥ 0 ; 0 means use program determined value

27. Nonsway moment factor, U1 Minor

Value ≥ 0 ; 0 means use program determined value

28. Sway moment factor, U2 Major

Value ≥ 0 ; 0 means use program determined value

29. Sway moment factor, U2 Minor

Introduction

Value ≥ 0 ; 0 means use program determined value
30. Parameter for compressive resistance, n

Value ≥ 0 ; 0 means use program determined value
31. Yield stress, F_y

Value ≥ 0 ; 0 means use program determined value [F/L2]
32. Expected to specified F_y ratio, R_y

Value ≥ 0 ; 0 means use program determined value [F/L2]=
33. Compressive resistance, C_r

Value ≥ 0 ; 0 means use program determined value [F]
34. Tensile resistance, T_r

Value ≥ 0 ; 0 means use program determined value [F]
35. Major bending resistance, M_{r3}

Value ≥ 0 ; 0 means use program determined value [FL]
36. Minor bending resistance, M_{r2}

Value ≥ 0 ; 0 means use program determined value [FL]
37. Major shear resistance, V_{r2}

Value ≥ 0 ; 0 means use program determined value [F]
38. Minor shear resistance, V_{r3}

Value ≥ 0 ; 0 means use program determined value [F]
39. Demand/capacity ratio limit

Value ≥ 0 ; 0 means use program determined value

ProgDet

Type: System.Boolean

If this item is True, the specified value is program determined

Return Value

Type: Int32

Returns zero if the item is successfully retrieved; otherwise it returns a nonzero value

▲ Remarks

▲ Examples

VB

Copy

```
Public Sub Example()  
    Dim SapModel As cSapModel  
    Dim EtabsObject As cOAPI  
    Dim ret As Integer = -1  
    Dim Value As Double  
    Dim ProgDet As Boolean
```

'create ETABS object

```
    Dim myHelper as cHelper = New Helper  
    EtabsObject = myHelper.CreateObjectProgID("CSI.ETABS.API.ETABSObject")
```

Return Value

```
'start ETABS application
ret = EtabsObject.ApplicationStart()

'create SapModel object
SapModel = EtabsObject.SapModel

'initialize model
ret = SapModel.InitializeNewModel()

'create steel deck template model
ret = SapModel.File.NewSteelDeck(4, 12, 4, 4, 24, 24)

'set steel design code
ret = SapModel.DesignSteel.SetCode("CSA-S16-09")

'get overwrite item
ret = SapModel.DesignSteel.Canadian_S16_09.GetOverwrite("8", 1, Value, ProgDet)

'close ETABS
EtabsObject.ApplicationExit(False)

'clean up variables
SapModel = Nothing
EtabsObject = Nothing

End Sub
```

```
int GetPreference(
    int Item,
    double% Value
)
```

```
abstract GetPreference :
    Item : int *
    Value : float byref -> int
```

Parameters

Item

Type: SystemInt32

This is an integer between 1 and 21, inclusive, indicating the preference item considered

1. Multi-response case design
2. Framing type
3. Spectral Acceleration Ratio, $I_e \cdot F_a \cdot S_a(0.2)$
4. Ductility related modification factor, R_d
5. Overstrength related modification factor, R_o

6. Capacity factor, Phi bending
7. Capacity factor, Phi compression
8. Capacity factor, Phi tension
9. Capacity factor, Phi shear
10. Slender section modification
11. Ignore seismic code
12. Ignore special seismic load
13. Doubler plate is plug welded
14. Consider deflection
15. DL deflection limit, L/Value
16. SDL + LL deflection limit, L/Value
17. LL deflection limit, L/Value
18. Total load deflection limit, L/Value
19. Total camber limit, L/Value
20. Pattern live load factor
21. Demand/capacity ratio limit

Value

Type: SystemDouble

The value of the considered preference item

1. Multi-response case design
 - **1** - Envelopes
 - **2** - Step-by-step
 - **3** - Last step
 - **4** - Envelopes -- All
 - **5** - Step-by-step -- All
2. Framing type
 - **1** - Type LD MRF
 - **2** - Type MD MRF
 - **3** - Type D MRF
 - **4** - Type LD CBF(V)
 - **5** - Type LD CBF(TC)
 - **6** - Type LD CBF(TO)
 - **7** - Type LD CBF(OT)
 - **8** - Type MD CBF(V)
 - **9** - Type MD CBF(TC)
 - **10** - Type MD CBF(TO)
 - **11** - Type MD CBF(OT)
 - **12** - EBF
 - **13** - Cantilever Column
 - **14** - Conventional MF
 - **15** - Conventional BF
3. Spectral Acceleration Ratio, $I_e \cdot F_a \cdot S_a(0.2)$

Value > 0

4. Ductility related modification factor, R_d

Value > 0

5. Overstrength related modification factor, R_o

Value > 0

6. Capacity factor, Phi bending

Value > 0

7. Capacity factor, Phi compression

Value > 0

8. Capacity factor, Phi tension

Value > 0

9. Capacity factor, Phi shear

Value > 0

10. Slender section modification

· **1** - modified geometry

· **2** - modified Fy

11. Ignore seismic code

· 0 = No

· Any other value = Yes

12. Ignore special seismic load

· 0 = No

· Any other value = Yes

13. Doubler plate is plug welded

· 0 = No

· Any other value = Yes

14. Consider deflection

· 0 = No

· Any other value = Yes

15. DL deflection limit, L/Value

Value > 0

19. Total camber limit, L/Value

Value > 0

20. Pattern live load factor

Value >= 0

21. Demand/capacity ratio limit

Value > 0

Return Value

Type: Int32

Returns zero if the item is successfully retrieved; otherwise, it returns a nonzero value

Remarks

Examples

VB

Copy

```
Public Sub Example()
    Dim SapModel As cSapModel
    Dim EtabsObject As cOAPI
    Dim ret As Integer = -1
    Dim Value As Double

    'create ETABS object
    Dim myHelper as cHelper = New Helper
    EtabsObject = myHelper.CreateObjectProgID("CSI.ETABS.API.ETABSObject")

    'start ETABS application
    ret = EtabsObject.ApplicationStart()

    'create SapModel object
    SapModel = EtabsObject.SapModel

    'initialize model
    ret = SapModel.InitializeNewModel()

    'create steel deck template model
    ret = SapModel.File.NewSteelDeck(4, 12, 12, 4, 4, 24, 24)

    'set steel design code
    ret = SapModel.DesignSteel.SetCode("CSA-S16-09")

    'get preference item
    ret = SapModel.DesignSteel.Canadian_S16_09.GetPreference(4, Value)

    'close ETABS
    EtabsObject.ApplicationExit(False)

    'clean up variables
    SapModel = Nothing
    EtabsObject = Nothing

End Sub
```

CSI API ETABS v1

cDStCanadian_S16_09AddLanguageSpecificTextSet("L Method

Sets the value of a steel design overwrite item

Namespace: ETABSV1

Assembly: ETABSV1 (in ETABSV1.dll) Version: 1.0.0.0 (1.24.0.0)

■ Syntax

C#

VB

C++

F#

Copy

```
int SetOverwrite(
    string Name,
    int Item,
    double Value,
    eItemType ItemType = eItemType.Objects
)
```

```
Function SetOverwrite (
    Name As String,
    Item As Integer,
    Value As Double,
    ?ItemType As eItemType = eItemType.Objects
) As Integer
```

```
Dim instance As cDStCanadian_S16_09
Dim Name As String
Dim Item As Integer
Dim Value As Double
Dim ItemType As eItemType
Dim returnValue As Integer
```

```
returnValue = instance.SetOverwrite(Name,
    Item, Value, ItemType)
```

```
int SetOverwrite(
    String^ Name,
    int Item,
    double Value,
    eItemType ItemType = eItemType::Objects
)
```

```
abstract SetOverwrite :
    Name : string *
    Item : int *
    Value : float *
    ?ItemType : eItemType
(* Defaults:
    let _ItemType = defaultArg ItemType eItemType.Objects
*)
-> int
```

Parameters

Name

Type: SystemString

The name of an existing frame object with a steel frame design procedure

Item

Type: SystemInt32

This is an integer between 1 and 39, inclusive, indicating the overwrite item considered

1. Framing type
2. Consider deflection
3. Deflection check type
4. DL deflection limit, L/Value
5. SDL + LL deflection limit, L/Value
6. LL deflection limit, L/Value
7. Total load deflection limit, L/Value
8. Total-camber limit, L/Value
9. DL deflection limit, absolute
10. SDL + LL deflection limit, absolute
11. LL deflection limit, absolute
12. Total load deflection limit, absolute
13. Total-camber limit, absolute
14. Specified camber
15. Net area to total area ratio
16. Live load reduction factor
17. Unbraced length ratio, Major
18. Unbraced length ratio, Minor LTB
19. Unbraced length ratio, Lateral Torsional Buckling
20. Effective length factor, K Major
21. Effective length factor, K Minor
22. Effective length factor, K LTB
23. Moment coefficient, Omega1 Major
24. Moment coefficient, Omega1 Minor
25. Bending coefficient, Omega2
26. Nonsway moment factor, U1 Major
27. Nonsway moment factor, U1 Minor
28. Sway moment factor, U2 Major
29. Sway moment factor, U2 Minor
30. Parameter for compressive resistance, n
31. Yield stress, Fy
32. Expected to specified Fy ratio, Ry
33. Compressive resistance, Cr
34. Tensile resistance, Tr
35. Major bending resistance, Mr3
36. Minor bending resistance, Mr2
37. Major shear resistance, Vr2
38. Minor shear resistance, Vr3
39. Demand/capacity ratio limit

Value

Type: SystemDouble

The value of the considered overwrite item

1. Framing type
 - **0** - As specified in preferences
 - **1** - Type LD MRF
 - **2** - Type MD MRF
 - **3** - Type D MRF
 - **4** - Type LD CBF(V)
 - **5** - Type LD CBF(TC)
 - **6** - Type LD CBF(TO)
 - **7** - Type LD CBF(OT)
 - **8** - Type MD CBF(V)
 - **9** - Type MD CBF(TC)
 - **10** - Type MD CBF(TO)
 - **11** - Type MD CBF(OT)
 - **12** - EBF
 - **13** - Cantilever Column
 - **14** - Conventional MF
 - **15** - Conventional BF

2. Consider deflection?
 - 0 = No
 - Any other value = Yes

3. Deflection check type
 - **0** - Program Determined
 - **1** - Ratio
 - **2** - Absolute
 - **3** - Both

4. DL deflection limit, L/Value

Value ≥ 0 ; 0 means no check for this item

5. SDL + LL deflection limit, L/Value

Value ≥ 0 ; 0 means no check for this item

6. LL deflection limit, L/Value

Value ≥ 0 ; 0 means no check for this item

7. Total load deflection limit, L/Value

Value ≥ 0 ; 0 means no check for this item

8. Total-camber limit, L/Value

Value ≥ 0 ; 0 means no check for this item

9. DL deflection limit, absolute

Value ≥ 0 ; 0 means no check for this item. [L]

10. SDL + LL deflection limit, absolute

Value ≥ 0 ; 0 means no check for this item. [L]

11. LL deflection limit, absolute

Value ≥ 0 ; 0 means no check for this item. [L]

12. Total load deflection limit, absolute

Introduction

Value ≥ 0 ; 0 means no check for this item. [L]

13. Total-camber limit, absolute

Value ≥ 0 ; 0 means no check for this item. [L]

14. Specified camber

Value ≥ 0 . [L]

15. Net area to total area ratio

Value ≥ 0 ; 0 means use program default value

16. Live load reduction factor

Value ≥ 0 ; 0 means use program determined value

17. Unbraced length ratio, Major

Value ≥ 0 ; 0 means use program determined value

18. Unbraced length ratio, Minor

Value ≥ 0 ; 0 means use program determined value

19. Unbraced length ratio, Lateral Torsional Buckling

Value ≥ 0 ; 0 means use program determined value

20. Effective length factor, K Major

Value ≥ 0 ; 0 means use program determined value

21. Effective length factor, K Minor

Value ≥ 0 ; 0 means use program determined value

22. Effective length factor, K LTB

Value ≥ 0 ; 0 means use program determined value

23. Moment coefficient, Omega1 Major

Value ≥ 0 ; 0 means use program determined value

24. Moment coefficient, Omega1 Minor

Value ≥ 0 ; 0 means use program determined value

25. Moment coefficient, Omega2

Value ≥ 0 ; 0 means use program determined value

26. Nonsway moment factor, U1 Major

Value ≥ 0 ; 0 means use program determined value

27. Nonsway moment factor, U1 Minor

Value ≥ 0 ; 0 means use program determined value

28. Sway moment factor, U2 Major

Value ≥ 0 ; 0 means use program determined value

29. Sway moment factor, U2 Minor

Introduction

Value ≥ 0 ; 0 means use program determined value

30. Parameter for compressive resistance, n

Value ≥ 0 ; 0 means use program determined value

31. Yield stress, F_y

Value ≥ 0 ; 0 means use program determined value [F/L2]

32. Expected to specified F_y ratio, R_y

Value ≥ 0 ; 0 means use program determined value [F/L2]=

33. Compressive resistance, C_r

Value ≥ 0 ; 0 means use program determined value [F]

34. Tensile resistance, T_r

Value ≥ 0 ; 0 means use program determined value [F]

35. Major bending resistance, M_{r3}

Value ≥ 0 ; 0 means use program determined value [FL]

36. Minor bending resistance, M_{r2}

Value ≥ 0 ; 0 means use program determined value [FL]

37. Major shear resistance, V_{r2}

Value ≥ 0 ; 0 means use program determined value [F]

38. Minor shear resistance, V_{r3}

Value ≥ 0 ; 0 means use program determined value [F]

39. Demand/capacity ratio limit

Value ≥ 0 ; 0 means use program determined value

ItemType (Optional)

Type: $\hat{A}$ ETABSv1eItemType

This is one of the following items in the eItemType enumeration:

◇ Object = 0

◇ Group = 1

◇ SelectedObjects = 2

If this item is Objects, the assignment is made to the frame object specified by the Name item.

If this item is Group, the assignment is made to all frame objects in the group specified by the Name item.

If this item is SelectedObjects, the assignment is made to all selected frame objects and the Name item is ignored.

Return Value

Type: $\hat{A}$ Int32

Returns zero if the item is successfully retrieved; otherwise it returns a nonzero value

▲ Remarks

Examples

VB

Copy

```
Public Sub Example()
    Dim SapModel As cSapModel
    Dim EtabsObject As cOAPI
    Dim ret As Integer = -1

    'create ETABS object
    Dim myHelper as cHelper = New Helper
    EtabsObject = myHelper.CreateObjectProgID("CSI.ETABS.API.ETABSObject")

    'start ETABS application
    ret = EtabsObject.ApplicationStart()

    'create SapModel object
    SapModel = EtabsObject.SapModel

    'initialize model
    ret = SapModel.InitializeNewModel()

    'create steel deck template model
    ret = SapModel.File.NewSteelDeck(4, 12, 12, 4, 4, 24, 24)

    'set steel design code
    ret = SapModel.DesignSteel.SetCode("CSA-S16-09")

    'set overwrite item
    ret = SapModel.DesignSteel.Canadian_S16_09.SetOverwrite("8", 1, 7)

    'close ETABS
    EtabsObject.ApplicationExit(False)

    'clean up variables
    SapModel = Nothing
    EtabsObject = Nothing
End Sub
```

CSI API ETABS v1

cDStCanadian_S16_09AddLanguageSpecificTextSet("L Method

Sets the value of a steel design preference item

Namespace: ETABSv1

Assembly: ETABSv1 (in ETABSv1.dll) Version: 1.0.0.0 (1.24.0.0)

▲ Syntax

C#

VB

C++

F#

Copy

```
int SetPreference(
    int Item,
    double Value
)
```

```
Function SetPreference (
    Item As Integer,
    Value As Double
) As Integer
```

```
Dim instance As cDStCanadian_S16_09
Dim Item As Integer
Dim Value As Double
Dim returnValue As Integer
```

```
returnValue = instance.SetPreference(Item,
    Value)
```

```
int SetPreference(
    int Item,
    double Value
)
```

```
abstract SetPreference :
    Item : int *
    Value : float -> int
```

Parameters

Item

Type: SystemInt32

This is an integer between 1 and 21, inclusive, indicating the preference item considered

1. Multi-response case design
2. Framing type
3. Spectral Acceleration Ratio, $I_e \cdot F_a \cdot S_a(0.2)$
4. Ductility related modification factor, R_d
5. Overstrength related modification factor, R_o

6. Capacity factor, Phi bending
7. Capacity factor, Phi compression
8. Capacity factor, Phi tension
9. Capacity factor, Phi shear
10. Slender section modification
11. Ignore seismic code
12. Ignore special seismic load
13. Doubler plate is plug welded
14. Consider deflection
15. DL deflection limit, L/Value
16. SDL + LL deflection limit, L/Value
17. LL deflection limit, L/Value
18. Total load deflection limit, L/Value
19. Total camber limit, L/Value
20. Pattern live load factor
21. Demand/capacity ratio limit

Value

Type: SystemDouble

The value of the considered preference item

1. Multi-response case design
 - **1** - Envelopes
 - **2** - Step-by-step
 - **3** - Last step
 - **4** - Envelopes -- All
 - **5** - Step-by-step -- All
2. Framing type
 - **1** - Type LD MRF
 - **2** - Type MD MRF
 - **3** - Type D MRF
 - **4** - Type LD CBF(V)
 - **5** - Type LD CBF(TC)
 - **6** - Type LD CBF(TO)
 - **7** - Type LD CBF(OT)
 - **8** - Type MD CBF(V)
 - **9** - Type MD CBF(TC)
 - **10** - Type MD CBF(TO)
 - **11** - Type MD CBF(OT)
 - **12** - EBF
 - **13** - Cantilever Column
 - **14** - Conventional MF
 - **15** - Conventional BF
3. Spectral Acceleration Ratio, $I_e \cdot F_a \cdot S_a(0.2)$

Value > 0

4. Ductility related modification factor, R_d

Value > 0

5. Overstrength related modification factor, R_o

Value > 0

6. Capacity factor, Phi bending

Value > 0

7. Capacity factor, Phi compression

Value > 0

8. Capacity factor, Phi tension

Value > 0

9. Capacity factor, Phi shear

Value > 0

10. Slender section modification

· **1** - modified geometry

· **2** - modified Fy

11. Ignore seismic code

· 0 = No

· Any other value = Yes

12. Ignore special seismic load

· 0 = No

· Any other value = Yes

13. Doubler plate is plug welded

· 0 = No

· Any other value = Yes

14. Consider deflection

· 0 = No

· Any other value = Yes

15. DL deflection limit, L/Value

Value > 0

16. SDL + LL deflection limit, L/Value

Value > 0

17. LL deflection limit, L/Value

Value > 0

18. Total deflection limit, L/Value

Value > 0

19. Total camber limit, L/Value

Value > 0

20. Pattern live load factor

Value >= 0

21. Demand/capacity ratio limit

Value > 0

Return Value

Type: Int32

Returns zero if the item is successfully retrieved; otherwise, it returns a nonzero value

Remarks

Examples

VB

Copy

```
Public Sub Example()
    Dim SapModel As cSapModel
    Dim EtabsObject As cOAPI
    Dim ret As Integer = -1
    Dim Value As Double

    'create ETABS object
    Dim myHelper as cHelper = New Helper
    EtabsObject = myHelper.CreateObjectProgID("CSI.ETABS.API.ETABSObject")

    'start ETABS application
    ret = EtabsObject.ApplicationStart()

    'create SapModel object
    SapModel = EtabsObject.SapModel

    'initialize model
    ret = SapModel.InitializeNewModel()

    'create steel deck template model
    ret = SapModel.File.NewSteelDeck(4, 12, 12, 4, 4, 24, 24)

    'set steel design code
    ret = SapModel.DesignSteel.SetCode("CSA-S16-09")

    'set preference item
    ret = SapModel.DesignSteel.Canadian_S16_09.SetPreference(2, 6)

    'close ETABS
    EtabsObject.ApplicationExit(False)

    'clean up variables
    SapModel = Nothing
    EtabsObject = Nothing

End Sub

```

Parameters

Name

Type: SystemString

The name of an existing frame object with a steel frame design procedure

Item

Type: SystemInt32

This is an integer between 1 and 39, inclusive, indicating the overwrite item considered

1. Framing type
2. Consider deflection
3. Deflection check type
4. DL deflection limit, L/Value
5. SDL + LL deflection limit, L/Value
6. LL deflection limit, L/Value
7. Total load deflection limit, L/Value
8. Total-camber limit, L/Value
9. DL deflection limit, absolute
10. SDL + LL deflection limit, absolute
11. LL deflection limit, absolute
12. Total load deflection limit, absolute
13. Total-camber limit, absolute
14. Specified camber
15. Net area to total area ratio
16. Live load reduction factor
17. Unbraced length ratio, Major
18. Unbraced length ratio, Minor LTB
19. Unbraced length ratio, Lateral Torsional Buckling
20. Effective length factor, K Major
21. Effective length factor, K Minor
22. Effective length factor, K LTB
23. Moment coefficient, Omega1 Major
24. Moment coefficient, Omega1 Minor
25. Bending coefficient, Omega2
26. Nonsway moment factor, U1 Major
27. Nonsway moment factor, U1 Minor
28. Sway moment factor, U2 Major
29. Sway moment factor, U2 Minor
30. Parameter for compressive resistance, n
31. Yield stress, Fy
32. Expected to specified Fy ratio, Ry
33. Compressive resistance, Cr
34. Tensile resistance, Tr
35. Major bending resistance, Mr3
36. Minor bending resistance, Mr2
37. Major shear resistance, Vr2
38. Minor shear resistance, Vr3
39. Demand/capacity ratio limit

Value

Type: SystemDouble

The value of the considered overwrite item

1. Framing type
 - **0** - As specified in preferences
 - **1** - Type LD MRF
 - **2** - Type MD MRF
 - **3** - Type D MRF
 - **4** - Type LD CBF(V)
 - **5** - Type LD CBF(TC)
 - **6** - Type LD CBF(TO)
 - **7** - Type LD CBF(OT)
 - **8** - Type MD CBF(V)
 - **9** - Type MD CBF(TC)
 - **10** - Type MD CBF(TO)
 - **11** - Type MD CBF(OT)
 - **12** - EBF
 - **13** - Cantilever Column
 - **14** - Conventional MF
 - **15** - Conventional BF

2. Consider deflection?
 - 0 = No
 - Any other value = Yes

3. Deflection check type
 - **0** - Program Determined
 - **1** - Ratio
 - **2** - Absolute
 - **3** - Both

4. DL deflection limit, L/Value

Value ≥ 0 ; 0 means no check for this item

5. SDL + LL deflection limit, L/Value

Value ≥ 0 ; 0 means no check for this item

6. LL deflection limit, L/Value

Value ≥ 0 ; 0 means no check for this item

7. Total load deflection limit, L/Value

Value ≥ 0 ; 0 means no check for this item

8. Total-camber limit, L/Value

Value ≥ 0 ; 0 means no check for this item

9. DL deflection limit, absolute

Value ≥ 0 ; 0 means no check for this item. [L]

10. SDL + LL deflection limit, absolute

Value ≥ 0 ; 0 means no check for this item. [L]

11. LL deflection limit, absolute

Value ≥ 0 ; 0 means no check for this item. [L]

12. Total load deflection limit, absolute

Introduction

Value ≥ 0 ; 0 means no check for this item. [L]

13. Total-camber limit, absolute

Value ≥ 0 ; 0 means no check for this item. [L]

14. Specified camber

Value ≥ 0 . [L]

15. Net area to total area ratio

Value ≥ 0 ; 0 means use program default value

16. Live load reduction factor

Value ≥ 0 ; 0 means use program determined value

17. Unbraced length ratio, Major

Value ≥ 0 ; 0 means use program determined value

18. Unbraced length ratio, Minor

Value ≥ 0 ; 0 means use program determined value

19. Unbraced length ratio, Lateral Torsional Buckling

Value ≥ 0 ; 0 means use program determined value

20. Effective length factor, K Major

Value ≥ 0 ; 0 means use program determined value

21. Effective length factor, K Minor

Value ≥ 0 ; 0 means use program determined value

22. Effective length factor, K LTB

Value ≥ 0 ; 0 means use program determined value

23. Moment coefficient, Omega1 Major

Value ≥ 0 ; 0 means use program determined value

24. Moment coefficient, Omega1 Minor

Value ≥ 0 ; 0 means use program determined value

25. Moment coefficient, Omega2

Value ≥ 0 ; 0 means use program determined value

26. Nonsway moment factor, U1 Major

Value ≥ 0 ; 0 means use program determined value

27. Nonsway moment factor, U1 Minor

Value ≥ 0 ; 0 means use program determined value

28. Sway moment factor, U2 Major

Value ≥ 0 ; 0 means use program determined value

29. Sway moment factor, U2 Minor

Introduction

- Value ≥ 0 ; 0 means use program determined value
30. Parameter for compressive resistance, n
- Value ≥ 0 ; 0 means use program determined value
31. Yield stress, F_y
- Value ≥ 0 ; 0 means use program determined value [F/L2]
32. Expected to specified F_y ratio, R_y
- Value ≥ 0 ; 0 means use program determined value [F/L2]=
33. Compressive resistance, C_r
- Value ≥ 0 ; 0 means use program determined value [F]
34. Tensile resistance, T_r
- Value ≥ 0 ; 0 means use program determined value [F]
35. Major bending resistance, M_{r3}
- Value ≥ 0 ; 0 means use program determined value [FL]
36. Minor bending resistance, M_{r2}
- Value ≥ 0 ; 0 means use program determined value [FL]
37. Major shear resistance, V_{r2}
- Value ≥ 0 ; 0 means use program determined value [F]
38. Minor shear resistance, V_{r3}
- Value ≥ 0 ; 0 means use program determined value [F]
39. Demand/capacity ratio limit
- Value ≥ 0 ; 0 means use program determined value

ProgDet

Type: System.Boolean

If this item is True, the specified value is program determined

Return Value

Type: Int32

Returns zero if the item is successfully retrieved; otherwise it returns a nonzero value

CSI API ETABS v1

cDStCanadian_S16_14AddLanguageSpecificTextSet("L Method

Retrieves the value of a steel design preference item

Namespace: ETABSv1

Assembly: ETABSv1 (in ETABSv1.dll) Version: 1.0.0.0 (1.24.0.0)

▲ Syntax

C#

VB

C++

F#

Copy

```
int GetPreference(
    int Item,
    ref double Value
)
```

```
Function GetPreference (
    Item As Integer,
    ByRef Value As Double
) As Integer
```

```
Dim instance As cDStCanadian_S16_14
Dim Item As Integer
Dim Value As Double
Dim returnValue As Integer
```

```
returnValue = instance.GetPreference(Item,
    Value)
```

```
int GetPreference(
    int Item,
    double% Value
)
```

```
abstract GetPreference :
    Item : int *
    Value : float byref -> int
```

Parameters

Item

Type: SystemInt32

This is an integer between 1 and 21, inclusive, indicating the preference item considered

1. Multi-response case design
2. Framing type
3. Spectral Acceleration Ratio, $I_e \cdot F_a \cdot S_a(0.2)$
4. Ductility related modification factor, R_d
5. Overstrength related modification factor, R_o

6. Capacity factor, Phi bending
7. Capacity factor, Phi compression
8. Capacity factor, Phi tension
9. Capacity factor, Phi shear
10. Slender section modification
11. Ignore seismic code
12. Ignore special seismic load
13. Doubler plate is plug welded
14. Consider deflection
15. DL deflection limit, L/Value
16. SDL + LL deflection limit, L/Value
17. LL deflection limit, L/Value
18. Total load deflection limit, L/Value
19. Total camber limit, L/Value
20. Pattern live load factor
21. Demand/capacity ratio limit

Value

Type: SystemDouble

The value of the considered preference item

1. Multi-response case design
 - **1** - Envelopes
 - **2** - Step-by-step
 - **3** - Last step
 - **4** - Envelopes -- All
 - **5** - Step-by-step -- All
2. Framing type
 - **1** - Type LD MRF
 - **2** - Type MD MRF
 - **3** - Type D MRF
 - **4** - Type LD CBF(V)
 - **5** - Type LD CBF(TC)
 - **6** - Type LD CBF(TO)
 - **7** - Type LD CBF(OT)
 - **8** - Type MD CBF(V)
 - **9** - Type MD CBF(TC)
 - **10** - Type MD CBF(TO)
 - **11** - Type MD CBF(OT)
 - **12** - EBF
 - **13** - Cantilever Column
 - **14** - Conventional MF
 - **15** - Conventional BF
3. Spectral Acceleration Ratio, $I_e \cdot F_a \cdot S_a(0.2)$

Value > 0

4. Ductility related modification factor, R_d

Value > 0

5. Overstrength related modification factor, R_o

Value > 0

6. Capacity factor, Phi bending

Value > 0

7. Capacity factor, Phi compression

Value > 0

8. Capacity factor, Phi tension

Value > 0

9. Capacity factor, Phi shear

Value > 0

10. Slender section modification

· **1** - modified geometry

· **2** - modified Fy

11. Ignore seismic code

· 0 = No

· Any other value = Yes

12. Ignore special seismic load

· 0 = No

· Any other value = Yes

13. Doubler plate is plug welded

· 0 = No

· Any other value = Yes

14. Consider deflection

· 0 = No

· Any other value = Yes

15. DL deflection limit, L/Value

Value > 0

16. SDL + LL deflection limit, L/Value

Value > 0

17. LL deflection limit, L/Value

Value > 0

18. Total deflection limit, L/Value

Value > 0

19. Total camber limit, L/Value

Value > 0

20. Pattern live load factor

Value >= 0

21. Demand/capacity ratio limit

Value > 0

Return Value

Type: Int32

Returns zero if the item is successfully retrieved; otherwise, it returns a nonzero value

Remarks

Examples

VB

Copy

```
Public Sub Example()
    Dim SapModel As cSapModel
    Dim EtabsObject As cOAPI
    Dim ret As Integer = -1
    Dim Value As Double

    'create ETABS object
    Dim myHelper as cHelper = New Helper
    EtabsObject = myHelper.CreateObjectProgID("CSI.ETABS.API.ETABSObject")

    'start ETABS application
    ret = EtabsObject.ApplicationStart()

    'create SapModel object
    SapModel = EtabsObject.SapModel

    'initialize model
    ret = SapModel.InitializeNewModel()

    'create steel deck template model
    ret = SapModel.File.NewSteelDeck(4, 12, 12, 4, 4, 24, 24)

    'set steel design code
    ret = SapModel.DesignSteel.SetCode("CSA S16-14")

    'get preference item
    ret = SapModel.DesignSteel.Canadian_S16_14.GetPreference(4, Value)

    'close ETABS
    EtabsObject.ApplicationExit(False)

    'clean up variables
    SapModel = Nothing
    EtabsObject = Nothing

End Sub
```

Dim returnValue As Integer
```

```
returnValue = instance.SetOverwrite(Name,
    Item, Value, ItemType)
```

```
int SetOverwrite(
    String^ Name,
    int Item,
    double Value,
    eItemType ItemType = eItemType::Objects
)
```

```
abstract SetOverwrite :
    Name : string *
    Item : int *
    Value : float *
    ?ItemType : eItemType
(* Defaults:
    let _ItemType = defaultArg ItemType eItemType.Objects
*)
-> int
```

Parameters

Name

Type: SystemString

The name of an existing frame object with a steel frame design procedure

Item

Type: SystemInt32

This is an integer between 1 and 39, inclusive, indicating the overwrite item considered

1. Framing type
2. Consider deflection
3. Deflection check type
4. DL deflection limit, L/Value
5. SDL + LL deflection limit, L/Value
6. LL deflection limit, L/Value
7. Total load deflection limit, L/Value
8. Total-camber limit, L/Value
9. DL deflection limit, absolute
10. SDL + LL deflection limit, absolute
11. LL deflection limit, absolute
12. Total load deflection limit, absolute
13. Total-camber limit, absolute
14. Specified camber
15. Net area to total area ratio
16. Live load reduction factor
17. Unbraced length ratio, Major
18. Unbraced length ratio, Minor LTB
19. Unbraced length ratio, Lateral Torsional Buckling
20. Effective length factor, K Major
21. Effective length factor, K Minor
22. Effective length factor, K LTB
23. Moment coefficient, Omega1 Major
24. Moment coefficient, Omega1 Minor
25. Bending coefficient, Omega2
26. Nonsway moment factor, U1 Major
27. Nonsway moment factor, U1 Minor
28. Sway moment factor, U2 Major
29. Sway moment factor, U2 Minor
30. Parameter for compressive resistance, n
31. Yield stress, Fy
32. Expected to specified Fy ratio, Ry
33. Compressive resistance, Cr
34. Tensile resistance, Tr
35. Major bending resistance, Mr3
36. Minor bending resistance, Mr2
37. Major shear resistance, Vr2
38. Minor shear resistance, Vr3
39. Demand/capacity ratio limit

Value

Type: SystemDouble

The value of the considered overwrite item

1. Framing type
 - **0** - As specified in preferences
 - **1** - Type LD MRF
 - **2** - Type MD MRF
 - **3** - Type D MRF
 - **4** - Type LD CBF(V)
 - **5** - Type LD CBF(TC)
 - **6** - Type LD CBF(TO)
 - **7** - Type LD CBF(OT)
 - **8** - Type MD CBF(V)
 - **9** - Type MD CBF(TC)
 - **10** - Type MD CBF(TO)
 - **11** - Type MD CBF(OT)
 - **12** - EBF
 - **13** - Cantilever Column
 - **14** - Conventional MF
 - **15** - Conventional BF

2. Consider deflection?
 - 0 = No
 - Any other value = Yes

3. Deflection check type
 - **0** - Program Determined
 - **1** - Ratio
 - **2** - Absolute
 - **3** - Both

4. DL deflection limit, L/Value

Value ≥ 0 ; 0 means no check for this item

5. SDL + LL deflection limit, L/Value

Value ≥ 0 ; 0 means no check for this item

6. LL deflection limit, L/Value

Value ≥ 0 ; 0 means no check for this item

7. Total load deflection limit, L/Value

Value ≥ 0 ; 0 means no check for this item

8. Total-camber limit, L/Value

Value ≥ 0 ; 0 means no check for this item

9. DL deflection limit, absolute

Value ≥ 0 ; 0 means no check for this item. [L]

10. SDL + LL deflection limit, absolute

Value ≥ 0 ; 0 means no check for this item. [L]

11. LL deflection limit, absolute

Value ≥ 0 ; 0 means no check for this item. [L]

12. Total load deflection limit, absolute

Introduction

Value ≥ 0 ; 0 means no check for this item. [L]

13. Total-camber limit, absolute

Value ≥ 0 ; 0 means no check for this item. [L]

14. Specified camber

Value ≥ 0 . [L]

15. Net area to total area ratio

Value ≥ 0 ; 0 means use program default value

16. Live load reduction factor

Value ≥ 0 ; 0 means use program determined value

17. Unbraced length ratio, Major

Value ≥ 0 ; 0 means use program determined value

18. Unbraced length ratio, Minor

Value ≥ 0 ; 0 means use program determined value

19. Unbraced length ratio, Lateral Torsional Buckling

Value ≥ 0 ; 0 means use program determined value

20. Effective length factor, K Major

Value ≥ 0 ; 0 means use program determined value

21. Effective length factor, K Minor

Value ≥ 0 ; 0 means use program determined value

22. Effective length factor, K LTB

Value ≥ 0 ; 0 means use program determined value

23. Moment coefficient, Omega1 Major

Value ≥ 0 ; 0 means use program determined value

24. Moment coefficient, Omega1 Minor

Value ≥ 0 ; 0 means use program determined value

25. Moment coefficient, Omega2

Value ≥ 0 ; 0 means use program determined value

26. Nonsway moment factor, U1 Major

Value ≥ 0 ; 0 means use program determined value

27. Nonsway moment factor, U1 Minor

Value ≥ 0 ; 0 means use program determined value

28. Sway moment factor, U2 Major

Value ≥ 0 ; 0 means use program determined value

29. Sway moment factor, U2 Minor

Introduction

Value ≥ 0 ; 0 means use program determined value

30. Parameter for compressive resistance, n

Value ≥ 0 ; 0 means use program determined value

31. Yield stress, F_y

Value ≥ 0 ; 0 means use program determined value [F/L2]

32. Expected to specified F_y ratio, R_y

Value ≥ 0 ; 0 means use program determined value [F/L2]=

33. Compressive resistance, C_r

Value ≥ 0 ; 0 means use program determined value [F]

34. Tensile resistance, T_r

Value ≥ 0 ; 0 means use program determined value [F]

35. Major bending resistance, M_{r3}

Value ≥ 0 ; 0 means use program determined value [FL]

36. Minor bending resistance, M_{r2}

Value ≥ 0 ; 0 means use program determined value [FL]

37. Major shear resistance, V_{r2}

Value ≥ 0 ; 0 means use program determined value [F]

38. Minor shear resistance, V_{r3}

Value ≥ 0 ; 0 means use program determined value [F]

39. Demand/capacity ratio limit

Value ≥ 0 ; 0 means use program determined value

ItemType (Optional)

Type: $\hat{A}$ ETABSv1eItemType

This is one of the following items in the eItemType enumeration:

◇ Object = 0

◇ Group = 1

◇ SelectedObjects = 2

If this item is Objects, the assignment is made to the frame object specified by the Name item.

If this item is Group, the assignment is made to all frame objects in the group specified by the Name item.

If this item is SelectedObjects, the assignment is made to all selected frame objects and the Name item is ignored.

Return Value

Type: $\hat{A}$ Int32

Returns zero if the item is successfully retrieved; otherwise it returns a nonzero value

▲ Remarks

Examples

VB

Copy

```
Public Sub Example()
    Dim SapModel As cSapModel
    Dim EtabsObject As cOAPI
    Dim ret As Integer = -1

    'create ETABS object
    Dim myHelper as cHelper = New Helper
    EtabsObject = myHelper.CreateObjectProgID("CSI.ETABS.API.ETABSObject")

    'start ETABS application
    ret = EtabsObject.ApplicationStart()

    'create SapModel object
    SapModel = EtabsObject.SapModel

    'initialize model
    ret = SapModel.InitializeNewModel()

    'create steel deck template model
    ret = SapModel.File.NewSteelDeck(4, 12, 12, 4, 4, 24, 24)

    'set steel design code
    ret = SapModel.DesignSteel.SetCode("CSA S16-14")

    'set overwrite item
    ret = SapModel.DesignSteel.Canadian_S16_14.SetOverwrite("8", 1, 7)

    'close ETABS
    EtabsObject.ApplicationExit(False)

    'clean up variables
    SapModel = Nothing
    EtabsObject = Nothing
End Sub
```

    int Item,
    double Value
)
```

```
abstract SetPreference :
    Item : int *
    Value : float -> int
```

Parameters

Item

Type: SystemInt32

This is an integer between 1 and 21, inclusive, indicating the preference item considered

1. Multi-response case design
2. Framing type
3. Spectral Acceleration Ratio, $I_e \cdot F_a \cdot S_a(0.2)$
4. Ductility related modification factor, R_d
5. Overstrength related modification factor, R_o

6. Capacity factor, Phi bending
7. Capacity factor, Phi compression
8. Capacity factor, Phi tension
9. Capacity factor, Phi shear
10. Slender section modification
11. Ignore seismic code
12. Ignore special seismic load
13. Doubler plate is plug welded
14. Consider deflection
15. DL deflection limit, L/Value
16. SDL + LL deflection limit, L/Value
17. LL deflection limit, L/Value
18. Total load deflection limit, L/Value
19. Total camber limit, L/Value
20. Pattern live load factor
21. Demand/capacity ratio limit

Value

Type: SystemDouble

The value of the considered preference item

1. Multi-response case design
 - **1** - Envelopes
 - **2** - Step-by-step
 - **3** - Last step
 - **4** - Envelopes -- All
 - **5** - Step-by-step -- All
2. Framing type
 - **1** - Type LD MRF
 - **2** - Type MD MRF
 - **3** - Type D MRF
 - **4** - Type LD CBF(V)
 - **5** - Type LD CBF(TC)
 - **6** - Type LD CBF(TO)
 - **7** - Type LD CBF(OT)
 - **8** - Type MD CBF(V)
 - **9** - Type MD CBF(TC)
 - **10** - Type MD CBF(TO)
 - **11** - Type MD CBF(OT)
 - **12** - EBF
 - **13** - Cantilever Column
 - **14** - Conventional MF
 - **15** - Conventional BF
3. Spectral Acceleration Ratio, $I_e \cdot F_a \cdot S_a(0.2)$

Value > 0

4. Ductility related modification factor, R_d

Value > 0

5. Overstrength related modification factor, R_o

Value > 0

6. Capacity factor, Phi bending

Value > 0

7. Capacity factor, Phi compression

Value > 0

8. Capacity factor, Phi tension

Value > 0

9. Capacity factor, Phi shear

Value > 0

10. Slender section modification

· **1** - modified geometry

· **2** - modified Fy

11. Ignore seismic code

· 0 = No

· Any other value = Yes

12. Ignore special seismic load

· 0 = No

· Any other value = Yes

13. Doubler plate is plug welded

· 0 = No

· Any other value = Yes

14. Consider deflection

· 0 = No

· Any other value = Yes

15. DL deflection limit, L/Value

Value > 0

16. SDL + LL deflection limit, L/Value

Value > 0

17. LL deflection limit, L/Value

Value > 0

18. Total deflection limit, L/Value

Value > 0

19. Total camber limit, L/Value

Value > 0

20. Pattern live load factor

Value >= 0

21. Demand/capacity ratio limit

Value > 0

Return Value

Type: Int32

Returns zero if the item is successfully retrieved; otherwise, it returns a nonzero value

Remarks

Examples

VB

Copy

```
Public Sub Example()
    Dim SapModel As cSapModel

Parameters

Name

Type: SystemString

The name of an existing frame object with a steel frame design procedure

Item

Type: SystemInt32

This is an integer between 1 and 39, inclusive, indicating the overwrite item considered

1. Framing type
2. Consider deflection
3. Deflection check type
4. DL deflection limit, L/Value
5. SDL + LL deflection limit, L/Value
6. LL deflection limit, L/Value
7. Total load deflection limit, L/Value
8. Total-camber limit, L/Value
9. DL deflection limit, absolute
10. SDL + LL deflection limit, absolute
11. LL deflection limit, absolute
12. Total load deflection limit, absolute
13. Total-camber limit, absolute
14. Specified camber
15. Net area to total area ratio
16. Live load reduction factor
17. Unbraced length ratio, Major
18. Unbraced length ratio, Minor LTB
19. Unbraced length ratio, Lateral Torsional Buckling
20. Effective length factor, K Major
21. Effective length factor, K Minor
22. Effective length factor, K LTB
23. Moment coefficient, Omega1 Major
24. Moment coefficient, Omega1 Minor
25. Bending coefficient, Omega2
26. Nonsway moment factor, U1 Major
27. Nonsway moment factor, U1 Minor
28. Sway moment factor, U2 Major
29. Sway moment factor, U2 Minor
30. Parameter for compressive resistance, n
31. Yield stress, Fy
32. Expected to specified Fy ratio, Ry
33. Compressive resistance, Cr
34. Tensile resistance, Tr
35. Major bending resistance, Mr3
36. Minor bending resistance, Mr2
37. Major shear resistance, Vr2
38. Minor shear resistance, Vr3
39. Demand/capacity ratio limit

Value

Type: SystemDouble

The value of the considered overwrite item

1. Framing type
 - **0** - As specified in preferences
 - **1** - Type LD MRF
 - **2** - Type MD MRF
 - **3** - Type D MRF
 - **4** - Type LD CBF(V)
 - **5** - Type LD CBF(TC)
 - **6** - Type LD CBF(TO)
 - **7** - Type LD CBF(OT)
 - **8** - Type MD CBF(V)
 - **9** - Type MD CBF(TC)
 - **10** - Type MD CBF(TO)
 - **11** - Type MD CBF(OT)
 - **12** - EBF
 - **13** - Cantilever Column
 - **14** - Conventional MF
 - **15** - Conventional BF

2. Consider deflection?
 - 0 = No
 - Any other value = Yes

3. Deflection check type
 - **0** - Program Determined
 - **1** - Ratio
 - **2** - Absolute
 - **3** - Both

4. DL deflection limit, L/Value

Value ≥ 0 ; 0 means no check for this item

5. SDL + LL deflection limit, L/Value

Value ≥ 0 ; 0 means no check for this item

6. LL deflection limit, L/Value

Value ≥ 0 ; 0 means no check for this item

7. Total load deflection limit, L/Value

Value ≥ 0 ; 0 means no check for this item

8. Total-camber limit, L/Value

Value ≥ 0 ; 0 means no check for this item

9. DL deflection limit, absolute

Value ≥ 0 ; 0 means no check for this item. [L]

10. SDL + LL deflection limit, absolute

Value ≥ 0 ; 0 means no check for this item. [L]

11. LL deflection limit, absolute

Value ≥ 0 ; 0 means no check for this item. [L]

12. Total load deflection limit, absolute

Introduction

Value ≥ 0 ; 0 means no check for this item. [L]

13. Total-camber limit, absolute

Value ≥ 0 ; 0 means no check for this item. [L]

14. Specified camber

Value ≥ 0 . [L]

15. Net area to total area ratio

Value ≥ 0 ; 0 means use program default value

16. Live load reduction factor

Value ≥ 0 ; 0 means use program determined value

17. Unbraced length ratio, Major

Value ≥ 0 ; 0 means use program determined value

18. Unbraced length ratio, Minor

Value ≥ 0 ; 0 means use program determined value

19. Unbraced length ratio, Lateral Torsional Buckling

Value ≥ 0 ; 0 means use program determined value

20. Effective length factor, K Major

Value ≥ 0 ; 0 means use program determined value

21. Effective length factor, K Minor

Value ≥ 0 ; 0 means use program determined value

22. Effective length factor, K LTB

Value ≥ 0 ; 0 means use program determined value

23. Moment coefficient, Omega1 Major

Value ≥ 0 ; 0 means use program determined value

24. Moment coefficient, Omega1 Minor

Value ≥ 0 ; 0 means use program determined value

25. Moment coefficient, Omega2

Value ≥ 0 ; 0 means use program determined value

26. Nonsway moment factor, U1 Major

Value ≥ 0 ; 0 means use program determined value

27. Nonsway moment factor, U1 Minor

Value ≥ 0 ; 0 means use program determined value

28. Sway moment factor, U2 Major

Value ≥ 0 ; 0 means use program determined value

29. Sway moment factor, U2 Minor

Introduction

Value ≥ 0 ; 0 means use program determined value
30. Parameter for compressive resistance, n

Value ≥ 0 ; 0 means use program determined value
31. Yield stress, F_y

Value ≥ 0 ; 0 means use program determined value [F/L2]
32. Expected to specified F_y ratio, R_y

Value ≥ 0 ; 0 means use program determined value [F/L2]=
33. Compressive resistance, C_r

Value ≥ 0 ; 0 means use program determined value [F]
34. Tensile resistance, T_r

Value ≥ 0 ; 0 means use program determined value [F]
35. Major bending resistance, M_{r3}

Value ≥ 0 ; 0 means use program determined value [FL]
36. Minor bending resistance, M_{r2}

Value ≥ 0 ; 0 means use program determined value [FL]
37. Major shear resistance, V_{r2}

Value ≥ 0 ; 0 means use program determined value [F]
38. Minor shear resistance, V_{r3}

Value ≥ 0 ; 0 means use program determined value [F]
39. Demand/capacity ratio limit

Value ≥ 0 ; 0 means use program determined value

ProgDet

Type: System.Boolean

If this item is True, the specified value is program determined

Return Value

Type: Int32

Returns zero if the item is successfully retrieved; otherwise it returns a nonzero value

▲ Remarks

▲ Examples

VB

Copy

```
Public Sub Example()  
    Dim SapModel As cSapModel  
    Dim EtabsObject As cOAPI  
    Dim ret As Integer = -1  
    Dim Value As Double  
    Dim ProgDet As Boolean
```

'create ETABS object

```
    Dim myHelper as cHelper = New Helper  
    EtabsObject = myHelper.CreateObjectProgID("CSI.ETABS.API.ETABSObject")
```

Return Value

```
'start ETABS application
ret = EtabsObject.ApplicationStart()

'create SapModel object
SapModel = EtabsObject.SapModel

'initialize model
ret = SapModel.InitializeNewModel()

'create steel deck template model
ret = SapModel.File.NewSteelDeck(4, 12, 12, 4, 4, 24, 24)

'set steel design code
ret = SapModel.DesignSteel.SetCode("CSA S16-19")

'get overwrite item
ret = SapModel.DesignSteel.Canadian_S16_19.GetOverwrite("8", 1, Value, ProgDet)

'close ETABS
EtabsObject.ApplicationExit(False)

'clean up variables
SapModel = Nothing
EtabsObject = Nothing

End Sub
```

CSI API ETABS v1

cDStCanadian_S16_19AddLanguageSpecificTextSet("L Method

Retrieves the value of a steel design preference item

Namespace: ETABSv1

Assembly: ETABSv1 (in ETABSv1.dll) Version: 1.0.0.0 (1.24.0.0)

▲ Syntax

C#

VB

C++

F#

Copy

```
int GetPreference(
    int Item,
    ref double Value
)
```

```
Function GetPreference (
    Item As Integer,
    ByRef Value As Double
) As Integer
```

```
Dim instance As cDStCanadian_S16_19
Dim Item As Integer
Dim Value As Double
Dim returnValue As Integer
```

```
returnValue = instance.GetPreference(Item,
    Value)
```

```
int GetPreference(
    int Item,
    double% Value
)
```

```
abstract GetPreference :
    Item : int *
    Value : float byref -> int
```

Parameters

Item

Type: SystemInt32

This is an integer between 1 and 22, inclusive, indicating the preference item considered

1. Multi-response case design
2. Framing type
3. Spectral Acceleration Ratio, $I_e \cdot F_a \cdot S_a(0.2)$
4. Ductility related modification factor, R_d
5. Overstrength related modification factor, R_o

6. Capacity factor, Phi bending
7. Capacity factor, Phi compression
8. Capacity factor, Phi tension
9. Capacity factor, Phi shear
10. Slender section modification
11. Ignore seismic code
12. Ignore special seismic load
13. Doubler plate is plug welded
14. Consider deflection
15. DL deflection limit, L/Value
16. SDL + LL deflection limit, L/Value
17. LL deflection limit, L/Value
18. Total load deflection limit, L/Value
19. Total camber limit, L/Value
20. Pattern live load factor
21. Demand/capacity ratio limit
22. Seismic Design Category

Value

Type: SystemDouble

The value of the considered preference item

1. Multi-response case design
 - **1** - Envelopes
 - **2** - Step-by-step
 - **3** - Last step
 - **4** - Envelopes -- All
 - **5** - Step-by-step -- All
2. Framing type
 - **1** - Type LD MRF
 - **2** - Type MD MRF
 - **3** - Type D MRF
 - **4** - Type LD CBF(V)
 - **5** - Type LD CBF(TC)
 - **6** - Type LD CBF(TO)
 - **7** - Type LD CBF(OT)
 - **8** - Type MD CBF(V)
 - **9** - Type MD CBF(TC)
 - **10** - Type MD CBF(TO)
 - **11** - Type MD CBF(OT)
 - **12** - EBF
 - **13** - Cantilever Column
 - **14** - Conventional MF
 - **15** - Conventional BF
3. Spectral Acceleration Ratio, $I_e \cdot F_a \cdot S_a(0.2)$

Value > 0

4. Ductility related modification factor, R_d

Value > 0

5. Overstrength related modification factor, R_o

Value > 0

6. Capacity factor, Phi bending

Value > 0

7. Capacity factor, Phi compression

Value > 0

8. Capacity factor, Phi tension

Value > 0

9. Capacity factor, Phi shear

Value > 0

10. Slender section modification

- **1** - modified geometry
- **2** - modified Fy

11. Ignore seismic code

- 0 = No
- Any other value = Yes

12. Ignore special seismic load

- 0 = No
- Any other value = Yes

13. Doubler plate is plug welded

- 0 = No
- Any other value = Yes

14. Consider deflection

- 0 = No
- Any other value = Yes

15. DL deflection limit, L/Value

Value > 0

16. SDL + LL deflection limit, L/Value

Value > 0

17. LL deflection limit, L/Value

Value > 0

18. Total deflection limit, L/Value

Value > 0

19. Total camber limit, L/Value

Value > 0

20. Pattern live load factor

Value >= 0

21. Demand/capacity ratio limit

Value > 0

22. Seismic Design Category

- **1** - SC0
- **2** - SC1

- 3 - SC2
- 4 - SC3
- 5 - SC4

Return Value

Type: [Int32](#)

Returns zero if the item is successfully retrieved; otherwise, it returns a nonzero value

cDStCanadian_S16_19span id="LSTBA15809E_0"AddLanguageSpecificTextSet("LSTBA15809E_30?cpp=::

Parameters

Name

Type: SystemString

The name of an existing frame object with a steel frame design procedure

Item

Type: SystemInt32

This is an integer between 1 and 39, inclusive, indicating the overwrite item considered

1. Framing type
2. Consider deflection
3. Deflection check type
4. DL deflection limit, L/Value
5. SDL + LL deflection limit, L/Value
6. LL deflection limit, L/Value
7. Total load deflection limit, L/Value
8. Total-camber limit, L/Value
9. DL deflection limit, absolute
10. SDL + LL deflection limit, absolute
11. LL deflection limit, absolute
12. Total load deflection limit, absolute
13. Total-camber limit, absolute
14. Specified camber
15. Net area to total area ratio
16. Live load reduction factor
17. Unbraced length ratio, Major
18. Unbraced length ratio, Minor LTB
19. Unbraced length ratio, Lateral Torsional Buckling
20. Effective length factor, K Major
21. Effective length factor, K Minor
22. Effective length factor, K LTB
23. Moment coefficient, Omega1 Major
24. Moment coefficient, Omega1 Minor
25. Bending coefficient, Omega2
26. Nonsway moment factor, U1 Major
27. Nonsway moment factor, U1 Minor
28. Sway moment factor, U2 Major
29. Sway moment factor, U2 Minor
30. Parameter for compressive resistance, n
31. Yield stress, Fy
32. Expected to specified Fy ratio, Ry
33. Compressive resistance, Cr
34. Tensile resistance, Tr
35. Major bending resistance, Mr3
36. Minor bending resistance, Mr2
37. Major shear resistance, Vr2
38. Minor shear resistance, Vr3
39. Demand/capacity ratio limit

Value

Type: SystemDouble

The value of the considered overwrite item

1. Framing type
 - **0** - As specified in preferences
 - **1** - Type LD MRF
 - **2** - Type MD MRF
 - **3** - Type D MRF
 - **4** - Type LD CBF(V)
 - **5** - Type LD CBF(TC)
 - **6** - Type LD CBF(TO)
 - **7** - Type LD CBF(OT)
 - **8** - Type MD CBF(V)
 - **9** - Type MD CBF(TC)
 - **10** - Type MD CBF(TO)
 - **11** - Type MD CBF(OT)
 - **12** - EBF
 - **13** - Cantilever Column
 - **14** - Conventional MF
 - **15** - Conventional BF

2. Consider deflection?
 - 0 = No
 - Any other value = Yes

3. Deflection check type
 - **0** - Program Determined
 - **1** - Ratio
 - **2** - Absolute
 - **3** - Both

4. DL deflection limit, L/Value

Value ≥ 0 ; 0 means no check for this item

5. SDL + LL deflection limit, L/Value

Value ≥ 0 ; 0 means no check for this item

6. LL deflection limit, L/Value

Value ≥ 0 ; 0 means no check for this item

7. Total load deflection limit, L/Value

Value ≥ 0 ; 0 means no check for this item

8. Total-camber limit, L/Value

Value ≥ 0 ; 0 means no check for this item

9. DL deflection limit, absolute

Value ≥ 0 ; 0 means no check for this item. [L]

10. SDL + LL deflection limit, absolute

Value ≥ 0 ; 0 means no check for this item. [L]

11. LL deflection limit, absolute

Value ≥ 0 ; 0 means no check for this item. [L]

12. Total load deflection limit, absolute

Introduction

Value ≥ 0 ; 0 means no check for this item. [L]

13. Total-camber limit, absolute

Value ≥ 0 ; 0 means no check for this item. [L]

14. Specified camber

Value ≥ 0 . [L]

15. Net area to total area ratio

Value ≥ 0 ; 0 means use program default value

16. Live load reduction factor

Value ≥ 0 ; 0 means use program determined value

17. Unbraced length ratio, Major

Value ≥ 0 ; 0 means use program determined value

18. Unbraced length ratio, Minor

Value ≥ 0 ; 0 means use program determined value

19. Unbraced length ratio, Lateral Torsional Buckling

Value ≥ 0 ; 0 means use program determined value

20. Effective length factor, K Major

Value ≥ 0 ; 0 means use program determined value

21. Effective length factor, K Minor

Value ≥ 0 ; 0 means use program determined value

22. Effective length factor, K LTB

Value ≥ 0 ; 0 means use program determined value

23. Moment coefficient, Omega1 Major

Value ≥ 0 ; 0 means use program determined value

24. Moment coefficient, Omega1 Minor

Value ≥ 0 ; 0 means use program determined value

25. Moment coefficient, Omega2

Value ≥ 0 ; 0 means use program determined value

26. Nonsway moment factor, U1 Major

Value ≥ 0 ; 0 means use program determined value

27. Nonsway moment factor, U1 Minor

Value ≥ 0 ; 0 means use program determined value

28. Sway moment factor, U2 Major

Value ≥ 0 ; 0 means use program determined value

29. Sway moment factor, U2 Minor

Introduction

Value ≥ 0 ; 0 means use program determined value

30. Parameter for compressive resistance, n

Value ≥ 0 ; 0 means use program determined value

31. Yield stress, F_y

Value ≥ 0 ; 0 means use program determined value [F/L2]

32. Expected to specified F_y ratio, R_y

Value ≥ 0 ; 0 means use program determined value [F/L2]=

33. Compressive resistance, C_r

Value ≥ 0 ; 0 means use program determined value [F]

34. Tensile resistance, T_r

Value ≥ 0 ; 0 means use program determined value [F]

35. Major bending resistance, M_{r3}

Value ≥ 0 ; 0 means use program determined value [FL]

36. Minor bending resistance, M_{r2}

Value ≥ 0 ; 0 means use program determined value [FL]

37. Major shear resistance, V_{r2}

Value ≥ 0 ; 0 means use program determined value [F]

38. Minor shear resistance, V_{r3}

Value ≥ 0 ; 0 means use program determined value [F]

39. Demand/capacity ratio limit

Value ≥ 0 ; 0 means use program determined value

ItemType (Optional)

Type: $\hat{A}$ ETABSv1eItemType

This is one of the following items in the eItemType enumeration:

◇ Object = 0

◇ Group = 1

◇ SelectedObjects = 2

If this item is Objects, the assignment is made to the frame object specified by the Name item.

If this item is Group, the assignment is made to all frame objects in the group specified by the Name item.

If this item is SelectedObjects, the assignment is made to all selected frame objects and the Name item is ignored.

Return Value

Type: $\hat{A}$ Int32

Returns zero if the item is successfully retrieved; otherwise it returns a nonzero value

▲ Remarks

Examples

VB

Copy

```
Public Sub Example()
    Dim SapModel As cSapModel
    Dim EtabsObject As cOAPI
    Dim ret As Integer = -1

    'create ETABS object
    Dim myHelper as cHelper = New Helper
    EtabsObject = myHelper.CreateObjectProgID("CSI.ETABS.API.ETABSObject")

    'start ETABS application
    ret = EtabsObject.ApplicationStart()

    'create SapModel object
    SapModel = EtabsObject.SapModel

    'initialize model
    ret = SapModel.InitializeNewModel()

    'create steel deck template model
    ret = SapModel.File.NewSteelDeck(4, 12, 12, 4, 4, 24, 24)

    'set steel design code
    ret = SapModel.DesignSteel.SetCode("CSA S16-19")

    'set overwrite item
    ret = SapModel.DesignSteel.Canadian_S16_19.SetOverwrite("8", 1, 7)

    'close ETABS
    EtabsObject.ApplicationExit(False)

    'clean up variables
    SapModel = Nothing
    EtabsObject = Nothing
End Sub
```

CSI API ETABS v1

cDStChinese_2018AddLanguageSpecificTextSet("LSTD37E262F_0") Method

Sets the value of a steel design overwrite item.

Namespace: [ETABSv1](#)

Assembly: [ETABSv1](#) (in ETABSv1.dll) Version: 1.0.0.0 (1.24.0.0)

■ Syntax

[C#](#)

[VB](#)

[C++](#)

[F#](#)

[Copy](#)

```
int GetOverwrite(
    string Name,
    int Item,
    ref double Value,
    ref bool ProgDet
)
```

```
Function GetOverwrite (
    Name As String,
    Item As Integer,
    ByRef Value As Double,
    ByRef ProgDet As Boolean
) As Integer
```

```
Dim instance As cDStChinese_2018
Dim Name As String
Dim Item As Integer
Dim Value As Double
Dim ProgDet As Boolean
Dim returnValue As Integer
```

```
returnValue = instance.GetOverwrite(Name,
    Item, Value, ProgDet)
```

```
int GetOverwrite(
    String^ Name,
    int Item,
    double% Value,
    bool% ProgDet
)
```

```
abstract GetOverwrite :
    Name : string *
    Item : int *
    Value : float byref *
    ProgDet : bool byref -> int
```

Parameters

Name

Type: SystemString

Item

Type: SystemInt32

This is an integer between 1 and 45, inclusive, indicating the overwrite item considered.

1. Framing Type
2. Element Type
3. Seismic Design Grade
4. Energy Dissipation Member?
5. Is Transfer Member?
6. Seismic Magnification Factor
7. Dual System Magnification Factor
8. Ignore B/T Check?
9. Classify Beam as Flexo-Compression Member?
10. Is Rolled Section?
11. Is Flange Edge Cut by Gas?
12. Is Both End Pinned?
13. Ignore Beam Φ_B ?
14. Is Beam Top Loaded?
15. Consider Deflection?
16. Live Load Deflection Limit, L/Value
17. Total Load Deflection Limit, L/Value
18. Total-Camber Deflection Limit, L/Value
19. Specified Camber
20. Net Area to Total Area Ratio
21. Live Load Reduction Factor
22. Unbraced Length Ratio (Major)
23. Unbraced Length Ratio (Minor), Lateral Torsional Buckling
24. Effective Length Factor (μ_e Major)
25. Effective Length Factor (μ_e Minor)
26. Sway M Amplification Factor (α_{II} Major)
27. Sway M Amplification Factor (α_{II} Minor)
28. Axial Stability Coefficient (Φ Major)
29. Axial Stability Coefficient (Φ Minor)
30. Flexural Stability Coefficient (Φ_b Major)
31. Flexural Stability Coefficient (Φ_b Minor)
32. Moment Coefficient (β_m Major)
33. Moment Coefficient (β_m Minor)
34. Moment Coefficient (β_t Major)
35. Moment Coefficient (β_t Minor)
36. Plasticity Factor (γ Major)
37. Plasticity Factor (γ Minor)
38. Section Influence Coefficient (η)
39. Beam/Column Capacity Factor (η)
40. Slenderness Limit in Compression (l/r)
41. Slenderness Limit in Tension (l/r)
42. Yield stress, F_y
43. Allowable Normal Stress, f

- 44. Allowable Shear Stress, f_v
- 45. Consider Fictitious shear?

Value

Type: SystemDouble

The value of the considered overwrite item.

- 1. Framing Type
 - 1. Sway Moment Frame, SMF
 - 2. Centrically Braced Frame, CBF
 - 3. Eccentrically Braced Frame, EBF
 - 4. NonSway Moment Frame, NMF
- 2. Element Type
 - 1. Column
 - 2. Beam
 - 3. Brace

Value > 0

43. Allowable Normal Stress, f

Value > 0

44. Allowable Shear Stress, f_v

Value > 0

45. Consider Fictitious shear?

0 = No

Any other value = Yes

ProgDet

Type: SystemBoolean

If this item is True, the specified value is program determined.

Return Value

Type: Int32

Returns zero if the item is successfully set; otherwise it returns a nonzero value.

```

Parameters

Name

Type: SystemString

The name of a frame object with a steel frame design procedure

Item

Type: SystemInt32

This is an integer between 1 and 59, inclusive, indicating the overwrite item considered.

1. Framing Type
2. Consider Deflection
3. Deflection check type
4. DL deflection limit, L/Value
5. SDL + LL deflection limits, L/Value
6. LL deflection limit, L/Value
7. Total load deflection limit, L/Value
8. Total camber limit, L/Value
9. DL deflection limit, absolute
10. SDL + LL deflection limit, absolute
11. LL deflection limit, absolute
12. Total load deflection limit, absolute
13. Total camber limit, absolute
14. Specified camber
15. Net area to total area ratio
16. Live load reduction factor
17. Unbraced length ratio, L_y
18. Unbraced length ratio, L_z
19. Effective length factor, K_{2y}
20. Effective length factor, K_{2z}
21. Moment coefficient, k_{yy}
22. Moment coefficient, k_{zz}
23. Bending coefficient, C_1
24. Effective length factor, K_{1y}
25. Effective length factor, K_{1z}
26. Yield stress, F_y
27. Compressive capacity, N_c, R_d
28. Tensile capacity, N_t, R_d
29. Bending capacity Y-Y, M_{cy}, R_d
30. Bending capacity Z-Z, M_{cz}, R_d
31. Buckling resistance moment, M_b, R_d
32. Shear capacity Z-Z, V_z, R_d
33. Shear capacity Y-Y, V_y, R_d
34. Demand/capacity ratio limit
35. Section class
36. Column buckling curve, y-y
37. Column buckling curve, z-z
38. Buckling curve for LTB
39. System overstrength factor, Ω
40. Is rolled section
41. Unbraced length ratio, LLTB
44. Effective length factor, KLTB

- 45. Material overstrength, GammaOv
- 49. Bending coefficient, C2
- 50. Bending coefficient, C3
- 51. Warping constant, Iw
- 52. Elastic torsional buckling force, Ncr,T
- 53. Elastic torsional-flexural buckling force, Ncr,TF
- 54. Elastic critical moment for lateral-torsional buckling, Mcr
- 55. Moment coefficient, kzy
- 56. Moment coefficient, kyz
- 57. Warping coefficient, kw
- 58. Coordinate of load application, za
- 59. Coordinate of shear center, zs

Value

Type: SystemDouble

The numeric value of the considered overwrite item.

1. Design Section
2. Framing Type
 - . 0 = Program Default
 - . 1 = DCH-MRF (Ductility Class High - Moment Frame)
 - . 2 = DCM-MRF (Ductility Class Medium - Moment Frame)
 - . 3 = DCL-MRF (Ductility Class Low - Moment Frame)
 - . 4 = DCH-CBF (Ductility Class High - Concentrically Braced Frame)
 - . 5 = DCM-CBF (Ductility Class Medium - Concentrically Braced Frame)
 - . 6 = DCL-CBF (Ductility Class Low - Concentrically Braced Frame)
 - . 7 = DCH-EBF (Ductility Class High - Eccentrically Braced Frame)
 - . 8 = DCM-EBF (Ductility Class Medium - Eccentrically Braced Frame)
 - . 9 = DCL-EBF (Ductility Class Low - Eccentrically Braced Frame)
 - . 10 = Inverted Pendulum Structure
 - . 11 = Secondary
 - . 12 = Non Seismic
3. Consider Deflection
 - . 0 = Program Default
 - . 1 = No
 - . 2 = Yes
4. Deflection check type
 - . 0 = Program Default
 - . 1 = Ratio
 - . 2 = Absolute
 - . 3 = Both
5. DL deflection limit, L/Value

Value ≥ 0 ; 0 means no check for this item.
6. SDL + LL deflection limits, L/Value

Value ≥ 0 ; 0 means no check for this item.
7. Value ≥ 0 ; 0 means no check for this item.

LL deflection limit, L/Value
8. Total load deflection limit, L/Value

Introduction

Value ≥ 0 ; 0 means no check for this item.

9. Total camber limit, $L/Value$

Value ≥ 0 ; 0 means no check for this item.

10. DL deflection limit, absolute

Value ≥ 0 ; 0 means no check for this item. [L]

11. SDL + LL deflection limit, absolute

Value ≥ 0 ; 0 means no check for this item. [L]

12. LL deflection limit, absolute

Value ≥ 0 ; 0 means no check for this item. [L]

13. Total load deflection limit, absolute

Value ≥ 0 ; 0 means no check for this item. [L]

14. Total camber limit, absolute

Value ≥ 0 ; 0 means no check for this item. [L]

15. Specified camber

Value ≥ 0 ; 0 means no check for this item. [L]

16. Net area to total area ratio

Value ≥ 0 ; 0 means use program determined value.

17. Live load reduction factor

Value ≥ 0 ; 0 means use program determined value.

18. Unbraced length ratio, L_y

Value ≥ 0 ; 0 means use program determined value.

19. Unbraced length ratio, L_z

Value ≥ 0 ; 0 means use program determined value.

20. Effective length factor, K_{2y}

Value ≥ 0 ; 0 means use program determined value.

21. Effective length factor, K_{2z}

Value ≥ 0 ; 0 means use program determined value.

22. Moment coefficient, k_{yy}

Value ≥ 0 ; 0 means use program determined value.

23. Moment coefficient, k_{zz}

Value ≥ 0 ; 0 means use program determined value.

24. Bending coefficient, C_1

Value ≥ 0 ; 0 means use program determined value.

25. Effective length factor, K_{1y}

Value ≥ 0 ; 0 means use program determined value.

26. Effective length factor, $K1z$

Value ≥ 0 ; 0 means use program determined value.

27. Yield stress, F_y

Value ≥ 0 ; 0 means use program determined value. $[F/L^2]$

28. Compressive capacity, N_c, R_d

Value ≥ 0 ; 0 means use program determined value. $[F]$

29. Tensile capacity, N_t, R_d

Value ≥ 0 ; 0 means use program determined value. $[F]$

30. Bending capacity Y-Y, M_{cy}, R_d

Value ≥ 0 ; 0 means use program determined value. $[F.L]$

31. Bending capacity Z-Z, M_{cz}, R_d

Value ≥ 0 ; 0 means use program determined value. $[F.L]$

32. Buckling resistance moment, M_b, R_d

Value ≥ 0 ; 0 means use program determined value. $[F.L]$

33. Shear capacity Z-Z, V_z, R_d

Value ≥ 0 ; 0 means use program determined value. $[F]$

34. Shear capacity Y-Y, V_y, R_d

Value ≥ 0 ; 0 means use program determined value. $[F]$

35. Demand/capacity ratio limit

Value ≥ 0 ; 0 means use program determined value.

36. Section Class

- 0 = Program Default
- 1 = Class 1
- 2 = Class 2
- 3 = Class 3
- 4 = Class 4

37. Column buckling curve (y-y)

- 0 = Program Default
- 1 = a0
- 2 = a
- 3 = b
- 4 = c
- 5 = d

38. Column buckling curve (z-z)

- 0 = Program Default
- 1 = a0
- 2 = a
- 3 = b
- 4 = c
- 5 = d

39. Buckling curve for LTB

- 0 = Program Default
- 1 = a0
- 2 = a
- 3 = b
- 4 = c
- 5 = d

40. System overstrength factor, Omega

Value ≥ 0 ; 0 means use a program determined value.

41. Is rolled section

- 0 = Program Default
- 1 = No
- 2 = Yes

42. Unbraced length ratio, LLTB

Value ≥ 0 ; 0 means use program determined value.

44. Effective length factor, KLTB

Value ≥ 0 ; 0 means use program determined value.

45. Material overstrength, GammaOv

Value ≥ 0 ; 0 means use program determined value.

49. Bending coefficient, C2

Value ≥ 0 ; 0 means use program determined value.

50. Bending coefficient, C3

Value ≥ 0 ; 0 means use program determined value.

51. Warping constant, Iw

Value ≥ 0 ; 0 means use program determined value.

52. Elastic torsional buckling force, Ncr,T

Value ≥ 0 ; 0 means use program determined value.

53. Elastic torsional-flexural buckling force, Ncr,TF

Value ≥ 0 ; 0 means use program determined value.

54. Elastic critical moment for lateral-torsional buckling, Mcr

Value ≥ 0 ; 0 means use program determined value.

55. Moment coefficient, kzy

Value ≥ 0 ; 0 means use program determined value.

56. Moment coefficient, kyz

Value ≥ 0 ; 0 means use program determined value.

57. Warping coefficient, kw

Value ≥ 0 ; 0 means use program determined value.

58. Coordinate of load application, za

59. Coordinate of shear center, zs

ProgDet

Type: System.Boolean

If this item is True, the specified value is program determined.

Return Value

Type: Int32

Returns zero if the item is successfully retrieved; otherwise it returns a nonzero value.

- 0 = No
- Any other value = Yes
24. Are Doubler plates plug-welded
- 0 = No
- Any other value = Yes

Return Value

Type: Int32

Returns zero if the item is successfully retrieved; otherwise it returns a nonzero value.

▲ Remarks

▲ Examples

VB

Copy

```
Public Sub Example()
    Dim SapModel As cSapModel
    Dim EtabsObject As cOAPI
    Dim ret As Integer = -1
    Dim Value As Double
    Dim ProgDet As Boolean

    'create ETABS object
    Dim myHelper as cHelper = New Helper
    EtabsObject = myHelper.CreateObjectProgID("CSI.ETABS.API.ETABSObject")

    'start ETABS application
```

Return Value

Introduction

```
ret = EtabsObject.ApplicationStart()  
  
'create SapModel object  
  SapModel = EtabsObject.SapModel  
  
'initialize model  
  ret = SapModel.InitializeNewModel()  
  
'create steel deck template model  
  ret = SapModel.File.NewSteelDeck(4, 12, 12, 4, 4, 24, 24)  
  
'set steel design code  
  ret = SapModel.DesignSteel.SetCode("Eurocode 3-2005")  
  
'set overwrite item  
  ret = SapModel.DesignSteel.Eurocode_3_2005.GetPreference(2, Value)  
  
'close ETABS  
  EtabsObject.ApplicationExit(False)  
  
'clean up variables  
  SapModel = Nothing  
  EtabsObject = Nothing  
  
End Sub
```

CSI API ETABS v1

cDStEurocode_3_2005AddLanguageSpecificTextSet("L Method

Sets the value of a steel design overwrite item

Namespace: [ETABSv1](#)

Assembly: [ETABSv1](#) (in ETABSv1.dll) Version: 1.0.0.0 (1.24.0.0)

■ Syntax

[C#](#)

[VB](#)

[C++](#)

[F#](#)

[Copy](#)

```
int SetOverwrite(
    string Name,
    int Item,
    double Value,
    eItemType ItemType = eItemType.Objects
)
```

```
Function SetOverwrite (
    Name As String,
    Item As Integer,
    Value As Double,
    ?ItemType As eItemType = eItemType.Objects
) As Integer
```

```
Dim instance As cDStEurocode_3_2005
Dim Name As String
Dim Item As Integer
Dim Value As Double
Dim ItemType As eItemType
Dim returnValue As Integer
```

```
returnValue = instance.SetOverwrite(Name,
    Item, Value, ItemType)
```

```
int SetOverwrite(
    String^ Name,
    int Item,
    double Value,
    eItemType ItemType = eItemType::Objects
)
```

```
abstract SetOverwrite :
    Name : string *
    Item : int *
    Value : float *
    ?ItemType : eItemType
(* Defaults:
    let _ItemType = defaultArg ItemType eItemType.Objects
*)
-> int
```

Parameters**Name**

Type: SystemString

The name of an existing frame object or group, depending on the value of the ItemType item.

Item

Type: SystemInt32

This is an integer between 1 and 59, inclusive, indicating the overwrite item considered.

1. Framing Type
2. Consider Deflection
3. Deflection check type
4. DL deflection limit, L/Value
5. SDL + LL deflection limits, L/Value
6. LL deflection limit, L/Value
7. Total load deflection limit, L/Value
8. Total camber limit, L/Value
9. DL deflection limit, absolute
10. SDL + LL deflection limit, absolute
11. LL deflection limit, absolute
12. Total load deflection limit, absolute
13. Total camber limit, absolute
14. Specified camber
15. Net area to total area ratio
16. Live load reduction factor
17. Unbraced length ratio, Ly
18. Unbraced length ratio, Lz
19. Effective length factor, K2y
20. Effective length factor, K2z
21. Moment coefficient, kyy
22. Moment coefficient, kzz
23. Bending coefficient, C1
24. Effective length factor, K1y
25. Effective length factor, K1z
26. Yield stress, Fy
27. Compressive capacity, Nc,Rd
28. Tensile capacity Nt,Rd
29. Bending capacity Y-Y, Mcy,Rd
30. Bending capacity Z-Z, Mcz,Rd
31. Buckling resistance moment, Mb,Rd
32. Shear capacity Z-Z, Vz,Rd
33. Shear capacity Y-Y, Vy,Rd
34. Demand/capacity ratio limit
35. Section class
36. Column buckling curve, y-y
37. Column buckling curve, z-z
38. Buckling curve for LTB
39. System overstrength factor, Omega
40. Is rolled section
41. Unbraced length ratio, LTB

- 44. Effective length factor, K LTB
- 45. Material overstrength, GammaOv
- 49. Bending coefficient, C2
- 50. Bending coefficient, C3
- 51. Warping constant, Iw
- 52. Elastic torsional buckling force, Ncr,T
- 53. Elastic torsional-flexural buckling force, Ncr,TF
- 54. Elastic critical moment for lateral-torsional buckling, Mcr
- 55. Moment coefficient, kzy
- 56. Moment coefficient, kyz
- 57. Warping coefficient, kw
- 58. Coordinate of load application, za
- 59. Coordinate of shear center, zs

Value

Type: SystemDouble

The numeric value of the considered overwrite item.

1. Design Section
2. Framing Type
 - 0 = Program Default
 - 1 = DCH-MRF (Ductility Class High - Moment Frame)
 - 2 = DCM-MRF (Ductility Class Medium - Moment Frame)
 - 3 = DCL-MRF (Ductility Class Low - Moment Frame)
 - 4 = DCH-CBF (Ductility Class High - Concentrically Braced Frame)
 - 5 = DCM-CBF (Ductility Class Medium - Concentrically Braced Frame)
 - 6 = DCL-CBF (Ductility Class Low - Concentrically Braced Frame)
 - 7 = DCH-EBF (Ductility Class High - Eccentrically Braced Frame)
 - 8 = DCM-EBF (Ductility Class Medium - Eccentrically Braced Frame)
 - 9 = DCL-EBF (Ductility Class Low - Eccentrically Braced Frame)
 - 10 = Inverted Pendulum Structure
 - 11 = Secondary
 - 12 = Non Seismic
3. Consider Deflection
 - 0 = Program Default
 - 1 = No
 - 2 = Yes
4. Deflection check type
 - 0 = Program Default
 - 1 = Ratio
 - 2 = Absolute
 - 3 = Both
5. DL deflection limit, L/Value

Value ≥ 0 ; 0 means no check for this item.

6. SDL + LL deflection limits, L/Value

Value ≥ 0 ; 0 means no check for this item.

7. Value ≥ 0 ; 0 means no check for this item.

LL deflection limit, L/Value

Introduction

8. Total load deflection limit, L/Value

Value ≥ 0 ; 0 means no check for this item.

9. Total camber limit, L/Value

Value ≥ 0 ; 0 means no check for this item.

10. DL deflection limit, absolute

Value ≥ 0 ; 0 means no check for this item. [L]

11. SDL + LL deflection limit, absolute

Value ≥ 0 ; 0 means no check for this item. [L]

12. LL deflection limit, absolute

Value ≥ 0 ; 0 means no check for this item. [L]

13. Total load deflection limit, absolute

Value ≥ 0 ; 0 means no check for this item. [L]

14. Total camber limit, absolute

Value ≥ 0 ; 0 means no check for this item. [L]

15. Specified camber

Value ≥ 0 ; 0 means no check for this item. [L]

16. Net area to total area ratio

Value ≥ 0 ; 0 means use program determined value.

17. Live load reduction factor

Value ≥ 0 ; 0 means use program determined value.

18. Unbraced length ratio, L_y

Value ≥ 0 ; 0 means use program determined value.

19. Unbraced length ratio, L_z

Value ≥ 0 ; 0 means use program determined value.

20. Effective length factor, K_{2y}

Value ≥ 0 ; 0 means use program determined value.

21. Effective length factor, K_{2z}

Value ≥ 0 ; 0 means use program determined value.

22. Moment coefficient, k_{yy}

Value ≥ 0 ; 0 means use program determined value.

23. Moment coefficient, k_{zz}

Value ≥ 0 ; 0 means use program determined value.

24. Bending coefficient, C_1

Value ≥ 0 ; 0 means use program determined value.

25. Effective length factor, K_{1y}

Value ≥ 0 ; 0 means use program determined value.

26. Effective length factor, K_{1z}

Value ≥ 0 ; 0 means use program determined value.

27. Yield stress, F_y

Value ≥ 0 ; 0 means use program determined value. $[F/L^2]$

28. Compressive capacity, N_c, R_d

Value ≥ 0 ; 0 means use program determined value. $[F]$

29. Tensile capacity N_t, R_d

Value ≥ 0 ; 0 means use program determined value. $[F]$

30. Bending capacity Y-Y, M_{cy}, R_d

Value ≥ 0 ; 0 means use program determined value. $[F.L]$

31. Bending capacity Z-Z, M_{cz}, R_d

Value ≥ 0 ; 0 means use program determined value. $[F.L]$

32. Buckling resistance moment, M_b, R_d

Value ≥ 0 ; 0 means use program determined value. $[F.L]$

33. Shear capacity Z-Z, V_z, R_d

Value ≥ 0 ; 0 means use program determined value. $[F]$

34. Shear capacity Y-Y, V_y, R_d

Value ≥ 0 ; 0 means use program determined value. $[F]$

35. Demand/capacity ratio limit

Value ≥ 0 ; 0 means use program determined value.

36. Section Class

- . 0 = Program Default
- . 1 = Class 1
- . 2 = Class 2
- . 3 = Class 3
- . 4 = Class 4

37. Column buckling curve (y-y)

- . 0 = Program Default
- . 1 = a0
- . 2 = a
- . 3 = b
- . 4 = c
- . 5 = d

38. Column buckling curve (z-z)

- . 0 = Program Default
- . 1 = a0
- . 2 = a
- . 3 = b

- 4 = c
- 5 = d
- 39. Buckling curve for LTB
 - 0 = Program Default
 - 1 = a0
 - 2 = a
 - 3 = b
 - 4 = c
 - 5 = d
- 40. System overstrength factor, Omega

Value ≥ 0 ; 0 means use a program determined value.
- 41. Is rolled section
 - 0 = Program Default
 - 1 = No
 - 2 = Yes
- 42. Unbraced length ratio, LTB

Value ≥ 0 ; 0 means use program determined value.
- 44. Effective length factor, KLTB

Value ≥ 0 ; 0 means use program determined value.
- 45. Material overstrength, GammaOv

Value ≥ 0 ; 0 means use program determined value.
- 49. Bending coefficient, C2

Value ≥ 0 ; 0 means use program determined value.
- 50. Bending coefficient, C3

Value ≥ 0 ; 0 means use program determined value.
- 51. Warping constant, Iw

Value ≥ 0 ; 0 means use program determined value.
- 52. Elastic torsional buckling force, Ncr,T

Value ≥ 0 ; 0 means use program determined value.
- 53. Elastic torsional-flexural buckling force, Ncr,TF

Value ≥ 0 ; 0 means use program determined value.
- 54. Elastic critical moment for lateral-torsional buckling, Mcr

Value ≥ 0 ; 0 means use program determined value.
- 55. Moment coefficient, kzy

Value ≥ 0 ; 0 means use program determined value.
- 56. Moment coefficient, kyz

Value ≥ 0 ; 0 means use program determined value.
- 57. Warping coefficient, kw

Value ≥ 0 ; 0 means use program determined value.

Value ≥ 0 ; 0 means use program determined value.

58. Coordinate of load application, za

59. Coordinate of shear center, zs

ItemType (Optional)

Type: $\hat{A}$ ETABSv1eItemType

This is one of the following items in the eItemType enumeration:

◊ Object = 0

◊ Group = 1

◊ SelectedObjects = 2

If this item is Objects, the assignment is made to the frame object specified by the Name item.

If this item is Group, the assignment is made to all frame objects in the group specified by the Name item.

If this item is SelectedObjects, the assignment is made to all selected frame objects and the Name item is ignored.

Return Value

Type: $\hat{A}$ Int32

Returns zero if the item is successfully set; otherwise it returns a nonzero value.

▲ Remarks

▲ Examples

VB

Copy

```
Public Sub Example()
    Dim SapModel As cSapModel
    Dim EtabsObject As cOAPI
    Dim ret As Integer = -1
    Dim Value As Double
    Dim ProgDet As Boolean

    'create ETABS object
    Dim myHelper as cHelper = New Helper
    EtabsObject = myHelper.CreateObjectProgID("CSI.ETABS.API.ETABSObject")

    'start ETABS application
    ret = EtabsObject.ApplicationStart()

    'create SapModel object
    SapModel = EtabsObject.SapModel

    'initialize model
    ret = SapModel.InitializeNewModel()

    'create steel deck template model
    ret = SapModel.File.NewSteelDeck(4, 12, 12, 4, 4, 24, 24)

    'set steel design code
    ret = SapModel.DesignSteel.SetCode("Eurocode 3-2005")

    'set overwrite item
    ret = SapModel.DesignSteel.Eurocode_3_2005.SetOverwrite("8", 2, 1)

    'close ETABS
```

Introduction

```
EtabsObject.ApplicationExit(False)

'clean up variables
  SapModel = Nothing
  EtabsObject = Nothing

End Sub
```

CSI API ETABS v1

cDStEurocode_3_2005AddLanguageSpecificTextSet("L Method

Sets the value of a steel design preference item.

Namespace: ETABSv1

Assembly: ETABSv1 (in ETABSv1.dll) Version: 1.0.0.0 (1.24.0.0)

■ Syntax

C#

VB

C++

F#

Copy

```
int SetPreference(
    int Item,
    double Value
)
```

```
Function SetPreference (
    Item As Integer,
    Value As Double
) As Integer
```

```
Dim instance As cDStEurocode_3_2005
Dim Item As Integer
Dim Value As Double
Dim returnValue As Integer
```

```
returnValue = instance.SetPreference(Item,
    Value)
```

```
int SetPreference(
    int Item,
    double Value
)
```

```
abstract SetPreference :
    Item : int *
    Value : float -> int
```

Parameters

Item

Type: SystemInt32

This is an integer between 1 and 24, inclusive, indicating the preference item considered.

1. Country
2. Combos equation
3. K factor method
4. Framing type
5. Partial safety factor, GammaM0

6. Partial safety factor, Γ_{M1}
7. Partial safety factor, Γ_{M2}
8. Consider deflection
9. DL deflection limit, $L/Value$
10. SDL + LL deflection limit, $L/Value$
11. LL deflection limit, $L/Value$
12. Total load deflection limit, $L/Value$
13. Total camber limit, $L/Value$
14. Pattern live load factor
15. Demand/capacity ratio limit
16. Multi-response case design
17. Reliability class
18. Behavior factor, q
19. System overstrength, Ω
20. Consider P-delta
21. Consider torsion
22. Ignore seismic code
23. Ignore special seismic load
24. Are Doubler plates plug-welded

Value

Type: SystemDouble

The numeric value of the considered preference item.

1. Country
 - 1 = CEN Default
 - 2 = United Kingdom
 - 3 = Slovenia
 - 4 = Bulgaria
 - 5 = Norway
 - 6 = Singapore
 - 7 = Sweden
 - 8 = Finland
 - 9 = Denmark
 - 10 = Portugal
 - 11 = Germany
 - 12 = Poland
 - 13 = Ireland
2. Combos equation
 - 1 = Eq. 6.10
 - 2 = Max of Eqs. 6.10a and 6.10b
3. K factor method
 - 1 = Method A
 - 2 = Method B
 - 3 = Both
4. Framing type
 - 1 = DCH-MRF (Ductility Class High - Moment Frame)
 - 2 = DCM-MRF (Ductility Class Medium - Moment Frame)
 - 3 = DCL-MRF (Ductility Class Low - Moment Frame)
 - 4 = DCH-CBF (Ductility Class High - Concentrically Braced Frame)
 - 5 = DCM-CBF (Ductility Class Medium - Concentrically Braced Frame)
 - 6 = DCL-CBF (Ductility Class Low - Concentrically Braced Frame)

Introduction

- 7 = DCH-EBF (Ductility Class High - Eccentrically Braced Frame)
- 8 = DCM-EBF (Ductility Class Medium - Eccentrically Braced Frame)
- 9 = DCL-EBF (Ductility Class Low - Eccentrically Braced Frame)
- 10 = Inverted Pendulum Structure
- 11 = Secondary
- 12 = Non Seismic

5. Partial safety factor, Γ_{M0}

Value > 0

6. Partial safety factor, Γ_{M1}

Value > 0

7. Partial safety factor, Γ_{M2}

Value > 0

8. Consider deflection

0 = No

Any other value = Yes

9. DL deflection limit, $L/Value$

Value > 0

10. SDL + LL deflection limit, $L/Value$

Value > 0

11. LL deflection limit, $L/Value$

Value > 0

12. Total load deflection limit, $L/Value$

Value > 0

13. Total camber limit limit, $L/Value$

Value > 0

14. Pattern live load factor

Value > 0

15. Demand/capacity ratio limit

Value > 0

16. Multi-response case design

- 1 = Envelopes
- 2 = Step-by-Step
- 3 = Last Step
- 4 = Envelope -- All
- 5 = Step-by-Step -- All

17. Reliability class

- 1 = Class 1
- 2 = Class 2

- 3 = Class 3
18. Behavior factor, q
- Value > 0
19. System overstrength, Ω
- Value > 0
20. Consider P-delta
- 0 = No
- Any other value = Yes
21. Consider Torsion
- 0 = No
- Any other value = Yes
22. Ignore seismic code
- 0 = No
- Any other value = Yes
23. Ignore special seismic load
- 0 = No
- Any other value = Yes
24. Are Doubler plates plug-welded
- 0 = No
- Any other value = Yes

Return Value

Type: Int32

Returns zero if the item is successfully retrieved; otherwise it returns a nonzero value.

CSI API ETABS v1

cDStItalianNTC2008SAddLanguageSpecificTextSet("LST Method

Retrieves the value of a steel design overwrite item

Namespace: [ETABSv1](#)

Assembly: [ETABSv1](#) (in ETABSv1.dll) Version: 1.0.0.0 (1.24.0.0)

■ Syntax

[C#](#)

[VB](#)

[C++](#)

[F#](#)

[Copy](#)

```
int GetOverwrite(
    string Name,
    int Item,
    ref double Value,
    ref bool ProgDet
)
```

```
Function GetOverwrite (
    Name As String,
    Item As Integer,
    ByRef Value As Double,
    ByRef ProgDet As Boolean
) As Integer
```

```
Dim instance As cDStItalianNTC2008S
Dim Name As String
Dim Item As Integer
Dim Value As Double
Dim ProgDet As Boolean
Dim returnValue As Integer
```

```
returnValue = instance.GetOverwrite(Name,
    Item, Value, ProgDet)
```

```
int GetOverwrite(
    String^ Name,
    int Item,
    double% Value,
    bool% ProgDet
)
```

```
abstract GetOverwrite :
    Name : string *
    Item : int *
    Value : float byref *
    ProgDet : bool byref -> int
```

Parameters

Name

Type: SystemString

The name of a frame object with a steel frame design procedure

Item

Type: SystemInt32

This is an integer between 1 and 57, inclusive, indicating the overwrite item considered.

1. Design Section
2. Framing Type
3. Section Class
4. Column buckling curve (y-y)
5. Column buckling curve (z-z)
6. Buckling curve for LTB
7. System Overstrength
8. Is Shape Rolled
9. Consider Deflection
10. Deflection check type
11. DL deflection limit, L/Value
12. SDL + LL deflection limits, L/Value
13. LL deflection limit, L/Value
14. Total load deflection limit, L/Value
15. Total camber limit, L/Value
16. DL deflection limit, absolute
17. SDL + LL deflection limit, absolute
18. LL deflection limit, absolute
19. Total load deflection limit, absolute
20. Total camber limit, absolute
21. Specified camber
22. Net area to total area ratio
23. Live load reduction factor
24. Unbraced length ratio, L_y
25. Unbraced length ratio, L_z
26. Unbraced length ratio, LLTB
27. Effective length factor, K_{1y}
28. Effective length factor, K_{1z}
29. Effective length factor, K_{2y}
30. Effective length factor, K_{2z}
31. Effective length factor, KLTB
32. Bending coefficient, C_1
33. Moment coefficient, k_{yy}
34. Moment coefficient, k_{zz}
35. Moment coefficient, k_{zy}
36. Moment coefficient, k_{yz}
37. Yield stress, F_y
38. Material Overstrength, Γ_{Ov}
39. Compressive capacity, N_{cRd}
40. Tensile capacity, N_{tRd}
41. Bending capacity Y-Y, $M_{cy,Rd}$
42. Bending capacity Z-Z, $M_{cz,Rd}$

- 43. Buckling resistance moment, M_b, R_d
- 44. Shear capacity Z-Z, V_z, R_d
- 45. Shear capacity Y-Y, V_y, R_d
- 46. Demand/capacity ratio limit
- 49. Bending coefficient, C_2
- 50. Bending coefficient, C_3
- 51. Warping constant, I_w
- 52. Elastic torsional buckling force, $N_{cr, T}$
- 53. Elastic torsional-flexural buckling force, $N_{cr, TF}$
- 54. Elastic critical moment for lateral-torsional buckling, M_{cr}
- 55. Warping coefficient, k_w
- 56. Coordinate of load application, z_a
- 57. Coordinate of shear center, z_s

Value

Type: SystemDouble

The numeric value of the considered overwrite item.

1. Design Section
2. Framing Type
 - . 0 = Program Default
 - . 1 = DCH-MRF
 - . 2 = DCL-MRF
 - . 3 = DCH-CBF
 - . 4 = DCL-CBF
 - . 5 = DCH-EBF
 - . 6 = DCL-EBF
 - . 7 = InvPendulum
 - . 8 = Non Dissipative
3. Section Class
 - . 0 = Program Default
 - . 1 = Class 1
 - . 2 = Class 2
 - . 3 = Class 3
 - . 4 = Class 4
4. Column buckling curve (y-y)
 - . 0 = Program Default
 - . 1 = a0
 - . 2 = a
 - . 3 = b
 - . 4 = c
 - . 5 = d
5. Column buckling curve (z-z)
 - . 0 = Program Default
 - . 1 = a0
 - . 2 = a
 - . 3 = b
 - . 4 = c
 - . 5 = d
6. Buckling curve for LTB
 - . 0 = Program Default
 - . 1 = a0
 - . 2 = a

- 3 = b
- 4 = c
- 5 = d

7. System Overstrength

Value ≥ 0 ; 0 means use a program determined value.

8. Is Shape Rolled

- 0 = Program Default
- 1 = No
- 2 = Yes

9. Consider Deflection

- 0 = Program Default
- 1 = No
- 2 = Yes

10. Deflection check type

- 0 = Program Default
- 1 = Ratio
- 2 = Absolute
- 3 = Both

11. DL deflection limit, L/Value

Value ≥ 0 ; 0 means no check for this item.

12. SDL + LL deflection limits, L/Value

Value ≥ 0 ; 0 means no check for this item.

13. Value ≥ 0 ; 0 means no check for this item.

LL deflection limit, L/Value

14. Total load deflection limit, L/Value

Value ≥ 0 ; 0 means no check for this item.

15. Total camber limit, L/Value

Value ≥ 0 ; 0 means no check for this item.

16. DL deflection limit, absolute

Value ≥ 0 ; 0 means no check for this item. [L]

17. SDL + LL deflection limit, absolute

Value ≥ 0 ; 0 means no check for this item. [L]

18. LL deflection limit, absolute

Value ≥ 0 ; 0 means no check for this item. [L]

19. Total load deflection limit, absolute

Value ≥ 0 ; 0 means no check for this item. [L]

20. Total camber limit, absolute

Value ≥ 0 ; 0 means no check for this item. [L]

21. Specified camber

Introduction

Value ≥ 0 ; 0 means no check for this item. [L]

22. Net area to total area ratio

Value ≥ 0 ; 0 means use program determined value.

23. Live load reduction factor

Value ≥ 0 ; 0 means use program determined value.

24. Unbraced length ratio, L_y

Value ≥ 0 ; 0 means use program determined value.

25. Unbraced length ratio, L_z

Value ≥ 0 ; 0 means use program determined value.

26. Unbraced length ratio, LLTB

Value ≥ 0 ; 0 means use program determined value.

27. Effective length factor, K_{1y}

Value ≥ 0 ; 0 means use program determined value.

28. Effective length factor, K_{1z}

Value ≥ 0 ; 0 means use program determined value.

29. Effective length factor, K_{2y}

Value ≥ 0 ; 0 means use program determined value.

30. Effective length factor, K_{2z}

Value ≥ 0 ; 0 means use program determined value.

31. Effective length factor, KLTB

Value ≥ 0 ; 0 means use program determined value.

32. Bending coefficient, C_1

Value ≥ 0 ; 0 means use program determined value.

33. Bending coefficient, k_{yy}

Value ≥ 0 ; 0 means use program determined value.

34. Moment coefficient, k_{zz}

Value ≥ 0 ; 0 means use program determined value.

35. Moment coefficient, k_{zy}

Value ≥ 0 ; 0 means use program determined value.

36. Moment coefficient, k_{yz}

Value ≥ 0 ; 0 means use program determined value.

37. Yield stress, F_y

Value ≥ 0 ; 0 means use program determined value. [F/L^2]

38. Material Overstrength, Γ_{Ov}

Introduction

Value ≥ 0 ; 0 means use program determined value.

39. Compressive capacity, N_c, R_d

Value ≥ 0 ; 0 means use program determined value. [F]

40. Tensile capacity, N_t, R_d

Value ≥ 0 ; 0 means use program determined value. [F]

41. Bending capacity Y-Y, M_{cy}, R_d

Value ≥ 0 ; 0 means use program determined value. [F.L]

42. Bending capacity Z-Z, M_{cz}, R_d

Value ≥ 0 ; 0 means use program determined value. [F.L]

43. Buckling resistance moment, M_b, R_d

Value ≥ 0 ; 0 means use program determined value. [F.L]

44. Shear capacity Z-Z, V_z, R_d

Value ≥ 0 ; 0 means use program determined value. [F]

45. Shear capacity Y-Y, V_y, R_d

Value ≥ 0 ; 0 means use program determined value. [F]

46. Demand/capacity ratio limit

Value ≥ 0 ; 0 means use program determined value.

49. Bending coefficient, C_2

Value ≥ 0 ; 0 means use program determined value.

50. Bending coefficient, C_3

Value ≥ 0 ; 0 means use program determined value.

51. Warping constant, I_w

Value ≥ 0 ; 0 means use program determined value.

52. Elastic torsional buckling force, N_{crT}

Value ≥ 0 ; 0 means use program determined value.

53. Elastic torsional-flexural buckling force, N_{crTF}

Value ≥ 0 ; 0 means use program determined value.

54. Elastic critical moment for lateral-torsional buckling, M_{cr}

Value ≥ 0 ; 0 means use program determined value.

55. Warping coefficient, k_w

Value ≥ 0 ; 0 means use program determined value.

56. Coordinate of load application, z_a

57. Coordinate of shear center, z_s

ProgDet

Type: SystemBoolean

If this item is True, the specified value is program determined.

Return ValueType: Int32

Returns zero if the item is successfully retrieved; otherwise it returns a nonzero value.

CSI API ETABS v1

cDStItalianNTC2008SAddLanguageSpecificTextSet("LSTCF2DBFC8_0")

Method

Retrieves the value of a steel design preference item.

Namespace: [ETABSv1](#)

Assembly: [ETABSv1](#) (in ETABSv1.dll) Version: 1.0.0.0 (1.24.0.0)

Syntax

[C#](#)

[VB](#)

[C++](#)

[F#](#)

[Copy](#)

```
int GetPreference(
    int Item,
    ref double Value
)
```

```
Function GetPreference (
    Item As Integer,
    ByRef Value As Double
) As Integer
```

```
Dim instance As cDStItalianNTC2008S
Dim Item As Integer
Dim Value As Double
Dim returnValue As Integer
```

```
returnValue = instance.GetPreference(Item,
    Value)
```

```
int GetPreference(
    int Item,
    double% Value
)
```

```
abstract GetPreference :
    Item : int *
    Value : float byref -> int
```

Parameters

Item

Type: [SystemInt32](#)

This is an integer between 3 and 23, inclusive, indicating the preference item considered.

3. Method used for Buckling in P-M-M
4. Framing type
5. Partial safety factor, GammaM0
6. Partial safety factor, GammaM1
7. Partial safety factor, GammaM2

8. Consider deflection
9. DL deflection limit, L/Value
10. SDL + LL deflection limit, L/Value
11. LL deflection limit, L/Value
12. Total load deflection limit, L/Value
13. Total camber limit, L/Value
14. Pattern live load factor
15. Demand/capacity ratio limit
16. Multi-response case design
17. Behavior factor, q
18. System overstrength, Ω
19. Consider P-delta
20. Consider torsion
21. Ignore seismic code
22. Ignore special seismic load
23. Are Doubler plates plug-welded

Value

Type: SystemDouble

The numeric value of the considered preference item.

3. Method used for Buckling in P-M-M
 - . 1 = Method A
 - . 2 = Method B
 - . 3 = Both
4. Framing type
 - . 1 = DCH-MRF (Ductility Class High - Moment Frame)
 - . 2 = DCL-MRF (Ductility Class Low - Moment Frame)
 - . 3 = DCH-CBF (Ductility Class High - Concentrically Braced Frame)
 - . 4 = DCL-CBF (Ductility Class Low - Concentrically Braced Frame)
 - . 5 = DCH-EBF (Ductility Class High - Eccentrically Braced Frame)
 - . 6 = DCL-EBF (Ductility Class Low - Eccentrically Braced Frame)
 - . 7 = Inverted Pendulum Structure
 - . 8 = Non Dissipative
5. Partial safety factor, Γ_{M0}

Value > 0

6. Partial safety factor, Γ_{M1}

Value > 0

7. Partial safety factor, Γ_{M2}

Value > 0

8. Consider deflection

1 or "No" - Default

2 or "Yes"

9. DL deflection limit, L/Value

Value > 0

10. SDL + LL deflection limit, L/Value

- Value > 0
11. LL deflection limit, L/Value
- Value > 0
12. Total load deflection limit, L/Value
- Value > 0
13. Total camber limit limit, L/Value
- Value > 0
14. Pattern live load factor
- Value > 0
15. Demand/capacity ratio limit
- Value > 0
16. Multi-response case design
 · 1 = Envelopes
 · 2 = Step-by-Step
 · 3 = Last Step
 · 4 = Envelope -- All
 · 5 = Step-by-Step -- All
 17. Behavior factor, q
- Value > 0
18. System overstrength, Omega
- Value > 0
19. Consider P-delta
- 1 or "No" - Default
2 or "Yes"
20. Consider Torsion
- 1 or "No" - Default
2 or "Yes"
21. Ignore seismic code
- 1 or "No" - Default
2 or "Yes"
22. Ignore special seismic load
- 1 or "No" - Default
2 or "Yes"
23. Are Doubler plates plug-welded
- 1 or "No" - Default

2 or "Yes"

Return Value

Type: Int32

Returns zero if the item is successfully retrieved; otherwise it returns a nonzero value.

CSI API ETABS v1

cDStItalianNTC2008SAddLanguageSpecificTextSet("LS

Method

Sets the value of a steel design overwrite item

Namespace: ETABSv1

Assembly: ETABSv1 (in ETABSv1.dll) Version: 1.0.0.0 (1.24.0.0)

■ Syntax

C#

VB

C++

F#

Copy

```
int SetOverwrite(
    string Name,
    int Item,
    double Value,
    eItemType ItemType = eItemType.Objects
)
```

```
Function SetOverwrite (
    Name As String,
    Item As Integer,
    Value As Double,
    ?ItemType As eItemType = eItemType.Objects
) As Integer
```

```
Dim instance As cDStItalianNTC2008S
Dim Name As String
Dim Item As Integer
Dim Value As Double
Dim ItemType As eItemType
Dim returnValue As Integer
```

```
returnValue = instance.SetOverwrite(Name,
    Item, Value, ItemType)
```

```
int SetOverwrite(
    String^ Name,
    int Item,
    double Value,
    eItemType ItemType = eItemType::Objects
)
```

```
abstract SetOverwrite :
    Name : string *
    Item : int *
    Value : float *
    ?ItemType : eItemType
(* Defaults:
    let _ItemType = defaultArg ItemType eItemType.Objects
*)
-> int
```

Parameters**Name**

Type: SystemString

The name of an existing frame object or group, depending on the value of the ItemType item.

Item

Type: SystemInt32

This is an integer between 1 and 57, inclusive, indicating the overwrite item considered.

1. Design Section
2. Framing Type
3. Section Class
4. Column buckling curve (y-y)
5. Column buckling curve (z-z)
6. Buckling curve for LTB
7. System Overstrength
8. Is Shape Rolled
9. Consider Deflection
10. Deflection check type
11. DL deflection limit, L/Value
12. SDL + LL deflection limits, L/Value
13. LL deflection limit, L/Value
14. Total load deflection limit, L/Value
15. Total camber limit, L/Value
16. DL deflection limit, absolute
17. SDL + LL deflection limit, absolute
18. LL deflection limit, absolute
19. Total load deflection limit, absolute
20. Total camber limit, absolute
21. Specified camber
22. Net area to total area ratio
23. Live load reduction factor
24. Unbraced length ratio, Ly
25. Unbraced length ratio, Lz
26. Unbraced length ratio, LLTB
27. Effective length factor, K1y
28. Effective length factor, K1z
29. Effective length factor, K2y
30. Effective length factor, K2z
31. Effective length factor, KLTB
32. Bending coefficient, C1
33. Moment coefficient, kyy
34. Moment coefficient, kzz
35. Moment coefficient, kzy
36. Moment coefficient, kyz
37. Yield stress, Fy
38. Material Overstrength, GammaOv
39. Compressive capacity, Nc,Rd
40. Tensile capacity, Nt,Rd
41. Bending capacity Y-Y, Mcy,Rd

- 42. Bending capacity Z-Z, M_{cz}, R_d
- 43. Buckling resistance moment, M_b, R_d
- 44. Shear capacity Z-Z, V_z, R_d
- 45. Shear capacity Y-Y, V_y, R_d
- 46. Demand/capacity ratio limit
- 49. Bending coefficient, C2
- 50. Bending coefficient, C3
- 51. Warping constant, I_w
- 52. Elastic torsional buckling force, $N_{cr, T}$
- 53. Elastic torsional-flexural buckling force, $N_{cr, TF}$
- 54. Elastic critical moment for lateral-torsional buckling, M_{cr}
- 55. Warping coefficient, k_w
- 56. Coordinate of load application, z_a
- 57. Coordinate of shear center, z_s

Value

Type: SystemDouble

The numeric value of the considered overwrite item.

- 1. Design Section
- 2. Framing Type
 - . 0 = Program Default
 - . 1 = DCH-MRF
 - . 2 = DCL-MRF
 - . 3 = DCH-CBF
 - . 4 = DCL-CBF
 - . 5 = DCH-EBF
 - . 6 = DCL-EBF
 - . 7 = InvPendulum
 - . 8 = Non Dissipative
- 3. Section Class
 - . 0 = Program Default
 - . 1 = Class 1
 - . 2 = Class 2
 - . 3 = Class 3
 - . 4 = Class 4
- 4. Column buckling curve (y-y)
 - . 0 = Program Default
 - . 1 = a0
 - . 2 = a
 - . 3 = b
 - . 4 = c
 - . 5 = d
- 5. Column buckling curve (z-z)
 - . 0 = Program Default
 - . 1 = a0
 - . 2 = a
 - . 3 = b
 - . 4 = c
 - . 5 = d
- 6. Buckling curve for LTB
 - . 0 = Program Default
 - . 1 = a0

- . 2 = a
- . 3 = b
- . 4 = c
- . 5 = d

7. System Overstrength

Value ≥ 0 ; 0 means use a program determined value.

8. Is Shape Rolled

- . 0 = Program Default
- . 1 = No
- . 2 = Yes

9. Consider Deflection

- . 0 = Program Default
- . 1 = No
- . 2 = Yes

10. Deflection check type

- . 0 = Program Default
- . 1 = Ratio
- . 2 = Absolute
- . 3 = Both

11. DL deflection limit, L/Value

Value ≥ 0 ; 0 means no check for this item.

12. SDL + LL deflection limits, L/Value

Value ≥ 0 ; 0 means no check for this item.

13. Value ≥ 0 ; 0 means no check for this item.

LL deflection limit, L/Value

14. Total load deflection limit, L/Value

Value ≥ 0 ; 0 means no check for this item.

15. Total camber limit, L/Value

Value ≥ 0 ; 0 means no check for this item.

16. DL deflection limit, absolute

Value ≥ 0 ; 0 means no check for this item. [L]

17. SDL + LL deflection limit, absolute

Value ≥ 0 ; 0 means no check for this item. [L]

18. LL deflection limit, absolute

Value ≥ 0 ; 0 means no check for this item. [L]

19. Total load deflection limit, absolute

Value ≥ 0 ; 0 means no check for this item. [L]

20. Total camber limit, absolute

Value ≥ 0 ; 0 means no check for this item. [L]

21. Specified camber

Introduction

Value ≥ 0 ; 0 means no check for this item. [L]

22. Net area to total area ratio

Value ≥ 0 ; 0 means use program determined value.

23. Live load reduction factor

Value ≥ 0 ; 0 means use program determined value.

24. Unbraced length ratio, L_y

Value ≥ 0 ; 0 means use program determined value.

25. Unbraced length ratio, L_z

Value ≥ 0 ; 0 means use program determined value.

26. Unbraced length ratio, LLTB

Value ≥ 0 ; 0 means use program determined value.

27. Effective length factor, K_{1y}

Value ≥ 0 ; 0 means use program determined value.

28. Effective length factor, K_{1z}

Value ≥ 0 ; 0 means use program determined value.

29. Effective length factor, K_{2y}

Value ≥ 0 ; 0 means use program determined value.

30. Effective length factor, K_{2z}

Value ≥ 0 ; 0 means use program determined value.

31. Effective length factor, KLTB

Value ≥ 0 ; 0 means use program determined value.

32. Bending coefficient, C_1

Value ≥ 0 ; 0 means use program determined value.

33. Moment coefficient, k_{yy}

Value ≥ 0 ; 0 means use program determined value.

34. Moment coefficient, k_{zz}

Value ≥ 0 ; 0 means use program determined value.

35. Moment coefficient, k_{zy}

Value ≥ 0 ; 0 means use program determined value.

36. Moment coefficient, k_{yz}

Value ≥ 0 ; 0 means use program determined value.

37. Yield stress, F_y

Value ≥ 0 ; 0 means use program determined value. [F/L^2]

38. Material Overstrength, Γ_{Ov}

Introduction

Value ≥ 0 ; 0 means use program determined value.

39. Compressive capacity, N_c, R_d

Value ≥ 0 ; 0 means use program determined value. [F]

40. Tensile capacity, N_t, R_d

Value ≥ 0 ; 0 means use program determined value. [F]

41. Bending capacity Y-Y, M_{cy}, R_d

Value ≥ 0 ; 0 means use program determined value. [F.L]

42. Bending capacity Z-Z, M_{cz}, R_d

Value ≥ 0 ; 0 means use program determined value. [F.L]

43. Buckling resistance moment, M_b, R_d

Value ≥ 0 ; 0 means use program determined value. [F.L]

44. Shear capacity Z-Z, V_z, R_d

Value ≥ 0 ; 0 means use program determined value. [F]

45. Shear capacity Y-Y, V_y, R_d

Value ≥ 0 ; 0 means use program determined value. [F]

46. Demand/capacity ratio limit

Value ≥ 0 ; 0 means use program determined value.

49. Bending coefficient, C_2

Value ≥ 0 ; 0 means use program determined value.

50. Bending coefficient, C_3

Value ≥ 0 ; 0 means use program determined value.

51. Warping constant, I_w

Value ≥ 0 ; 0 means use program determined value.

52. Elastic torsional buckling force, N_{cr}, T

Value ≥ 0 ; 0 means use program determined value.

53. Elastic torsional-flexural buckling force, N_{cr}, T_F

Value ≥ 0 ; 0 means use program determined value.

54. Elastic critical moment for lateral-torsional buckling, M_{cr}

Value ≥ 0 ; 0 means use program determined value.

55. Warping coefficient, k_w

Value ≥ 0 ; 0 means use program determined value.

56. Coordinate of load application, z_a

57. Coordinate of shear center, z_s

ItemType (Optional)

Type: $\hat{A}$ ETABSv1eItemType

This is one of the following items in the eItemType enumeration:

- ◇ Object = 0
- ◇ Group = 1
- ◇ SelectedObjects = 2

If this item is Objects, the assignment is made to the frame object specified by the Name item.

If this item is Group, the assignment is made to all frame objects in the group specified by the Name item.

If this item is SelectedObjects, the assignment is made to all selected frame objects and the Name item is ignored.

Return Value

Type: Int32

Returns zero if the item is successfully set; otherwise it returns a nonzero value.

▲ Remarks

▲ Examples

VB

Copy

```
Public Sub Example()
    Dim SapModel As cSapModel
    Dim EtabsObject As cOAPI
    Dim ret As Integer = -1
    Dim Value As Double
    Dim ProgDet As Boolean

    'create ETABS object
    Dim myHelper as cHelper = New Helper
    EtabsObject = myHelper.CreateObjectProgID("CSI.ETABS.API.ETABSObject")

    'start ETABS application
    ret = EtabsObject.ApplicationStart()

    'create SapModel object
    SapModel = EtabsObject.SapModel

    'initialize model
    ret = SapModel.InitializeNewModel()

    'create steel deck template model
    ret = SapModel.File.NewSteelDeck(4, 12, 12, 4, 4, 24, 24)

    'set steel design code
    ret = SapModel.DesignSteel.SetCode("Italian NTC 2008")

    'set overwrite item
    ret = SapModel.DesignSteel.Italian_NTC_2008.SetOverwrite("8", 2, 1)

    'close ETABS
    EtabsObject.ApplicationExit(False)

    'clean up variables
    SapModel = Nothing
    EtabsObject = Nothing
End Sub
```

CSI API ETABS v1

cDStItalianNTC2008SAddLanguageSpecificTextSet("LST19D83C28_0")

Method

Sets the value of a steel design preference item.

Namespace: ETABSv1

Assembly: ETABSv1 (in ETABSv1.dll) Version: 1.0.0.0 (1.24.0.0)

■ Syntax

C#

VB

C++

F#

Copy

```
int SetPreference(
    int Item,
    double Value
)
```

```
Function SetPreference (
    Item As Integer,
    Value As Double
) As Integer
```

```
Dim instance As cDStItalianNTC2008S
Dim Item As Integer
Dim Value As Double
Dim returnValue As Integer
```

```
returnValue = instance.SetPreference(Item,
    Value)
```

```
int SetPreference(
    int Item,
    double Value
)
```

```
abstract SetPreference :
    Item : int *
    Value : float -> int
```

Parameters

Item

Type: SystemInt32

This is an integer between 3 and 23, inclusive, indicating the preference item considered.

3. Method used for Buckling in P-M-M
4. Framing type
5. Partial safety factor, GammaM0
6. Partial safety factor, GammaM1
7. Partial safety factor, GammaM2

8. Consider deflection
9. DL deflection limit, L/Value
10. SDL + LL deflection limit, L/Value
11. LL deflection limit, L/Value
12. Total load deflection limit, L/Value
13. Total camber limit, L/Value
14. Pattern live load factor
15. Demand/capacity ratio limit
16. Multi-response case design
17. Behavior factor, q
18. System overstrength, Ω
19. Consider P-delta
20. Consider torsion
21. Ignore seismic code
22. Ignore special seismic load
23. Are Doubler plates plug-welded

Value

Type: SystemDouble

The numeric value of the considered preference item.

3. Method used for Buckling in P-M-M

- 1 = Method A
- 2 = Method B
- 3 = Both

4. Framing type

- 1 = DCH-MRF
- 2 = DCL-MRF
- 3 = DCH-CBF
- 4 = DCL-CBF
- 5 = DCH-EBF
- 6 = DCL-EBF
- 7 = InvPendulum
- 8 = Non Dissipative

5. Partial safety factor, Γ_{M0}

Value > 0

6. Partial safety factor, Γ_{M1}

Value > 0

7. Partial safety factor, Γ_{M2}

Value > 0

8. Consider deflection

1 or "No" - Default

2 or "Yes"

9. DL deflection limit, L/Value

Value > 0

10. SDL + LL deflection limit, L/Value

- Value > 0
11. LL deflection limit, L/Value
- Value > 0
12. Total load deflection limit, L/Value
- Value > 0
13. Total camber limit limit, L/Value
- Value > 0
14. Pattern live load factor
- Value > 0
15. Demand/capacity ratio limit
- Value > 0
16. Multi-response case design
 · 1 = Envelopes
 · 2 = Step-by-Step
 · 3 = Last Step
 · 4 = Envelope -- All
 · 5 = Step-by-Step -- All
 17. Behavior factor, q
- Value > 0
18. System overstrength, Omega
- Value > 0
19. Consider P-delta
- 1 or "No" - Default
2 or "Yes"
20. Consider Torsion
- 1 or "No" - Default
2 or "Yes"
21. Ignore seismic code
- 1 or "No" - Default
2 or "Yes"
22. Ignore special seismic load
- 1 or "No" - Default
2 or "Yes"
23. Are Doubler plates plug-welded
- 1 or "No" - Default

2 or "Yes"

Return Value

Type: Int32

Returns zero if the item is successfully retrieved; otherwise it returns a nonzero value.

```

```
abstract GetOverwrite :
    Name : string *
    Item : int *
    textValue : string byref *
    numericValue : float byref *
    ProgDet : bool byref -> int
```

Parameters

Name

Type: SystemString

The name of a frame object with a steel frame design procedure

Item

Type: SystemInt32

This is an integer between 1 and 57, inclusive, indicating the overwrite item considered.

1. Design Section
2. Framing Type
3. Section Class
4. Column buckling curve (y-y)
5. Column buckling curve (z-z)
6. Buckling curve for LTB
7. System Overstrength
8. Is Shape Rolled

33. Moment coefficient, k_{yy}
34. Moment coefficient, k_{zz}
35. Moment coefficient, k_{zy}
36. Moment coefficient, k_{yz}
37. Yield stress, F_y
38. Material Overstrength, Γ_{Ov}
39. Compressive capacity, N_c, R_d
40. Tensile capacity N_t, R_d
41. Bending capacity Y-Y, M_{cy}, R_d
42. Bending capacity Z-Z, M_{cz}, R_d

- 43. Buckling resistance moment, Mb,Rd
- 44. Shear capacity Z-Z, Vz,Rd
- 45. Shear capacity Y-Y, Vy,Rd
- 46. Demand/capacity ratio limit
- 49. Bending coefficient, C2
- 50. Bending coefficient, C3
- 51. Warping constant, Iw
- 52. Elastic torsional buckling force, Ncr,T
- 53. Elastic torsional-flexural buckling force, Ncr,TF
- 54. Elastic critical moment for lateral-torsional buckling, Mcr
- 55. Warping coefficient, kw
- 56. Coordinate of load application, za
- 57. Coordinate of shear center, zs

textValue

Type: SystemString

The string value of the considered overwrite item.

numericValue

Type: SystemDouble

The numeric value of the considered overwrite item.

- 1. Design Section
- 2. Framing Type
 - . 0 = Program Default

- Value ≥ 0 ; 0 means use program determined value. [F]
46. Demand/capacity ratio limit
- Value ≥ 0 ; 0 means use program determined value.
49. Bending coefficient, C_2
- Value ≥ 0 ; 0 means use program determined value.
50. Bending coefficient, C_3
- Value ≥ 0 ; 0 means use program determined value.
51. Warping constant, I_w
- Value ≥ 0 ; 0 means use program determined value.
52. Elastic torsional buckling force, $N_{cr,T}$
- Value ≥ 0 ; 0 means use program determined value.
53. Elastic torsional-flexural buckling force, $N_{cr,TF}$
- Value ≥ 0 ; 0 means use program determined value.
54. Elastic critical moment for lateral-torsional buckling, M_{cr}
- Value ≥ 0 ; 0 means use program determined value.
55. Warping coefficient, k_w
- Value ≥ 0 ; 0 means use program determined value.
56. Coordinate of load application, z_a
57. Coordinate of shear center, z_s

ProgDet

Type: System.Boolean

If this item is True, the specified value is program determined.

Return Value

Type: Int32

Returns zero if the item is successfully retrieved; otherwise it returns a nonzero value.

▲ Remarks

▲ Examples

VB

Copy

```
Public Sub Example()
    Dim SapModel As cSapModel
    Dim EtabsObject As cOAPI
    Dim ret As Integer = -1
    Dim textValue As String
    Dim Value As Double
    Dim ProgDet As Boolean

    'create ETABS object
    Dim myHelper as cHelper = New Helper
    EtabsObject = myHelper.CreateObjectProgID("CSI.ETABS.API.ETABSObject")

    'start ETABS application
    ret = EtabsObject.ApplicationStart()

    'create SapModel object
    SapModel = EtabsObject.SapModel

    'initialize model
    ret = SapModel.InitializeNewModel()

    'create steel deck template model

CSI API ETABS v1

cDStItalianNTC2018SAddLanguageSpecificTextSet("LST7BF205B3_0") Method

Retrieves the value of a steel design preference item.

Namespace: ETABSv1

Assembly: ETABSv1 (in ETABSv1.dll) Version: 1.0.0.0 (1.24.0.0)

Syntax

C#

VB

C++

F#

Copy

```
int GetPreference(
    int Item,
    ref string textValue,
    ref double numericValue
)
```

```
Function GetPreference (
    Item As Integer,
    ByRef textValue As String,
    ByRef numericValue As Double
) As Integer
```

```
Dim instance As cDStItalianNTC2018S
Dim Item As Integer
Dim textValue As String
Dim numericValue As Double
Dim returnValue As Integer
```

```
returnValue = instance.GetPreference(Item,
    textValue, numericValue)
```

```
int GetPreference(
    int Item,
    String^% textValue,
    double% numericValue
)
```

```
abstract GetPreference :
    Item : int *
    textValue : string byref *
    numericValue : float byref -> int
```

Parameters

Item

Type: System.Int32

This is an integer between 3 and 23, inclusive, indicating the preference item considered.

3. Method used for Buckling in P-M-M

4. Framing type
5. Partial safety factor, GammaM0
6. Partial safety factor, GammaM1
7. Partial safety factor, GammaM2
8. Consider deflection
9. DL deflection limit, L/Value
10. SDL + LL deflection limit, L/Value
11. LL deflection limit, L/Value
12. Total load deflection limit, L/Value
13. Total camber limit, L/Value
14. Pattern live load factor
15. Demand/capacity ratio limit
16. Multi-response case design
17. Behavior factor, q
18. System overstrength, Omega
19. Consider P-delta
20. Consider torsion
21. Ignore seismic code
22. Ignore special seismic load
23. Are Doubler plates plug-welded

textValue

Type: SystemString

The string value of the considered preference item.

numericValue

Type: SystemDouble

The numeric value of the considered preference item.

3. Method used for Buckling in P-M-M
 - 1 = Method A
 - 2 = Method B
 - 3 = Both
4. Framing type
 - 1 = DCH-MRF (Ductility Class High - Moment Frame)
 - 2 = DCL-MRF (Ductility Class Low - Moment Frame)
 - 3 = DCH-CBF (Ductility Class High - Concentrically Braced Frame)
 - 4 = DCL-CBF (Ductility Class Low - Concentrically Braced Frame)
 - 5 = DCH-EBF (Ductility Class High - Eccentrically Braced Frame)
 - 6 = DCL-EBF (Ductility Class Low - Eccentrically Braced Frame)
 - 7 = Inverted Pendulum Structure
 - 8 = Non Dissipative
5. Partial safety factor, GammaM0

Value > 0
6. Partial safety factor, GammaM1

Value > 0
7. Partial safety factor, GammaM2

Value > 0
8. Consider deflection

1 or "No" - Default

2 or "Yes"

9. DL deflection limit, L/Value

Value > 0

10. SDL + LL deflection limit, L/Value

Value > 0

11. LL deflection limit, L/Value

Value > 0

12. Total load deflection limit, L/Value

Value > 0

13. Total camber limit limit, L/Value

Value > 0

14. Pattern live load factor

Value > 0

15. Demand/capacity ratio limit

Value > 0

16. Multi-response case design

- 1 = Envelopes
- 2 = Step-by-Step
- 3 = Last Step
- 4 = Envelope -- All
- 5 = Step-by-Step -- All

17. Behavior factor, q

Value > 0

18. System overstrength, Omega

Value > 0

19. Consider P-delta

1 or "No" - Default

2 or "Yes"

20. Consider Torsion

1 or "No" - Default

2 or "Yes"

21. Ignore seismic code

1 or "No" - Default

2 or "Yes"

22. Ignore special seismic load

1 or "No" - Default

2 or "Yes"

23. Are Doubler plates plug-welded

1 or "No" - Default

2 or "Yes"

Return Value

Type: Int32

Returns zero if the item is successfully retrieved; otherwise it returns a nonzero value.

CSI API ETABS v1

cDStItalianNTC2018SAddLanguageSpecificTextSet("LST89262CD3_0")

Method

Sets the value of a steel design overwrite item

Namespace: ETABSv1

Assembly: ETABSv1 (in ETABSv1.dll) Version: 1.0.0.0 (1.24.0.0)

Syntax

C#

VB

C++

F#

Copy

```
int SetOverwrite(
    string Name,
    int Item,
    string textValue,
    double numericValue,
    eItemType ItemType = eItemType.Objects
)
```

```
Function SetOverwrite (
    Name As String,
    Item As Integer,
    textValue As String,
    numericValue As Double,
    ?ItemType As eItemType = eItemType.Objects
) As Integer
```

```
Dim instance As cDStItalianNTC2018S
Dim Name As String
Dim Item As Integer
Dim textValue As String
Dim numericValue As Double
Dim ItemType As eItemType
Dim returnValue As Integer
```

```
returnValue = instance.SetOverwrite(Name,
    Item, textValue, numericValue, ItemType)
```

```
int SetOverwrite(
    String^ Name,
    int Item,
    String^ textValue,
    double numericValue,
    eItemType ItemType = eItemType::Objects
)
```

```
abstract SetOverwrite :
    Name : string *
    Item : int *
    textValue : string *
    numericValue : float *
    ?ItemType : eItemType
```

```
(* Defaults:
    let _ItemType = defaultArg ItemType eItemType.Objects
*)
-> int
```

Parameters

Name

Type: SystemString

The name of an existing frame object or group, depending on the value of the ItemType item.

Item

Type: SystemInt32

This is an integer between 1 and 57, inclusive, indicating the overwrite item considered.

1. Design Section
2. Framing Type
3. Section Class
4. Column buckling curve (y-y)
5. Column buckling curve (z-z)
6. Buckling curve for LTB
7. System Overstrength
8. Is Shape Rolled
9. Consider Deflection
10. Deflection check type
11. DL deflection limit, L/Value
12. SDL + LL deflection limits, L/Value
13. LL deflection limit, L/Value
14. Total load deflection limit, L/Value
15. Total camber limit, L/Value
16. DL deflection limit, absolute
17. SDL + LL deflection limit, absolute
18. LL deflection limit, absolute
19. Total load deflection limit, absolute
20. Total camber limit, absolute
21. Specified camber
22. Net area to total area ratio
23. Live load reduction factor
24. Unbraced length ratio, Ly
25. Unbraced length ratio, Lz
26. Unbraced length ratio, LLTB
27. Effective length factor, K1y
28. Effective length factor, K1z
29. Effective length factor, K2y
30. Effective length factor, K2z
31. Effective length factor KLTB
32. Bending coefficient, C1
33. Bending coefficient, kyy
34. Bending coefficient, kzz
35. Bending coefficient, kzy
36. Bending coefficient, kyz

37. Yield stress, F_y
38. Material Overstrength, Γ_{ov}
39. Compressive capacity, $N_{c,Rd}$
40. Tensile capacity $N_{t,Rd}$
41. Bending capacity Y-Y, $M_{cy,Rd}$
42. Bending capacity Z-Z, $M_{cz,Rd}$
43. Buckling resistance moment, $M_{b,Rd}$
44. Shear capacity Z-Z, $V_{z,Rd}$
45. Shear capacity Y-Y, $V_{y,Rd}$
46. Demand/capacity ratio limit
49. Bending coefficient, C_2
50. Bending coefficient, C_3
51. Warping constant, I_w
52. Elastic torsional buckling force, $N_{cr,T}$
53. Elastic torsional-flexural buckling force, $N_{cr,TF}$
54. Elastic critical moment for lateral-torsional buckling, M_{cr}
55. Warping coefficient, k_w
56. Coordinate of load application, z_a
57. Coordinate of shear center, z_s

textValue

Type: SystemString

The string value of the considered overwrite item.

numericValue

Type: SystemDouble

The numeric value of the considered overwrite item.

1. Design Section
2. Framing Type
 - 0 = Program Default
 - 1 = DCH-MRF
 - 2 = DCL-MRF
 - 3 = DCH-CBF
 - 4 = DCL-CBF
 - 5 = DCH-EBF
 - 6 = DCL-EBF
 - 7 = InvPendulum
 - 8 = Non Dissipative
3. Section Class
 - 0 = Program Default
 - 1 = Class 1
 - 2 = Class 2
 - 3 = Class 3
 - 4 = Class 4
4. Column buckling curve (y-y)
 - 0 = Program Default
 - 1 = a0
 - 2 = a
 - 3 = b
 - 4 = c
 - 5 = d
5. Column buckling curve (z-z)
 - 0 = Program Default

Introduction

- . 1 = a0
 - . 2 = a
 - . 3 = b
 - . 4 = c
 - . 5 = d
6. Buckling curve for LTB
- . 0 = Program Default
 - . 1 = a0
 - . 2 = a
 - . 3 = b
 - . 4 = c
 - . 5 = d
7. System Overstrength
- Value ≥ 0 ; 0 means use a program determined value.
8. Is Shape Rolled
- . 0 = Program Default
 - . 1 = No
 - . 2 = Yes
9. Consider Deflection
- . 0 = Program Default
 - . 1 = No
 - . 2 = Yes
10. Deflection check type
- . 0 = Program Default
 - . 1 = Ratio
 - . 2 = Absolute
 - . 3 = Both
11. DL deflection limit, L/Value
- Value ≥ 0 ; 0 means no check for this item.
12. SDL + LL deflection limits, L/Value
- Value ≥ 0 ; 0 means no check for this item.
13. Value ≥ 0 ; 0 means no check for this item.
- LL deflection limit, L/Value
14. Total load deflection limit, L/Value
- Value ≥ 0 ; 0 means no check for this item.
15. Total camber limit, L/Value
- Value ≥ 0 ; 0 means no check for this item.
16. DL deflection limit, absolute
- Value ≥ 0 ; 0 means no check for this item. [L]
17. SDL + LL deflection limit, absolute
- Value ≥ 0 ; 0 means no check for this item. [L]
18. LL deflection limit, absolute

Introduction

Value ≥ 0 ; 0 means no check for this item. [L]

19. Total load deflection limit, absolute

Value ≥ 0 ; 0 means no check for this item. [L]

20. Total camber limit, absolute

Value ≥ 0 ; 0 means no check for this item. [L]

21. Specified camber

Value ≥ 0 ; 0 means no check for this item. [L]

22. Net area to total area ratio

Value ≥ 0 ; 0 means use program determined value.

23. Live load reduction factor

Value ≥ 0 ; 0 means use program determined value.

24. Unbraced length ratio, L_y

Value ≥ 0 ; 0 means use program determined value.

25. Unbraced length ratio, L_z

Value ≥ 0 ; 0 means use program determined value.

26. Unbraced length ratio, LLTB

Value ≥ 0 ; 0 means use program determined value.

27. Effective length factor, K_{1y}

Value ≥ 0 ; 0 means use program determined value.

28. Effective length factor, K_{1z}

Value ≥ 0 ; 0 means use program determined value.

29. Effective length factor, K_{2y}

Value ≥ 0 ; 0 means use program determined value.

30. Effective length factor, K_{2z}

Value ≥ 0 ; 0 means use program determined value.

31. Effective length factor, KLTB

Value ≥ 0 ; 0 means use program determined value.

32. Bending coefficient, C_1

Value ≥ 0 ; 0 means use program determined value.

33. Moment coefficient, k_{yy}

Value ≥ 0 ; 0 means use program determined value.

34. Moment coefficient, k_{zz}

Value ≥ 0 ; 0 means use program determined value.

35. Moment coefficient, k_{zy}

Introduction

- Value ≥ 0 ; 0 means use program determined value.
36. Moment coefficient, k_{yz}
- Value ≥ 0 ; 0 means use program determined value.
37. Yield stress, F_y
- Value ≥ 0 ; 0 means use program determined value. $[F/L^2]$
38. Material Overstrength, $\Gamma_{M,Ov}$
- Value ≥ 0 ; 0 means use program determined value.
39. Compressive capacity, $N_{c,Rd}$
- Value ≥ 0 ; 0 means use program determined value. $[F]$
40. Tensile capacity, $N_{t,Rd}$
- Value ≥ 0 ; 0 means use program determined value. $[F]$
41. Bending capacity Y-Y, $M_{cy,Rd}$
- Value ≥ 0 ; 0 means use program determined value. $[F.L]$
42. Bending capacity Z-Z, $M_{cz,Rd}$
- Value ≥ 0 ; 0 means use program determined value. $[F.L]$
43. Buckling resistance moment, $M_{b,Rd}$
- Value ≥ 0 ; 0 means use program determined value. $[F.L]$
44. Shear capacity Z-Z, $V_{z,Rd}$
- Value ≥ 0 ; 0 means use program determined value. $[F]$
45. Shear capacity Y-Y, $V_{y,Rd}$
- Value ≥ 0 ; 0 means use program determined value. $[F]$
46. Demand/capacity ratio limit
- Value ≥ 0 ; 0 means use program determined value.
49. Bending coefficient, C_2
- Value ≥ 0 ; 0 means use program determined value.
50. Bending coefficient, C_3
- Value ≥ 0 ; 0 means use program determined value.
51. Warping constant, I_w
- Value ≥ 0 ; 0 means use program determined value.
52. Elastic torsional buckling force, $N_{cr,T}$
- Value ≥ 0 ; 0 means use program determined value.
53. Elastic torsional-flexural buckling force, $N_{cr,TF}$
- Value ≥ 0 ; 0 means use program determined value.
54. Elastic critical moment for lateral-torsional buckling, M_{cr}

Value ≥ 0 ; 0 means use program determined value.

55. Warping coefficient, kw

Value ≥ 0 ; 0 means use program determined value.

56. Coordinate of load application, za

57. Coordinate of shear center, zs

ItemType (Optional)

Type: $\hat{A}$ ETABSv1eItemType

This is one of the following items in the eItemType enumeration:

◊ Object = 0

◊ Group = 1

◊ SelectedObjects = 2

If this item is Objects, the assignment is made to the frame object specified by the Name item.

If this item is Group, the assignment is made to all frame objects in the group specified by the Name item.

If this item is SelectedObjects, the assignment is made to all selected frame objects and the Name item is ignored.

Return Value

Type: $\hat{A}$ Int32

Returns zero if the item is successfully set; otherwise it returns a nonzero value.

CSI API ETABS v1

cDStItalianNTC2018SAddLanguageSpecificTextSet("LST3F59757E1860") Method

Sets the value of a steel design preference item.

Namespace: [ETABSV1](#)

Assembly: [ETABSV1](#) (in ETABSV1.dll) Version: 1.0.0.0 (1.24.0.0)

■ Syntax

[C#](#)

[VB](#)

[C++](#)

[F#](#)

[Copy](#)

```
int SetPreference(
    int Item,
    string textValue,
    double numericValue
)
```

```
Function SetPreference (
    Item As Integer,
    textValue As String,
    numericValue As Double
) As Integer
```

```
Dim instance As cDStItalianNTC2018S
Dim Item As Integer
Dim textValue As String
Dim numericValue As Double
Dim returnValue As Integer
```

```
returnValue = instance.SetPreference(Item,
    textValue, numericValue)
```

```
int SetPreference(
    int Item,
    String^ textValue,
    double numericValue
)
```

```
abstract SetPreference :
    Item : int *
    textValue : string *
    numericValue : float -> int
```

Parameters

Item

Type: [System.Int32](#)

This is an integer between 3 and 23, inclusive, indicating the preference item considered.

3. Method used for Buckling in P-M-M

4. Framing type
5. Partial safety factor, GammaM0
6. Partial safety factor, GammaM1
7. Partial safety factor, GammaM2
8. Consider deflection
9. DL deflection limit, L/Value
10. SDL + LL deflection limit, L/Value
11. LL deflection limit, L/Value
12. Total load deflection limit, L/Value
13. Total camber limit, L/Value
14. Pattern live load factor
15. Demand/capacity ratio limit
16. Multi-response case design
17. Behavior factor, q
18. System overstrength, Omega
19. Consider P-delta
20. Consider torsion
21. Ignore seismic code
22. Ignore special seismic load
23. Are Doubler plates plug-welded

textValue

Type:Â SystemString

The string value of the considered preference item.

numericValue

Type:Â SystemDouble

The numeric value of the considered preference item.

3. Method used for Buckling in P-M-M

- 1 = Method A
- 2 = Method B
- 3 = Both

4. Framing type

- 1 = DCH-MRF
- 2 = DCL-MRF
- 3 = DCH-CBF
- 4 = DCL-CBF
- 5 = DCH-EBF
- 6 = DCL-EBF
- 7 = InvPendulum
- 8 = Non Dissipative

5. Partial safety factor, GammaM0

Value > 0

6. Partial safety factor, GammaM1

Value > 0

7. Partial safety factor, GammaM2

Value > 0

8. Consider deflection

1 or "No" - Default

2 or "Yes"

9. DL deflection limit, L/Value

Value > 0

10. SDL + LL deflection limit, L/Value

Value > 0

11. LL deflection limit, L/Value

Value > 0

12. Total load deflection limit, L/Value

Value > 0

13. Total camber limit limit, L/Value

Value > 0

14. Pattern live load factor

Value > 0

15. Demand/capacity ratio limit

Value > 0

16. Multi-response case design

- 1 = Envelopes
- 2 = Step-by-Step
- 3 = Last Step
- 4 = Envelope -- All
- 5 = Step-by-Step -- All

17. Behavior factor, q

Value > 0

18. System overstrength, Omega

Value > 0

19. Consider P-delta

1 or "No" - Default

2 or "Yes"

20. Consider Torsion

1 or "No" - Default

2 or "Yes"

21. Ignore seismic code

1 or "No" - Default

2 or "Yes"

22. Ignore special seismic load

1 or "No" - Default

2 or "Yes"

23. Are Doubler plates plug-welded

1 or "No" - Default

2 or "Yes"

Return Value

Type: Int32

Returns zero if the item is successfully retrieved; otherwise it returns a nonzero value.

CSI API ETABS v1

cDStSP16_13330_2011AddLanguageSpecificTextSet("L Method

Retrieves the value of a steel design overwrite item

Namespace: [ETABSv1](#)

Assembly: [ETABSv1](#) (in ETABSv1.dll) Version: 1.0.0.0 (1.24.0.0)

▲ Syntax

[C#](#)

[VB](#)

[C++](#)

[F#](#)

[Copy](#)

```
int GetOverwrite(
    string Name,
    int Item,
    ref double Value,
    ref bool ProgDet
)
```

```
Function GetOverwrite (
    Name As String,
    Item As Integer,
    ByRef Value As Double,
    ByRef ProgDet As Boolean
) As Integer
```

```
Dim instance As cDStSP16_13330_2011
Dim Name As String
Dim Item As Integer
Dim Value As Double
Dim ProgDet As Boolean
Dim returnValue As Integer
```

```
returnValue = instance.GetOverwrite(Name,
    Item, Value, ProgDet)
```

```
int GetOverwrite(
    String^ Name,
    int Item,
    double% Value,
    bool% ProgDet
)
```

```
abstract GetOverwrite :
    Name : string *
    Item : int *
    Value : float byref *
    ProgDet : bool byref -> int
```

Parameters

Name

Type: SystemString

The name of an existing frame object with a steel frame design procedure

Item

Type: SystemInt32

This is an integer between 1 and 40, inclusive, indicating the overwrite item considered

1. Framing type (Not used anymore)
2. Section class (Not used anymore)
3. Service factor, GammaC
4. Safety factor, GammaU
5. Factor for L-Shapes, GammaC1
6. Column buckling curve major
7. Column buckling curve minor
8. Is rolled section?
9. Is beam top loaded?
10. Consider deflection
11. Deflection check type
12. DL deflection limit, L/Value
13. SDL + LL deflection limit, L/Value
14. LL deflection limit, L/Value (Not used anymore)
15. Total load deflection limit, L/Value
16. Total-camber limit, L/Value
17. DL deflection limit, absolute
18. SDL + LL deflection limit, absolute
19. LL deflection limit, absolute (Not used anymore)
20. Total load deflection limit, absolute
21. Total-camber limit, absolute
22. Specified camber
23. Net area to total area ratio
24. Live load reduction factor
25. Unbraced length ratio, Major
26. Unbraced length ratio, Minor
27. Unbraced length ratio, LTB
28. Effective length factor, K1 Major (Not used anymore)
29. Effective length factor, K1 Minor (Not used anymore)
30. Effective length factor, K Major
31. Effective length factor, K Minor
32. Effective length factor, K LTB
33. Characteristic strength, Ryn
34. Design yield strength, Ry
35. Design fracture strength, Ru
36. Design shear strength, Rs
37. Demand/capacity ratio limit
38. Limit slenderness compression, A
39. Limit slenderness compression, B
40. Limit slenderness tension

Value

Type: SystemDouble

The value of the considered overwrite item

1. Framing type (Not used anymore)
2. Section class (Not used anymore)
3. Service factor, GammaC

Value ≥ 0 ; 0 means use program determined value

4. Safety factor, GammaU

Value ≥ 0 ; 0 means use program determined value

5. Factor for L-Shapes, GammaC1

Value ≥ 0 ; 0 means use program determined value

6. Column buckling curve major
 - . 0 = Program Determined
 - . 1 = a
 - . 2 = b
 - . 3 = c

7. Column buckling curve minor
 - . 0 = Program Determined
 - . 1 = a
 - . 2 = b
 - . 3 = c

8. Is rolled section?
 - . 0 = Program Determined
 - . 1 = No
 - . 2 = Yes

9. Is beam top loaded?
 - . 0 = Program Determined
 - . 1 = No
 - . 2 = Yes

10. Consider deflection?
 - . 0 = Program Determined
 - . 1 = No
 - . 2 = Yes

11. Deflection check type
 - . 0 = Program Determined
 - . 1 = Ratio
 - . 2 = Absolute
 - . 3 = Both

12. DL deflection limit, L/Value

Value ≥ 0 ; 0 means no check for this item

13. SDL + LL deflection limit, L/Value

Value ≥ 0 ; 0 means no check for this item

14. LL deflection limit, L/Value (Not used anymore)
15. Total load deflection limit, L/Value

Value ≥ 0 ; 0 means no check for this item

16. Total-camber limit, L/Value

Introduction

Value ≥ 0 ; 0 means no check for this item

17. DL deflection limit, absolute

Value ≥ 0 ; 0 means no check for this item. [L]

18. SDL + LL deflection limit, absolute

Value ≥ 0 ; 0 means no check for this item. [L]

19. LL deflection limit, absolute (Not used anymore)

20. Total load deflection limit, absolute

Value ≥ 0 ; 0 means no check for this item. [L]

21. Total-camber limit, absolute

Value ≥ 0 ; 0 means no check for this item. [L]

22. Specified camber

Value ≥ 0 . [L]

23. Net area to total area ratio

Value ≥ 0 ; 0 means use program default value

24. Live load reduction factor

Value ≥ 0 ; 0 means use program determined value

25. Unbraced length ratio, Major

Value ≥ 0 ; 0 means use program determined value

26. Unbraced length ratio, Minor

Value ≥ 0 ; 0 means use program determined value

27. Unbraced length ratio, LTB

Value ≥ 0 ; 0 means use program determined value

28. Effective length factor, K1 Major (Not used anymore)

29. Effective length factor, K1 Minor (Not used anymore)

30. Effective length factor, K Major

Value ≥ 0 ; 0 means use program determined value

31. Effective length factor, K Minor

Value ≥ 0 ; 0 means use program determined value

32. Effective length factor, K LTB

Value ≥ 0 ; 0 means use program determined value

33. Characteristic strength, R_y

Value ≥ 0 ; 0 means use program determined value [F/L2]

34. Design yield strength, R_y

Value ≥ 0 ; 0 means use program determined value [F/L2]

35. Design fracture strength, R_u

Introduction

Value ≥ 0 ; 0 means use program determined value [F/L2]

36. Design shear strength, R_s

Value ≥ 0 ; 0 means use program determined value [F/L2]

37. Demand/capacity ratio limit

Value ≥ 0 ; 0 means use program determined value

38. Limit slenderness compression, A

Value ≥ 0 ; 0 means use program determined value

39. Limit slenderness compression, B

Value ≥ 0 ; 0 means use program determined value

40. Limit slenderness tension

Value ≥ 0 ; 0 means use program determined value

ProgDet

Type: System.Boolean

If this item is True, the specified value is program determined

Return Value

Type: Int32

Returns zero if the item is successfully retrieved; otherwise it returns a nonzero value

▲ Remarks

▲ Examples

VB

Copy

```
Public Sub Example()  
    Dim SapModel As cSapModel  
    Dim EtabsObject As cOAPI  
    Dim ret As Integer = -1  
    Dim Value As Double  
    Dim ProgDet As Boolean  
  
    'create ETABS object  
    Dim myHelper as cHelper = New Helper  
    EtabsObject = myHelper.CreateObjectProgID("CSI.ETABS.API.ETABSObject")  
  
    'start ETABS application  
    ret = EtabsObject.ApplicationStart()  
  
    'create SapModel object  
    SapModel = EtabsObject.SapModel  
  
    'initialize model  
    ret = SapModel.InitializeNewModel()  
  
    'create steel deck template model  
    ret = SapModel.File.NewSteelDeck(4, 12, 12, 4, 4, 24, 24)  
  
    'set steel design code  
    ret = SapModel.DesignSteel.SetCode("SP 16.13330.2011")  
  
    'get overwrite item  
    ret = SapModel.DesignSteel.SP16_13330_2011.GetOverwrite("8", 1, Value, ProgDet)
```

Return Value

```
'close ETABS
  EtabsObject.ApplicationExit(False)

'clean up variables
  SapModel = Nothing
  EtabsObject = Nothing

End Sub
```

```

Parameters

Item

Type: [SystemInt32](#)

This is an integer between 1 and 16, inclusive, indicating the preference item considered

1. Multi-response case design
2. Framing type (Not used anymore)
3. Section class (Not used anymore)
4. GammaM
5. GammaC

- 6. GammeU
- 7. GammaC1
- 8. Consider deflection
- 9. DL deflection limit, L/Value
- 10. SDL + LL deflection limit, L/Value
- 11. LL deflection limit, L/Value (Not used anymore)
- 12. Total load deflection limit, L/Value
- 13. Total - Camber limit, L/Value
- 14. Pattern live load factor
- 15. Demand/capacity ratio limit
- 16. Reliability factor
- 17. Max Number of Auto Iterations

Value

Type: SystemDouble

The value of the considered preference item

- 1. Multi-response case design
 - 1 = Envelopes
 - 2 = Step-by-step
 - 3 = Last step
 - 4 = Envelopes -- All
 - 5 = Step-by-step -- All
- 2. Framing type (Not used anymore)
- 3. Section class (Not used anymore)
- 4. GammaM

Value > 0

- 5. GammaC

Value > 0

- 6. GammaU

Value > 0

- 7. GammaC1

Value > 0

- 8. Consider deflection
 - 0 = No
 - Any other value = Yes
- 9. DL deflection limit, L/Value

Value > 0

- 10. SDL + LL deflection limit, L/Value

Value > 0

- 11. LL deflection limit, L/Value (Not used anymore)
- 12. Total deflection limit, L/Value

Value > 0

- 13. Total camber limit, L/Value

Value > 0

14. Pattern live load factor

Value ≥ 0

15. Demand/capacity ratio limit

Value > 0

16. Reliability factor

Value > 0

17. Max Number of Auto Iterations

Value > 0 **Return Value**Type: $\hat{A}$ Int32

Returns zero if the item is successfully retrieved; otherwise, it returns a nonzero value

abstract SetOverwrite :
    Name : string *
    Item : int *
    Value : float *
    ?ItemType : eItemType
(* Defaults:
    let _ItemType = defaultArg ItemType eItemType.Objects
*)
-> int
```

Parameters

Name

Type: SystemString

The name of an existing frame object with a steel frame design procedure

Item

Type: SystemInt32

This is an integer between 1 and 40, inclusive, indicating the overwrite item considered

1. Framing type (Not used anymore)
2. Section class (Not used anymore)
3. Service factor, GammaC
4. Safety factor, GammaU
5. Factor for L-Shapes, GammaC1
6. Column buckling curve major
7. Column buckling curve minor
8. Is rolled section?
9. Is beam top loaded?
10. Consider deflection
11. Deflection check type
12. DL deflection limit, L/Value
13. SDL + LL deflection limit, L/Value
14. LL deflection limit, L/Value (Not used anymore)
15. Total load deflection limit, L/Value
16. Total-camber limit, L/Value
17. DL deflection limit, absolute
18. SDL + LL deflection limit, absolute
19. LL deflection limit, absolute (Not used anymore)
20. Total load deflection limit, absolute
21. Total-camber limit, absolute
22. Specified camber
23. Net area to total area ratio
24. Live load reduction factor
25. Unbraced length ratio, Major
26. Unbraced length ratio, Minor
27. Unbraced length ratio, LTB
28. Effective length factor, K1 Major (Not used anymore)
29. Effective length factor, K1 Minor (Not used anymore)
30. Effective length factor, K Major
31. Effective length factor, K Minor
32. Effective length factor, K LTB
33. Characteristic strength, Ryn
34. Design yield strength, Ry
35. Design fracture strength, Ru
36. Design shear strength, Rs
37. Demand/capacity ratio limit
38. Limit slenderness compression, A
39. Limit slenderness compression, B
40. Limit slenderness tension

Value

Type: SystemDouble

The value of the considered overwrite item

1. Framing type (Not used anymore)
2. Section class (Not used anymore)
3. Service factor, GammaC

Value ≥ 0 ; 0 means use program determined value

4. Safety factor, GammaU

Value ≥ 0 ; 0 means use program determined value

5. Factor for L-Shapes, GammaC1

Value ≥ 0 ; 0 means use program determined value

6. Column buckling curve major
 - 0 = Program Determined
 - 1 = a
 - 2 = b
 - 3 = c

7. Column buckling curve minor
 - 0 = Program Determined
 - 1 = a
 - 2 = b
 - 3 = c

8. Is rolled section?
 - 0 = Program Determined
 - 1 = No
 - 2 = Yes

9. Is beam top loaded?
 - 0 = Program Determined
 - 1 = No
 - 2 = Yes

10. Consider deflection?
 - 0 = Program Determined
 - 1 = No
 - 2 = Yes

11. Deflection check type
 - 0 = Program Determined
 - 1 = Ratio
 - 2 = Absolute
 - 3 = Both

12. DL deflection limit, L/Value

Value ≥ 0 ; 0 means no check for this item

13. SDL + LL deflection limit, L/Value

Value ≥ 0 ; 0 means no check for this item

14. LL deflection limit, L/Value (Not used anymore)

15. Total load deflection limit, L/Value

Value ≥ 0 ; 0 means no check for this item

16. Total-camber limit, L/Value

Introduction

Value ≥ 0 ; 0 means no check for this item

17. DL deflection limit, absolute

Value ≥ 0 ; 0 means no check for this item. [L]

18. SDL + LL deflection limit, absolute

Value ≥ 0 ; 0 means no check for this item. [L]

19. LL deflection limit, absolute (Not used anymore)

20. Total load deflection limit, absolute

Value ≥ 0 ; 0 means no check for this item. [L]

21. Total-camber limit, absolute

Value ≥ 0 ; 0 means no check for this item. [L]

22. Specified camber

Value ≥ 0 . [L]

23. Net area to total area ratio

Value ≥ 0 ; 0 means use program default value

24. Live load reduction factor

Value ≥ 0 ; 0 means use program determined value

25. Unbraced length ratio, Major

Value ≥ 0 ; 0 means use program determined value

26. Unbraced length ratio, Minor

Value ≥ 0 ; 0 means use program determined value

27. Unbraced length ratio, LTB

Value ≥ 0 ; 0 means use program determined value

28. Effective length factor, K1 Major (Not used anymore)

29. Effective length factor, K1 Minor (Not used anymore)

30. Effective length factor, K Major

Value ≥ 0 ; 0 means use program determined value

31. Effective length factor, K Minor

Value ≥ 0 ; 0 means use program determined value

32. Effective length factor, K LTB

Value ≥ 0 ; 0 means use program determined value

33. Characteristic strength, R_{yn}

Value ≥ 0 ; 0 means use program determined value [F/L2]

34. Design yield strength, R_y

Value ≥ 0 ; 0 means use program determined value [F/L2]

35. Design fracture strength, R_u

Introduction

Value ≥ 0 ; 0 means use program determined value [F/L2]

36. Design shear strength, R_s

Value ≥ 0 ; 0 means use program determined value [F/L2]

37. Demand/capacity ratio limit

Value ≥ 0 ; 0 means use program determined value

38. Limit slenderness compression, A

Value ≥ 0 ; 0 means use program determined value

39. Limit slenderness compression, B

Value ≥ 0 ; 0 means use program determined value

40. Limit slenderness tension

Value ≥ 0 ; 0 means use program determined value

ItemType (Optional)

Type: $\hat{A}$ ETABSv1eItemType

Return Value

Type: $\hat{A}$ Int32

Returns zero if the item is successfully retrieved; otherwise it returns a nonzero value

▲ Remarks

▲ Examples

VB

Copy

```
Public Sub Example()  
    Dim SapModel As cSapModel  
    Dim EtabsObject As cOAPI  
    Dim ret As Integer = -1  
    Dim Value As Double  
    Dim ProgDet As Boolean  
  
    'create ETABS object  
    Dim myHelper as cHelper = New Helper  
    EtabsObject = myHelper.CreateObjectProgID("CSI.ETABS.API.ETABSObject")  
  
    'start ETABS application  
    ret = EtabsObject.ApplicationStart()  
  
    'create SapModel object  
    SapModel = EtabsObject.SapModel  
  
    'initialize model  
    ret = SapModel.InitializeNewModel()  
  
    'create steel deck template model  
    ret = SapModel.File.NewSteelDeck(4, 12, 12, 4, 4, 24, 24)  
  
    'set steel design code  
    ret = SapModel.DesignSteel.SetCode("SP 16.13330.2011")  
  
    'get overwrite item  
    ret = SapModel.DesignSteel.SP16_13330_2011.GetOverwrite("8", 1, Value, ProgDet)
```

Introduction

```
'close ETABS
  EtabsObject.ApplicationExit(False)

'clean up variables
  SapModel = Nothing
  EtabsObject = Nothing

End Sub
```

    ProgDet : bool byref -> int
```

Parameters

Name

Type: SystemString

The name of an existing frame object with a steel frame design procedure

Item

Type: SystemInt32

This is an integer between 1 and 40, inclusive, indicating the overwrite item considered

1. Framing type (Not used anymore)
2. Section class (Not used anymore)
3. Service factor, GammaC
4. Safety factor, GammaU
5. Factor for L-Shapes, GammaC1
6. Column buckling curve major
7. Column buckling curve minor
8. Is rolled section?
9. Is beam top loaded?
10. Consider deflection
11. Deflection check type
12. DL deflection limit, L/Value
13. SDL + LL deflection limit, L/Value
14. LL deflection limit, L/Value (Not used anymore)
15. Total load deflection limit, L/Value
16. Total-camber limit, L/Value
17. DL deflection limit, absolute
18. SDL + LL deflection limit, absolute
19. LL deflection limit, absolute (Not used anymore)
20. Total load deflection limit, absolute
21. Total-camber limit, absolute
22. Specified camber
23. Net area to total area ratio
24. Live load reduction factor
25. Unbraced length ratio, Major
26. Unbraced length ratio, Minor
27. Unbraced length ratio, LTB
28. Effective length factor, K1 Major (Not used anymore)
29. Effective length factor, K1 Minor (Not used anymore)
30. Effective length factor, K Major
31. Effective length factor, K Minor
32. Effective length factor, K LTB
33. Characteristic strength, Ryn
34. Design yield strength, Ry
35. Design fracture strength, Ru
36. Design shear strength, Rs
37. Demand/capacity ratio limit
38. Limit slenderness compression, A
39. Limit slenderness compression, B
40. Limit slenderness tension

Value

Type: SystemDouble

The value of the considered overwrite item

1. Framing type (Not used anymore)
2. Section class (Not used anymore)
3. Service factor, GammaC

Value ≥ 0 ; 0 means use program determined value

4. Safety factor, GammaU

Value ≥ 0 ; 0 means use program determined value

5. Factor for L-Shapes, GammaC1

Value ≥ 0 ; 0 means use program determined value

6. Column buckling curve major
 - . 0 = Program Determined
 - . 1 = a
 - . 2 = b
 - . 3 = c

7. Column buckling curve minor
 - . 0 = Program Determined
 - . 1 = a
 - . 2 = b
 - . 3 = c

8. Is rolled section?
 - . 0 = Program Determined
 - . 1 = No
 - . 2 = Yes

9. Is beam top loaded?
 - . 0 = Program Determined
 - . 1 = No
 - . 2 = Yes

10. Consider deflection?
 - . 0 = Program Determined
 - . 1 = No
 - . 2 = Yes

11. Deflection check type
 - . 0 = Program Determined
 - . 1 = Ratio
 - . 2 = Absolute
 - . 3 = Both

12. DL deflection limit, L/Value

Value ≥ 0 ; 0 means no check for this item

13. SDL + LL deflection limit, L/Value

Value ≥ 0 ; 0 means no check for this item

14. LL deflection limit, L/Value (Not used anymore)

15. Total load deflection limit, L/Value

Value ≥ 0 ; 0 means no check for this item

16. Total-camber limit, L/Value

Introduction

Value ≥ 0 ; 0 means no check for this item

17. DL deflection limit, absolute

Value ≥ 0 ; 0 means no check for this item. [L]

18. SDL + LL deflection limit, absolute

Value ≥ 0 ; 0 means no check for this item. [L]

19. LL deflection limit, absolute (Not used anymore)

20. Total load deflection limit, absolute

Value ≥ 0 ; 0 means no check for this item. [L]

21. Total-camber limit, absolute

Value ≥ 0 ; 0 means no check for this item. [L]

22. Specified camber

Value ≥ 0 . [L]

23. Net area to total area ratio

Value ≥ 0 ; 0 means use program default value

24. Live load reduction factor

Value ≥ 0 ; 0 means use program determined value

25. Unbraced length ratio, Major

Value ≥ 0 ; 0 means use program determined value

26. Unbraced length ratio, Minor

Value ≥ 0 ; 0 means use program determined value

27. Unbraced length ratio, LTB

Value ≥ 0 ; 0 means use program determined value

28. Effective length factor, K1 Major (Not used anymore)

29. Effective length factor, K1 Minor (Not used anymore)

30. Effective length factor, K Major

Value ≥ 0 ; 0 means use program determined value

31. Effective length factor, K Minor

Value ≥ 0 ; 0 means use program determined value

32. Effective length factor, K LTB

Value ≥ 0 ; 0 means use program determined value

33. Characteristic strength, R_y

Value ≥ 0 ; 0 means use program determined value [F/L2]

34. Design yield strength, R_y

Value ≥ 0 ; 0 means use program determined value [F/L2]

35. Design fracture strength, R_u

Introduction

Value ≥ 0 ; 0 means use program determined value [F/L2]

36. Design shear strength, R_s

Value ≥ 0 ; 0 means use program determined value [F/L2]

37. Demand/capacity ratio limit

Value ≥ 0 ; 0 means use program determined value

38. Limit slenderness compression, A

Value ≥ 0 ; 0 means use program determined value

39. Limit slenderness compression, B

Value ≥ 0 ; 0 means use program determined value

40. Limit slenderness tension

Value ≥ 0 ; 0 means use program determined value

ProgDet

Type: System.Boolean

If this item is True, the specified value is program determined

Return Value

Type: Int32

Returns zero if the item is successfully retrieved; otherwise it returns a nonzero value

▲ Remarks

▲ Examples

VB

Copy

```
Public Sub Example()  
    Dim SapModel As cSapModel  
    Dim EtabsObject As cOAPI  
    Dim ret As Integer = -1  
    Dim Value As Double  
    Dim ProgDet As Boolean  
  
    'create ETABS object  
    Dim myHelper as cHelper = New Helper  
    EtabsObject = myHelper.CreateObjectProgID("CSI.ETABS.API.ETABSObject")  
  
    'start ETABS application  
    ret = EtabsObject.ApplicationStart()  
  
    'create SapModel object  
    SapModel = EtabsObject.SapModel  
  
    'initialize model  
    ret = SapModel.InitializeNewModel()  
  
    'create steel deck template model  
    ret = SapModel.File.NewSteelDeck(4, 12, 12, 4, 4, 24, 24)  
  
    'set steel design code  
    ret = SapModel.DesignSteel.SetCode("SP 16.13330.2017")  
  
    'get overwrite item  
    ret = SapModel.DesignSteel.SP16_13330_2017.GetOverwrite("8", 1, Value, ProgDet)
```

Return Value

```
'close ETABS
  EtabsObject.ApplicationExit(False)

'clean up variables
  SapModel = Nothing
  EtabsObject = Nothing

End Sub
```

CSI API ETABS v1

cDStSP16_13330_2017AddLanguageSpecificTextSet("L Method

Sets the value of a steel design overwrite item

Namespace: ETABSv1

Assembly: ETABSv1 (in ETABSv1.dll) Version: 1.0.0.0 (1.24.0.0)

■ Syntax

C#

VB

C++

F#

Copy

```
int SetOverwrite(
    string Name,
    int Item,
    double Value,
    eItemType ItemType = eItemType.Objects
)
```

```
Function SetOverwrite (
    Name As String,
    Item As Integer,
    Value As Double,
    ItemType As eItemType = eItemType.Objects
) As Integer
```

```
Dim instance As cDStSP16_13330_2017
Dim Name As String
Dim Item As Integer
Dim Value As Double
Dim ItemType As eItemType
Dim returnValue As Integer
```

```
returnValue = instance.SetOverwrite(Name,
    Item, Value, ItemType)
```

```
int SetOverwrite(
    String^ Name,
    int Item,
    double Value,
    eItemType ItemType = eItemType::Objects
)
```

```
abstract SetOverwrite :
    Name : string *
    Item : int *
    Value : float *
    ?ItemType : eItemType
(* Defaults:
    let _ItemType = defaultArg ItemType eItemType.Objects
*)
-> int
```

Parameters

Name

Type: SystemString

The name of an existing frame object with a steel frame design procedure

Item

Type: SystemInt32

This is an integer between 1 and 40, inclusive, indicating the overwrite item considered

1. Framing type (Not used anymore)
2. Section class (Not used anymore)
3. Service factor, GammaC
4. Safety factor, GammaU
5. Factor for L-Shapes, GammaC1
6. Column buckling curve major
7. Column buckling curve minor
8. Is rolled section?
9. Is beam top loaded?
10. Consider deflection
11. Deflection check type
12. DL deflection limit, L/Value
13. SDL + LL deflection limit, L/Value
14. LL deflection limit, L/Value (Not used anymore)
15. Total load deflection limit, L/Value
16. Total-camber limit, L/Value
17. DL deflection limit, absolute
18. SDL + LL deflection limit, absolute
19. LL deflection limit, absolute (Not used anymore)
20. Total load deflection limit, absolute
21. Total-camber limit, absolute
22. Specified camber
23. Net area to total area ratio
24. Live load reduction factor
25. Unbraced length ratio, Major
26. Unbraced length ratio, Minor
27. Unbraced length ratio, LTB
28. Effective length factor, K1 Major (Not used anymore)
29. Effective length factor, K1 Minor (Not used anymore)
30. Effective length factor, K Major
31. Effective length factor, K Minor
32. Effective length factor, K LTB
33. Characteristic strength, Ryn
34. Design yield strength, Ry
35. Design fracture strength, Ru
36. Design shear strength, Rs
37. Demand/capacity ratio limit
38. Limit slenderness compression, A
39. Limit slenderness compression, B
40. Limit slenderness tension

Value

Type: SystemDouble

The value of the considered overwrite item

1. Framing type (Not used anymore)
2. Section class (Not used anymore)
3. Service factor, GammaC

Value ≥ 0 ; 0 means use program determined value

4. Safety factor, GammaU

Value ≥ 0 ; 0 means use program determined value

5. Factor for L-Shapes, GammaC1

Value ≥ 0 ; 0 means use program determined value

6. Column buckling curve major
 - . 0 = Program Determined
 - . 1 = a
 - . 2 = b
 - . 3 = c

7. Column buckling curve minor
 - . 0 = Program Determined
 - . 1 = a
 - . 2 = b
 - . 3 = c

8. Is rolled section?
 - . 0 = Program Determined
 - . 1 = No
 - . 2 = Yes

9. Is beam top loaded?
 - . 0 = Program Determined
 - . 1 = No
 - . 2 = Yes

10. Consider deflection?
 - . 0 = Program Determined
 - . 1 = No
 - . 2 = Yes

11. Deflection check type
 - . 0 = Program Determined
 - . 1 = Ratio
 - . 2 = Absolute
 - . 3 = Both

12. DL deflection limit, L/Value

Value ≥ 0 ; 0 means no check for this item

13. SDL + LL deflection limit, L/Value

Value ≥ 0 ; 0 means no check for this item

14. LL deflection limit, L/Value (Not used anymore)

15. Total load deflection limit, L/Value

Value ≥ 0 ; 0 means no check for this item

16. Total-camber limit, L/Value

Introduction

Value ≥ 0 ; 0 means no check for this item

17. DL deflection limit, absolute

Value ≥ 0 ; 0 means no check for this item. [L]

18. SDL + LL deflection limit, absolute

Value ≥ 0 ; 0 means no check for this item. [L]

19. LL deflection limit, absolute (Not used anymore)

20. Total load deflection limit, absolute

Value ≥ 0 ; 0 means no check for this item. [L]

21. Total-camber limit, absolute

Value ≥ 0 ; 0 means no check for this item. [L]

22. Specified camber

Value ≥ 0 . [L]

23. Net area to total area ratio

Value ≥ 0 ; 0 means use program default value

24. Live load reduction factor

Value ≥ 0 ; 0 means use program determined value

25. Unbraced length ratio, Major

Value ≥ 0 ; 0 means use program determined value

26. Unbraced length ratio, Minor

Value ≥ 0 ; 0 means use program determined value

27. Unbraced length ratio, LTB

Value ≥ 0 ; 0 means use program determined value

28. Effective length factor, K1 Major (Not used anymore)

29. Effective length factor, K1 Minor (Not used anymore)

30. Effective length factor, K Major

Value ≥ 0 ; 0 means use program determined value

31. Effective length factor, K Minor

Value ≥ 0 ; 0 means use program determined value

32. Effective length factor, K LTB

Value ≥ 0 ; 0 means use program determined value

33. Characteristic strength, R_y

Value ≥ 0 ; 0 means use program determined value [F/L2]

34. Design yield strength, R_y

Value ≥ 0 ; 0 means use program determined value [F/L2]

35. Design fracture strength, R_u

Introduction

Value ≥ 0 ; 0 means use program determined value [F/L2]

36. Design shear strength, R_s

Value ≥ 0 ; 0 means use program determined value [F/L2]

37. Demand/capacity ratio limit

Value ≥ 0 ; 0 means use program determined value

38. Limit slenderness compression, A

Value ≥ 0 ; 0 means use program determined value

39. Limit slenderness compression, B

Value ≥ 0 ; 0 means use program determined value

40. Limit slenderness tension

Value ≥ 0 ; 0 means use program determined value

ItemType (Optional)

Type: $\hat{A}$ ETABSv1eItemType

Return Value

Type: $\hat{A}$ Int32

Returns zero if the item is successfully retrieved; otherwise it returns a nonzero value

▲ Remarks

▲ Examples

VB

Copy

```
Public Sub Example()  
    Dim SapModel As cSapModel  
    Dim EtabsObject As cOAPI  
    Dim ret As Integer = -1  
    Dim Value As Double  
    Dim ProgDet As Boolean  
  
    'create ETABS object  
    Dim myHelper as cHelper = New Helper  
    EtabsObject = myHelper.CreateObjectProgID("CSI.ETABS.API.ETABSObject")  
  
    'start ETABS application  
    ret = EtabsObject.ApplicationStart()  
  
    'create SapModel object  
    SapModel = EtabsObject.SapModel  
  
    'initialize model  
    ret = SapModel.InitializeNewModel()  
  
    'create steel deck template model  
    ret = SapModel.File.NewSteelDeck(4, 12, 12, 4, 4, 24, 24)  
  
    'set steel design code  
    ret = SapModel.DesignSteel.SetCode("SP 16.13330.2017")  
  
    'get overwrite item  
    ret = SapModel.DesignSteel.SP16_13330_2017.GetOverwrite("8", 1, Value, ProgDet)
```

Introduction

```
'close ETABS
  EtabsObject.ApplicationExit(False)

'clean up variables
  SapModel = Nothing
  EtabsObject = Nothing

End Sub
```

CSI API ETABS v1

cDStSP16_13330_2017AddLanguageSpecificTextSet("L Method

Sets the value of a steel design preference item

Namespace: ETABSv1

Assembly: ETABSv1 (in ETABSv1.dll) Version: 1.0.0.0 (1.24.0.0)

Syntax

C#

VB

C++

F#

Copy

```
int SetPreference(
    int Item,
    double Value
)
```

```
Function SetPreference (
    Item As Integer,
    Value As Double
) As Integer
```

```
Dim instance As cDStSP16_13330_2017
Dim Item As Integer
Dim Value As Double
Dim returnValue As Integer
```

```
returnValue = instance.SetPreference(Item,
    Value)
```

```
int SetPreference(
    int Item,
    double Value
)
```

```
abstract SetPreference :
    Item : int *
    Value : float -> int
```

Parameters

Item

Type: SystemInt32

This is an integer between 1 and 16, inclusive, indicating the preference item considered

1. Multi-response case design
2. Framing type (Not used anymore)
3. Section class (Not used anymore)
4. GammaM
5. GammaC

- 6. GammeU
- 7. GammaC1
- 8. Consider deflection
- 9. DL deflection limit, L/Value
- 10. SDL + LL deflection limit, L/Value
- 11. LL deflection limit, L/Value (Not used anymore)
- 12. Total load deflection limit, L/Value
- 13. Total - Camber limit, L/Value
- 14. Pattern live load factor
- 15. Demand/capacity ratio limit
- 16. Reliability factor
- 17. Max Number of Auto Iterations

Value

Type: SystemDouble

The value of the considered preference item

- 1. Multi-response case design
 - 1 = Envelopes
 - 2 = Step-by-step
 - 3 = Last step
 - 4 = Envelopes -- All
 - 5 = Step-by-step -- All
- 2. Framing type (Not used anymore)
- 3. Section class (Not used anymore)
- 4. GammaM

Value > 0

- 5. GammaC

Value > 0

- 6. GammaU

Value > 0

- 7. GammaC1

Value > 0

- 8. Consider deflection
 - 0 = No
 - Any other value = Yes
- 9. DL deflection limit, L/Value

Value > 0

- 10. SDL + LL deflection limit, L/Value

Value > 0

- 11. LL deflection limit, L/Value (Not used anymore)
- 12. Total deflection limit, L/Value

Value > 0

- 13. Total camber limit, L/Value

Value > 0

14. Pattern live load factor

Value ≥ 0

15. Demand/capacity ratio limit

Value > 0

16. Reliability factor

Value > 0

17. Max Number of Auto Iterations

Value > 0 **Return Value**Type: $\hat{A}$ Int32

Returns zero if the item is successfully retrieved; otherwise, it returns a nonzero value

▲ Remarks

▲ Examples

VB

Copy

```

Public Sub Example()
    Dim SapModel As cSapModel

CSI API ETABS v1

cEditGeneralAddLanguageSpecificTextSet("LST8ED49 Method

Moves selected point, frame, cable, tendon, area, solid and link objects.

Namespace: [ETABSv1](#)

Assembly: [ETABSv1](#) (in ETABSv1.dll) Version: 1.0.0.0 (1.24.0.0)

■ Syntax

[C#](#)

[VB](#)

[C++](#)

[F#](#)

[Copy](#)

```
int Move(
double DX,
double DY,
double DZ
)
```

```
Function Move (
DX As Double,
DY As Double,
DZ As Double
) As Integer
```

```
Dim instance As cEditGeneral
Dim DX As Double
Dim DY As Double
Dim DZ As Double
Dim returnValue As Integer
```

```
returnValue = instance.Move(DX, DY, DZ)
```

```
int Move(
double DX,
double DY,
double DZ
)
```

```
abstract Move :
    DX : float *
    DY : float *
    DZ : float -> int
```

Parameters

DX

Type: [System.Double](#)

This is the x offset used, in the present coordinate system, for moving the selected objects.

DY

Type: SystemDouble

This is the y offset used, in the present coordinate system, for moving the selected objects.

DZ

Type: SystemDouble

This is the z offset used, in the present coordinate system, for moving the selected objects.

Return Value

Type: Int32

Returns zero if the move is successful; otherwise it returns a nonzero value.

▲ Remarks

CSI API ETABS v1

cFileAddLanguageSpecificTextSet("LST997383AB_0?c Method

Creates a new, blank model.

Namespace: ETABSV1

Assembly: ETABSV1 (in ETABSV1.dll) Version: 1.0.0.0 (1.24.0.0)

▲ Syntax

C#

VB

C++

F#

Copy

```
int NewBlank()
```

```
Function NewBlank As Integer
```

```
Dim instance As cFile
```

```
Dim returnValue As Integer
```

```
returnValue = instance.NewBlank()
```

```
int NewBlank()
```

```
abstract NewBlank : unit -> int
```

Return Value

Type: Int32

Returns zero if the new blank model is successfully created, otherwise it returns a nonzero value.

▲ Remarks

Do not use this function to add to an existing model. This function should be used only for creating a new model and typically would be preceded by calls to ApplicationStart or InitializeNewModel(eUnits).

▲ Examples

VB

Copy

```
Public Sub Example()
```

```
    Dim SapModel As cSapModel
```

```
    Dim EtabsObject As cOAPI
```

```
    Dim ret As Integer = -1
```

```
    'create ETABS object
```

```
    Dim myHelper as cHelper = New Helper
```

```
    EtabsObject = myHelper.CreateObjectProgID("CSI.ETABS.API.ETABSObject")
```

```
    'start ETABS application
```

```
    ret = EtabsObject.ApplicationStart()
