CSI API ETABS v1

cFileAddLanguageSpecificTextSet("LSTC398FFDB_0?c

Method

Creates a new grid-only model from template.

Namespace: ETABSv1

Assembly: ETABSv1 (in ETABSv1.dll) Version: 1.0.0.0 (1.24.0.0)

▲ Syntax

C#

VB

C++

F#

Copy

```
int NewGridOnly(
    int NumberStorys,
    double TypicalStoryHeight,
    double BottomStoryHeight,
    int NumberLinesX,
    int NumberLinesY,
    double SpacingX,
    double SpacingY
)
```

```
Function NewGridOnly (
    NumberStorys As Integer,
    TypicalStoryHeight As Double,
    BottomStoryHeight As Double,
    NumberLinesX As Integer,
    NumberLinesY As Integer,
    SpacingX As Double,
    SpacingY As Double
) As Integer
```

```
Dim instance As cFile
Dim NumberStorys As Integer
Dim TypicalStoryHeight As Double
Dim BottomStoryHeight As Double
Dim NumberLinesX As Integer
Dim NumberLinesY As Integer
Dim SpacingX As Double
Dim SpacingY As Double
Dim returnValue As Integer
```

```
returnValue = instance.NewGridOnly(NumberStorys,
    TypicalStoryHeight, BottomStoryHeight,
    NumberLinesX, NumberLinesY, SpacingX,
    SpacingY)
```

```
int NewGridOnly(
    int NumberStorys,
    double TypicalStoryHeight,
    double BottomStoryHeight,
    int NumberLinesX,
    int NumberLinesY,
```

```
double SpacingX,
double SpacingY
)
```

```
abstract NewGridOnly :
    NumberStorys : int *
    TypicalStoryHeight : float *
    BottomStoryHeight : float *
    NumberLinesX : int *
    NumberLinesY : int *
    SpacingX : float *
    SpacingY : float -> int
```

Parameters

NumberStorys

Type: SystemInt32

The number of stories in the model

TypicalStoryHeight

Type: SystemDouble

The story height that will be used for all stories in the model, except the bottom story. [L]

BottomStoryHeight

Type: SystemDouble

The story height will be used for the bottom story. [L]

NumberLinesX

Type: SystemInt32

The number of grid lines in the X direction.

NumberLinesY

Type: SystemInt32

The number of grid lines in the Y direction.

SpacingX

Type: SystemDouble

The uniform spacing for grid lines in the X direction. [L]

SpacingY

Type: SystemDouble

The uniform spacing for grid lines in the Y direction. [L]

Return Value

Type: Int32

Returns zero if the new grid only model is successfully created; otherwise it returns a nonzero value.

Remarks

Do not use this function to add to an existing model. This function should be used only for creating a new model and typically would be preceded by a call to InitializeNewModel(eUnits).

Examples

VB

Copy

```
Public Sub Example()
    Dim SapModel As cSapModel
    Dim EtabsObject As cOAPI
    Dim ret As Integer = -1
```

Introduction

```
'create ETABS object
    Dim myHelper as cHelper = New Helper
    EtabsObject = myHelper.CreateObjectProgID("CSI.ETABS.API.ETABSObject")

'start ETABS application
    ret = EtabsObject.ApplicationStart()

'create SapModel object
    SapModel = EtabsObject.SapModel

'initialize model
    ret = SapModel.InitializeNewModel()

'create grid-only template model
    ret = SapModel.File.NewGridOnly(4,12,12,4,4,24,24)

'close ETABS
    EtabsObject.ApplicationExit(False)

'clean up variables
    SapModel = Nothing
    EtabsObject = Nothing
End Sub
```

Dim NumberStorys As Integer
Dim TypicalStoryHeight As Double
Dim BottomStoryHeight As Double
Dim NumberLinesX As Integer
Dim NumberLinesY As Integer
Dim SpacingX As Double
Dim SpacingY As Double
Dim returnValue As Integer
```

```
returnValue = instance.NewSteelDeck(NumberStorys,
    TypicalStoryHeight, BottomStoryHeight,
    NumberLinesX, NumberLinesY, SpacingX,
    SpacingY)
```

```
int NewSteelDeck(
    int NumberStorys,
    double TypicalStoryHeight,
    double BottomStoryHeight,
    int NumberLinesX,
    int NumberLinesY,
```

cFilesid="LSTD1362B8D_0"AddLanguageSpecificTextSet("LSTD1362B8D_0?cpp=::|nu=.);NewSteelD

```
double SpacingX,
double SpacingY
)
```

```
abstract NewSteelDeck :
    NumberStorys : int *
    TypicalStoryHeight : float *
    BottomStoryHeight : float *
    NumberLinesX : int *
    NumberLinesY : int *
    SpacingX : float *
    SpacingY : float -> int
```

Parameters

NumberStorys

Type: SystemInt32

The number of stories in the model

TypicalStoryHeight

Type: SystemDouble

The story height that will be used for all stories in the model, except the bottom story. [L]

BottomStoryHeight

Type: SystemDouble

The story height that will be used for the bottom story. [L]

NumberLinesX

Type: SystemInt32

The number of grid lines in the X direction.

NumberLinesY

Type: SystemInt32

The number of grid lines in the Y direction.

SpacingX

Type: SystemDouble

The uniform spacing for grid lines in the X direction. [L]

SpacingY

Type: SystemDouble

The uniform spacing for grid lines in the Y direction. [L]

Return Value

Type: Int32

Returns zero if the new steel deck model is successfully created; otherwise it returns a nonzero value.

Remarks

Do not use this function to add to an existing model. This function should be used only for creating a new model and typically would be preceded by a call to InitializeNewModel(eUnits).

Examples

VB

Copy

```
Public Sub Example()
    Dim SapModel As cSapModel
    Dim EtabsObject As cOAPI
    Dim ret As Integer = -1
```

Introduction

```
'create ETABS object
    Dim myHelper as cHelper = New Helper
    EtabsObject = myHelper.CreateObjectProgID("CSI.ETABS.API.ETABSObject")

'start ETABS application
    ret = EtabsObject.ApplicationStart()

'create SapModel object
    SapModel = EtabsObject.SapModel

'initialize model
    ret = SapModel.InitializeNewModel()

'create steel deck template model
    ret = SapModel.File.NewSteelDeck(4,12,12,4,4,24,24)

'close ETABS
    EtabsObject.ApplicationExit(False)

'clean up variables
    SapModel = Nothing
    EtabsObject = Nothing
End Sub
```

Dim returnValue As Integer
```

```
returnValue = instance.OpenFile(FileName)
```

```
int OpenFile(
    String^ FileName
)
```

```
abstract OpenFile :
    FileName : string -> int
```

Parameters

FileName

Type: SystemString

The full path of a model file to be opened in the application.

Return Value

Type: Int32

Returns zero if the file is successfully opened and nonzero if it is not opened.

▲ Remarks

▲ Examples

VB

Copy

```
Public Sub Example()
    Dim SapModel As cSapModel
    Dim EtabsObject As c0API
```

cFilesid="LST2382CBF2_0"AddLanguageSpecificTextSet("LST2382CBF2_0?cpp=::|nu=.")1050nFile M

Introduction

```
Dim FileName as String
Dim ret As Integer = -1

'create ETABS object
Dim myHelper as cHelper = New Helper
EtabsObject = myHelper.CreateObjectProgID("CSI.ETABS.API.ETABSObject")

'start ETABS application
ret = EtabsObject.ApplicationStart()

'create SapModel object
SapModel = EtabsObject.SapModel

'initialize model
ret = SapModel.InitializeNewModel()

'open an existing file - If no file exists, run the Save example first.
FileName = "c:\CSI_API_temp\example.edb"
ret = SapModel.File.OpenFile(FileName)

'close ETABS
EtabsObject.ApplicationExit(False)

'clean up variables
SapModel = Nothing
EtabsObject = Nothing
End Sub
```

CSI API ETABS v1

cFileAddLanguageSpecificTextSet("LST9B53E4F1_0?c Method

Saves the present model.

Namespace: ETABSv1

Assembly: ETABSv1 (in ETABSv1.dll) Version: 1.0.0.0 (1.24.0.0)

▲ Syntax

C#

VB

C++

F#

Copy

```
int Save(
    string FileName = ""
)
```

```
Function Save (
    0FileName As String = ""
) As Integer
```

```
Dim instance As cFile
Dim FileName As String
Dim returnValue As Integer
```

```
returnValue = instance.Save(FileName)
```

```
int Save(
    String^ FileName = L""
)
```

```
abstract Save :
    ?FileName : string
(* Defaults:
    let _FileName = defaultArg FileName ""
*)
-> int
```

Parameters

FileName (Optional)

Type: SystemString

The full path to which the model file is saved.

Return Value

Type: Int32

Returns zero if the file is successfully saved and nonzero if it is not saved.

▲ Remarks

If no file name is specified, the file is saved using its current name. If there is no current name for the file (the file has not been saved previously) and this function is

called with no file name specified, an error will be returned.

Examples

VB

Copy

```
Public Sub Example()  
    Dim SapModel As cSapModel  
    Dim EtabsObject As cOAPI  
    Dim ret As Integer = -1  
  
    'create ETABS object  
    Dim myHelper as cHelper = New Helper  
    EtabsObject = myHelper.CreateObjectProgID("CSI.ETABS.API.ETABSObject")  
  
    'start ETABS application  
    ret = EtabsObject.ApplicationStart()  
  
    'create SapModel object  
    SapModel = EtabsObject.SapModel  
  
    'initialize model  
    ret = SapModel.InitializeNewModel()  
  
    'create steel deck template model  
    ret = SapModel.File.NewSteelDeck(4,12,12,4,4,24,24)  
  
    'save file  
    System.IO.Directory.CreateDirectory("c:\CSI_API_temp")  
    ret = SapModel.File.Save("C:\CSI_API_temp\example.edb")  
  
    'close ETABS  
    EtabsObject.ApplicationExit(False)  
  
    'clean up variables  
    SapModel = Nothing  
    EtabsObject = Nothing  
End Sub
```

CSI API ETABS v1

cFrameObj Interface

Namespace: Â ETABSv1

Assembly: Â ETABSv1 (in ETABSv1.dll) Version: 1.0.0.0 (1.24.0.0)

▲ Syntax

C#

VB

C++

F#

Copy

```
public interface cFrameObj
```

```
Public Interface cFrameObj
```

```
Dim instance As cFrameObj
```

```
public interface class cFrameObj
```

```
type cFrameObj = interface end
```

The cFrameObj type exposes the following members.

▲ Methods

Â	Name	Description
⇒	<u>AddByCoord</u>	Adds a new frame object whose end points are at the specified coordinates.
⇒	<u>AddByPoint</u>	Adds a new frame object whose end points are specified by name.
⇒	<u>ChangeName</u>	
⇒	<u>Count</u>	
⇒	<u>Delete</u>	Deletes frame objects.
⇒	<u>DeleteLateralBracing</u>	
⇒	<u>DeleteLoadDistributed</u>	Deletes the distributed load assignments to the specified frame objects for the specified load pattern.
⇒	<u>DeleteLoadPoint</u>	Deletes the point load assignments to the specified frame objects for the specified load pattern.
⇒	<u>DeleteLoadTemperature</u>	
⇒	<u>DeleteMass</u>	
⇒	<u>DeleteModifiers</u>	
⇒	<u>DeleteSpring</u>	
⇒	<u>GetAllFrames</u>	Retrieves select data for all frame objects in the model
⇒	<u>GetColumnSpliceOverwrite</u>	Retrieves the frame object column splice overwrite assignment.
⇒	<u>GetCurved_2</u>	Retrieves frame object curve data

Introduction

⇒ <u>GetDesignOrientation</u>	Retrieves the design orientation for a given frame object
⇒ <u>GetDesignProcedure</u>	Retrieves the design procedure for a frame object
⇒ <u>GetElm</u>	
⇒ <u>GetEndLengthOffset</u>	Retrieves the frame object end offsets along the 1-axis of the object.
⇒ <u>GetGroupAssign</u>	Retrieves the groups to which a frame object is assigned.
⇒ <u>GetGUID</u>	Retrieves the GUID for the specified frame object.
⇒ <u>GetHingeAssigns</u>	DEPRECATED Retrieves frame object hinge assignments.
⇒ <u>GetHingeAssigns_1</u>	Retrieves frame object hinge assignments. The assignments include the hinge property, type, and location
⇒ <u>GetInsertionPoint</u>	Retrieves frame object insertion point assignments. The assignments include the cardinal point and end joint offsets.
⇒ <u>GetLabelFromName</u>	Retrieves the label and story for a unique frame object name
⇒ <u>GetLabelNameList</u>	Retrieves the names and labels of all defined frame objects.
⇒ <u>GetLateralBracing</u>	
⇒ <u>GetLoadDistributed</u>	Retrieves the distributed load assignments to frame objects.
⇒ <u>GetLoadPoint</u>	Retrieves the point load assignments to frame objects.
⇒ <u>GetLoadTemperature</u>	Retrieves the temperature load assignments to frame objects.
⇒ <u>GetLocalAxes</u>	Retrieves the frame local axis angle assignment for frame objects.
⇒ <u>GetMass</u>	
⇒ <u>GetMaterialOverwrite</u>	
⇒ <u>GetModifiers</u>	Retrieves the frame modifier assignment for frame objects. The default value for all modifiers is one.
⇒ <u>GetNameFromLabel</u>	Retrieves the unique name of a frame object, given the label and story level
⇒ <u>GetNameList</u>	Retrieves the names of all defined frame objects.
⇒ <u>GetNameListOnStory</u>	Retrieves the names of the defined frame objects on a given story.
⇒ <u>GetOutputStations</u>	Retrieves frame object output station data
⇒ <u>GetPier</u>	Retrieves the pier label assignments of a frame object
⇒ <u>GetPoints</u>	Retrieves the names of the point objects at each end of a specified frame object.
⇒ <u>GetReleases</u>	
⇒ <u>GetSection</u>	Retrieves the frame section property assigned to a frame object.

⇒ <u>GetSectionNonPrismatic</u>	
⇒ <u>GetSelected</u>	
⇒ <u>GetSpandrel</u>	Retrieves the Spandrel label assignments of a frame object
⇒ <u>GetSpringAssignment</u>	Retrieves the named line spring property assignment for a frame object
⇒ <u>GetSupports</u>	Retrieves support data for a given frame beam object
⇒ <u>GetTCLimits</u>	
⇒ <u>GetTransformationMatrix</u>	
⇒ <u>GetTypeOAPI</u>	Retrieves the type of frame object (straight or curved)
⇒ <u>SetColumnSpliceOverwrite</u>	Sets the frame object column splice overwrite assignment.
⇒ <u>SetDesignProcedure</u>	Sets the design procedure for frame objects.
⇒ <u>SetEndLengthOffset</u>	Assigns frame object end offsets along the 1-axis of the object.
⇒ <u>SetGroupAssign</u>	Adds or removes frame objects from a specified group.
⇒ <u>SetGUID</u>	Sets the GUID for the specified frame object. If the GUID is passed in as a blank string, the program automatically creates a GUID for the object.
⇒ <u>SetInsertionPoint</u>	Assigns frame object insertion point data. The assignments include the cardinal point and end joint offsets.
⇒ <u>SetLateralBracing</u>	
⇒ <u>SetLoadDistributed</u>	Assigns distributed loads to frame objects.
⇒ <u>SetLoadPoint</u>	Assigns point loads to frame objects.
⇒ <u>SetLoadTemperature</u>	
⇒ <u>SetLocalAxes</u>	Assigns a local axis angle to frame objects.
⇒ <u>SetMass</u>	
⇒ <u>SetMaterialOverwrite</u>	
⇒ <u>SetModifiers</u>	Sets the frame modifier assignment for frame objects. The default value for all modifiers is one
⇒ <u>SetOutputStations</u>	Assigns frame object output station data.
⇒ <u>SetPier</u>	Sets the pier label assignment of one or more frame objects
⇒ <u>SetReleases</u>	Makes end release and partial fixity assignments to frame objects.
⇒ <u>SetSection</u>	Assigns a frame section property to a frame object.
⇒ <u>SetSelected</u>	Sets the selected status for a frame object.
⇒ <u>SetSpandrel</u>	Sets the Spandrel label assignment of one or more frame objects
⇒ <u>SetSpringAssignment</u>	Assigns an existing named line spring property to frame objects
⇒ <u>SetTCLimits</u>	Makes tension/compression force limit assignments to frame objects.

    ZJ : float *
    Name : string byref *
    ?PropName : string *
    ?UserName : string *
    ?CSys : string
(* Defaults:
    let _PropName = defaultArg PropName "Default"
    let _UserName = defaultArg UserName ""
    let _CSys = defaultArg CSys "Global"
*)
-> int
```

Parameters

XI

Type:Â SystemDouble

The coordinates of the I-End of the added frame object. The coordinates are in the coordinate system defined by the CSys item.

YI

Type:Â SystemDouble

The coordinates of the I-End of the added frame object. The coordinates are in the coordinate system defined by the CSys item.

ZI

Type:Â SystemDouble

The coordinates of the I-End of the added frame object. The coordinates are in the coordinate system defined by the CSys item.

XJ

Type:Â SystemDouble

The coordinates of the J-End of the added frame object. The coordinates are in the coordinate system defined by the CSys item.

YJ

Type:Â SystemDouble

The coordinates of the J-End of the added frame object. The coordinates are in the coordinate system defined by the CSys item.

ZJ

Type:Â SystemDouble

The coordinates of the J-End of the added frame object. The coordinates are in the coordinate system defined by the CSys item.

Name

Type:Â SystemString

This is the name that the program ultimately assigns for the frame object. If no userName is specified, the program assigns a default name to the frame object. If a userName is specified and that name is not used for another frame, cable or tendon object, the userName is assigned to the frame object, otherwise a default name is assigned to the frame object.

PropName (Optional)

Type:Â SystemString

This is Default, None, or the name of a defined frame section property.

If it is Default, the program assigns a default section property to the frame object. If it is None, no section property is assigned to the frame object. If it is the name of a defined frame section property, that property is assigned to the frame object.

UserName (Optional)

Type:Â SystemString

This is an optional user specified name for the frame object. If a UserName is specified and that name is already used for another frame object, the program ignores the UserName.

CSys (Optional)

Type:Â SystemString

The name of the coordinate system in which the frame object end point coordinates are defined.

Return Value

Type:Â Int32

Returns zero if the frame object is successfully added, otherwise it returns a nonzero value.

▲Remarks

Note that the End I and End J joints of the added frame object are determined based on the orientation of the object and may not be the same order as specified in the parameters of this API functions. Please use GetPoints(String, String, String) to check the position of the End I and End J joints.

▲Examples

VB

Copy

```
Public Sub Example()
    Dim SapModel As cSapModel
    Dim EtabsObject As cOAPI
    Dim ret As Integer = -1
    Dim Name As String

    'create ETABS object
    Dim myHelper as cHelper = New Helper
    EtabsObject = myHelper.CreateObjectProgID("CSI.ETABS.API.ETABSObject")

    'start ETABS application
    ret = EtabsObject.ApplicationStart()
```

Return Value

Introduction

```
'create SapModel object
  SapModel = EtabsObject.SapModel

'initialize model
  ret = SapModel.InitializeNewModel(eUnits.lb_ft_F)

'create steel deck template model
  ret = SapModel.File.NewSteelDeck(4, 12, 12, 4, 4, 24, 24)

'add frame object by coordinates
  ret = SapModel.FrameObj.AddByCoord(0, 72, 48, 0, 48, 36, Name)

'close ETABS
  EtabsObject.ApplicationExit(False)

'clean up variables
  SapModel = Nothing
  EtabsObject = Nothing

End Sub
```

CSI API ETABS v1

cFrameObjAddLanguageSpecificTextSet("LST1A5655F0_0?cpp=::|1965");AddByMethod

Adds a new frame object whose end points are specified by name.

Namespace: ETABSv1

Assembly: ETABSv1 (in ETABSv1.dll) Version: 1.0.0.0 (1.24.0.0)

Syntax

C#

VB

C++

F#

Copy

```
int AddByPoint(
    string Point1,
    string Point2,
    ref string Name,
    string PropName = "Default",
    string UserName = ""
)
```

```
Function AddByPoint (
    Point1 As String,
    Point2 As String,
    ByRef Name As String,
    PropName As String = "Default",
    UserName As String = ""
) As Integer
```

```
Dim instance As cFrameObj
Dim Point1 As String
Dim Point2 As String
Dim Name As String
Dim PropName As String
Dim UserName As String
Dim returnValue As Integer
```

```
returnValue = instance.AddByPoint(Point1,
    Point2, Name, PropName, UserName)
```

```
int AddByPoint(
    String^ Point1,
    String^ Point2,
    String^% Name,
    String^ PropName = L"Default",
    String^ UserName = L""
)
```

```
abstract AddByPoint :
    Point1 : string *
    Point2 : string *
    Name : string byref *
    ?PropName : string *
    ?UserName : string
```

cFrameObjid="LST1A5655F0_0"AddLanguageSpecificTextSet("LST1A5655F0_0?cpp=::|1965");AddBy

```
(* Defaults:
    let _PropName = defaultArg PropName "Default"
    let _UserName = defaultArg UserName ""
*)
-> int
```

Parameters

Point1

Type: SystemString

The name of a defined point object at the I-End of the added frame object.

Point2

Type: SystemString

The name of a defined point object at the J-End of the added frame object.

Name

Type: SystemString

This is the name that the program ultimately assigns for the frame object. If no UserName is specified, the program assigns a default name to the frame object. If a UserName is specified and that name is not used for another frame, cable or tendon object, the UserName is assigned to the frame object, otherwise a default name is assigned to the frame object.

PropName (Optional)

Type: SystemString

This is Default, None, or the name of a defined frame section property.

If it is Default, the program assigns a default section property to the frame object. If it is None, no section property is assigned to the frame object. If it is the name of a defined frame section property, that property is assigned to the frame object.

UserName (Optional)

Type: SystemString

This is an optional user specified name for the frame object. If a UserName is specified and that name is already used for another frame object, the program ignores the UserName.

Return Value

Type: Int32

Returns zero if the frame object is successfully added, otherwise it returns a nonzero value.

Remarks

Note that the End I and End J joints of the added frame object are determined based on the orientation of the object and may not be the same order as specified in the parameters of this API functions. Please use GetPoints(String, String, String) to check the position of the End I and End J joints.

Examples

VB

Copy

```
Public Sub Example()
    Dim SapModel As cSapModel
    Dim EtabsObject As cOAPI
    Dim ret As Integer = -1
    Dim Name As String
```

Introduction

```
'create ETABS object
    Dim myHelper as cHelper = New Helper
    EtabsObject = myHelper.CreateObjectProgID("CSI.ETABS.API.ETABSObject")

'start ETABS application
    ret = EtabsObject.ApplicationStart()

'create SapModel object
    SapModel = EtabsObject.SapModel

'initialize model
    ret = SapModel.InitializeNewModel()

'create steel deck template model
    ret = SapModel.File.NewSteelDeck(4, 12, 12, 4, 4, 24, 24)

'add frame object by points
    ret = SapModel.FrameObj.AddByPoint("1", "6", Name)

'close ETABS
    EtabsObject.ApplicationExit(False)

'clean up variables
    SapModel = Nothing
    EtabsObject = Nothing

End Sub
```

CSI API ETABS v1

cFrameObjAddLanguageSpecificTextSet("LST49780FA1_0?cpp=::|1072);DeleteMethod

Deletes frame objects.

Namespace: ETABSv1

Assembly: ETABSv1 (in ETABSv1.dll) Version: 1.0.0.0 (1.24.0.0)

Syntax

C#

VB

C++

F#

Copy

```
int Delete(
    string Name,
    eItemType ItemType = eItemType.Objects
)
```

```
Function Delete (
    Name As String,
    ItemType As eItemType = eItemType.Objects
) As Integer
```

```
Dim instance As cFrameObj
Dim Name As String
Dim ItemType As eItemType
Dim returnValue As Integer
```

```
returnValue = instance.Delete(Name, ItemType)
```

```
int Delete(
    String^ Name,
    eItemType ItemType = eItemType::Objects
)
```

```
abstract Delete :
    Name : string *
    ?ItemType : eItemType
(* Defaults:
    let _ItemType = defaultArg ItemType eItemType.Objects
*)
-> int
```

Parameters

Name

Type: SystemString

The name of an existing frame object or group depending on the value of the ItemType item.

ItemType (Optional)

Type: ETABSv1eItemType

This is one of the following items in the eItemType enumeration:

cFrameObjid="LST49780FA1_0"AddLanguageSpecificTextSet("LST49780FA1_0?cpp=::|1072);Delete

- ◇ Object = 0
- ◇ Group = 1
- ◇ SelectedObjects = 2

If this item is Objects, the frame object specified by the Name item is deleted.

If this item is Group, all of the frame objects in the group specified by the Name item are deleted.

If this item is SelectedObjects, all selected frame objects are deleted, and the Name item is ignored.

Return Value

Type: Int32

Returns zero if the frame object is successfully deleted, otherwise it returns a nonzero value.

▲ Remarks

▲ Examples

VB

Copy

```
Public Sub Example()
    Dim SapModel As cSapModel
    Dim EtabsObject As cOAPI
    Dim ret As Integer = -1

    'create ETABS object
    Dim myHelper as cHelper = New Helper
    EtabsObject = myHelper.CreateObjectProgID("CSI.ETABS.API.ETABSObject")

    'start ETABS application
    ret = EtabsObject.ApplicationStart()

    'create SapModel object
    SapModel = EtabsObject.SapModel

    'initialize model
    ret = SapModel.InitializeNewModel()

    'create steel deck template model
    ret = SapModel.File.NewSteelDeck(4, 12, 12, 4, 4, 24, 24)

    'delete frame object
    ret = SapModel.FrameObj.Delete("1")

    'close ETABS
    EtabsObject.ApplicationExit(False)

    'clean up variables
    SapModel = Nothing
    EtabsObject = Nothing
End Sub
```

CSI API ETABS v1

cFrameObjAddLanguageSpecificTextSet("LSTA7133175_0") Method

Deletes the distributed load assignments to the specified frame objects for the specified load pattern.

Namespace: $\hat{A}$ ETABSV1

Assembly: $\hat{A}$ ETABSV1 (in ETABSV1.dll) Version: 1.0.0.0 (1.24.0.0)

■ Syntax

C#

VB

C++

F#

Copy

```
int DeleteLoadDistributed(
    string Name,
    string LoadPat,
    eItemType ItemType = eItemType.Objects
)
```

```
Function DeleteLoadDistributed (
    Name As String,
    LoadPat As String,
    ItemType As eItemType = eItemType.Objects
) As Integer
```

```
Dim instance As cFrameObj
Dim Name As String
Dim LoadPat As String
Dim ItemType As eItemType
Dim returnValue As Integer
```

```
returnValue = instance.DeleteLoadDistributed(Name,
    LoadPat, ItemType)
```

```
int DeleteLoadDistributed(
    String^ Name,
    String^ LoadPat,
    eItemType ItemType = eItemType::Objects
)
```

```
abstract DeleteLoadDistributed :
    Name : string *
    LoadPat : string *
    ?ItemType : eItemType
(* Defaults:
    let _ItemType = defaultArg ItemType eItemType.Objects
*)
-> int
```

Parameters

Name

Type:Â SystemString

The name of an existing frame object or group depending on the value of the ItemType item.

LoadPat

Type:Â SystemString

The name of a defined load pattern.

ItemType (Optional)

Type:Â ETABSv1eItemType

This is one of the following items in the eItemType enumeration:

◊ Object = 0

◊ Group = 1

◊ SelectedObjects = 2

If this item is Objects, the load assignments are deleted for the frame object specified by the Name item.

If this item is Group, the load assignments are deleted for all frame objects in the group specified by the Name item.

If this item is SelectedObjects, the load assignments are deleted for all selected frame objects, and the Name item is ignored.

Return ValueType:Â Int32

Returns zero if the load assignments are successfully deleted, otherwise it returns a nonzero value.

▲ Remarks

▲ Examples

VB

Copy

```
Public Sub Example()
    Dim SapModel As cSapModel
    Dim EtabsObject As cOAPI
    Dim ret As Integer = -1

    'create ETABS object
    Dim myHelper as cHelper = New Helper
    EtabsObject = myHelper.CreateObjectProgID("CSI.ETABS.API.ETABSObject")

    'start ETABS application
    ret = EtabsObject.ApplicationStart()

    'create SapModel object
    SapModel = EtabsObject.SapModel

CSI API ETABS v1

cFrameObjAddLanguageSpecificTextSet("LSTEEA6CC24_0?cpp=1995.") Method

Retrieves the frame object column splice overwrite assignment.

Namespace: ETABSv1

Assembly: ETABSv1 (in ETABSv1.dll) Version: 1.0.0.0 (1.24.0.0)

■ Syntax

C#

VB

C++

F#

Copy

```
int GetColumnSpliceOverwrite(
    string Name,
    ref int SpliceOption,
    ref double Height
)
```

```
Function GetColumnSpliceOverwrite (
    Name As String,
    ByRef SpliceOption As Integer,
    ByRef Height As Double
) As Integer
```

```
Dim instance As cFrameObj
Dim Name As String
Dim SpliceOption As Integer
Dim Height As Double
Dim returnValue As Integer
```

```
returnValue = instance.GetColumnSpliceOverwrite(Name,
    SpliceOption, Height)
```

```
int GetColumnSpliceOverwrite(
    String^ Name,
    int% SpliceOption,
    double% Height
)
```

```
abstract GetColumnSpliceOverwrite :
    Name : string *
    SpliceOption : int byref *
    Height : float byref -> int
```

Parameters

Name

Type: SystemString

The name of an existing frame object.

SpliceOption

Type: SystemInt32

This is a numeric value from 1 to 3 that specifies the option used for defining the splice overwrite.

1. from story data (default)
2. no splice
3. splice at height above story at bottom of the column object

Height

Type: SystemDouble

If the SpliceOption=3, this specifies the height of the splice above the story at the bottom of the column object.

Return Value

Type: Int32

Returns zero if the column splice overwrite data is successfully retrieved, otherwise it returns a nonzero value.

▲ Remarks

▲ Examples

VB

Copy

```
Public Sub Example()
    Dim SapModel As cSapModel
    Dim EtabsObject As cOAPI
    Dim ret As Integer = -1

    'create ETABS object
    Dim myHelper as cHelper = New Helper
    EtabsObject = myHelper.CreateObjectProgID("CSI.ETABS.API.ETABSObject")

    'start ETABS application
    ret = EtabsObject.ApplicationStart()

    'create SapModel object
    SapModel = EtabsObject.SapModel

    'initialize model
    ret = SapModel.InitializeNewModel()

    'create steel deck template model
    ret = SapModel.File.NewSteelDeck(4, 12, 12, 4, 4, 24, 24)

    'assign column splice overwrite
    ret = SapModel.FrameObj.SetColumnSpliceOverwrite("15", 2, 0)

    'get column splice overwrite
    Dim SpliceOption As Integer
    Dim Height As Double
    ret = SapModel.FrameObj.GetColumnSpliceOverwrite("15", SpliceOption, Height)

    'close ETABS
    EtabsObject.ApplicationExit(False)

    'clean up variables
    SapModel = Nothing
    EtabsObject = Nothing

End Sub
```

CSI API ETABS v1

cFrameObjAddLanguageSpecificTextSet("LST4A2E0073_0") Method

Retrieves frame object curve data

Namespace: ETABSv1

Assembly: ETABSv1 (in ETABSv1.dll) Version: 1.0.0.0 (1.24.0.0)

■ Syntax

C#

VB

C++

F#

Copy

```
int GetCurved_2(
    string Name,
    ref int CurveType,
    ref double Tension,
    ref int NumPnts,
    ref double[] gx,
    ref double[] gy,
    ref double[] gz
)
```

```
Function GetCurved_2 (
    Name As String,
    ByRef CurveType As Integer,
    ByRef Tension As Double,
    ByRef NumPnts As Integer,
    ByRef gx As Double(),
    ByRef gy As Double(),
    ByRef gz As Double()
) As Integer
```

```
Dim instance As cFrameObj
Dim Name As String
Dim CurveType As Integer
Dim Tension As Double
Dim NumPnts As Integer
Dim gx As Double()
Dim gy As Double()
Dim gz As Double()
Dim returnValue As Integer
```

```
returnValue = instance.GetCurved_2(Name,
    CurveType, Tension, NumPnts, gx, gy,
    gz)
```

```
int GetCurved_2(
    String^ Name,
    int% CurveType,
    double% Tension,
    int% NumPnts,
    array<double>^% gx,
    array<double>^% gy,
```

cFrameObjAddLanguageSpecificTextSet("LST4A2E0073_0?cpp=::1098");GetC

```
array<double>^% gz
)
```

```
abstract GetCurved 2 :
    Name : string *
    CurveType : int byref *
    Tension : float byref *
    NumPnts : int byref *
    gx : float[] byref *
    gy : float[] byref *
    gz : float[] byref -> int
```

Parameters

Name

Type:Â [SystemString](#)

The name of an existing curved frame object

CurveType

Type:Â [SystemInt32](#)

The type of curve, this is an integer from the following list:

- ◊ Straight = 0
- ◊ Circular Curve = 1
- ◊ Multilinear Curve = 2
- ◊ Bezier Curve = 3
- ◊ Spline Curve = 4

Tension

Type:Â [SystemDouble](#)

Used for spline, a value that specifies the amount that the curve bends between control points. Values greater than 1 produce unpredictable results

NumPnts

Type:Â [SystemInt32](#)

The number of points along the curve

gx

Type:Â [SystemDouble](#)

An array of size NumPnts, the global X coordinates

gy

Type:Â [SystemDouble](#)

An array of size NumPnts, the global Y coordinates

gz

Type:Â [SystemDouble](#)

An array of size NumPnts, the global Z coordinates

Return Value

Type:Â [Int32](#)

Returns zero if the data is successfully retrieved, otherwise it returns a nonzero value

CSI API ETABS v1

cFrameObjAddLanguageSpecificTextSet("LSTFC4759F7_0?cpp=::2001");GetDesignOrientation

Method

Retrieves the design orientation for a given frame object

Namespace: ETABSv1

Assembly: ETABSv1 (in ETABSv1.dll) Version: 1.0.0.0 (1.24.0.0)

Syntax

C#

VB

C++

F#

Copy

```
int GetDesignOrientation(
    string Name,
    ref eFrameDesignOrientation DesignOrientation
)
```

```
Function GetDesignOrientation (
    Name As String,
    ByRef DesignOrientation As eFrameDesignOrientation
) As Integer
```

```
Dim instance As cFrameObj
Dim Name As String
Dim DesignOrientation As eFrameDesignOrientation
Dim returnValue As Integer
```

```
returnValue = instance.GetDesignOrientation(Name,
    DesignOrientation)
```

```
int GetDesignOrientation(
    String^ Name,
    eFrameDesignOrientation% DesignOrientation
)
```

```
abstract GetDesignOrientation :
    Name : string *
    DesignOrientation : eFrameDesignOrientation byref -> int
```

Parameters

Name

Type: SystemString

The name of the frame object

DesignOrientation

Type: ETABSv1eFrameDesignOrientation

A value from the eFrameDesignOrientation enumeration

Return Value

Type: Int32

CSI API ETABS v1

cFrameObjAddLanguageSpecificTextSet("LST7A3C1C5_0")

Method

Retrieves the design procedure for a frame object

Namespace: ETABSv1

Assembly: ETABSv1 (in ETABSv1.dll) Version: 1.0.0.0 (1.24.0.0)

Syntax

C#

VB

C++

F#

Copy

```
int GetDesignProcedure(
    string Name,
    ref int MyType
)
```

```
Function GetDesignProcedure (
    Name As String,
    ByRef MyType As Integer
) As Integer
```

```
Dim instance As cFrameObj
Dim Name As String
Dim MyType As Integer
Dim returnValue As Integer
```

```
returnValue = instance.GetDesignProcedure(Name,
    MyType)
```

```
int GetDesignProcedure(
    String^ Name,
    int% MyType
)
```

```
abstract GetDesignProcedure :
    Name : string *
    MyType : int byref -> int
```

Parameters

Name

Type: SystemString

The name of an existing frame object

MyType

Type: SystemInt32

This is an integer from the list below, indicating the design procedure type of the specified frame object.

◇ Program determined = 0

◇ Steel Frame Design = 1

- ◇ Concrete Frame Design = 2
- ◇ Composite Beam Design = 3
- ◇ Steel Joist Design = 4
- ◇ No Design = 7
- ◇ Composite Column Design = 13

Return Value

Type: Int32

Returns zero if the design procedure is successfully retrieved; otherwise it returns a nonzero value

▲ Remarks

▲ Examples

VB

Copy

```
Public Sub Example()  
    Dim SapModel As cSapModel  
    Dim EtabsObject As cOAPI  
    Dim ret As Integer = -1  
    Dim MyType as Integer  
  
    'create ETABS object  
    Dim myHelper as cHelper = New Helper  
    EtabsObject = myHelper.CreateObjectProgID("CSI.ETABS.API.ETABSObject")  
  
    'start ETABS application  
    ret = EtabsObject.ApplicationStart()  
  
    'create SapModel object  
    SapModel = EtabsObject.SapModel  
  
    'initialize model  
    ret = SapModel.InitializeNewModel()  
  
    'create steel deck template model  
    ret = SapModel.File.NewSteelDeck(4, 12, 12, 4, 4, 24, 24)  
  
    'set design procedure  
    ret = SapModel.FrameObj.GetDesignProcedure("8", MyType)  
  
    'close ETABS  
    EtabsObject.ApplicationExit(False)  
  
    'clean up variables  
    SapModel = Nothing  
    EtabsObject = Nothing  
  
End Sub
```

CSI API ETABS v1

cFrameObjAddLanguageSpecificTextSet("LST11D12F23_0?cpp=::2008");GetEndLengthOffset Method

Retrieves the frame object end offsets along the 1-axis of the object.

Namespace: ETABSv1

Assembly: ETABSv1 (in ETABSv1.dll) Version: 1.0.0.0 (1.24.0.0)

■ Syntax

C#

VB

C++

F#

Copy

```
int GetEndLengthOffset(
    string Name,
    ref bool AutoOffset,
    ref double Length1,
    ref double Length2,
    ref double RZ
)
```

```
Function GetEndLengthOffset (
    Name As String,
    ByRef AutoOffset As Boolean,
    ByRef Length1 As Double,
    ByRef Length2 As Double,
    ByRef RZ As Double
) As Integer
```

```
Dim instance As cFrameObj
Dim Name As String
Dim AutoOffset As Boolean
Dim Length1 As Double
Dim Length2 As Double
Dim RZ As Double
Dim returnValue As Integer
```

```
returnValue = instance.GetEndLengthOffset(Name,
    AutoOffset, Length1, Length2, RZ)
```

```
int GetEndLengthOffset(
    String^ Name,
    bool% AutoOffset,
    double% Length1,
    double% Length2,
    double% RZ
)
```

```
abstract GetEndLengthOffset :
    Name : string *
    AutoOffset : bool byref *
    Length1 : float byref *
    Length2 : float byref *
    RZ : float byref -> int
```

cFrameObjid="LST11D12F23_0"AddLanguageSpecificTextSet("LST11D12F23_0?cpp=::2008");GetEndLengthOffset

Parameters

Name

Type:Â [SystemString](#)

The name of an existing frame object.

AutoOffset

Type:Â [SystemBoolean](#)

If this item is True, the end length offsets are automatically determined by the program from object connectivity.

Length1

Type:Â [SystemDouble](#)

The offset length along the 1-axis of the frame object at the I-End of the frame object. [L]

Length2

Type:Â [SystemDouble](#)

The offset length along the 1-axis of the frame object at the J-End of the frame object. [L]

RZ

Type:Â [SystemDouble](#)

The rigid zone factor. This is the fraction of the end offset length assumed to be rigid for bending and shear deformations.

Return Value

Type:Â [Int32](#)

Returns zero if the offsets are successfully retrieved, otherwise it returns a nonzero value.

CSI API ETABS v1

cFrameObjAddLanguageSpecificTextSet("LST731D63E8_0?cpp=::2014") Method

Retrieves the groups to which a frame object is assigned.

Namespace: [ETABSv1](#)

Assembly: [ETABSv1](#) (in ETABSv1.dll) Version: 1.0.0.0 (1.24.0.0)

Syntax

[C#](#)

[VB](#)

[C++](#)

[F#](#)

[Copy](#)

```
int GetGroupAssign(
    string Name,
    ref int NumberGroups,
    ref string[] Groups
)
```

```
Function GetGroupAssign (
    Name As String,
    ByRef NumberGroups As Integer,
    ByRef Groups As String()
) As Integer
```

```
Dim instance As cFrameObj
Dim Name As String
Dim NumberGroups As Integer
Dim Groups As String()
Dim returnValue As Integer
```

```
returnValue = instance.GetGroupAssign(Name,
    NumberGroups, Groups)
```

```
int GetGroupAssign(
    String^ Name,
    int% NumberGroups,
    array<String^>^% Groups
)
```

```
abstract GetGroupAssign :
    Name : string *
    NumberGroups : int byref *
    Groups : string[] byref -> int
```

Parameters

Name

Type: [SystemString](#)

The name of an existing frame object.

NumberGroups

Type:Â SystemInt32

The number of group names retrieved.

Groups

Type:Â SystemString

This is an array of the names of the groups to which the frame object is assigned.

Return Value

Type:Â Int32

Returns zero if the group assignments are successfully retrieved, otherwise it returns a nonzero value.

▲ Remarks

▲ Examples

VB

Copy

```
Public Sub Example()
    Dim SapModel As cSapModel
    Dim EtabsObject As cOAPI
    Dim ret As Integer = -1
    Dim NumberGroups As Integer
    Dim Groups() as String

    'create ETABS object
    Dim myHelper as cHelper = New Helper
    EtabsObject = myHelper.CreateObjectProgID("CSI.ETABS.API.ETABSObject")

    'start ETABS application
    ret = EtabsObject.ApplicationStart()

    'create SapModel object
    SapModel = EtabsObject.SapModel

    'initialize model
    ret = SapModel.InitializeNewModel()

    'create steel deck template model
    ret = SapModel.File.NewSteelDeck(4, 12, 12, 4, 4, 24, 24)

    'define new groups
    ret = SapModel.GroupDef.SetGroup("Group1")
    ret = SapModel.GroupDef.SetGroup("Group2")

    'add frame object to groups
    ret = SapModel.FrameObj.SetGroupAssign("3", "Group1")
    ret = SapModel.FrameObj.SetGroupAssign("3", "Group2")

    'get frame object groups
    ret = SapModel.FrameObj.GetGroupAssign("3", NumberGroups, Groups)

    'close ETABS
    EtabsObject.ApplicationExit(False)

    'clean up variables
    SapModel = Nothing
    EtabsObject = Nothing
End Sub
```

CSI API ETABS v1

cFrameObjAddLanguageSpecificTextSet("LST64E8BD82_0") Method

Retrieves the GUID for the specified frame object.

Namespace: [ETABSv1](#)

Assembly: [ETABSv1](#) (in ETABSv1.dll) Version: 1.0.0.0 (1.24.0.0)

▲ Syntax

[C#](#)

[VB](#)

[C++](#)

[F#](#)

[Copy](#)

```
int GetGUID(
    string Name,
    ref string GUID
)
```

```
Function GetGUID (
    Name As String,
    ByRef GUID As String
) As Integer
```

```
Dim instance As cFrameObj
Dim Name As String
Dim GUID As String
Dim returnValue As Integer
```

```
returnValue = instance.GetGUID(Name, GUID)
```

```
int GetGUID(
    String^ Name,
    String^% GUID
)
```

```
abstract GetGUID :
    Name : string *
    GUID : string byref -> int
```

Parameters

Name

Type: [SystemString](#)

The name of an existing frame object.

GUID

Type: [SystemString](#)

The GUID (Global Unique ID) for the specified frame object.

Return Value

Type: Int32

Returns zero if the frame object GUID is successfully retrieved; otherwise it returns nonzero

▀ **Remarks**

▀ **Examples**

VB

Copy

```
Public Sub Example()
    Dim SapModel As cSapModel
    Dim EtabsObject As cOAPI
    Dim ret As Integer = -1
    Dim GUID As String

    'create ETABS object
    Dim myHelper as cHelper = New Helper
    EtabsObject = myHelper.CreateObjectProgID("CSI.ETABS.API.ETABSObject")

    'start ETABS application
    ret = EtabsObject.ApplicationStart()

    'create SapModel object
    SapModel = EtabsObject.SapModel

    'initialize model
    ret = SapModel.InitializeNewModel()

    'create steel deck template model
    ret = SapModel.File.NewSteelDeck(4, 12, 12, 4, 4, 24, 24)

    'get GUID
    ret = SapModel.FrameObj.GetGUID("1", GUID)

    'close ETABS
    EtabsObject.ApplicationExit(False)

    'clean up variables
    SapModel = Nothing
    EtabsObject = Nothing

End Sub
```

Dim returnValue As Integer
```

```
returnValue = instance.GetHingeAssigns(Name,
    NumberHinges, HingeNum, Prop, MyType,
    Behavior, Source, RD)
```

```
int GetHingeAssigns(
    String^ Name,
    int% NumberHinges,
    array<int>^% HingeNum,
```

cFrameObjid="LST50965F91_0"AddLanguageSpecificTextSet("LST50965F91_0?cpp=::|2015);GetHir

```
array<String>^% Prop,
array<int>^% MyType,
array<int>^% Behavior,
array<String>^% Source,
array<double>^% RD
)

abstract GetHingeAssigns :
    Name : string *
    NumberHinges : int byref *
    HingeNum : int[] byref *
    Prop : string[] byref *
    MyType : int[] byref *
    Behavior : int[] byref *
    Source : string[] byref *
    RD : float[] byref -> int
```

Parameters

Name

Type: SystemString

The name of an existing frame object.

NumberHinges

Type: SystemInt32

The number of frame hinges assigned to the frame object.

HingeNum

Type: SystemInt32

An array of size NumberHinges. This is the hinge identification number.

Prop

Type: SystemString

An array of size NumberHinges. This is the name of the property of the hinge.

MyType

Type: SystemInt32

An array of size NumberHinges. This is a numeric value from 1 to 14 that specifies the type of the hinge.

1. P
2. V2
3. V3
4. T
5. M2
6. M3
7. Interacting P-M2
8. Interacting P-M3
9. Interacting M2-M3
10. Interacting P-M2-M3
11. Fiber P-M2-M3
12. Fiber P-M3
13. Parametric Concrete P-M2-M3
14. Parametric Steel P-M2-M3

Behavior

Type: SystemInt32

An array of size NumberHinges. This is a numeric value from 1 to 2 that specifies behavior of the hinge.

1. Force-controlled
2. Deformation-controlled

Source

Type: SystemString

An array of size NumberHinges. This is the name of the assigned hinge property, or "Auto" if an auto-generated hinge.

RD

Type: SystemDouble

An array of size NumberHinges. This is the distance of the hinge from the end of the i-end offset, as a ratio to the clear length of the frame object.

Return Value

Type: Int32

Returns zero if the hinge data is successfully retrieved, otherwise it returns a nonzero value.

▲ Remarks

This function is DEPRECATED. Please refer to GetHingeAssigns_1(String, Int32, Int32, String, Int32, Int32, String, eHingeLocationType, Double, Double)

    Source : string[] byref *  
    LocType : eHingeLocationType[] byref *  
    RD : float[] byref *  
    AD : float[] byref -> int
```

Parameters

Name

Type:Â SystemString

The name of an existing frame object.

NumberHinges

Type:Â SystemInt32

The number of frame hinges assigned to the frame object.

HingeNum

Type:Â SystemInt32

An array of size NumberHinges. This is the hinge identification number.

Prop

Type:Â SystemString

An array of size NumberHinges. This is the name of the property of the hinge.

MyType

Type:Â SystemInt32

An array of size NumberHinges. This is a numeric value from 1 to 14 that specifies the type of the hinge.

1. P
2. V2
3. V3
4. T
5. M2
6. M3
7. Interacting P-M2
8. Interacting P-M3
9. Interacting M2-M3

- 10. Interacting P-M2-M3
- 11. Fiber P-M2-M3
- 12. Fiber P-M3
- 13. Parametric Concrete P-M2-M3
- 14. Parametric Steel P-M2-M3

Behavior

Type: SystemInt32

An array of size NumberHinges. This is a numeric value from 1 to 2 that specifies behavior of the hinge.

- 1. Force-controlled
- 2. Deformation-controlled

Source

Type: SystemString

An array of size NumberHinges. This is the name of the assigned hinge property, or "Auto" if an auto-generated hinge.

LocType

Type: ETABSv1eHingeLocationType

An array of size NumberHinges. This is a value from the eHingeLocationType enumeration, specifying the type used to define the location of the hinge.

RD

Type: SystemDouble

An array of size NumberHinges. If LocType = RelativeDistance, this is the distance of the hinge from the end of the i-end offset, as a ratio to the clear length of the frame object.

AD

Type: SystemDouble

An array of size NumberHinges. If LocType = OffsetFromIEnd, this is the absolute distance of the hinge from the end of the i-end offset. If LocType = OffsetFromJEnd, this is the absolute distance of the hinge from the end of the j-end offset.

Return Value

Type: Int32

Returns zero if the hinge data is successfully retrieved, otherwise it returns a nonzero value.

CSI API ETABS v1

cFrameObjAddLanguageSpecificTextSet("LSTCC3EBF86_0?cpp=2021-")

Method

Retrieves frame object insertion point assignments. The assignments include the cardinal point and end joint offsets.

Namespace: $\hat{A}$ ETABSV1

Assembly: $\hat{A}$ ETABSV1 (in ETABSV1.dll) Version: 1.0.0.0 (1.24.0.0)

Syntax

C#

VB

C++

F#

Copy

```
int GetInsertionPoint(
    string Name,
    ref int CardinalPoint,
    ref bool Mirror2,
    ref bool StiffTransform,
    ref double[] Offset1,
    ref double[] Offset2,
    ref string CSys
)
```

```
Function GetInsertionPoint (
    Name As String,
    ByRef CardinalPoint As Integer,
    ByRef Mirror2 As Boolean,
    ByRef StiffTransform As Boolean,
    ByRef Offset1 As Double(),
    ByRef Offset2 As Double(),
    ByRef CSys As String
) As Integer
```

```
Dim instance As cFrameObj
Dim Name As String
Dim CardinalPoint As Integer
Dim Mirror2 As Boolean
Dim StiffTransform As Boolean
Dim Offset1 As Double()
Dim Offset2 As Double()
Dim CSys As String
Dim returnValue As Integer
```

```
returnValue = instance.GetInsertionPoint(Name,
    CardinalPoint, Mirror2, StiffTransform,
    Offset1, Offset2, CSys)
```

```
int GetInsertionPoint(
    String^ Name,
    int% CardinalPoint,
    bool% Mirror2,
    bool% StiffTransform,
    array<double>^% Offset1,
```

cFrameObjspan id="LSTCC3EBF86_0"AddLanguageSpecificTextSet("LSTCC3EBF86_0?cpp=2021-");Get

```
array<double>^% Offset2,
String^% CSys
)
```

```
abstract GetInsertionPoint :
    Name : string *
    CardinalPoint : int byref *
    Mirror2 : bool byref *
    StiffTransform : bool byref *
    Offset1 : float[] byref *
    Offset2 : float[] byref *
    CSys : string byref -> int
```

Parameters

Name

Type:Â SystemString

The name of an existing frame object.

CardinalPoint

Type:Â SystemInt32

This is a numeric value from 1 to 11 that specifies the cardinal point for the frame object. The cardinal point specifies the relative position of the frame section on the line representing the frame object.

1. bottom left
2. bottom center
3. bottom right
4. middle left
5. middle center
6. middle right
7. top left
8. top center
9. top right
10. centroid
11. shear center

Mirror2

Type:Â SystemBoolean

If this item is True, the frame object section is assumed to be mirrored (flipped) about its local 2-axis.

StiffTransform

Type:Â SystemBoolean

If this item is True, the frame object stiffness is transformed for cardinal point and joint offsets from the frame section centroid.

Offset1

Type:Â SystemDouble

This is an array of three joint offset distances, in the coordinate directions specified by CSys, at the I-End of the frame object. [L]

- ◊ Offset1(0) = Offset in the 1-axis or X-axis direction
- ◊ Offset1(1) = Offset in the 2-axis or Y-axis direction
- ◊ Offset1(2) = Offset in the 3-axis or Z-axis direction

Offset2

Type:Â SystemDouble

This is an array of three joint offset distances, in the coordinate directions specified by CSys, at the J-End of the frame object. [L]

Introduction

- ◇ Offset2(0) = Offset in the 1-axis or X-axis direction
- ◇ Offset2(1) = Offset in the 2-axis or Y-axis direction
- ◇ Offset2(2) = Offset in the 3-axis or Z-axis direction

CSys

Type: SystemString

This is Local or the name of a defined coordinate system. It is the coordinate system in which the Offset1 and Offset2 items are specified.

Return Value

Type: Int32

Returns zero if the insertion point data is successfully retrieved, otherwise it returns a nonzero value.

Remarks

Examples

VB

Copy

```
Public Sub Example()  
    Dim SapModel As cSapModel  
    Dim EtabsObject As cOAPI  
    Dim ret As Integer = -1  
  
    'create ETABS object  
    Dim myHelper as cHelper = New Helper  
    EtabsObject = myHelper.CreateObjectProgID("CSI.ETABS.API.ETABSObject")  
  
    'start ETABS application  
    ret = EtabsObject.ApplicationStart()  
  
    'create SapModel object  
    SapModel = EtabsObject.SapModel  
  
    'initialize model  
    ret = SapModel.InitializeNewModel()  
  
    'create steel deck template model  
    ret = SapModel.File.NewSteelDeck(4, 12, 12, 4, 4, 24, 24)  
  
    'assign frame insertion point  
    ReDim Offset1(2)  
    ReDim Offset2(2)  
    For i=0 To 2  
        Offset1(i)=10 + i  
        Offset2(i)=20 + i  
    Next i  
    ret = SapModel.FrameObj.SetInsertionPoint("15", 7, False, True, Offset1, Offset2)  
  
    'get frame insertion point  
    ReDim Offset1(2)  
    ReDim Offset2(2)  
    ret = SapModel.FrameObj.GetInsertionPoint("15", CardinalPoint, Mirror2, StiffTransform, Offset1, Offset2)  
  
    'close ETABS  
    EtabsObject.ApplicationExit(False)  
  
    'clean up variables  
    SapModel = Nothing  
    EtabsObject = Nothing
```

Return Value

End Sub

    String^ Name,
    String^% Label,
    String^% Story
)
```

```
abstract GetLabelFromName :
    Name : string *
    Label : string byref *
    Story : string byref -> int
```

Parameters

Name

Type: SystemString

The name of the frame object

Label

Type:Â SystemString
 The frame object label

Story

Type:Â SystemString
 The frame object story level

Return Value

Type:Â Int32
 Returns zero if the data is successfully retrieved, otherwise it returns nonzero.

▲ Remarks

CSI API ETABS v1

cFrameObjAddLanguageSpecificTextSet("LST2996B2C7_0") Method

Retrieves the names and labels of all defined frame objects.

Namespace: [ETABSv1](#)

Assembly: [ETABSv1](#) (in ETABSv1.dll) Version: 1.0.0.0 (1.24.0.0)

Syntax

[C#](#)

[VB](#)

[C++](#)

[F#](#)

[Copy](#)

```
int GetLabelNameList(
    ref int NumberNames,
    ref string[] MyName,
    ref string[] MyLabel,
    ref string[] MyStory
)
```

```
Function GetLabelNameList (
    ByRef NumberNames As Integer,
    ByRef MyName As String(),
    ByRef MyLabel As String(),
    ByRef MyStory As String()
) As Integer
```

```
Dim instance As cFrameObj
Dim NumberNames As Integer
Dim MyName As String()
Dim MyLabel As String()
Dim MyStory As String()
Dim returnValue As Integer
```

```
returnValue = instance.GetLabelNameList(NumberNames,
    MyName, MyLabel, MyStory)
```

```
int GetLabelNameList(
    int% NumberNames,
    array<String^>^% MyName,
    array<String^>^% MyLabel,
    array<String^>^% MyStory
)
```

```
abstract GetLabelNameList :
    NumberNames : int byref *
    MyName : string[] byref *
    MyLabel : string[] byref *
    MyStory : string[] byref -> int
```

Parameters**NumberNames**

Type: SystemInt32

The number of frame object names retrieved by the program.

MyName

Type: SystemString

This is a one-dimensional array of frame object names. The MyName array is created as a dynamic, zero-based, array by the API user:

```
Dim MyName() as String
```

The array is dimensioned to (NumberNames + 1) inside the program, filled with the names, and returned to the API user.

MyLabel

Type: SystemString

This is a one-dimensional array of frame object labels. The MyLabel array is created as a dynamic, zero-based, array by the API user:

```
Dim MyLabel() as String
```

The array is dimensioned to (NumberNames + 1) inside the program, filled with the labels, and returned to the API user.

MyStory

Type: SystemString

This is a one-dimensional array of the story levels of the frame objects. The MyStory array is created as a dynamic, zero-based, array by the API user:

```
Dim MyStory() as String
```

The array is dimensioned to (NumberNames + 1) inside the program, filled with the story levels, and returned to the API user.

Return Value

Type: Int32

Returns zero if the data is successfully retrieved, otherwise it returns nonzero.

▲ **Remarks**

▲ **Examples**

VB

Copy

```
Public Sub Example()
    Dim SapModel As cSapModel
    Dim EtabsObject As cOAPI
    Dim ret As Integer = -1
    Dim NumberNames As Integer
    Dim MyName() As String
    Dim MyLabel() As String
    Dim MyStory() As String

    'create ETABS object
    Dim myHelper as cHelper = New Helper
    EtabsObject = myHelper.CreateObjectProgID("CSI.ETABS.API.ETABSObject")
```

```
'start ETABS application
  ret = EtabsObject.ApplicationStart()

'create SapModel object
  SapModel = EtabsObject.SapModel

'initialize model
  ret = SapModel.InitializeNewModel()

'create steel deck template model
  ret = SapModel.File.NewSteelDeck(4, 12, 4, 4, 24, 24)

'get area object data
  ret = SapModel.FrameObj.GetLabelNameList(NumberNames, MyName, MyLabel, MyStory)

'close ETABS
  EtabsObject.ApplicationExit(False)

'clean up variables
  SapModel = Nothing
  EtabsObject = Nothing

End Sub
```

    Val2 : float[] byref *
    ?ItemType : eItemType
(* Defaults:
    let _ItemType = defaultArg ItemType eItemType.Objects
*)
-> int
```

Parameters

Name

Type: SystemString

The name of an existing frame object or group, depending on the value of the ItemType item.

NumberItems

	Type:Â <u>SystemInt32</u> The total number of distributed loads retrieved for the specified frame objects.
FrameName	Type:Â <u>SystemString</u> This is an array that includes the name of the frame object associated with each distributed load.
LoadPat	Type:Â <u>SystemString</u> This is an array that includes the name of the load pattern associated with each distributed load.
MyType	Type:Â <u>SystemInt32</u> This is an array that includes 1 or 2, indicating the type of distributed load. 1. Force per unit length 2. Moment per unit length
CSys	Type:Â <u>SystemString</u> This is an array that includes the name of the coordinate system in which each distributed load is defined. It may be Local or the name of a defined coordinate system.
Dir	Type:Â <u>SystemInt32</u> This is an integer between 1 and 11, indicating the direction of the load. 1. Local 1 axis (only applies when CSys is Local) 2. Local 2 axis (only applies when CSys is Local) 3. Local 3 axis (only applies when CSys is Local) 4. X direction (does not apply when CSys is Local) 5. Y direction (does not apply when CSys is Local) 6. Z direction (does not apply when CSys is Local) 7. Projected X direction (does not apply when CSys is Local) 8. Projected Y direction (does not apply when CSys is Local) 9. Projected Z direction (does not apply when CSys is Local) 10. Gravity direction (only applies when CSys is Global) 11. Projected Gravity direction (only applies when CSys is Global) The positive gravity direction (see Dir = 10 and 11) is in the negative Global Z direction.
RD1	Type:Â <u>SystemDouble</u>
RD2	Type:Â <u>SystemDouble</u>
Dist1	Type:Â <u>SystemDouble</u> This is an array that includes the actual distance from the I-End of the frame object to the start of the distributed load. [L]
Dist2	Type:Â <u>SystemDouble</u> This is an array that includes the actual distance from the I-End of the frame object to the end of the distributed load. [L]
Val1	Type:Â <u>SystemDouble</u> This is an array that includes the load value at the start of the distributed load.

[F/L] when MyType is 1 and [FL/L] when MyType is 2

Val2

Type: SystemDouble

This is an array that includes the load value at the end of the distributed load.

[F/L] when MyType is 1 and [FL/L] when MyType is 2

ItemType (Optional)

Type: ETABSv1eItemType

This is one of the following items in the eItemType enumeration:

◊ Object = 0

◊ Group = 1

◊ SelectedObjects = 2

If this item is Objects, the assignments are retrieved for the frame object specified by the Name item.

If this item is Group, the assignments are retrieved for all frame objects in the group specified by the Name item.

If this item is SelectedObjects, the assignments are retrieved for all selected frame objects and the Name item is ignored.

Return Value

Type: Int32

Returns zero if the load assignments are successfully retrieved, otherwise it returns a nonzero value.

▲ Remarks

▲ Examples

VB

Copy

```
Public Sub Example()
    Dim SapModel As cSapModel
    Dim EtabsObject As cOAPI
    Dim ret As Integer = -1
    Dim NumberItems As Integer
    Dim FrameName() As String
    Dim LoadPat() As String
    Dim MyType() As Integer
    Dim CSys() As String
    Dim Dir() As Integer
    Dim RD1() As Double
    Dim RD2() As Double
    Dim Dist1() As Double
    Dim Dist2() As Double
    Dim Val1() As Double
    Dim Val2() As Double

    'create ETABS object

    Dist : float[] byref *
    Val : float[] byref *
    ?ItemType : eItemType
(* Defaults:
    let _ItemType = defaultArg ItemType eItemType.Objects
*)
-> int
```

Parameters

Name

Type:Â SystemString

The name of an existing frame object or group, depending on the value of the ItemType item.

NumberItems

Type:Â SystemInt32

The total number of point loads retrieved for the specified frame objects.

FrameName

Type:Â SystemString

This is an array that includes the name of the frame object associated with each point load.

LoadPat

Type:Â SystemString

This is an array that includes the name of the load pattern associated with each point load.

MyType

Type:Â SystemInt32

This is an array that includes 1 or 2, indicating the type of point load.

1. Force
2. Moment

CSys

Type:Â SystemString

This is an array that includes the name of the coordinate system in which each point load is defined. It may be Local or the name of a defined coordinate system.

Dir

Type:Â SystemInt32

This is an integer between 1 and 11, indicating the direction of the load.

1. Local 1 axis (only applies when CSys is Local)
2. Local 2 axis (only applies when CSys is Local)
3. Local 3 axis (only applies when CSys is Local)
4. X direction (does not apply when CSys is Local)
5. Y direction (does not apply when CSys is Local)
6. Z direction (does not apply when CSys is Local)
7. Projected X direction (does not apply when CSys is Local)
8. Projected Y direction (does not apply when CSys is Local)
9. Projected Z direction (does not apply when CSys is Local)
10. Gravity direction (only applies when CSys is Global)
11. Projected Gravity direction (only applies when CSys is Global)

The positive gravity direction (see Dir = 10 and 11) is in the negative Global Z direction.

RelDist

Type:Â SystemDouble

This is an array that includes the relative distance from the I-End of the frame object to the location where the point load is applied.

Dist

Type:Â SystemDouble

Val

Type:Â SystemDouble

ItemType (Optional)

Type:Â ETABSv1eItemType

This is one of the following items in the eItemType enumeration:

- ◇ Object = 0
- ◇ Group = 1
- ◇ SelectedObjects = 2

If this item is Objects, the assignments are retrieved for the frame object specified by the Name item.

If this item is Group, the assignments are retrieved for all frame objects in the group specified by the Name item.

If this item is SelectedObjects, the assignments are retrieved for all selected frame objects and the Name item is ignored.

Return Value

Type:Â Int32

Returns zero if the load assignments are successfully retrieved, otherwise it returns a nonzero value.

Return Value

Remarks

    MyType : int[] byref *
    Val : float[] byref *
    PatternName : string[] byref *
    ?ItemType : eItemType
(* Defaults:
    let _ItemType = defaultArg ItemType eItemType.Objects
*)
-> int

```

Parameters

Name

Type:Â SystemString

The name of an existing frame object or group, depending on the value of the ItemType item.

NumberItems

Type:Â SystemInt32

The total number of temperature loads retrieved for the specified frame objects.

FrameName

Type:Â SystemString

This is an array that includes the name of the frame object associated with each temperature load.

LoadPat

Type:Â SystemString

This is an array that includes the name of the load pattern associated with each temperature load.

MyType

Type:Â SystemInt32

This is an array that includes 1, 2 or 3, indicating the type of temperature load.

1. Temperature

2. Temperature gradient along local 2 axis

3. Temperature gradient along local 3 axis

Val

Type:Â SystemDouble

PatternName

Type:Â SystemString

This is an array that includes the joint pattern name, if any, used to specify the temperature load.

ItemType (Optional)

Type:Â ETABSv1eItemType

This is one of the following items in the eItemType enumeration:

◊ Object = 0

◇ Group = 1

◇ SelectedObjects = 2

If this item is Objects, the assignments are retrieved for the frame object specified by the Name item.

If this item is Group, the assignments are retrieved for all frame objects in the group specified by the Name item.

If this item is SelectedObjects, the assignments are retrieved for all selected frame objects and the Name item is ignored.

Return Value

Type: $\hat{A}$ Int32

Returns zero if the load assignments are successfully retrieved, otherwise it returns a nonzero value.

▲ Remarks

▲ Examples

VB

Copy

```
Public Sub Example()
    Dim SapModel As cSapModel
    Dim EtabsObject As cOAPI
    Dim ret As Integer = -1
    Dim NumberItems As Integer
    Dim FrameName() As String

```
Dim instance As cFrameObj
Dim Name As String
Dim Ang As Double
Dim Advanced As Boolean
Dim returnValue As Integer
```

```
returnValue = instance.GetLocalAxes(Name,
    Ang, Advanced)
```

```
int GetLocalAxes(
    String^ Name,
    double% Ang,
    bool% Advanced
)
```

```
abstract GetLocalAxes :
    Name : string *
    Ang : float byref *
    Advanced : bool byref -> int
```

Parameters

Name

Type: [SystemString](#)

The name of an existing frame object.

Ang

Type: SystemDouble

This is the angle that the local 2 and 3 axes are rotated about the positive local 1 axis, from the default orientation or, if the Advanced item is True, from the orientation determined by the plane reference vector. The rotation for a positive angle appears counter clockwise when the local +1 axis is pointing toward you.
[deg]

Advanced

Type: SystemBoolean

This item is True if the line object local axes orientation was obtained using advanced local axes parameters.

Return Value

Type: Int32

Returns zero if the assignment is successfully retrieved, otherwise it returns a nonzero value.

▲ Remarks

▲ Examples

VB

Copy

```
Public Sub Example()
    Dim SapModel As cSapModel
    Dim EtabsObject As cOAPI
    Dim ret As Integer = -1

    'create ETABS object
    Dim myHelper as cHelper = New Helper
    EtabsObject = myHelper.CreateObjectProgID("CSI.ETABS.API.ETABSObject")

    'start ETABS application
    ret = EtabsObject.ApplicationStart()

    'create SapModel object
    SapModel = EtabsObject.SapModel

    'initialize model
    ret = SapModel.InitializeNewModel()

    'create steel deck template model
    ret = SapModel.File.NewSteelDeck(4, 12, 12, 4, 4, 24, 24)

    'get frame local axis angle
    ret = SapModel.FrameObj.GetLocalAxes("3", Ang, Advanced)

    'close ETABS
    EtabsObject.ApplicationExit(False)

    'clean up variables
    SapModel = Nothing
    EtabsObject = Nothing
End Sub
```

CSI API ETABS v1

cFrameObjAddLanguageSpecificTextSet("LST53B2C_0")

Method

Retrieves the frame modifier assignment for frame objects. The default value for all modifiers is one.

Namespace: [ETABSV1](#)

Assembly: [ETABSV1](#) (in ETABSV1.dll) Version: 1.0.0.0 (1.24.0.0)

Syntax

[C#](#)

[VB](#)

[C++](#)

[F#](#)

[Copy](#)

```
int GetModifiers(
    string Name,
    ref double[] Value
)
```

```
Function GetModifiers (
    Name As String,
    ByRef Value As Double()
) As Integer
```

```
Dim instance As cFrameObj
Dim Name As String
Dim Value As Double()
Dim returnValue As Integer
```

```
returnValue = instance.GetModifiers(Name,
    Value)
```

int GetModifiers(
    String^ Name,
    array<double>^% Value
)
```

```
abstract GetModifiers :
    Name : string *
    Value : float[] byref -> int
```

Parameters

Name

Type: [SystemString](#)

The name of an existing frame object

Value

Type: [SystemDouble](#)

This is an array of eight unitless modifiers:

Value

Modifier

Value(0) Cross sectional area modifier

cFrameObjid="LST53B2C_0"AddLanguageSpecificTextSet("LST53B2C_0?cpp=::|nu=.");**GetModifiers**

Introduction

Value(1) Shear area in local 2 direction modifier
Value(2) Shear area in local 3 direction modifier
Value(3) Torsional constant modifier
Value(4) Moment of inertia about local 2 axis modifier
Value(5) Moment of inertia about local 3 axis modifier
Value(6) Mass modifier
Value(7) Weight modifier

Return Value

Type: Int32

Returns zero if the modifier assignments are successfully retrieved, otherwise it returns a nonzero value

▲ Remarks

▲ Examples

VB

Copy

```

CSI API ETABS v1

cFrameObjAddLanguageSpecificTextSet("LSTD221F6BB_0")

Method

Retrieves the names of all defined frame objects.

Namespace: ETABSv1

Assembly: ETABSv1 (in ETABSv1.dll) Version: 1.0.0.0 (1.24.0.0)

Syntax

C#

VB

C++

F#

Copy

```
int GetNameList(
    ref int NumberNames,
    ref string[] MyName
)
```

```
Function GetNameList (
    ByRef NumberNames As Integer,
    ByRef MyName As String()
) As Integer
```

```
Dim instance As cFrameObj
Dim NumberNames As Integer
Dim MyName As String()
Dim returnValue As Integer
```

```
returnValue = instance.GetNameList(NumberNames,
    MyName)
```

```
int GetNameList(
    int% NumberNames,
    array<String^>^% MyName
)
```

```
abstract GetNameList :
    NumberNames : int byref *
    MyName : string[] byref -> int
```

Parameters

NumberNames

Type: System.Int32

The number of frame object names retrieved by the program.

MyName

Type: System.String

This is a one-dimensional array of frame object names. The MyName array is created as a dynamic, zero-based, array by the API user:

```
Dim MyName() as String
```

cFrameObjspan id="LSTD221F6BB_0"AddLanguageSpecificTextSet("LSTD221F6BB_0?cpp=:2064.");GetN

The array is dimensioned to (NumberNames + 1) inside the ETABS program, filled with the names, and returned to the API user.

Return Value

Type: Int32

Returns zero if the names are successfully retrieved, otherwise it returns nonzero.

▲ **Remarks**

▲ **Examples**

VB

Copy

```
Public Sub Example()
    Dim SapModel As cSapModel
    Dim EtabsObject As cOAPI
    Dim ret As Integer = -1
    Dim NumberNames As Integer
    Dim MyName() As String

    'create ETABS object
    Dim myHelper as cHelper = New Helper
    EtabsObject = myHelper.CreateObjectProgID("CSI.ETABS.API.ETABSObject")

    'start ETABS application
    ret = EtabsObject.ApplicationStart()

    'create SapModel object
    SapModel = EtabsObject.SapModel

    'initialize model
    ret = SapModel.InitializeNewModel()

    'create steel deck template model
    ret = SapModel.File.NewSteelDeck(4, 12, 12, 4, 4, 24, 24)

    'get frame object names
    ret = SapModel.FrameObj.GetNameList(NumberNames, MyName)

    'close ETABS
    EtabsObject.ApplicationExit(False)

    'clean up variables
    SapModel = Nothing
    EtabsObject = Nothing

End Sub
```

    array<String^>^% MyName
)
```

```
abstract GetNameListOnStory :
    StoryName : string *
    NumberNames : int byref *
    MyName : string[] byref -> int
```

Parameters

StoryName

Type: [SystemString](#)

The name of an existing story.

NumberNames

Type: SystemInt32

The number of frame object names retrieved by the program.

MyName

Type: SystemString

This is a one-dimensional array of frame object names. The MyName array is created as a dynamic, zero-based, array by the API user:

```
Dim MyName() as String
```

The array is dimensioned to (NumberNames + 1) inside the ETABS program, filled with the names, and returned to the API user.

Return Value

Type: Int32

Returns zero if the names are successfully retrieved, otherwise it returns nonzero.

▲ Remarks

Introduction

```
abstract GetOutputStations :  
    Name : string *  
    MyType : int byref *  
    MaxSegSize : float byref *  
    MinSections : int byref *  
    NoOutPutAndDesignAtElementEnds : bool byref *  
    NoOutPutAndDesignAtPointLoads : bool byref -> int
```

Parameters

Name

Type:Â SystemString

The name of an existing frame object

MyType

Type:Â SystemInt32

This is either 1 or 2 indicating how the output stations are specified

1. maximum segment size, that is, maximum station spacing
2. minimum number of stations

MaxSegSize

Type:Â SystemDouble

The maximum segment size, that is, the maximum station spacing. This item applies only when MyType = 1. [L]

MinSections

Type:Â SystemInt32

The minimum number of stations. This item applies only when MyType = 2.

NoOutPutAndDesignAtElementEnds

Type:Â SystemBoolean

If this item is True, no additional output stations are added at the ends of line elements when the frame object is internally meshed. In ETABS, this item will always be False.

NoOutPutAndDesignAtPointLoads

Type:Â SystemBoolean

If this item is True, no additional output stations are added at point load locations. In ETABS, this item will always be False.

Return Value

Type:Â Int32

Returns zero if the data is successfully retrieved, otherwise it returns a nonzero value

▲ Remarks

▲ Examples

VB

Copy

CSI API ETABS v1

cFrameObjAddLanguageSpecificTextSet("LST94138DF7_0?cpp=::2069");GetPi

Method

Retrieves the pier label assignments of a frame object

Namespace: ETABSv1

Assembly: ETABSv1 (in ETABSv1.dll) Version: 1.0.0.0 (1.24.0.0)

Syntax

C#

VB

C++

F#

Copy

```
int GetPier(
    string Name,
    ref string PierName
)
```

```
Function GetPier (
    Name As String,
    ByRef PierName As String
) As Integer
```

```
Dim instance As cFrameObj
Dim Name As String
Dim PierName As String
Dim returnValue As Integer
```

```
returnValue = instance.GetPier(Name, PierName)
```

```
int GetPier(
    String^ Name,
    String^% PierName
)
```

```
abstract GetPier :
    Name : string *
    PierName : string byref -> int
```

Parameters

Name

Type: SystemString

The name of an existing frame object

PierName

Type: SystemString

The name of the pier assignment, if any, or "None"

Return Value

Type: Int32

Returns zero if the assignment is successfully retrieved; otherwise it returns a nonzero value.

▀ **Remarks**

▀ **Examples**

VB

Copy

```
Public Sub Example()
    Dim SapModel As cSapModel
    Dim EtabsObject As cOAPI
    Dim ret As Integer = -1
    Dim PierName as String

    'create ETABS object
    Dim myHelper as cHelper = New Helper
    EtabsObject = myHelper.CreateObjectProgID("CSI.ETABS.API.ETABSObject")

    'start ETABS application
    ret = EtabsObject.ApplicationStart()

    'create SapModel object
    SapModel = EtabsObject.SapModel

    'initialize model
    ret = SapModel.InitializeNewModel()

    'create steel deck template model
    ret = SapModel.File.NewSteelDeck(4, 12, 12, 4, 4, 24, 24)

    'define new pier label
    ret = SapModel.PierLabel.SetPier("MyPier")

    'set assignment
    ret = SapModel.FrameObj.SetPier("3", "MyPier")

    'get assignment
    ret = SapModel.FrameObj.GetPier("3", PierName)

    'close ETABS
    EtabsObject.ApplicationExit(False)

    'clean up variables
    SapModel = Nothing
    EtabsObject = Nothing

End Sub
```

Dim Name As String
Dim Point1 As String
Dim Point2 As String
Dim returnValue As Integer
```

```
returnValue = instance.GetPoints(Name,
    Point1, Point2)
```

```
int GetPoints(
    String^ Name,
    String^% Point1,
    String^% Point2
)
```

```
abstract GetPoints :
    Name : string *
    Point1 : string byref *
    Point2 : string byref -> int
```

Parameters

Name

Type: [SystemString](#)

The name of a defined frame object.

Point1

Type: SystemString

The name of the point object at the I-End of the specified frame object.

Point2

Type: SystemString

The name of the point object at the J-End of the specified frame object.

Return Value

Type: Int32

Returns zero if the point names are successfully retrieved, otherwise it returns a nonzero value.

▲ Remarks

▲ Examples

VB

Copy

```
Public Sub Example()
    Dim SapModel As cSapModel
    Dim EtabsObject As cOAPI
    Dim ret As Integer = -1
    Dim Point1 As String
    Dim Point2 As String

    'create ETABS object
    Dim myHelper as cHelper = New Helper
    EtabsObject = myHelper.CreateObjectProgID("CSI.ETABS.API.ETABSObject")

    'start ETABS application
    ret = EtabsObject.ApplicationStart()

    'create SapModel object
    SapModel = EtabsObject.SapModel

    'initialize model
    ret = SapModel.InitializeNewModel()

    'create steel deck template model
    ret = SapModel.File.NewSteelDeck(4, 12, 12, 4, 4, 24, 24)

    'get names of points
    ret = SapModel.FrameObj.GetPoints("3", Point1, Point2)

    'close ETABS
    EtabsObject.ApplicationExit(False)

    'clean up variables
    SapModel = Nothing
    EtabsObject = Nothing
End Sub
```

CSI API ETABS v1

cFrameObjAddLanguageSpecificTextSet("LSTC40B0890_0?cpp=::2017");GetS

Method

Retrieves the frame section property assigned to a frame object.

Namespace: [ETABSv1](#)

Assembly: [ETABSv1](#) (in ETABSv1.dll) Version: 1.0.0.0 (1.24.0.0)

Syntax

[C#](#)

[VB](#)

[C++](#)

[F#](#)

[Copy](#)

```
int GetSection(
    string Name,
    ref string PropName,
    ref string SAuto
)
```

```
Function GetSection (
    Name As String,
    ByRef PropName As String,
    ByRef SAuto As String
) As Integer
```

```
Dim instance As cFrameObj
Dim Name As String
Dim PropName As String
Dim SAuto As String
Dim returnValue As Integer
```

```
returnValue = instance.GetSection(Name,
    PropName, SAuto)
```

```
int GetSection(
    String^ Name,
    String^% PropName,
    String^% SAuto
)
```

```
abstract GetSection :
    Name : string *
    PropName : string byref *
    SAuto : string byref -> int
```

Parameters

Name

Type: [SystemString](#)

The name of a defined frame object.

PropName

Type: SystemString

If no auto select list is assigned to the frame object, this is the name of the frame section property assigned to the frame object. If an auto select list is assigned to the frame object, this is the name of the frame section property, within the auto select list, which is currently being used as the analysis property for the frame object. If this item is None, no frame section property is assigned to the frame object.

SAuto

Type: SystemString

This is the name of the auto select list assigned to the frame object, if any. If this item is returned as a blank string, no auto select list is assigned to the frame object.

Return Value

Type: Int32

Returns zero if the frame object property is successfully retrieved, otherwise it returns a nonzero value.

▲ Remarks

▲ Examples

VB

Copy

```
Public Sub Example()
    Dim SapModel As cSapModel
    Dim EtabsObject As cOAPI
    Dim ret As Integer = -1
    Dim PropName As String
    Dim SAuto As String

    'create ETABS object
    Dim myHelper as cHelper = New Helper
    EtabsObject = myHelper.CreateObjectProgID("CSI.ETABS.API.ETABSObject")

    'start ETABS application
    ret = EtabsObject.ApplicationStart()

    'create SapModel object
    SapModel = EtabsObject.SapModel

    'initialize model
    ret = SapModel.InitializeNewModel()

    'create steel deck template model
    ret = SapModel.File.NewSteelDeck(4, 12, 12, 4, 4, 24, 24)

    'get frame section property
    ret = SapModel.FrameObj.GetSection("3", PropName, SAuto)

    'close ETABS
    EtabsObject.ApplicationExit(False)

    'clean up variables
    SapModel = Nothing
    EtabsObject = Nothing

End Sub
```

CSI API ETABS v1

cFrameObjAddLanguageSpecificTextSet("LST138BC5B7_0") Method

Retrieves the Spandrel label assignments of a frame object

Namespace: [ETABSv1](#)

Assembly: [ETABSv1](#) (in ETABSv1.dll) Version: 1.0.0.0 (1.24.0.0)

▲ Syntax

[C#](#)

[VB](#)

[C++](#)

[F#](#)

[Copy](#)

```
int GetSpandrel(
    string Name,
    ref string SpandrelName
)
```

```
Function GetSpandrel (
    Name As String,
    ByRef SpandrelName As String
) As Integer
```

```
Dim instance As cFrameObj
Dim Name As String
Dim SpandrelName As String
Dim returnValue As Integer
```

```
returnValue = instance.GetSpandrel(Name,
    SpandrelName)
```

```
int GetSpandrel(
    String^ Name,
    String^% SpandrelName
)
```

```
abstract GetSpandrel :
    Name : string *
    SpandrelName : string byref -> int
```

Parameters

Name

Type: [SystemString](#)

The name of an existing frame object

SpandrelName

Type: [SystemString](#)

The name of the Spandrel assignment, if any, or "None"

Return ValueType: Int32

Returns zero if the assignment is successfully retrieved; otherwise it returns a nonzero value.

▲ **Remarks**

▲ **Examples**

VB

Copy

```
Public Sub Example()
    Dim SapModel As cSapModel
    Dim EtabsObject As cOAPI

CSI API ETABS v1

cFrameObjAddLanguageSpecificTextSet("LST3F88A4A_0?cpp=::|nu2087GetSpringAssignment")

Method

Retrieves the named line spring property assignment for a frame object

Namespace: ETABSv1

Assembly: ETABSv1 (in ETABSv1.dll) Version: 1.0.0.0 (1.24.0.0)

Syntax

C#

VB

C++

F#

Copy

```
int GetSpringAssignment(
    string Name,
    ref string SpringProp
)
```

```
Function GetSpringAssignment (
    Name As String,
    ByRef SpringProp As String
) As Integer
```

```
Dim instance As cFrameObj
Dim Name As String
Dim SpringProp As String
Dim returnValue As Integer
```

```
returnValue = instance.GetSpringAssignment(Name,
    SpringProp)
```

```
int GetSpringAssignment(
    String^ Name,
    String^% SpringProp
)
```

```
abstract GetSpringAssignment :
    Name : string *
    SpringProp : string byref -> int
```

Parameters

Name

Type: SystemString

The name of an existing frame object

SpringProp

Type: SystemString

The name of an existing line spring property

Return Value

Type: Int32

Returns zero if the assignment is successfully retrieved, otherwise it returns a nonzero value

▲ **Remarks**

▲ **Examples**

VB

Copy

```
Public Sub Example()
    Dim SapModel As cSapModel
    Dim EtabsObject As cOAPI
    Dim ret As Integer = -1
    Dim SpringProp As String

    'create ETABS object
    Dim myHelper as cHelper = New Helper
    EtabsObject = myHelper.CreateObjectProgID("CSI.ETABS.API.ETABSObject")

    'start ETABS application
    ret = EtabsObject.ApplicationStart()

    'create SapModel object
    SapModel = EtabsObject.SapModel

    'initialize model
    ret = SapModel.InitializeNewModel()

```

cFrameObjid="LST2E5F35E3_0"AddLanguageSpecificTextSet("LST2E5F35E3_0?cpp=::2090");GetS

SupportType2 : eObjType byref -> int

Parameters

Name

Type: SystemString

The name of an existing frame beam object

SupportName1

Type: SystemString

The name of the column frame object, beam frame object or wall area object which supports the beam at its start node

SupportType1

Type: ETABSv1eObjType

A value from the eObjType enumeration

SupportName2

Type: SystemString

The name of the column frame object, beam frame object or wall area object which supports the beam at its end node

SupportType2

Type: ETABSv1eObjType

A value from the eObjType enumeration

Return Value

Type: Int32

CSI API ETABS v1

cFrameObjAddLanguageSpecificTextSet("LSTFAA67885_0")

Method

Retrieves the type of frame object (straight or curved)

Namespace: ETABSv1

Assembly: ETABSv1 (in ETABSv1.dll) Version: 1.0.0.0 (1.24.0.0)

Syntax

C#

VB

C++

F#

Copy

```
int GetType0API(
    string Name,
    ref string MyType
)
```

```
Function GetType0API (
    Name As String,
    ByRef MyType As String
) As Integer
```

```
Dim instance As cFrameObj
Dim Name As String
Dim MyType As String
Dim returnValue As Integer
```

```
returnValue = instance.GetType0API(Name,
    MyType)
```

```
int GetType0API(
    String^ Name,
    String^% MyType
)
```

```
abstract GetType0API :
    Name : string *
    MyType : string byref -> int
```

Parameters

Name

Type: SystemString

The name of a defined frame object

MyType

Type: SystemString

This is "Straight" or "Curved", indicating the type of frame object

Return Value

Type: Int32

Returns zero if the frame object type is successfully retrieved, otherwise it returns a nonzero value

▀ **Remarks**

▀ **Examples**

VB

Copy

```
Public Sub Example()
    Dim SapModel As cSapModel
    Dim EtabsObject As cOAPI
    Dim ret As Integer = -1
    Dim MyType As String

    'create ETABS object
    Dim myHelper as cHelper = New Helper
    EtabsObject = myHelper.CreateObjectProgID("CSI.ETABS.API.ETABSObject")

    'start ETABS application
    ret = EtabsObject.ApplicationStart()

    'create SapModel object
    SapModel = EtabsObject.SapModel

    'initialize model
    ret = SapModel.InitializeNewModel()

    'create steel deck template model
    ret = SapModel.File.NewSteelDeck(4, 12, 12, 4, 4, 24, 24)

    'get frame type
    ret = SapModel.FrameObj.GetTypeOAPI("3", MyType)

    'close ETABS
    EtabsObject.ApplicationExit(False)

    'clean up variables
    SapModel = Nothing
    EtabsObject = Nothing

End Sub
```

Sets the frame object column splice overwrite assignment.

Namespace: ETABSv1

Assembly: ETABSv1 (in ETABSv1.dll) Version: 1.0.0.0 (1.24.0.0)

Syntax

C#

VB

C++

F#

Copy

```
int SetColumnSpliceOverwrite(
    string Name,
    int SpliceOption,
    double Height,
    eItemType ItemType = eItemType.Objects
)
```

```
Function SetColumnSpliceOverwrite (
    Name As String,
    SpliceOption As Integer,
    Height As Double,
    ItemType As eItemType = eItemType.Objects
) As Integer
```

```
Dim instance As cFrameObj
Dim Name As String
Dim SpliceOption As Integer
Dim Height As Double
Dim ItemType As eItemType
Dim returnValue As Integer
```

```
returnValue = instance.SetColumnSpliceOverwrite(Name,
    SpliceOption, Height, ItemType)
```

```
int SetColumnSpliceOverwrite(
    String^ Name,
    int SpliceOption,
    double Height,
    eItemType ItemType = eItemType::Objects
)
```

```
abstract SetColumnSpliceOverwrite :
    Name : string *
    SpliceOption : int *
    Height : float *
    ?ItemType : eItemType
(* Defaults:
    let _ItemType = defaultArg ItemType eItemType.Objects
*)
-> int
```

cFrameObjid="LST2AE1F7C2_0"AddLanguageSpecificTextSet("LST2AE1F7C2_0?cpp=:2008.");SetC

Parameters

Name

Type:Â SystemString

The name of an existing frame object.

SpliceOption

Type:Â SystemInt32

This is a numeric value from 1 to 3 that specifies the option used for defining the splice overwrite.

1. from story data (default)

2. no splice

3. splice at height above story at bottom of the column object

Height

Type:Â SystemDouble

If the SpliceOption=3, this specifies the height of the splice above the story at the bottom of the column object.

ItemType (Optional)

Type:Â ETABSv1eItemType**Return Value**Type:Â Int32

Returns zero if the column splice overwrite assignment is successful, otherwise it returns a nonzero value.

▲Remarks

▲Examples

VB

Copy

```
Public Sub Example()
    Dim SapModel As cSapModel
    Dim EtabsObject As cOAPI
    Dim ret As Integer = -1

    'create ETABS object
    Dim myHelper as cHelper = New Helper
    EtabsObject = myHelper.CreateObjectProgID("CSI.ETABS.API.ETABSObject")

    'start ETABS application
    ret = EtabsObject.ApplicationStart()

    'create SapModel object
    SapModel = EtabsObject.SapModel

    'initialize model
    ret = SapModel.InitializeNewModel()

    'create steel deck template model
    ret = SapModel.File.NewSteelDeck(4, 12, 12, 4, 4, 24, 24)

    'assign column splice overwrite
    ret = SapModel.FrameObj.SetColumnSpliceOverwrite("15", 2, 0)

    'close ETABS
    EtabsObject.ApplicationExit(False)

    'clean up variables
```

Introduction

```
SapModel = Nothing  
EtabsObject = Nothing
```

End Sub

CSI API ETABS v1

cFrameObjAddLanguageSpecificTextSet("LST5A8CAC76_0?cpp=21011.") Method

Sets the design procedure for frame objects.

Namespace: [ETABSv1](#)

Assembly: [ETABSv1](#) (in ETABSv1.dll) Version: 1.0.0.0 (1.24.0.0)

Syntax

[C#](#)

[VB](#)

[C++](#)

[F#](#)

[Copy](#)

```
int SetDesignProcedure(
    string Name,
    int MyType,
    eItemType ItemType = eItemType.Objects
)
```

```
Function SetDesignProcedure (
    Name As String,
    MyType As Integer,
    ?ItemType As eItemType = eItemType.Objects
) As Integer
```

```
Dim instance As cFrameObj
Dim Name As String
Dim MyType As Integer
Dim ItemType As eItemType
Dim returnValue As Integer
```

```
returnValue = instance.SetDesignProcedure(Name,
    MyType, ItemType)
```

```
int SetDesignProcedure(
    String^ Name,
    int MyType,
    eItemType ItemType = eItemType::Objects
)
```

```
abstract SetDesignProcedure :
    Name : string *
    MyType : int *
    ?ItemType : eItemType
(* Defaults:
    let _ItemType = defaultArg ItemType eItemType.Objects
*)
-> int
```

Parameters

Name

Type: SystemString

The name of an existing frame object or group, depending on the value of the ItemType item.

MyType

Type: SystemInt32

This is an integer from the list below, indicating the design procedure type desired for the specified frame object.

- ◊ Program determined = 0
- ◊ Steel Frame Design = 1
- ◊ Concrete Frame Design = 2
- ◊ Composite Beam Design = 3
- ◊ Steel Joist Design = 4
- ◊ No Design = 7
- ◊ Composite Column Design = 13

ItemType (Optional)

Type: ETABSv1eItemType

This is one of the following items in the eItemType enumeration:

- ◊ Object = 0
- ◊ Group = 1
- ◊ SelectedObjects = 2

If this item is Objects, the assignment is made to the frame object specified by the Name item.

If this item is Group, the assignment is made to all frame objects in the group specified by the Name item.

If this item is SelectedObjects, the assignment is made to all selected frame objects and the Name item is ignored.

Return Value

Type: Int32

Returns zero if the design procedure is successfully set; otherwise it returns a nonzero value.

▲ Remarks

▲ Examples

VB

Copy

```
Public Sub Example()
    Dim SapModel As cSapModel
    Dim EtabsObject As cOAPI
    Dim ret As Integer = -1

    'create ETABS object
    Dim myHelper as cHelper = New Helper
    EtabsObject = myHelper.CreateObjectProgID("CSI.ETABS.API.ETABSObject")

    'start ETABS application
    ret = EtabsObject.ApplicationStart()

    'create SapModel object
    SapModel = EtabsObject.SapModel

    'initialize model
```

Parameters

Introduction

```
ret = SapModel.InitializeNewModel()  
  
'create steel deck template model  
ret = SapModel.File.NewSteelDeck(4, 12, 12, 4, 4, 24, 24)  
  
'set design procedure  
ret = SapModel.FrameObj.SetDesignProcedure("8", 3)  
  
'close ETABS  
EtabsObject.ApplicationExit(False)  
  
'clean up variables  
SapModel = Nothing  
EtabsObject = Nothing  
  
End Sub
```

CSI API ETABS v1

cFrameObjAddLanguageSpecificTextSet("LSTA3AF17A_0?cpp=::|n24.04#SetEndLengthOffset")

Method

Assigns frame object end offsets along the 1-axis of the object.

Namespace: ETABSv1

Assembly: ETABSv1 (in ETABSv1.dll) Version: 1.0.0.0 (1.24.0.0)

▲ Syntax

C#

VB

C++

F#

Copy

```
int SetEndLengthOffset(
    string Name,
    bool AutoOffset,
    double Length1,
    double Length2,
    double RZ,
    eItemType ItemType = eItemType.Objects
)
```

```
Function SetEndLengthOffset (
    Name As String,
    AutoOffset As Boolean,
    Length1 As Double,
    Length2 As Double,
    RZ As Double,
    ItemType As eItemType = eItemType.Objects
) As Integer
```

```
Dim instance As cFrameObj
Dim Name As String
Dim AutoOffset As Boolean
Dim Length1 As Double
Dim Length2 As Double
Dim RZ As Double
Dim ItemType As eItemType
Dim returnValue As Integer
```

```
returnValue = instance.SetEndLengthOffset(Name,
    AutoOffset, Length1, Length2, RZ,
    ItemType)
```

```
int SetEndLengthOffset(
    String^ Name,
    bool AutoOffset,
    double Length1,
    double Length2,
    double RZ,
    eItemType ItemType = eItemType::Objects
)
```

abstract SetEndLengthOffset :

cFrameObjid="LSTA3AF17A_0"AddLanguageSpecificTextSet("LSTA3AF17A_0?cpp=::|n24.04#SetEndLengthOffset")

Introduction

```
Name : string *
AutoOffset : bool *
Length1 : float *
Length2 : float *
RZ : float *
?ItemType : eItemType
(* Defaults:
    let _ItemType = defaultArg ItemType eItemType.Objects
*)
-> int
```

Parameters

Name

Type:Â SystemString

The name of an existing frame object or group, depending on the value of the ItemType item.

AutoOffset

Type:Â SystemBoolean

If this item is True, the end length offsets are automatically determined by the program from object connectivity, and the Length1, Length2 and RZ items are ignored.

Length1

Type:Â SystemDouble

The offset length along the 1-axis of the frame object at the I-End of the frame object. [L]

Length2

Type:Â SystemDouble

The offset length along the 1-axis of the frame object at the J-End of the frame object. [L]

RZ

Type:Â SystemDouble

The rigid zone factor. This is the fraction of the end offset length assumed to be rigid for bending and shear deformations.

ItemType (Optional)

Type:Â ETABSv1eItemType

This is one of the following items in the eItemType enumeration:

◊ Object = 0

◊ Group = 1

◊ SelectedObjects = 2

If this item is Objects, the assignment is made to the frame object specified by the Name item.

If this item is Group, the assignment is made to all frame objects in the group specified by the Name item.

If this item is SelectedObjects, the assignment is made to all selected frame objects and the Name item is ignored.

Return Value

Type:Â Int32

Returns zero if the offsets are successfully assigned, otherwise it returns a nonzero

value.

▲ Remarks

▲ Examples

VB

Copy

```
Public Sub Example()
    Dim SapModel As cSapModel
    Dim EtabsObject As cOAPI

CSI API ETABS v1

cFrameObjAddLanguageSpecificTextSet("LST2E9C2A66_0") Method

Adds or removes frame objects from a specified group.

Namespace: ETABSv1

Assembly: ETABSv1 (in ETABSv1.dll) Version: 1.0.0.0 (1.24.0.0)

Syntax

C#

VB

C++

F#

Copy

```
int SetGroupAssign(
    string Name,
    string GroupName,
    bool Remove = false,
    eItemType ItemType = eItemType.Objects
)
```

```
Function SetGroupAssign (
    Name As String,
    GroupName As String,
    Remove As Boolean = false,
    ItemType As eItemType = eItemType.Objects
) As Integer
```

```
Dim instance As cFrameObj
Dim Name As String
Dim GroupName As String
Dim Remove As Boolean
Dim ItemType As eItemType
Dim returnValue As Integer
```

```
returnValue = instance.SetGroupAssign(Name,
    GroupName, Remove, ItemType)
```

```
int SetGroupAssign(
    String^ Name,
    String^ GroupName,
    bool Remove = false,
    eItemType ItemType = eItemType::Objects
)
```

```
abstract SetGroupAssign :
    Name : string *
    GroupName : string *
    ?Remove : bool *
    ?ItemType : eItemType
(* Defaults:
    let _Remove = defaultArg Remove false
    let _ItemType = defaultArg ItemType eItemType.Objects
*)
-> int
```

cFrameObjid="LST2E9C2A66_0"AddLanguageSpecificTextSet("LST2E9C2A66_0?cpp=:2107.");SetG

Parameters

Name

Type:Â SystemString

The name of an existing point object or group depending on the value of the ItemType item.

GroupName

Type:Â SystemString

The name of an existing group to which the assignment is made.

Remove (Optional)

Type:Â SystemBoolean

ItemType (Optional)

Type:Â ETABSv1eItemType

This is one of the following items in the eItemType enumeration:

◊ Object = 0

◊ Group = 1

◊ SelectedObjects = 2

If this item is Objects, the frame object specified by the Name item is added or removed from the group specified by the GroupName item.

If this item is Group, all frame objects in the group specified by the Name item are added or removed from the group specified by the GroupName item.

If this item is SelectedObjects, all selected frame objects are added or removed from the group specified by the GroupName item and the Name item is ignored.

Return ValueType:Â Int32

Returns zero if the group assignment is successful, otherwise it returns a nonzero value.

▲ Remarks

CSI API ETABS v1

cFrameObjAddLanguageSpecificTextSet("LST8D1CF84C_0")

Method

Sets the GUID for the specified frame object. If the GUID is passed in as a blank string, the program automatically creates a GUID for the object.

Namespace: ETABSv1

Assembly: ETABSv1 (in ETABSv1.dll) Version: 1.0.0.0 (1.24.0.0)

Syntax

C#

VB

C++

F#

Copy

```
int SetGUID(
    string Name,
    string GUID = ""
)
```

```
Function SetGUID (
    Name As String,
    GUID As String = ""
) As Integer
```

```
Dim instance As cFrameObj
Dim Name As String
Dim GUID As String
Dim returnValue As Integer
```

```
returnValue = instance.SetGUID(Name, GUID)
```

```
int SetGUID(
    String^ Name,
    String^ GUID = L""
)
```

```
abstract SetGUID :
    Name : string *
    ?GUID : string
(* Defaults:
    let _GUID = defaultArg GUID ""
*)
-> int
```

Parameters

Name

Type: SystemString

The name of an existing frame object.

GUID (Optional)

Type: SystemString

The GUID (Global Unique ID) for the specified frame object.

cFrameObjspan id="LST8D1CF84C_0"AddLanguageSpecificTextSet("LST8D1CF84C_0?cpp=2110.");SetC

Return Value

Type: Int32

Returns zero if the frame object GUID is successfully set; otherwise it returns nonzero.

▲ **Remarks**

▲ **Examples**

VB

Copy

```
Public Sub Example()
    Dim SapModel As cSapModel
    Dim EtabsObject As cOAPI
    Dim ret As Integer = -1

    'create ETABS object
    Dim myHelper as cHelper = New Helper
    EtabsObject = myHelper.CreateObjectProgID("CSI.ETABS.API.ETABSObject")

    'start ETABS application
    ret = EtabsObject.ApplicationStart()

    'create SapModel object
    SapModel = EtabsObject.SapModel

    'initialize model
    ret = SapModel.InitializeNewModel()

    'create steel deck template model
    ret = SapModel.File.NewSteelDeck(4, 12, 12, 4, 4, 24, 24)

    'set program created GUID
    ret = SapModel.FrameObj.SetGUID("1")

    'close ETABS
    EtabsObject.ApplicationExit(False)

    'clean up variables
    SapModel = Nothing
    EtabsObject = Nothing

End Sub
```

CSI API ETABS v1

cFrameObjAddLanguageSpecificTextSet("LST75B3566E_0?cpp=::20142");SetIn

Method

Assigns frame object insertion point data. The assignments include the cardinal point and end joint offsets.

Namespace: ETABSV1

Assembly: ETABSV1 (in ETABSV1.dll) Version: 1.0.0.0 (1.24.0.0)

Syntax

C#

VB

C++

F#

Copy

```
int SetInsertionPoint(
    string Name,
    int CardinalPoint,
    bool Mirror2,
    bool StiffTransform,
    ref double[] Offset1,
    ref double[] Offset2,
    string CSys = "Local",
    eItemType ItemType = eItemType.Objects
)
```

```
Function SetInsertionPoint (
    Name As String,
    CardinalPoint As Integer,
    Mirror2 As Boolean,
    StiffTransform As Boolean,
    ByRef Offset1 As Double(),
    ByRef Offset2 As Double(),
    CSys As String = "Local",
    ItemType As eItemType = eItemType.Objects
) As Integer
```

```
Dim instance As cFrameObj
Dim Name As String
Dim CardinalPoint As Integer
Dim Mirror2 As Boolean
Dim StiffTransform As Boolean
Dim Offset1 As Double()
Dim Offset2 As Double()
Dim CSys As String
Dim ItemType As eItemType
Dim returnValue As Integer
```

```
returnValue = instance.SetInsertionPoint(Name,
    CardinalPoint, Mirror2, StiffTransform,
    Offset1, Offset2, CSys, ItemType)
```

```
int SetInsertionPoint(
    String^ Name,
    int CardinalPoint,
```

cFrameObjid="LST75B3566E_0"AddLanguageSpecificTextSet("LST75B3566E_0?cpp=::20142");SetIn

```

bool Mirror2,
bool StiffTransform,
array<double>^% Offset1,
array<double>^% Offset2,
String^ CSys = L"Local",
eItemType ItemType = eItemType::Objects
)

abstract SetInsertionPoint :
    Name : string *
    CardinalPoint : int *
    Mirror2 : bool *
    StiffTransform : bool *
    Offset1 : float[] byref *
    Offset2 : float[] byref *
    ?CSys : string *
    ?ItemType : eItemType
(* Defaults:
    let _CSys = defaultArg CSys "Local"
    let _ItemType = defaultArg ItemType eItemType.Objects
*)
-> int

```

Parameters

Name

Type:Â SystemString

The name of an existing frame object or group, depending on the value of the ItemType item.

CardinalPoint

Type:Â SystemInt32

This is a numeric value from 1 to 11 that specifies the cardinal point for the frame object. The cardinal point specifies the relative position of the frame section on the line representing the frame object.

1. bottom left
2. bottom center
3. bottom right
4. middle left
5. middle center
6. middle right
7. top left
8. top center
9. top right
10. centroid
11. shear center

Mirror2

Type:Â SystemBoolean

If this item is True, the frame object section is assumed to be mirrored (flipped) about its local 2-axis.

StiffTransform

Type:Â SystemBoolean

If this item is True, the frame object stiffness is transformed for cardinal point and joint offsets from the frame section centroid.

Offset1

Type: SystemDouble

This is an array of three joint offset distances, in the coordinate directions specified by CSys, at the I-End of the frame object. [L]

- ◊ Offset1(0) = Offset in the 1-axis or X-axis direction
- ◊ Offset1(1) = Offset in the 2-axis or Y-axis direction
- ◊ Offset1(2) = Offset in the 3-axis or Z-axis direction

Offset2

Type: SystemDouble

This is an array of three joint offset distances, in the coordinate directions specified by CSys, at the J-End of the frame object. [L]

- ◊ Offset2(0) = Offset in the 1-axis or X-axis direction
- ◊ Offset2(1) = Offset in the 2-axis or Y-axis direction
- ◊ Offset2(2) = Offset in the 3-axis or Z-axis direction

CSys (Optional)

Type: SystemString

This is Local or the name of a defined coordinate system. It is the coordinate system in which the Offset1 and Offset2 items are specified.

ItemType (Optional)

Type: ETABSv1eItemType

This is one of the following items in the eItemType enumeration:

- ◊ Object = 0
- ◊ Group = 1
- ◊ SelectedObjects = 2

If this item is Objects, the assignment is made to the frame object specified by the Name item.

If this item is Group, the assignment is made to all frame objects in the group specified by the Name item.

If this item is SelectedObjects, the assignment is made to all selected frame objects and the Name item is ignored.

Return Value

Type: Int32

Returns zero if the insertion point data is successfully assigned, otherwise it returns a nonzero value.

▲ Remarks

▲ Examples

VB

Copy

```
Public Sub Example()
    Dim SapModel As cSapModel
    Dim EtabsObject As c0API
    Dim ret As Integer = -1
    Dim i As Integer
    Dim Offset1() As Double
    Dim Offset2() As Double

    'create ETABS object
    Dim myHelper as cHelper = New Helper
    EtabsObject = myHelper.CreateObjectProgID("CSI.ETABS.API.ETABSObject")
```

Introduction

```
'start ETABS application
ret = EtabsObject.ApplicationStart()

'create SapModel object
SapModel = EtabsObject.SapModel

'initialize model
ret = SapModel.InitializeNewModel()

'create steel deck template model
ret = SapModel.File.NewSteelDeck(4, 12, 12, 4, 4, 24, 24)

'assign frame insertion point
ReDim Offset1(2)
ReDim Offset2(2)
For i=0 To 2
    Offset1(i)=10 + i
    Offset2(i)=20 + i
Next i
ret = SapModel.FrameObj.SetInsertionPoint("15", 7, False, True, Offset1, Offset2)

'close ETABS

double Dist2,
double Val1,
double Val2,
String^ CSys = L"Global",
bool RelDist = true,
bool Replace = true,
eItemType ItemType = eItemType::Objects
)

abstract SetLoadDistributed :
    Name : string *
    LoadPat : string *
    MyType : int *
    Dir : int *
    Dist1 : float *
    Dist2 : float *
    Val1 : float *
    Val2 : float *
    ?CSys : string *
    ?RelDist : bool *
    ?Replace : bool *
    ?ItemType : eItemType
(* Defaults:
    let _CSys = defaultArg CSys "Global"
    let _RelDist = defaultArg RelDist true
    let _Replace = defaultArg Replace true
    let _ItemType = defaultArg ItemType eItemType.Objects
*)
-> int
```

Parameters

Name

Type:Â SystemString

The name of an existing frame object or group, depending on the value of the ItemType item.

LoadPat

Type:Â SystemString

The name of a defined load pattern.

MyType

Type:Â SystemInt32

This is 1 or 2, indicating the type of distributed load.

1. Force per unit length

2. Moment per unit length

Dir

Type: SystemInt32

This is an integer between 1 and 11, indicating the direction of the load.

1. Local 1 axis (only applies when CSys is Local)
2. Local 2 axis (only applies when CSys is Local)
3. Local 3 axis (only applies when CSys is Local)
4. X direction (does not apply when CSys is Local)
5. Y direction (does not apply when CSys is Local)
6. Z direction (does not apply when CSys is Local)
7. Projected X direction (does not apply when CSys is Local)
8. Projected Y direction (does not apply when CSys is Local)
9. Projected Z direction (does not apply when CSys is Local)
10. Gravity direction (only applies when CSys is Global)
11. Projected Gravity direction (only applies when CSys is Global)

The positive gravity direction (see Dir = 10 and 11) is in the negative Global Z direction.

Dist1

Type: SystemDouble

This is the distance from the I-End of the frame object to the start of the distributed load. This may be a relative distance ($0 \leq \text{Dist1} \leq 1$) or an actual distance, depending on the value of the RelDist item. [L] when RelDist is False

Dist2

Type: SystemDouble

This is the distance from the I-End of the frame object to the end of the distributed load. This may be a relative distance ($0 \leq \text{Dist2} \leq 1$) or an actual distance, depending on the value of the RelDist item. [L] when RelDist is False

Val1

Type: SystemDouble

This is the load value at the start of the distributed load. [F/L] when MyType is 1 and [FL/L] when MyType is 2

Val2

Type: SystemDouble

This is the load value at the end of the distributed load. [F/L] when MyType is 1 and [FL/L] when MyType is 2

CSys (Optional)

Type: SystemString

This is Local or the name of a defined coordinate system. It is the coordinate system in which the loads are specified.

RelDist (Optional)

Type: SystemBoolean

If this item is True, the specified Dist item is a relative distance, otherwise it is an actual distance.

Replace (Optional)

Type: SystemBoolean

If this item is True, all previous loads, if any, assigned to the specified frame object(s), in the specified load pattern, are deleted before making the new assignment.

ItemType (Optional)

Type: ETABSv1eItemType

This is one of the following items in the eItemType enumeration:

- ◇ Object = 0
- ◇ Group = 1
- ◇ SelectedObjects = 2

If this item is Objects, the assignment is made to the frame object specified by the Name item.

If this item is Group, the assignment is made to all frame objects in the group specified by the Name item.

If this item is SelectedObjects, the assignment is made to all selected frame objects and the Name item is ignored.

Return Value

Type: $\hat{A}$ Int32

Returns zero if the loads are successfully assigned, otherwise it returns a nonzero value.

▲ Remarks

▲ Examples

VB

Copy

```
Public Sub Example()
    Dim SapModel As cSapModel
    Dim EtabsObject As cOAPI
    Dim ret As Integer = -1

    'create ETABS object
    Dim myHelper as cHelper = New Helper
    EtabsObject = myHelper.CreateObjectProgID("CSI.ETABS.API.ETABSObject")

    'start ETABS application
    ret = EtabsObject.ApplicationStart()

    'create SapModel object
    SapModel = EtabsObject.SapModel

    'initialize model
    ret = SapModel.InitializeNewModel()

    'create steel deck template model
    ret = SapModel.File.NewSteelDeck(4, 12, 12, 4, 4, 24, 24)

    'assign frame distributed loads
    ret = SapModel.FrameObj.SetLoadDistributed("15", "DEAD", 1, 10, 0, 1, 0.08, 0.08)

    'close ETABS
    EtabsObject.ApplicationExit(False)

    'clean up variables
    SapModel = Nothing
    EtabsObject = Nothing
End Sub
```

    let _RelDist = defaultArg RelDist true
    let _Replace = defaultArg Replace true
    let _ItemType = defaultArg ItemType eItemType.Objects
*)
-> int
```

Parameters

Name

Type:Â SystemString

The name of an existing frame object or group, depending on the value of the ItemType item.

LoadPat

Type:Â SystemString

The name of a defined load pattern.

MyType

Type:Â SystemInt32

This is 1 or 2, indicating the type of point load.

1. Force
2. Moment

Dir

Type:Â SystemInt32

This is an integer between 1 and 11, indicating the direction of the load.

1. Local 1 axis (only applies when CSys is Local)
2. Local 2 axis (only applies when CSys is Local)
3. Local 3 axis (only applies when CSys is Local)
4. X direction (does not apply when CSys is Local)
5. Y direction (does not apply when CSys is Local)

6. Z direction (does not apply when CSys is Local)
7. Projected X direction (does not apply when CSys is Local)
8. Projected Y direction (does not apply when CSys is Local)
9. Projected Z direction (does not apply when CSys is Local)
10. Gravity direction (only applies when CSys is Global)
11. Projected Gravity direction (only applies when CSys is Global)

The positive gravity direction (see Dir = 10 and 11) is in the negative Global Z direction.

Dist

Type: SystemDouble

Val

Type: SystemDouble

CSys (Optional)

Type: SystemString

This is Local or the name of a defined coordinate system. It is the coordinate system in which the loads are specified.

RelDist (Optional)

Type: SystemBoolean

If this item is True, the specified dist item is a relative distance, otherwise it is an actual distance.

Replace (Optional)

Type: SystemBoolean

If this item is True, all previous loads, if any, assigned to the specified frame object(s), in the specified load pattern, are deleted before making the new assignment.

ItemType (Optional)

Type: ETABSv1eItemType

This is one of the following items in the eItemType enumeration:

- ◊ Object = 0
- ◊ Group = 1
- ◊ SelectedObjects = 2

If this item is Objects, the assignment is made to the frame object specified by the Name item.

If this item is Group, the assignment is made to all frame objects in the group specified by the Name item.

If this item is SelectedObjects, the assignment is made to all selected frame objects and the Name item is ignored.

Return Value

Type: Int32

Returns zero if the loads are successfully assigned, otherwise it returns a nonzero value.

▲ Remarks

▲ Examples

VB

Copy

```
Public Sub Example()
```

CSI API ETABS v1

cFrameObjAddLanguageSpecificTextSet("LST7FBE6435_0?cpp=::2129");SetLocal

Method

Assigns a local axis angle to frame objects.

Namespace: [ETABSV1](#)

Assembly: [ETABSV1](#) (in ETABSV1.dll) Version: 1.0.0.0 (1.24.0.0)

Syntax

[C#](#)

[VB](#)

[C++](#)

[F#](#)

[Copy](#)

```
int SetLocalAxes(
    string Name,
    double Ang,
    eItemType ItemType = eItemType.Objects
)
```

```
Function SetLocalAxes (
    Name As String,
    Ang As Double,
    Optional ItemType As eItemType = eItemType.Objects
) As Integer
```

```
Dim instance As cFrameObj
Dim Name As String
Dim Ang As Double
Dim ItemType As eItemType
Dim returnValue As Integer
```

```
returnValue = instance.SetLocalAxes(Name,
    Ang, ItemType)
```

```
int SetLocalAxes(
    String^ Name,
    double Ang,
    eItemType ItemType = eItemType::Objects
)
```

```
abstract SetLocalAxes :
    Name : string *
    Ang : float *
    ?ItemType : eItemType
(* Defaults:
    let _ItemType = defaultArg ItemType eItemType.Objects
*)
-> int
```

Parameters

Name

Type: SystemString

The name of an existing frame object or group, depending on the value of the ItemType item.

Ang

Type: SystemDouble

This is the angle that the local 2 and 3 axes are rotated about the positive local 1 axis, from the default orientation or, if the Advanced item is True, from the orientation determined by the plane reference vector. The rotation for a positive angle appears counter clockwise when the local +1 axis is pointing toward you.
[deg]

ItemType (Optional)

Type: ETABSv1eItemType

This is one of the following items in the eItemType enumeration:

- ◊ Object = 0
- ◊ Group = 1
- ◊ SelectedObjects = 2

If this item is Objects, the local axes assignment is made to the frame object specified by the Name item.

If this item is Group, the local axes assignment is made to all frame objects in the group specified by the Name item.

If this item is SelectedObjects, the local axes assignment is made to all selected frame objects and the Name item is ignored.

Return Value

Type: Int32

Returns zero if the local axis angle is successfully assigned, otherwise it returns a nonzero value.

▲ Remarks

▲ Examples

VB

Copy

```
Public Sub Example()
    Dim SapModel As cSapModel
    Dim EtabsObject As cOAPI
    Dim ret As Integer = -1

    'create ETABS object
    Dim myHelper as cHelper = New Helper
    EtabsObject = myHelper.CreateObjectProgID("CSI.ETABS.API.ETABSObject")

CSI API ETABS v1

cFrameObjAddLanguageSpecificTextSet("LST963E12A

Method

Sets the frame modifier assignment for frame objects. The default value for all modifiers is one

Namespace: $\hat{A}$ ETABSV1

Assembly: $\hat{A}$ ETABSV1 (in ETABSV1.dll) Version: 1.0.0.0 (1.24.0.0)

■ Syntax

C#

VB

C++

F#

Copy

```
int SetModifiers(
    string Name,
    ref double[] Value,
    eItemType ItemType = eItemType.Objects
)
```

```
Function SetModifiers (
    Name As String,
    ByRef Value As Double(),
    Optional ItemType As eItemType = eItemType.Objects
) As Integer
```

```
Dim instance As cFrameObj
Dim Name As String
Dim Value As Double()
Dim ItemType As eItemType
Dim returnValue As Integer
```

```
returnValue = instance.SetModifiers(Name,
    Value, ItemType)
```

```
int SetModifiers(
    String^ Name,
    array<double>^% Value,
    eItemType ItemType = eItemType::Objects
)
```

```
abstract SetModifiers :
    Name : string *
    Value : float[] byref *
    ?ItemType : eItemType
(* Defaults:
    let _ItemType = defaultArg ItemType eItemType.Objects
*)
-> int
```

Parameters**Name**Type:Â SystemStringThe name of an existing frame object or group, depending on the value of the ItemType item.**Value**Type:Â SystemDouble

This is an array of eight unitless modifiers:

Value**Modifier**

Value(0) Cross sectional area modifier

Value(1) Shear area in local 2 direction modifier

Value(2) Shear area in local 3 direction modifier

Value(3) Torsional constant modifier

Value(4) Moment of inertia about local 2 axis modifier

Value(5) Moment of inertia about local 3 axis modifier

Value(6) Mass modifier

Value(7) Weight modifier

ItemType (Optional)Type:Â ETABSv1eItemTypeThis is one of the following items in the eItemType enumeration:

◊ Object = 0

◊ Group = 1

◊ SelectedObjects = 2

If this item is Objects, the assignment is made to the frame object specified by the Name item.If this item is Group, the assignment is made to all frame objects in the group specified by the Name item.If this item is SelectedObjects, the assignment is made to all selected frame objects and the Name item is ignored.**Return Value**Type:Â Int32

Returns zero if the modifier assignments are successfully assigned, otherwise it returns a nonzero value

▲ **Remarks**▲ **Examples**

VB

Copy

```
Public Sub Example()
    Dim SapModel As cSapModel
    Dim EtabsObject As cOAPI
    Dim ret As Integer = -1
    Dim Value() As Double
```

'create ETABS object

Dim myHelper as cHelper = New Helper

EtabsObject = myHelper.CreateObjectProgID("CSI.ETABS.API.ETABSObject")

Parameters

```
'start ETABS application
ret = EtabsObject.ApplicationStart()

'create SapModel object
SapModel = EtabsObject.SapModel

'initialize model
ret = SapModel.InitializeNewModel()

'create steel deck template model
ret = SapModel.File.NewSteelDeck(4, 12, 4, 4, 24, 24)

'assign modifiers
ReDim Value(7)
For i = 0 To 7
    Value(i) = 1
Next i
Value(5) = 100
ret = SapModel.FrameObj.SetModifiers("3", Value, eItemType.Objects)

'get modifiers
Dim myValue As Double()
ret = SapModel.FrameObj.GetModifiers("3", myValue)

'close ETABS
EtabsObject.ApplicationExit(False)

'clean up variables
SapModel = Nothing
EtabsObject = Nothing

End Sub
```

CSI API ETABS v1

cFrameObjAddLanguageSpecificTextSet("LSTB80C8CFD_0") Method

Assigns frame object output station data.

Namespace: ETABSv1

Assembly: ETABSv1 (in ETABSv1.dll) Version: 1.0.0.0 (1.24.0.0)

■ Syntax

C#

VB

C++

F#

Copy

```
int SetOutputStations(
    string Name,
    int MyType,
    double MaxSegSize,
    int MinSections,
    bool NoOutPutAndDesignAtElementEnds = false,
    bool NoOutPutAndDesignAtPointLoads = false,
    eItemType ItemType = eItemType.Objects
)
```

```
Function SetOutputStations (
    Name As String,
    MyType As Integer,
    MaxSegSize As Double,
    MinSections As Integer,
    NoOutPutAndDesignAtElementEnds As Boolean = false,
    NoOutPutAndDesignAtPointLoads As Boolean = false,
    ItemType As eItemType = eItemType.Objects
) As Integer
```

```
Dim instance As cFrameObj
Dim Name As String
Dim MyType As Integer
Dim MaxSegSize As Double
Dim MinSections As Integer
Dim NoOutPutAndDesignAtElementEnds As Boolean
Dim NoOutPutAndDesignAtPointLoads As Boolean
Dim ItemType As eItemType
Dim returnValue As Integer
```

```
returnValue = instance.SetOutputStations(Name,
    MyType, MaxSegSize, MinSections,
    NoOutPutAndDesignAtElementEnds,
    NoOutPutAndDesignAtPointLoads,
    ItemType)
```

```
int SetOutputStations(
    String^ Name,
    int MyType,
    double MaxSegSize,
    int MinSections,
```

cFrameObjAddLanguageSpecificTextSet("LSTB80C8CFD_0?cpp=2109.");Set

Introduction

```
bool NoOutPutAndDesignAtElementEnds = false,
bool NoOutPutAndDesignAtPointLoads = false,
eItemType ItemType = eItemType::Objects
)

abstract SetOutputStations :
    Name : string *
    MyType : int *
    MaxSegSize : float *
    MinSections : int *
    ?NoOutPutAndDesignAtElementEnds : bool *
    ?NoOutPutAndDesignAtPointLoads : bool *
    ?ItemType : eItemType
(* Defaults:
    let _NoOutPutAndDesignAtElementEnds = defaultArg NoOutPutAndDesignAtElementEnds false
    let _NoOutPutAndDesignAtPointLoads = defaultArg NoOutPutAndDesignAtPointLoads false
    let _ItemType = defaultArg ItemType eItemType.Objects
*)
-> int
```

Parameters

Name

Type: SystemString

The name of an existing frame object or group, depending on the value of the ItemType item.

MyType

Type: SystemInt32

This is 1 or 2, indicating how the output stations are specified.

1. maximum segment size, that is, maximum station spacing
2. minimum number of stations

MaxSegSize

Type: SystemDouble

The maximum segment size, that is, the maximum station spacing. This item applies only when MyType = 1. [L]

MinSections

Type: SystemInt32

The minimum number of stations. This item applies only when MyType = 2.

NoOutPutAndDesignAtElementEnds (Optional)

Type: SystemBoolean

If this item is True, no additional output stations are added at the ends of line elements when the frame object is internally meshed. In ETABS, this item will always be False

NoOutPutAndDesignAtPointLoads (Optional)

Type: SystemBoolean

If this item is True, no additional output stations are added at point load locations. In ETABS, this item will always be False

ItemType (Optional)

Type: ETABSV1eItemType

This is one of the following items in the eItemType enumeration:

- ◇ Object = 0
- ◇ Group = 1
- ◇ SelectedObjects = 2

Introduction

If this item is Objects, the assignment is made to the frame object specified by the Name item.

If this item is Group, the assignment is made to all frame objects in the group specified by the Name item.

If this item is SelectedObjects, the assignment is made to all selected frame objects and the Name item is ignored.

Return Value

Type: Int32

Returns zero if the data is successfully assigned, otherwise it returns a nonzero value.

▲ Remarks

▲ Examples

VB

Copy

```
Public Sub Example()  
    Dim SapModel As cSapModel  
    Dim EtabsObject As cOAPI  
    Dim ret As Integer = -1  
  
    'create ETABS object  
    Dim myHelper as cHelper = New Helper  
    EtabsObject = myHelper.CreateObjectProgID("CSI.ETABS.API.ETABSObject")  
  
    'start ETABS application  
    ret = EtabsObject.ApplicationStart()  
  
    'create SapModel object  
    SapModel = EtabsObject.SapModel  
  
    'initialize model  
    ret = SapModel.InitializeNewModel()  
  
    'create steel deck template model  
    ret = SapModel.File.NewSteelDeck(4, 12, 12, 4, 4, 24, 24)  
  
    'assign frame output station data  
    ret = SapModel.FrameObj.SetOutputStations("15", 1, 18, 0)  
  
    'close ETABS  
    EtabsObject.ApplicationExit(False)  
  
    'clean up variables  
    SapModel = Nothing  
    EtabsObject = Nothing  
  
End Sub
```

CSI API ETABS v1

cFrameObjAddLanguageSpecificTextSet("LST226F5BA_0") Method

Sets the pier label assignment of one or more frame objects

Namespace: [ETABSv1](#)

Assembly: [ETABSv1](#) (in ETABSv1.dll) Version: 1.0.0.0 (1.24.0.0)

Syntax

[C#](#)

[VB](#)

[C++](#)

[F#](#)

[Copy](#)

```
int SetPier(
    string Name,
    string PierName,
    eItemType ItemType = eItemType.Objects
)
```

```
Function SetPier (
    Name As String,
    PierName As String,
    ?ItemType As eItemType = eItemType.Objects
) As Integer
```

```
Dim instance As cFrameObj
Dim Name As String
Dim PierName As String
Dim ItemType As eItemType
Dim returnValue As Integer
```

```
returnValue = instance.SetPier(Name, PierName,
    ItemType)
```

```
int SetPier(
    String^ Name,
    String^ PierName,
    eItemType ItemType = eItemType::Objects
)
```

```
abstract SetPier :
    Name : string *
    PierName : string *
    ?ItemType : eItemType
(* Defaults:
    let _ItemType = defaultArg ItemType eItemType.Objects
*)
-> int
```

Parameters

Name

Type: SystemString

The name of an existing frame object or group, depending on the value of the ItemType item.

PierName

Type: SystemString

The name of the pier assignment, or "None", to unset any assignment

ItemType (Optional)

Type: ETABSv1eItemType

This is one of the following items in the eItemType enumeration:

◊ Object = 0

◊ Group = 1

◊ SelectedObjects = 2

If this item is Objects, the assignment is made to the frame object specified by the Name item.

If this item is Group, the assignment is made to all frame objects in the group specified by the Name item.

If this item is SelectedObjects, assignment is made to all selected frame objects, and the Name item is ignored.

Return Value

Type: Int32

Returns zero if the assignment is successful; otherwise it returns a nonzero value.

▲ Remarks

▲ Examples

VB

Copy

```
Public Sub Example()
    Dim SapModel As cSapModel
    Dim EtabsObject As cOAPI
    Dim ret As Integer = -1

CSI API ETABS v1

cFrameObjAddLanguageSpecificTextSet("LST10F9BDCC_0") Method

Makes end release and partial fixity assignments to frame objects.

Namespace: ETABSv1

Assembly: ETABSv1 (in ETABSv1.dll) Version: 1.0.0.0 (1.24.0.0)

■ Syntax

C#

VB

C++

F#

Copy

```
int SetReleases(
    string Name,
    ref bool[] II,
    ref bool[] JJ,
    ref double[] StartValue,
    ref double[] EndValue,
    eItemType ItemType = eItemType.Objects
)
```

```
Function SetReleases (
    Name As String,
    ByRef II As Boolean(),
    ByRef JJ As Boolean(),
    ByRef StartValue As Double(),
    ByRef EndValue As Double(),
    ByRef ItemType As eItemType = eItemType.Objects
) As Integer
```

```
Dim instance As cFrameObj
Dim Name As String
Dim II As Boolean()
Dim JJ As Boolean()
Dim StartValue As Double()
Dim EndValue As Double()
Dim ItemType As eItemType
Dim returnValue As Integer
```

```
returnValue = instance.SetReleases(Name,
    II, JJ, StartValue, EndValue, ItemType)
```

```
int SetReleases(
    String^ Name,
    array<bool>^% II,
    array<bool>^% JJ,
    array<double>^% StartValue,
    array<double>^% EndValue,
    eItemType ItemType = eItemType::Objects
)
```

```
abstract SetReleases :
    Name : string *
```

cFrameObjAddLanguageSpecificTextSet("LST10F9BDCC_0?cpp=2146-");Set

```

II : bool[] byref *
JJ : bool[] byref *
StartValue : float[] byref *
EndValue : float[] byref *
?ItemType : eItemType
(* Defaults:
    let _ItemType = defaultArg ItemType eItemType.Objects
*)
-> int

```

Parameters

Name

Type:Â SystemString

The name of an existing frame object or group, depending on the value of the ItemType item.

II

Type:Â SystemBoolean

JJ

Type:Â SystemBoolean

These is an array of six booleans indicating the J-End releases for the frame object.

- ◊ ii(0) and jj(0) = U1 release
- ◊ ii(1) and jj(1) = U2 release
- ◊ ii(2) and jj(2) = U3 release
- ◊ ii(3) and jj(3) = R1 release
- ◊ ii(4) and jj(4) = R2 release
- ◊ ii(5) and jj(5) = R3 release

StartValue

Type:Â SystemDouble

These is an array of six values indicating the I-End partial fixity springs for the frame object.

- ◊ StartValue(0) and EndValue(0) = U1 partial fixity [F/L]
- ◊ StartValue(1) and EndValue(1) = U2 partial fixity [F/L]
- ◊ StartValue(2) and EndValue(2) = U3 partial fixity [F/L]
- ◊ StartValue(3) and EndValue(3) = R1 partial fixity [FL/rad]
- ◊ StartValue(4) and EndValue(4) = R2 partial fixity [FL/rad]
- ◊ StartValue(5) and EndValue(5) = R3 partial fixity [FL/rad]

EndValue

Type:Â SystemDouble

These is an array of six values indicating the J-End partial fixity springs for the frame object.

- ◊ StartValue(0) and EndValue(0) = U1 partial fixity [F/L]
- ◊ StartValue(1) and EndValue(1) = U2 partial fixity [F/L]
- ◊ StartValue(2) and EndValue(2) = U3 partial fixity [F/L]
- ◊ StartValue(3) and EndValue(3) = R1 partial fixity [FL/rad]
- ◊ StartValue(4) and EndValue(4) = R2 partial fixity [FL/rad]
- ◊ StartValue(5) and EndValue(5) = R3 partial fixity [FL/rad]

ItemType (Optional)

Type:Â ETABSv1eItemType

This is one of the following items in the eItemType enumeration:

- ◊ Object = 0

◇ Group = 1

◇ SelectedObjects = 2

If this item is Objects, the assignment is made to the frame object specified by the Name item.

If this item is Group, the assignment is made to all frame objects in the group specified by the Name item.

If this item is SelectedObjects, the assignment is made to all selected frame objects and the Name item is ignored.

Return Value

Type: $\hat{A}$ Int32

Returns zero if the assignments are successfully retrieved, otherwise it returns a nonzero value.

Remarks

Partial fixity assignments are made to degrees of freedom that have been released only.

Some release assignments would cause instability in the model. An error is returned if this type of assignment is made. Unstable release assignments include the following:

- U1 released at both ends
- U2 released at both ends
- U3 released at both ends
- R1 released at both ends
- R2 released at both ends and U3 at either end
- R3 released at both ends and U2 at either end

Examples

VB

Copy

```
Public Sub Example()
    Dim SapModel As cSapModel
    Dim EtabsObject As cOAPI
    Dim ret As Integer = -1
    Dim ii() As Boolean
    Dim jj() As Boolean
    Dim StartValue() As Double
    Dim EndValue() As Double

    'create ETABS object
    Dim myHelper as cHelper = New Helper
    EtabsObject = myHelper.CreateObjectProgID("CSI.ETABS.API.ETABSObject")

    'start ETABS application
    ret = EtabsObject.ApplicationStart()

    'create SapModel object
    SapModel = EtabsObject.SapModel

    'initialize model
    ret = SapModel.InitializeNewModel()
```

Introduction

```
'create steel deck template model
  ret = SapModel.File.NewSteelDeck(4, 12, 12, 4, 4, 24, 24)

'assign end releases
  ReDim ii(5)
  ReDim jj(5)
  ReDim StartValue(5)
  ReDim EndValue(5)
  ii(5) = True
  jj(5) = True
  ret = SapModel.FrameObj.SetReleases("13", ii, jj, StartValue, EndValue)

'close ETABS
  EtabsObject.ApplicationExit(False)

'clean up variables
  SapModel = Nothing
  EtabsObject = Nothing

End Sub
```

CSI API ETABS v1

cFrameObjAddLanguageSpecificTextSet("LST2EAF6E3D_0?cpp=2150.");SetS

Method

Assigns a frame section property to a frame object.

Namespace: ETABSV1

Assembly: ETABSV1 (in ETABSV1.dll) Version: 1.0.0.0 (1.24.0.0)

Syntax

C#

VB

C++

F#

Copy

```
int SetSection(
    string Name,
    string PropName,
    eItemType ItemType = eItemType.Objects,
    double SVarRelStartLoc = 0,
    double SVarTotalLength = 0
)
```

```
Function SetSection (
    Name As String,
    PropName As String,
    ?ItemType As eItemType = eItemType.Objects,
    ?SVarRelStartLoc As Double = 0,
    ?SVarTotalLength As Double = 0
) As Integer
```

```
Dim instance As cFrameObj
Dim Name As String
Dim PropName As String
Dim ItemType As eItemType
Dim SVarRelStartLoc As Double
Dim SVarTotalLength As Double
Dim returnValue As Integer
```

```
returnValue = instance.SetSection(Name,
    PropName, ItemType, SVarRelStartLoc,
    SVarTotalLength)
```

```
int SetSection(
    String^ Name,
    String^ PropName,
    eItemType ItemType = eItemType::Objects,
    double SVarRelStartLoc = 0,
    double SVarTotalLength = 0
)
```

```
abstract SetSection :
    Name : string *
    PropName : string *
    ?ItemType : eItemType *
    ?SVarRelStartLoc : float *
```

cFrameObjid="LST2EAF6E3D_0"AddLanguageSpecificTextSet("LST2EAF6E3D_0?cpp=2150.");SetS

```

        ?SVarTotalLength : float
(* Defaults:
    let _ItemType = defaultArg ItemType eItemType.Objects
    let _SVarRelStartLoc = defaultArg SVarRelStartLoc 0
    let _SVarTotalLength = defaultArg SVarTotalLength 0
*)
-> int

```

Parameters

Name

Type:Â SystemString

The name of an existing frame object or group, depending on the value of the ItemType item.

PropName

Type:Â SystemString

This is None or the name of a frame section property to be assigned to the specified frame object(s).

ItemType (Optional)

Type:Â ETABSv1eItemType

This is one of the following items in the eItemType enumeration:

◊ Object = 0

◊ Group = 1

◊ SelectedObjects = 2

If this item is Objects, the assignment is made to the frame object specified by the Name item.

If this item is Group, the assignment is made to all frame objects in the group specified by the Name item.

If this item is SelectedObjects, the assignment is made to all selected frame objects and the Name item is ignored.

SVarRelStartLoc (Optional)

Type:Â SystemDouble

SVarTotalLength (Optional)

Type:Â SystemDouble

Return Value

Type:Â Int32

Returns zero if the frame section property data is successfully assigned, otherwise it returns a nonzero value.

▲ Remarks

▲ Examples

VB

Copy

```

CSI API ETABS v1

cFrameObjAddLanguageSpecificTextSet("LST9593BE44_0") Method

Sets the selected status for a frame object.

Namespace: [ETABSv1](#)

Assembly: [ETABSv1](#) (in ETABSv1.dll) Version: 1.0.0.0 (1.24.0.0)

Syntax

[C#](#)

[VB](#)

[C++](#)

[F#](#)

[Copy](#)

```
int SetSelected(
    string Name,
    bool Selected,
    eItemType ItemType = eItemType.Objects
)
```

```
Function SetSelected (
    Name As String,
    Selected As Boolean,
    ?ItemType As eItemType = eItemType.Objects
) As Integer
```

```
Dim instance As cFrameObj
Dim Name As String
Dim Selected As Boolean
Dim ItemType As eItemType
Dim returnValue As Integer
```

```
returnValue = instance.SetSelected(Name,
    Selected, ItemType)
```

```
int SetSelected(
    String^ Name,
    bool Selected,
    eItemType ItemType = eItemType::Objects
)
```

```
abstract SetSelected :
    Name : string *
    Selected : bool *
    ?ItemType : eItemType
(* Defaults:
    let _ItemType = defaultArg ItemType eItemType.Objects
*)
-> int
```

Parameters

Name

Type: SystemString

The name of an existing frame object or group depending on the value of the ItemType item.

Selected

Type: SystemBoolean

This item is True if the specified frame object is selected, otherwise it is False.

ItemType (Optional)

Type: ETABSv1eItemType

This is one of the following items in the eItemType enumeration:

◊ Object = 0

◊ Group = 1

◊ SelectedObjects = 2

If this item is Objects, the selected status is set for the frame object specified by the Name item.

If this item is Group, the selected status is set for all frame objects in the group specified by the Name item.

If this item is SelectedObjects, the selected status is set for all selected frame objects and the Name item is ignored.

Return Value

Type: Int32

Returns zero if the selected status is successfully set, otherwise it returns a nonzero value.

▲ Remarks

CSI API ETABS v1

cFrameObjAddLanguageSpecificTextSet("LST32B63482_0") Method

Sets the Spandrel label assignment of one or more frame objects

Namespace: [ETABSv1](#)

Assembly: [ETABSv1](#) (in ETABSv1.dll) Version: 1.0.0.0 (1.24.0.0)

Syntax

[C#](#)

[VB](#)

[C++](#)

[F#](#)

[Copy](#)

```
int SetSpandrel(
    string Name,
    string SpandrelName,
    eItemType ItemType = eItemType.Objects
)
```

```
Function SetSpandrel (
    Name As String,
    SpandrelName As String,
    ?ItemType As eItemType = eItemType.Objects
) As Integer
```

```
Dim instance As cFrameObj
Dim Name As String
Dim SpandrelName As String
Dim ItemType As eItemType
Dim returnValue As Integer
```

```
returnValue = instance.SetSpandrel(Name,
    SpandrelName, ItemType)
```

```
int SetSpandrel(
    String^ Name,
    String^ SpandrelName,
    eItemType ItemType = eItemType::Objects
)
```

```
abstract SetSpandrel :
    Name : string *
    SpandrelName : string *
    ?ItemType : eItemType
(* Defaults:
    let _ItemType = defaultArg ItemType eItemType.Objects
*)
-> int
```

Parameters

Name

Type: SystemString

The name of an existing frame object or group, depending on the value of the ItemType item.

SpandrelName

Type: SystemString

The name of the Spandrel assignment, or "None", to unset any assignment

ItemType (Optional)

Type: ETABSv1eItemType

This is one of the following items in the eItemType enumeration:

◊ Object = 0

◊ Group = 1

◊ SelectedObjects = 2

If this item is Objects, the assignment is made to the frame object specified by the Name item.

If this item is Group, the assignment is made to all frame objects in the group specified by the Name item.

If this item is SelectedObjects, assignment is made to all selected frame objects, and the Name item is ignored.

Return Value

Type: Int32

Returns zero if the assignment is successful; otherwise it returns a nonzero value.

▲ Remarks

▲ Examples

VB

Copy

```
Public Sub Example()
    Dim SapModel As cSapModel
    Dim EtabsObject As cOAPI
    Dim ret As Integer = -1
    Dim SpandrelName as String

    'create ETABS object
    Dim myHelper as cHelper = New Helper
    EtabsObject = myHelper.CreateObjectProgID("CSI.ETABS.API.ETABSObject")

    'start ETABS application
    ret = EtabsObject.ApplicationStart()

    'create SapModel object
    SapModel = EtabsObject.SapModel

    'initialize model
    ret = SapModel.InitializeNewModel()

    'create steel deck template model
    ret = SapModel.File.NewSteelDeck(4, 12, 4, 4, 24, 24)

    'define new Spandrel label
    ret = SapModel.SpandrelLabel.SetSpandrel("MySpandrel")

    'set assignment
    ret = SapModel.FrameObj.SetSpandrel("3", "MySpandrel")
```

Parameters

Introduction

```
'get assignment
    ret = SapModel.FrameObj.GetSpandrel("3", SpandrelName)

'close ETABS
    EtabsObject.ApplicationExit(False)

'clean up variables
    SapModel = Nothing
    EtabsObject = Nothing

End Sub
```

CSI API ETABS v1

cFrameObjAddLanguageSpecificTextSet("LSTE04E73B9_0") Method

Assigns an existing named line spring property to frame objects

Namespace: [ETABSv1](#)

Assembly: [ETABSv1](#) (in ETABSv1.dll) Version: 1.0.0.0 (1.24.0.0)

Syntax

[C#](#)

[VB](#)

[C++](#)

[F#](#)

[Copy](#)

```
int SetSpringAssignment(
    string Name,
    string SpringProp,
    eItemType ItemType = eItemType.Objects
)
```

```
Function SetSpringAssignment (
    Name As String,
    SpringProp As String,
    ?ItemType As eItemType = eItemType.Objects
) As Integer
```

```
Dim instance As cFrameObj
Dim Name As String
Dim SpringProp As String
Dim ItemType As eItemType
Dim returnValue As Integer
```

```
returnValue = instance.SetSpringAssignment(Name,
    SpringProp, ItemType)
```

```
int SetSpringAssignment(
    String^ Name,
    String^ SpringProp,
    eItemType ItemType = eItemType::Objects
)
```

```
abstract SetSpringAssignment :
    Name : string *
    SpringProp : string *
    ?ItemType : eItemType
(* Defaults:
    let _ItemType = defaultArg ItemType eItemType.Objects
*)
-> int
```

Parameters

Name

Type: SystemString

The name of an existing frame object or group depending on the value of the ItemType item.

SpringProp

Type: SystemString

The name of an existing line spring property

ItemType (Optional)

Type: ETABSv1eItemType

This is one of the following items in the eItemType enumeration:

◊ Object = 0

◊ Group = 1

◊ SelectedObjects = 2

If this item is Objects, the property assignment is made to the frame object specified by the Name item.

If this item is Group, the property assignment is made to all frame objects in the group specified by the Name item.

If this item is SelectedObjects, the property assignment is made to all selected frame objects and the Name item is ignored.

Return Value

Type: Int32

Returns zero if the property is successfully assigned, otherwise it returns a nonzero value

▲ Remarks

▲ Examples

VB

Copy

```
Public Sub Example()
    Dim SapModel As cSapModel
    Dim EtabsObject As cOAPI
    Dim ret As Integer = -1
    Dim SpringProp As String

    'create ETABS object
    Dim myHelper as cHelper = New Helper
    EtabsObject = myHelper.CreateObjectProgID("CSI.ETABS.API.ETABSObject")

    'start ETABS application
    ret = EtabsObject.ApplicationStart()

    'create SapModel object
    SapModel = EtabsObject.SapModel

    'initialize model
    ret = SapModel.InitializeNewModel()

    'create steel deck template model
    ret = SapModel.File.NewSteelDeck(4, 12, 12, 4, 4, 24, 24)

    'define new spring property
    ret = SapModel.PropLineSpring.SetLineSpringProp("mySpringProp1", 0, 10, 20, 0, 0, 1)

    'assign property
```

Parameters

Introduction

```
ret = SapModel.FrameObj.SetSpringAssignment("1", "mySpringProp1")

'close ETABS
  EtabsObject.ApplicationExit(False)

'clean up variables
  SapModel = Nothing
  EtabsObject = Nothing

End Sub
```

CSI API ETABS v1

cFrameObjAddLanguageSpecificTextSet("LSTB982EC93_0")

Method

Makes tension/compression force limit assignments to frame objects.

Namespace: ETABSv1

Assembly: ETABSv1 (in ETABSv1.dll) Version: 1.0.0.0 (1.24.0.0)

Syntax

C#

VB

C++

F#

Copy

```
int SetTCLimits(
    string Name,
    bool LimitCompressionExists,
    double LimitCompression,
    bool LimitTensionExists,
    double LimitTension,
    eItemType ItemType = eItemType.Objects
)
```

```
Function SetTCLimits (
    Name As String,
    LimitCompressionExists As Boolean,
    LimitCompression As Double,
    LimitTensionExists As Boolean,
    LimitTension As Double,
    ItemType As eItemType = eItemType.Objects
) As Integer
```

```
Dim instance As cFrameObj
Dim Name As String
Dim LimitCompressionExists As Boolean
Dim LimitCompression As Double
Dim LimitTensionExists As Boolean
Dim LimitTension As Double
Dim ItemType As eItemType
Dim returnValue As Integer

returnValue = instance.SetTCLimits(Name,
    LimitCompressionExists, LimitCompression,
    LimitTensionExists, LimitTension,
    ItemType)
```

```
int SetTCLimits(
    String^ Name,
    bool LimitCompressionExists,
    double LimitCompression,
    bool LimitTensionExists,
    double LimitTension,
    eItemType ItemType = eItemType::Objects
)
```

cFrameObjAddLanguageSpecificTextSet("LSTB982EC93_0?cpp=:2162");SetT

```

abstract SetTCLimits :
  Name : string *
  LimitCompressionExists : bool *
  LimitCompression : float *
  LimitTensionExists : bool *
  LimitTension : float *
  ?ItemType : eItemType
(* Defaults:
   let _ItemType = defaultArg ItemType eItemType.Objects
*)
-> int

```

Parameters

Name

Type:Â SystemString

The name of an existing frame object or group depending on the value of the ItemType item.

LimitCompressionExists

Type:Â SystemBoolean

This item is True if a compression force limit exists for the frame object.

LimitCompression

Type:Â SystemDouble

The compression force limit for the frame object. [F]

LimitTensionExists

Type:Â SystemBoolean

This item is True if a tension force limit exists for the frame object.

LimitTension

Type:Â SystemDouble

The tension force limit for the frame object. [F]

ItemType (Optional)

Type:Â ETABSv1eItemType

This is one of the following items in the eItemType enumeration:

◊ Object = 0

◊ Group = 1

◊ SelectedObjects = 2

If this item is Objects, the assignment is made to the frame object specified by the Name item.

If this item is Group, the assignment is made to all frame objects in the group specified by the Name item.

If this item is SelectedObjects, the assignment is made to all selected frame objects and the Name item is ignored.

Return Value

Type:Â Int32

Returns zero if the assignments are successfully applied, otherwise it returns a nonzero value.

▲ Remarks

Note that the tension and compression limits are only used in nonlinear analyses.

▲ Examples

VB

Copy

```
Public Sub Example()
    Dim SapModel As cSapModel
    Dim EtabsObject As cOAPI
    Dim ret As Integer = -1

    'create ETABS object
    Dim myHelper as cHelper = New Helper
    EtabsObject = myHelper.CreateObjectProgID("CSI.ETABS.API.ETABSObject")

    'start ETABS application
    ret = EtabsObject.ApplicationStart()

    'create SapModel object
    SapModel = EtabsObject.SapModel

    'initialize model
    ret = SapModel.InitializeNewModel()

    'create steel deck template model
    ret = SapModel.File.NewSteelDeck(4, 12, 12, 4, 4, 24, 24)

    'assign tension/compression limits
    ret = SapModel.FrameObj.SetTCLimits("1", False, 0, True, 100)

    'close ETABS
    EtabsObject.ApplicationExit(False)

    'clean up variables
    SapModel = Nothing
    EtabsObject = Nothing
End Sub
```

    int% FuncType,
    int% AddType
)
```

```
abstract GetType0API :
    Name : string *
    FuncType : int byref *
    AddType : int byref -> int
```

Parameters

Name

Type: [SystemString](#)

The name of an existing function

FuncType

Type: SystemInt32

This is one of the following numbers, indicating the type of function

1. Response Spectrum
2. Time History
3. Power spectral density
4. Steady state
5. Heat Transfer

AddType

Type: SystemInt32

The is one of the following items, indicating the function subtype

Response Spectrum Functions

- ◇ 0 = From file
- ◇ 1 = User
- ◇ 2 = UBC94
- ◇ 3 = UBC97

q : float byref -> int

Parameters

Name

Type:Â SystemString

The name of a NTC2008 response spectrum function

ParamsOption

Type:Â SystemInt32

This is 1, 2, or 3, indicating the option for defining the parameters

1. by latitude and longitude
2. by island
3. user specified

Latitude

Type:Â SystemDouble

The latitude for which the seismic coefficients are obtained. This item is meaningful only when ParamsOption = 1

Longitude

Type:Â SystemDouble

The longitude for which the seismic coefficients are obtained. This item is meaningful only when ParamsOption = 1

Island

Type:Â SystemInt32

This is one of the following values. This item is used only when ParamsOption = 2

1. Alicudi
2. Arcipelago Toscano
3. Filcudi
4. Isole Egadi
5. Lampedusa
6. Linosa
7. Lipari
8. Palmarola
9. Panarea
10. Pantelleria
11. Ponza
12. Salina
13. Santo Stefano
14. Sardegna
15. Stromboli
16. Tremiti
17. Ustica
18. Ventotene
19. Vulcano
20. Zannone

LimitState

Type:Â SystemInt32

This is 1, 2, 3, or 4, indicating the limit state

1. SLO
2. SLD
3. SLV

4. SLC

UsageClass

Type: SystemInt32

This is 1, 2, 3, or 4, indicating the usage class

1. I
2. II
3. III
4. IV

NomLife

Type: SystemDouble

The nominal life to be considered

PeakAccel

Type: SystemDouble

The peak ground acceleration, ag/g

F0

Type: SystemDouble

The magnitude factor

Tcs

Type: SystemDouble

The reference period, Tc*[s]

SpecType

Type: SystemInt32

This is 1, 2, 3, or 4, indicating the type of spectrum to consider

1. Elastic horizontal
2. Elastic vertical
3. Design horizontal
4. Design vertical

SoilType

Type: SystemInt32

This is 1, 2, 3, 4, or 5, indicating the subsoil type

1. A
2. B
3. C
4. D
5. E

Topography

Type: SystemInt32

This is 1, 2, 3, or 4, indicating the topography type

1. T1
2. T2
3. T3
4. T4

hRatio

Type: SystemDouble

The ratio for the site altitude at the base of the hill to the height of the hill

Damping

Type: SystemDouble

The damping, in percent. This is only applicable for SpecType 1 and 2

q

Type: SystemDouble

The behavior correction factor. This is only applicable for SpecType 3 and 4

Return ValueType: Int32

returns zero if the function is successfully retrieved; otherwise it returns a nonzero value

▲ Remarks

▲ Examples

VB

Copy

```
Public Sub Example()
```

```
    'dimension variables
    Dim SapObject as cOAPI
    Dim SapModel As cSapModel
    Dim ret As Integer

q : float -> int

Parameters

Name

Type:Â SystemString

The name of an existing or new function. If this is an existing function, that function is modified; otherwise, a new function is added

ParamsOption

Type:Â SystemInt32

This is 1, 2, or 3, indicating the option for defining the parameters

1. by latitude and longitude
2. by island
3. user specified

Latitude

Type:Â SystemDouble

The latitude for which the seismic coefficients are obtained. This item is meaningful only when ParamsOption = 1

Longitude

Type:Â SystemDouble

The longitude for which the seismic coefficients are obtained. This item is meaningful only when ParamsOption = 1

Island

Type:Â SystemInt32

This is one of the following values. This item is used only when ParamsOption = 2

1. Alicudi
2. Arcipelago Toscano
3. Filcudi
4. Isole Egadi
5. Lampedusa
6. Linosa
7. Lipari
8. Palmarola
9. Panarea
10. Pantelleria
11. Ponza
12. Salina
13. Santo Stefano
14. Sardegna
15. Stromboli
16. Tremiti
17. Ustica
18. Ventotene
19. Vulcano
20. Zannone

LimitState

Type:Â SystemInt32

This is 1, 2, 3, or 4, indicating the limit state

1. SLO
2. SLD

3. SLV
4. SLC

UsageClass

Type:Â SystemInt32

This is 1, 2, 3, or 4, indicating the usage class

1. I
2. II
3. III
4. IV

NomLife

Type:Â SystemDouble

The nominal life to be considered

PeakAccel

Type:Â SystemDouble

The peak ground acceleration, ag/g

F0

Type:Â SystemDouble

The magnitude factor

Tcs

Type:Â SystemDouble

The reference period, Tc*[s]

SpecType

Type:Â SystemInt32

This is 1, 2, 3, or 4, indicating the type of spectrum to consider

1. Elastic horizontal
2. Elastic vertical
3. Design horizontal
4. Design vertical

SoilType

Type:Â SystemInt32

This is 1, 2, 3, 4, or 5, indicating the subsoil type

1. A
2. B
3. C
4. D
5. E

Topography

Type:Â SystemInt32

This is 1, 2, 3, or 4, indicating the topography type

1. T1
2. T2
3. T3
4. T4

hRatio

Type:Â SystemDouble

The ratio for the site altitude at the base of the hill to the height of the hill

Damping

Type:Â SystemDouble

The damping, in percent. This is only applicable for SpecType 1 and 2

q

Type: SystemDouble

The behavior correction factor. This is only applicable for SpecType 3 and 4

Return Value

Type: Int32

Returns zero if the function is successfully defined; otherwise it returns a nonzero value

▲ Remarks

▲ Examples

VB

Copy

```
Public Sub Example()
```

```
    'dimension variables

```

q : float -> int

Parameters

Name

Type:Â SystemString

The name of an existing or new function. If this is an existing function, that function is modified; otherwise, a new function is added

ParamsOption

Type:Â SystemInt32

This is 1, 2, or 3, indicating the option for defining the parameters

1. by latitude and longitude
2. by island
3. user specified

Latitude

Type:Â SystemDouble

The latitude for which the seismic coefficients are obtained. This item is meaningful only when ParamsOption = 1

Longitude

Type:Â SystemDouble

The longitude for which the seismic coefficients are obtained. This item is meaningful only when ParamsOption = 1

Island

Type:Â SystemInt32

This is one of the following values. This item is used only when ParamsOption = 2

1. Alicudi
2. Arcipelago Toscano
3. Filcudi
4. Isole Egadi
5. Lampedusa
6. Linosa
7. Lipari
8. Palmarola
9. Panarea
10. Pantelleria
11. Ponza
12. Salina
13. Santo Stefano
14. Sardegna
15. Stromboli
16. Tremiti
17. Ustica
18. Ventotene
19. Vulcano
20. Zannone

LimitState

Type:Â SystemInt32

This is 1, 2, 3, or 4, indicating the limit state

1. SLO
2. SLD

3. SLV
4. SLC

UsageClass

Type:Â SystemInt32

This is 1, 2, 3, or 4, indicating the usage class

1. I
2. II
3. III
4. IV

NomLife

Type:Â SystemDouble

The nominal life to be considered

PeakAccel

Type:Â SystemDouble

The peak ground acceleration, ag/g

F0

Type:Â SystemDouble

The magnitude factor

Tcs

Type:Â SystemDouble

The reference period, Tc*[s]

SpecType

Type:Â SystemInt32

This is 1, 2, 3, or 4, indicating the type of spectrum to consider

1. Elastic horizontal
2. Elastic vertical
3. Design horizontal
4. Design vertical

SoilType

Type:Â SystemInt32

This is 1, 2, 3, 4, or 5, indicating the subsoil type

1. A
2. B
3. C
4. D
5. E

Topography

Type:Â SystemInt32

This is 1, 2, 3, or 4, indicating the topography type

1. T1
2. T2
3. T3
4. T4

hRatio

Type:Â SystemDouble

The ratio for the site altitude at the base of the hill to the height of the hill

Damping

Type:Â SystemDouble

The damping, in percent. This is only applicable for SpecType 1 and 2

q

Type: SystemDouble

The behavior correction factor. This is only applicable for SpecType 3 and 4

Return Value

Type: Int32

Returns zero if the function is successfully defined; otherwise it returns a nonzero value

CSI API ETABS v1

cGridSys Interface

Namespace: [ETABSV1](#)

Assembly: [ETABSV1](#) (in ETABSV1.dll) Version: 1.0.0.0 (1.24.0.0)

▲ Syntax

[C#](#)

[VB](#)

[C++](#)

[F#](#)

[Copy](#)

```
public interface cGridSys
```

```
Public Interface cGridSys
```

```
Dim instance As cGridSys
```

```
public interface class cGridSys
```

```
type cGridSys = interface end
```

The cGridSys type exposes the following members.

▲ Methods

▲	Name	Description
➤	ChangeName	Changes the name of a defined grid system.
➤	Count	Retrieves the number of defined grid systems.
➤	Delete	Deletes the specified grid system.
➤	GetGridSys	Retrieves the grid system specified by the Name item.
➤	GetGridSys_2	Retrieves the grid system specified by the Name item.
➤	GetGridSysCartesian	
➤	GetGridSysCylindrical	
➤	GetGridSysType	
➤	GetNameList	Retrieves the names of all defined grid systems.
➤	GetNameTypeList	
➤	GetTransformationMatrix	Retrieves the grid system transformation matrix.
➤	SetGridSys	Adds a new grid system, or modifies an existing grid system.

CSI API ETABS v1

cGridSys Methods

The cGridSys type exposes the following members.

Methods

⌕	Name	Description
⇒	<u>ChangeName</u>	Changes the name of a defined grid system.
⇒	<u>Count</u>	Retrieves the number of defined grid systems.
⇒	<u>Delete</u>	Deletes the specified grid system.
⇒	<u>GetGridSys</u>	Retrieves the grid system specified by the Name item.
⇒	<u>GetGridSys_2</u>	Retrieves the grid system specified by the Name item.
⇒	<u>GetGridSysCartesian</u>	
⇒	<u>GetGridSysCylindrical</u>	
⇒	<u>GetGridSysType</u>	
⇒	<u>GetNameList</u>	Retrieves the names of all defined grid systems.
⇒	<u>GetNameTypeList</u>	
⇒	<u>GetTransformationMatrix</u>	Retrieves the grid system transformation matrix.
⇒	<u>SetGridSys</u>	Adds a new grid system, or modifies an existing grid system.

CSI API ETABS v1

cGridSysAddLanguageSpecificTextSet("LSTAB8645EC Method

Changes the name of a defined grid system.

Namespace: ETABSV1

Assembly: ETABSV1 (in ETABSV1.dll) Version: 1.0.0.0 (1.24.0.0)

Syntax

C#

VB

C++

F#

Copy

```
int ChangeName(
    string Name,
    string NewName
)
```

```
Function ChangeName (
    Name As String,
    NewName As String
) As Integer
```

```
Dim instance As cGridSys
Dim Name As String
Dim NewName As String
Dim returnValue As Integer
```

```
returnValue = instance.ChangeName(Name,
    NewName)
```

```
int ChangeName(
    String^ Name,
    String^ NewName
)
```

```
abstract ChangeName :
    Name : string *
    NewName : string -> int
```

Parameters

Name

Type: SystemString

The existing name of a defined grid system.

NewName

Type: SystemString

The new name for the grid system.

Return Value

Type: Int32

Returns zero if the new name is successfully applied, otherwise it returns a nonzero value.

▀ **Remarks**

Changing the name of the Global grid system will fail and return an error.

▀ **Examples**

VB

Copy

```
Public Sub Example()
    Dim SapModel As cSapModel
    Dim EtabsObject As cOAPI
    Dim ret As Integer = -1

    'create ETABS object
    Dim myHelper as cHelper = New Helper
    EtabsObject = myHelper.CreateObjectProgID("CSI.ETABS.API.ETABSObject")

    'start ETABS application
    ret = EtabsObject.ApplicationStart()

    'create SapModel object
    SapModel = EtabsObject.SapModel

    'initialize model
    ret = SapModel.InitializeNewModel()

    'create steel deck template model
    ret = SapModel.File.NewSteelDeck(4, 12, 12, 4, 4, 24, 24)

    'define new grid system
    ret = SapModel.GridSys.SetGridSys("GridSysA", 1000, 1000, 0, 0, 0, 0)

    'change name of new grid system
    ret = SapModel.GridSys.ChangeName("GridSysA", "MyChangedCSysA")

    'close ETABS
    EtabsObject.ApplicationExit(False)

    'clean up variables
    SapModel = Nothing
    EtabsObject = Nothing

End Sub
```

Dim returnValue As Integer
```

```
returnValue = instance.Delete(Name)
```

```
int Delete(
    String^ Name
)
```

```
abstract Delete :
    Name : string -> int
```

Parameters

Name

Type: [SystemString](#)

The name of an existing grid system.

Return Value

Type: [Int32](#)

Returns zero if the grid system is successfully deleted, otherwise it returns a nonzero value.

▲ Remarks

Attempting to delete the Global grid system will fail and return an error.

▲ Examples

[VB](#)

[Copy](#)

Introduction

```
Public Sub Example()  
    Dim SapModel As cSapModel  
    Dim EtabsObject As cOAPI

cGridSysAddLanguageSpecificTextSet("LSTB219EDA7 Method

Retrieves the grid system specified by the Name item.

Namespace: [ETABSV1](#)

Assembly: [ETABSV1](#) (in ETABSV1.dll) Version: 1.0.0.0 (1.24.0.0)

▲ Syntax

[C#](#)

[VB](#)

[C++](#)

[F#](#)

[Copy](#)

```
int GetGridSys(
    string Name,
    ref double x,
    ref double y,
    ref double RZ
)
```

```
Function GetGridSys (
    Name As String,
    ByRef x As Double,
    ByRef y As Double,
    ByRef RZ As Double
) As Integer
```

```
Dim instance As cGridSys
Dim Name As String
Dim x As Double
Dim y As Double
Dim RZ As Double
Dim returnValue As Integer
```

```
returnValue = instance.GetGridSys(Name,
    x, y, RZ)
```

```
int GetGridSys(
    String^ Name,
    double% x,
    double% y,
    double% RZ
)
```

```
abstract GetGridSys :
    Name : string *
    x : float byref *
    y : float byref *
    RZ : float byref -> int
```

Parameters

Name

Type:Â SystemString

The name of an existing grid system.

x

Type:Â SystemDouble

The global X grid of the origin of the grid system. [L]

y

Type:Â SystemDouble

The global Y grid of the origin of the grid system. [L]

RZ

Type:Â SystemDouble

The rotation of an axis of the new grid system relative to the global grid system is defined as follows: (1) Rotate the grid system about the positive global Z-axis as defined by the RZ item. [deg]

Return ValueType:Â Int32

Returns zero if the grid system data is successfully retrieved, otherwise it returns a nonzero value.

▲ Remarks

▲ Examples

VB

Copy

```
Public Sub Example()
    Dim SapModel As cSapModel
    Dim EtabsObject As cOAPI

 Type:Â SystemDouble
 The global Y grid of the origin of the grid system. [L]
 RZ
 Type:Â SystemDouble
 The rotation of an axis of the new grid system relative to the global grid system is defined as follows: (1) Rotate the grid system about the positive global Z-axis as defined by the RZ item. [deg]
 GridSysType
 Type:Â SystemString
 NumXLines
 Type:Â SystemInt32
 NumYLines
 Type:Â SystemInt32
 GridLineIDX
 Type:Â SystemString
 GridLineIDY
 Type:Â SystemString
 OrdinateX
 Type:Â SystemDouble
 OrdinateY
 Type:Â SystemDouble
 VisibleX
 Type:Â SystemBoolean
 VisibleY
 Type:Â SystemBoolean
 BubbleLocX
 Type:Â SystemString
 BubbleLocY
 Type:Â SystemString

Return Value

Type:Â Int32
 Returns zero if the grid system data is successfully retrieved, otherwise it returns a nonzero value.

CSI API ETABS v1

cGridSysAddLanguageSpecificTextSet("LST9B0F690D_0") Method

Retrieves the names of all defined grid systems.

Namespace: [ETABSV1](#)

Assembly: [ETABSV1](#) (in ETABSV1.dll) Version: 1.0.0.0 (1.24.0.0)

Syntax

[C#](#)

[VB](#)

[C++](#)

[F#](#)

[Copy](#)

```
int GetNameList(
    ref int NumberNames,
    ref string[] MyName
)
```

```
Function GetNameList (
    ByRef NumberNames As Integer,
    ByRef MyName As String()
) As Integer
```

```
Dim instance As cGridSys
Dim NumberNames As Integer
Dim MyName As String()
Dim returnValue As Integer
```

```
returnValue = instance.GetNameList(NumberNames,
    MyName)
```

```
int GetNameList(
    int% NumberNames,
    array<String^>^% MyName
)
```

```
abstract GetNameList :
    NumberNames : int byref *
    MyName : string[] byref -> int
```

Parameters

NumberNames

Type: [System.Int32](#)

The number of grid system names retrieved by the program.

MyName

Type: [System.String](#)

This is a one-dimensional array of grid system names. The MyName array is created as a dynamic, zero-based, array by the API user:

```
Dim MyName() as String
```

cGridSysspan id="LST9B0F690D_0">AddLanguageSpecificTextSet("LST9B0F690D_0?cpp=::|n2268;GetNar

Introduction

The array is dimensioned to (NumberNames + 1) inside the ETABS program, filled with the names, and returned to the API user.

Return Value

Type: Int32

Returns zero if the names are successfully retrieved, otherwise it returns nonzero.

▲ **Remarks**

▲ **Examples**

VB

Copy

```
Public Sub Example()  
    Dim SapModel As cSapModel  
    Dim EtabsObject As cOAPI  
    Dim ret As Integer = -1  
  
    'create ETABS object  
    Dim myHelper as cHelper = New Helper  
    EtabsObject = myHelper.CreateObjectProgID("CSI.ETABS.API.ETABSObject")  
  
    'start ETABS application  
    ret = EtabsObject.ApplicationStart()  
  
    'create SapModel object  
    SapModel = EtabsObject.SapModel  
  
    'initialize model  
    ret = SapModel.InitializeNewModel()  
  
    'create steel deck template model  
    ret = SapModel.File.NewSteelDeck(4, 12, 12, 4, 4, 24, 24)  
  
    'define new grid system  
    ret = SapModel.GridSys.SetGridSys("GridSysA", 1000, 1000, 0, 0, 0, 0)  
  
    'get grid system names  
    ret = SapModel.GridSys.GetNameList(NumberNames, MyName)  
  
    'close ETABS  
    EtabsObject.ApplicationExit(False)  
  
    'clean up variables  
    SapModel = Nothing  
    EtabsObject = Nothing  
  
End Sub
```

CSI API ETABS v1

cGridSysAddLanguageSpecificTextSet("LST7CCD30CC0")

Method

Retrieves the grid system transformation matrix.

Namespace: [ETABSv1](#)

Assembly: [ETABSv1](#) (in ETABSv1.dll) Version: 1.0.0.0 (1.24.0.0)

▲ Syntax

[C#](#)

[VB](#)

[C++](#)

[F#](#)

[Copy](#)

```
int GetTransformationMatrix(
    string Name,
    ref double[] Value
)
```

```
Function GetTransformationMatrix (
    Name As String,
    ByRef Value As Double()
) As Integer
```

```
Dim instance As cGridSys
Dim Name As String
Dim Value As Double()
Dim returnValue As Integer
```

```
returnValue = instance.GetTransformationMatrix(Name,
    Value)
```

```
int GetTransformationMatrix(
    String^ Name,
    array<double>^% Value
)
```

```
abstract GetTransformationMatrix :
    Name : string *
    Value : float[] byref -> int
```

Parameters

Name

Type: [SystemString](#)

The name of an existing grid system.

Value

Type: [SystemDouble](#)

Value is an array of nine direction cosines that define the transformation matrix from the specified grid system to the global grid system.

Return Value

Type: Int32

Returns zero if the grid system transformation matrix is successfully returned, otherwise it returns a nonzero value.

▲ **Remarks**

▲ **Examples**

VB

Copy

```
Public Sub Example()
    Dim SapModel As cSapModel
    Dim EtabsObject As cOAPI
    Dim ret As Integer = -1

    'create ETABS object
    Dim myHelper as cHelper = New Helper
    EtabsObject = myHelper.CreateObjectProgID("CSI.ETABS.API.ETABSObject")

    'start ETABS application
    ret = EtabsObject.ApplicationStart()

    'create SapModel object
    SapModel = EtabsObject.SapModel

    'initialize model
    ret = SapModel.InitializeNewModel()

    'create steel deck template model
    ret = SapModel.File.NewSteelDeck(4, 12, 12, 4, 4, 24, 24)

    'define new grid system
    ret = SapModel.GridSys.SetGridSys("GridSysA", 1000, 1000, 0, 0, 0, 0)

    'get grid system transformation matrix
    ReDim Value(8)
    ret = SapModel.GridSys.GetTransformationMatrix("GridSysA", Value)

    'close ETABS
    EtabsObject.ApplicationExit(False)

    'clean up variables
    SapModel = Nothing
    EtabsObject = Nothing

End Sub
```

CSI API ETABS v1

cGridSysAddLanguageSpecificTextSet("LST94730656_0") Method

Adds a new grid system, or modifies an existing grid system.

Namespace: [ETABSV1](#)

Assembly: [ETABSV1](#) (in ETABSV1.dll) Version: 1.0.0.0 (1.24.0.0)

▲ Syntax

[C#](#)

[VB](#)

[C++](#)

[F#](#)

[Copy](#)

```
int SetGridSys(
    string Name,
    double x,
    double y,
    double RZ
)
```

```
Function SetGridSys (
    Name As String,
    x As Double,
    y As Double,
    RZ As Double
) As Integer
```

```
Dim instance As cGridSys
Dim Name As String
Dim x As Double
Dim y As Double
Dim RZ As Double
Dim returnValue As Integer
```

```
returnValue = instance.SetGridSys(Name,
    x, y, RZ)
```

```
int SetGridSys(
    String^ Name,
    double x,
    double y,
    double RZ
)
```

```
abstract SetGridSys :
    Name : string *
    x : float *
    y : float *
    RZ : float -> int
```

Parameters

Name

Type:Â SystemString

This is the name of a grid system. If this is the name of an existing grid system, that grid system is modified, otherwise a new grid system is added.

x

Type:Â SystemDouble

The global X grid of the origin of the grid system. [L]

y

Type:Â SystemDouble

The global Y grid of the origin of the grid system. [L]

RZ

Type:Â SystemDouble

The rotation of an axis of the new grid system relative to the global grid system is defined as follows: (1) Rotate the grid system about the positive global Z-axis as defined by the RZ item. [deg]

Return ValueType:Â Int32

Returns zero if the grid system is successfully added or modified, otherwise it returns a nonzero value.

▲Remarks

Modifying the Global grid system will fail and return an error.

▲Examples

VB

Copy

```
Public Sub Example()
    Dim SapModel As cSapModel
    Dim EtabsObject As cOAPI
    Dim ret As Integer = -1

    'create ETABS object
    Dim myHelper as cHelper = New Helper
    EtabsObject = myHelper.CreateObjectProgID("CSI.ETABS.API.ETABSObject")

    'start ETABS application
    ret = EtabsObject.ApplicationStart()

    'create SapModel object

CSI API ETABS v1

cGroup Interface

Namespace: [ETABSv1](#)

Assembly: [ETABSv1](#) (in ETABSv1.dll) Version: 1.0.0.0 (1.24.0.0)

▲ Syntax

[C#](#)

[VB](#)

[C++](#)

[F#](#)

[Copy](#)

```
public interface cGroup
```

```
Public Interface cGroup
```

```
Dim instance As cGroup
```

```
public interface class cGroup
```

```
type cGroup = interface end
```

The cGroup type exposes the following members.

▲ Methods

▲	Name	Description
⇒	Count	Retrieves the number of defined groups.
⇒	Delete	Deletes the specified group.
⇒	GetAssignments	Retrieves the assignments to a specified group
⇒	GetGroup	Retrieves the group data.
⇒	GetGroup_1	Retrieves the group data. Primarily for ETABS
⇒	GetNameList	
⇒	SetGroup	Sets the group data.
⇒	SetGroup_1	Sets the group data. Primarily for ETABS

CSI API ETABS v1

cGroup Methods

The cGroup type exposes the following members.

Methods

⌵	Name	Description
⇒	<u>Count</u>	Retrieves the number of defined groups.
⇒	<u>Delete</u>	Deletes the specified group.
⇒	<u>GetAssignments</u>	Retrieves the assignments to a specified group
⇒	<u>GetGroup</u>	Retrieves the group data.
⇒	<u>GetGroup_1</u>	Retrieves the group data. Primarily for ETABS
⇒	<u>GetNameList</u>	
⇒	<u>SetGroup</u>	Sets the group data.
⇒	<u>SetGroup_1</u>	Sets the group data. Primarily for ETABS

CSI API ETABS v1

cGroupAddLanguageSpecificTextSet("LST20FF6263_0 Method

Retrieves the number of defined groups.

Namespace: ETABSv1

Assembly: ETABSv1 (in ETABSv1.dll) Version: 1.0.0.0 (1.24.0.0)

▲ Syntax

C#

VB

C++

F#

Copy

```
int Count()
```

Function Count As Integer

```
Dim instance As cGroup
```

```
Dim returnValue As Integer
```

```
returnValue = instance.Count()
```

```
int Count()
```

```
abstract Count : unit -> int
```

Return Value

Type: Int32

Returns the number of defined groups.

▲ Remarks

▲ Examples

VB

Copy

```
Public Sub Example()
    Dim SapModel As cSapModel
    Dim EtabsObject As cOAPI
    Dim ret As Integer = -1
    Dim Count as Integer

    'create ETABS object
    Dim myHelper as cHelper = New Helper
    EtabsObject = myHelper.CreateObjectProgID("CSI.ETABS.API.ETABSObject")

    'start ETABS application
    ret = EtabsObject.ApplicationStart()

    'create SapModel object
    SapModel = EtabsObject.SapModel

    'initialize model
    ret = SapModel.InitializeNewModel()
```

Introduction

```
'create steel deck template model
  ret = SapModel.File.NewSteelDeck(4,12,12,4,4,24,24)

'return number of defined groups
  Count = SapModel.GroupDef.Count

'close ETABS
  EtabsObject.ApplicationExit(False)

'clean up variables
  SapModel = Nothing
  EtabsObject = Nothing
End Sub
```

CSI API ETABS v1

cGroupAddLanguageSpecificTextSet("LST13790709_0") Method

Deletes the specified group.

Namespace: [ETABSv1](#)

Assembly: [ETABSv1](#) (in ETABSv1.dll) Version: 1.0.0.0 (1.24.0.0)

▲ Syntax

[C#](#)

[VB](#)

[C++](#)

[F#](#)

[Copy](#)

```
int Delete(
    string Name
)
```

```
Function Delete (
    Name As String
) As Integer
```

```
Dim instance As cGroup
Dim Name As String
Dim returnValue As Integer
```

```
returnValue = instance.Delete(Name)
```

```
int Delete(
    String^ Name
)
```

```
abstract Delete :
    Name : string -> int
```

Parameters

Name

Type: [SystemString](#)

The name of an existing group.

Return Value

Type: [Int32](#)

Returns zero if the group is successfully deleted, otherwise it returns a nonzero value.

▲ Remarks

An error will be returned if an attempt is made to delete the Group named "ALL".

▲ Examples

VB

[Copy](#)

```
Public Sub Example()
```

CSI API ETABS v1

cGroupAddLanguageSpecificTextSet("LSTED40DAEE_0") Method

Retrieves the assignments to a specified group

Namespace: [ETABSv1](#)

Assembly: [ETABSv1](#) (in ETABSv1.dll) Version: 1.0.0.0 (1.24.0.0)

Syntax

[C#](#)

[VB](#)

[C++](#)

[F#](#)

[Copy](#)

```
int GetAssignments(
    string Name,
    ref int NumberItems,
    ref int[] ObjectType,
    ref string[] ObjectName
)
```

```
Function GetAssignments (
    Name As String,
    ByRef NumberItems As Integer,
    ByRef ObjectType As Integer(),
    ByRef ObjectName As String()
) As Integer
```

```
Dim instance As cGroup
Dim Name As String
Dim NumberItems As Integer
Dim ObjectType As Integer()
Dim ObjectName As String()
Dim returnValue As Integer
```

```
returnValue = instance.GetAssignments(Name,
    NumberItems, ObjectType, ObjectName)
```

```
int GetAssignments(
    String^ Name,
    int% NumberItems,
    array<int>^% ObjectType,
    array<String>^% ObjectName
)
```

```
abstract GetAssignments :
    Name : string *
    NumberItems : int byref *
    ObjectType : int[] byref *
    ObjectName : string[] byref -> int
```

Parameters

Name

Type:Â SystemString

The name of an existing group

NumberItems

Type:Â SystemInt32

The number of assignments made to the specified group

ObjectType

Type:Â SystemInt32

This is an array that includes the object type of each item in the group.

1. Point object
2. Frame object
3. Cable object
4. Tendon object
5. Area object
6. Solid object
7. Link object

ObjectName

Type:Â SystemString

This is an array that includes the name of each item in the group

Return ValueType:Â Int32

Returns zero if the group assignment is successfully retrieved, otherwise it returns a nonzero value

▲ Remarks

▲ Examples

VB

Copy

```
Public Sub Example()
    Dim SapModel As cSapModel
    Dim EtabsObject As cOAPI
    Dim ret As Integer = -1
    Dim NumberItems As Integer
    Dim ObjectType() As Integer
    Dim ObjectName() As String

    'create ETABS object

    SpecifiedForMassAndWeight : bool byref -> int
```

Parameters

Name

Type:Â SystemString

This is the name of an existing group.

Color

Type:Â SystemInt32

SpecifiedForSelection

Type:Â SystemBoolean

This item is True if the group is specified to be used for selection; otherwise it is False.

SpecifiedForSectionCutDefinition

Type: SystemBoolean

This item is True if the group is specified to be used for defining section cuts; otherwise it is False.

SpecifiedForSteelDesign

Type: SystemBoolean

This item is True if the group is specified to be used for defining steel frame design groups; otherwise it is False.

SpecifiedForConcreteDesign

Type: SystemBoolean

This item is True if the group is specified to be used for defining concrete frame design groups; otherwise it is False.

SpecifiedForAluminumDesign

Type: SystemBoolean

This item is True if the group is specified to be used for defining aluminum frame design groups; otherwise it is False.

SpecifiedForColdFormedDesign

Type: SystemBoolean

This item is True if the group is specified to be used for defining cold formed frame design groups; otherwise it is False.

SpecifiedForStaticNLActiveStage

Type: SystemBoolean

This item is True if the group is specified to be used for defining stages for nonlinear static analysis; otherwise it is False.

SpecifiedForBridgeResponseOutput

Type: SystemBoolean

This item is True if the group is specified to be used for reporting bridge response output; otherwise it is False.

SpecifiedForAutoSeismicOutput

Type: SystemBoolean

This item is True if the group is specified to be used for reporting auto seismic loads; otherwise it is False.

SpecifiedForAutoWindOutput

Type: SystemBoolean

This item is True if the group is specified to be used for reporting auto wind loads; otherwise it is False.

SpecifiedForMassAndWeight

Type: SystemBoolean

This item is True if the group is specified to be used for reporting group masses and weight; otherwise it is False.

Return Value

Type: Int32

Returns zero if the group data is successfully set; otherwise it returns a nonzero value.

▲ Remarks

Items SpecifiedForAluminumDesign, SpecifiedForColdFormedDesignSpecifiedForBridgeResponseOutput are not supported in ETABS.

▲ Examples

VB

Copy

```

Parameters

Name

Parameters

Type:Â SystemString

This is the name of an existing group.

color

Type:Â SystemInt32

The display color for the group specified as a Integer.

SpecifiedForSelection

Type:Â SystemBoolean

This item is True if the group is specified to be used for selection; otherwise it is False.

SpecifiedForSectionCutDefinition

Type:Â SystemBoolean

This item is True if the group is specified to be used for defining section cuts; otherwise it is False.

SpecifiedForSteelDesign

Type:Â SystemBoolean

This item is True if the group is specified to be used for defining steel frame design groups; otherwise it is False.

SpecifiedForConcreteDesign

Type:Â SystemBoolean

This item is True if the group is specified to be used for defining concrete frame design groups; otherwise it is False.

SpecifiedForAluminumDesign

Type:Â SystemBoolean

This item is True if the group is specified to be used for defining aluminum frame design groups; otherwise it is False.

SpecifiedForStaticNLActiveStage

Type:Â SystemBoolean

This item is True if the group is specified to be used for defining stages for nonlinear static analysis; otherwise it is False.

SpecifiedForAutoSeismicOutput

Type:Â SystemBoolean

This item is True if the group is specified to be used for reporting auto seismic loads; otherwise it is False.

SpecifiedForAutoWindOutput

Type:Â SystemBoolean

This item is True if the group is specified to be used for reporting auto wind loads; otherwise it is False.

SpecifiedForMassAndWeight

Type:Â SystemBoolean

This item is True if the group is specified to be used for reporting group masses and weight; otherwise it is False.

SpecifiedForSteelJoistDesign

Type:Â SystemBoolean

This item is True if the group is specified to be used for defining steel joist design groups; otherwise it is False.

SpecifiedForWallDesign

Type:Â SystemBoolean

This item is True if the group is specified to be used for defining wall design groups; otherwise it is False.

SpecifiedForBasePlateDesign

Type: SystemBoolean

This item is True if the group is specified to be used for defining base plate design groups; otherwise it is False.

SpecifiedForConnectionDesign

Type: SystemBoolean

This item is True if the group is specified to be used for defining connection design groups; otherwise it is False.

Return Value

Type: Int32

Returns zero if the group data is successfully set; otherwise it returns a nonzero value.

*)
-> int
```

Parameters**Name**Type:Â SystemString

This is the name of a group. If this is the name of an existing group, that group is modified, otherwise a new group is added.

Color (Optional)Type:Â SystemInt32**SpecifiedForSelection (Optional)**Type:Â SystemBoolean

This item is True if the group is specified to be used for selection; otherwise it is False.

SpecifiedForSectionCutDefinition (Optional)Type:Â SystemBoolean

This item is True if the group is specified to be used for defining section cuts; otherwise it is False.

SpecifiedForSteelDesign (Optional)Type:Â SystemBoolean

This item is True if the group is specified to be used for defining steel frame design groups; otherwise it is False.

SpecifiedForConcreteDesign (Optional)Type:Â SystemBoolean

This item is True if the group is specified to be used for defining concrete frame design groups; otherwise it is False.

SpecifiedForAluminumDesign (Optional)Type:Â SystemBoolean

This item is True if the group is specified to be used for defining aluminum frame design groups; otherwise it is False.

SpecifiedForColdFormedDesign (Optional)Type:Â SystemBoolean

This item is True if the group is specified to be used for defining cold formed frame design groups; otherwise it is False.

SpecifiedForStaticNLActiveStage (Optional)Type:Â SystemBoolean

This item is True if the group is specified to be used for defining stages for nonlinear static analysis; otherwise it is False.

SpecifiedForBridgeResponseOutput (Optional)Type:Â SystemBoolean

This item is True if the group is specified to be used for reporting bridge response output; otherwise it is False.

SpecifiedForAutoSeismicOutput (Optional)Type:Â SystemBoolean

This item is True if the group is specified to be used for reporting auto seismic loads; otherwise it is False.

SpecifiedForAutoWindOutput (Optional)Type:Â SystemBoolean

This item is True if the group is specified to be used for reporting auto wind loads; otherwise it is False.

SpecifiedForMassAndWeight (Optional)Type:Â SystemBoolean

This item is True if the group is specified to be used for reporting group masses

and weight; otherwise it is False.

Return Value

Type: Int32

Returns zero if the group data is successfully set; otherwise it returns a nonzero value.

Remarks

Items SpecifiedForAluminumDesign, SpecifiedForColdFormedDesignSpecifiedForBridgeResponseOutput are not supported in ETABS.

Examples

VB

Copy

```
Public Sub Example()
    Dim SapModel As cSapModel
    Dim EtabsObject As cOAPI
    Dim ret As Integer = -1

    'create ETABS object
    Dim myHelper as cHelper = New Helper
    EtabsObject = myHelper.CreateObjectProgID("CSI.ETABS.API.ETABSObject")

    'start ETABS application
    ret = EtabsObject.ApplicationStart()

    'create SapModel object
    SapModel = EtabsObject.SapModel

    'initialize model
    ret = SapModel.InitializeNewModel()

    'create steel deck template model
    ret = SapModel.File.NewSteelDeck(4,12,12,4,4,24,24)

    'define new group
    ret = SapModel.GroupDef.SetGroup("Group1")

    'close ETABS
    EtabsObject.ApplicationExit(False)

    'clean up variables
    SapModel = Nothing
    EtabsObject = Nothing
End Sub
```

let _SpecifiedForBasePlateDesign = defaultArg SpecifiedForBasePlateDesign true
let _SpecifiedForConnectionDesign = defaultArg SpecifiedForConnectionDesign true
*)
-> int
```

Parameters

Name

Type:Â SystemString

This is the name of a group. If this is the name of an existing group, that group is modified, otherwise a new group is added.

color (Optional)

Type:Â SystemInt32

The display color for the group specified as a Integer. If this value is input as â 1, the program automatically selects a display color for the group.

SpecifiedForSelection (Optional)

Type:Â SystemBoolean

This item is True if the group is specified to be used for selection; otherwise it is False.

SpecifiedForSectionCutDefinition (Optional)

Type:Â SystemBoolean

This item is True if the group is specified to be used for defining section cuts; otherwise it is False.

SpecifiedForSteelDesign (Optional)

Type:Â SystemBoolean

This item is True if the group is specified to be used for defining steel frame design groups; otherwise it is False.

SpecifiedForConcreteDesign (Optional)

Type:Â SystemBoolean

This item is True if the group is specified to be used for defining concrete frame design groups; otherwise it is False.

SpecifiedForAluminumDesign (Optional)

Type:Â SystemBoolean

This item is True if the group is specified to be used for defining aluminum frame design groups; otherwise it is False.

SpecifiedForStaticNLActiveStage (Optional)

Type:Â SystemBoolean

This item is True if the group is specified to be used for defining stages for nonlinear static analysis; otherwise it is False.

SpecifiedForAutoSeismicOutput (Optional)

Type:Â SystemBoolean

This item is True if the group is specified to be used for reporting auto seismic loads; otherwise it is False.

SpecifiedForAutoWindOutput (Optional)

Type:Â SystemBoolean

This item is True if the group is specified to be used for reporting auto wind

loads; otherwise it is False.

SpecifiedForMassAndWeight (Optional)

Type:Â SystemBoolean

This item is True if the group is specified to be used for reporting group masses and weight; otherwise it is False.

SpecifiedForSteelJoistDesign (Optional)

Type:Â SystemBoolean

This item is True if the group is specified to be used for defining steel joist design groups; otherwise it is False.

SpecifiedForWallDesign (Optional)

Type:Â SystemBoolean

This item is True if the group is specified to be used for defining wall design groups; otherwise it is False.

SpecifiedForBasePlateDesign (Optional)

Type:Â SystemBoolean

This item is True if the group is specified to be used for defining base plate design groups; otherwise it is False.

SpecifiedForConnectionDesign (Optional)

Type:Â SystemBoolean

This item is True if the group is specified to be used for defining connection design groups; otherwise it is False.

Return Value

Type:Â Int32

Returns zero if the group data is successfully set; otherwise it returns a nonzero value.

▲ Remarks

▲ Examples

VB

Copy

```
Public Sub Example()
    Dim SapModel As cSapModel

CSI API ETABS v1

cHelper Interface

Namespace: ETABSV1

Assembly: ETABSV1 (in ETABSV1.dll) Version: 1.0.0.0 (1.24.0.0)

Syntax

C#

VB

C++

F#

Copy

```
public interface cHelper
```

```
Public Interface cHelper
```

```
Dim instance As cHelper
```

```
public interface class cHelper
```

```
type cHelper = interface end
```

The cHelper type exposes the following members.

Methods

<u>Name</u>	<u>Description</u>
<u>CreateObject</u>	Starts the program at the given path.
<u>CreateObjectHost</u>	Starts the program at the given path on a given computer using the default TCP port.
<u>CreateObjectHostPort</u>	Starts the program at the given path on a given computer using the given TCP port.
<u>CreateObjectProgID</u>	Starts the program and returns the API object for the given program ID.
<u>CreateObjectProgIDHost</u>	Starts the program and returns the API object for the given program ID on a given computer using the default TCP port.
<u>CreateObjectProgIDHostPort</u>	Starts the program and returns the API object for the given program ID on a given computer using the given TCP port.
<u>GetOAPIVersionNumber</u>	Retrieves the API version.
<u>GetObject</u>	Attaches to the active running instance of the program.
<u>GetObjectHost</u>	Attaches to the active running instance of the program on a given computer using the default TCP port.
<u>GetObjectHostPort</u>	Attaches to the active running instance of the program on a given computer using the given TCP

port.

Attaches to the running instance of the program with the given process id.

CSI API ETABS v1

cHelperAddLanguageSpecificTextSet("LST1CE1B393_0") Method

Starts the program at the given path on a given computer using the default TCP port.

Namespace: ETABSv1

Assembly: ETABSv1 (in ETABSv1.dll) Version: 1.0.0.0 (1.24.0.0)

Syntax

C#

VB

C++

F#

Copy

```
c0API CreateObjectHost(
    string hostName,
    string fullPath
)
```

```
Function CreateObjectHost (
    hostName As String,
    fullPath As String
) As c0API
```

```
Dim instance As cHelper
Dim hostName As String
Dim fullPath As String
Dim returnValue As c0API
```

```
returnValue = instance.CreateObjectHost(hostName,
    fullPath)
```

```
c0API^ CreateObjectHost(
    String^ hostName,
    String^ fullPath
)
```

```
abstract CreateObjectHost :
    hostName : string *
    fullPath : string -> c0API
```

Parameters

hostName

Type: SystemString

The host computer name.

fullPath

Type: SystemString

The full path to the program executable on the host computer.

Return Value

Type: cOAPI

An instance of cOAPI if successful, nothing otherwise.

▲ **Remarks**

CSiAPIService.exe must be running on the host computer and listening to the default TCP port for the call to succeed.

The default TCP port can be overridden by setting the environment variable ETABSv1_cOAPI_DEFAULT_PORT on both the Main and the Host computers.

▲ **Examples**

VB

Copy

```
Public Sub Example()
    Dim myHelper As cHelper
    Dim SapModel As cSapModel
    Dim EtabsObject As cOAPI
    Dim ret As Integer = -1

    'create ETABS object
    myHelper = New Helper
    EtabsObject = myHelper.CreateObjectHost("RemoteServer", "C:\Program Files\Computers and Structures\ETABS\ETABSv1\cOAPI\cOAPI.dll")

    'start ETABS application
    ret = EtabsObject.ApplicationStart()

    'create SapModel object
    SapModel = EtabsObject.SapModel

    'initialize model
    ret = SapModel.InitializeNewModel()

    'close ETABS
    EtabsObject.ApplicationExit(False)

    'clean up variables
    SapModel = Nothing
    EtabsObject = Nothing
    myHelper = Nothing
End Sub
```

```

Parameters

hostName

Type: [SystemString](#)

The host computer name.

portNumber

Type: SystemInt32

The TCP port to connect to the host computer.

fullPath

Type: SystemString

The full path to the program executable on the host computer.

Return Value

Type: cOAPI

An instance of cOAPI if successful, nothing otherwise.

Remarks

CSiAPIService.exe must be running on the host computer and listening to the given TCP port for the call to succeed.

Examples

VB

Copy

```
Public Sub Example()  
    Dim myHelper As cHelper  
    Dim SapModel As cSapModel  
    Dim EtabsObject As cOAPI  
    Dim ret As Integer = -1  
  
    'create ETABS object  
    myHelper = New Helper  
    EtabsObject = myHelper.CreateObjectHostPort("RemoteServer", 8500, "C:\Program Files\Computers  
  
    'start ETABS application  
    ret = EtabsObject.ApplicationStart()  
  
    'create SapModel object  
    SapModel = EtabsObject.SapModel  
  
    'initialize model  
    ret = SapModel.InitializeNewModel()  
  
    'close ETABS  
    EtabsObject.ApplicationExit(False)  
  
    'clean up variables  
    SapModel = Nothing  
    EtabsObject = Nothing  
    myHelper = Nothing  
End Sub
```

CSI API ETABS v1

cHelperAddLanguageSpecificTextSet("LST85084D8D_0") Method

Starts the program and returns the API object for the given program ID.

Namespace: ETABSv1

Assembly: ETABSv1 (in ETABSv1.dll) Version: 1.0.0.0 (1.24.0.0)

■ Syntax

C#

VB

C++

F#

Copy

```
cOAPI CreateObjectProgID(
    string progID
)
```

```
Function CreateObjectProgID (
    progID As String
) As cOAPI
```

```
Dim instance As cHelper
Dim progID As String
Dim returnValue As cOAPI
```

```
returnValue = instance.CreateObjectProgID(progID)
```

```
cOAPI^ CreateObjectProgID(
    String^ progID
)
```

```
abstract CreateObjectProgID :
    progID : string -> cOAPI
```

Parameters

progID

Type: SystemString

The program ID of the API object.

Return Value

Type: cOAPI

An instance of cOAPI if successful, nothing otherwise.

■ Remarks

Searches the registry for the newest version unless overridden with an environment variable containing the full path of the API object's assembly. The overriding environment variable is found by replacing the "."s with "_" in the program id and appending "_PATH". e.g. the environment variable of "CSI.ETABS.API.ETABSObject" is "CSI_ETABS_API_ETABSObject_PATH".

cHelperspan id="LST85084D8D_0"AddLanguageSpecificTextSet("LST85084D8D_0?cpp=::|nu23);CreateO

Examples

VB

Copy

```
Public Sub Example()
    Dim myHelper As cHelper
    Dim SapModel As cSapModel
    Dim EtabsObject As cOAPI
    Dim ret As Integer = -1

    'create ETABS object
    myHelper = New Helper
    EtabsObject = myHelper.CreateObjectProgID("CSI.ETABS.API.ETABSObject")

    'start ETABS application
    ret = EtabsObject.ApplicationStart()

    'create SapModel object
    SapModel = EtabsObject.SapModel

    'initialize model
    ret = SapModel.InitializeNewModel()

    'close ETABS
    EtabsObject.ApplicationExit(False)

    'clean up variables
    SapModel = Nothing
    EtabsObject = Nothing
    myHelper = Nothing
End Sub
```

CSI API ETABS v1

cHelperAddLanguageSpecificTextSet("LST309572A_0? Method

Retrieves the API version.

Namespace: ETABSv1

Assembly: ETABSv1 (in ETABSv1.dll) Version: 1.0.0.0 (1.24.0.0)

▲ Syntax

C#

VB

C++

F#

Copy

```
double GetOAPIVersionNumber()
```

```
Function GetOAPIVersionNumber As Double
```

```
Dim instance As cHelper
```

```
Dim returnValue As Double
```

```
returnValue = instance.GetOAPIVersionNumber()
```

```
double GetOAPIVersionNumber()
```

```
abstract GetOAPIVersionNumber : unit -> float
```

Return Value

Type: Double

The API version.

▲ Remarks

The returned API version can be compared to GetOAPIVersionNumber to determine compatibility with the program.

▲ Examples

VB

Copy

```
Public Sub Example()
    Dim myHelper As cHelper
    Dim EtabsObject As cOAPI
    Dim clientAPIVersion As Double
    Dim programAPIVersion As Double
    Dim ret As Integer = -1

    'create ETABS object
    myHelper = New Helper
    EtabsObject = myHelper.CreateObjectProgID("CSI.ETABS.API.ETABSObject")

    'start ETABS application
    ret = EtabsObject.ApplicationStart()
```

Introduction

```
'get client API version
clientAPIVersion = myHelper.GetOAPIVersionNumber()

'get program API version
programAPIVersion = EtabsObject.GetOAPIVersionNumber()

'API compatibility check
If clientAPIVersion > programAPIVersion Then
    'API client uses a newer version of the API than the program.
    'All API functionality may be not be available.
    Exit Sub
End If

'close ETABS
EtabsObject.ApplicationExit(False)

'clean up variables
EtabsObject = Nothing
myHelper = Nothing
End Sub
```

CSI API ETABS v1

cHelperAddLanguageSpecificTextSet("LST4BD09954_0") Method

Attaches to the active running instance of the program on a given computer using the default TCP port.

Namespace: $\hat{A}$ ETABSV1

Assembly: $\hat{A}$ ETABSV1 (in ETABSV1.dll) Version: 1.0.0.0 (1.24.0.0)

■ Syntax

C#

VB

C++

F#

Copy

```
cOAPI GetObjectHost(
    string hostName,
    string progID
)
```

```
Function GetObjectHost (
    hostName As String,
    progID As String
) As cOAPI
```

```
Dim instance As cHelper
Dim hostName As String
Dim progID As String
Dim returnValue As cOAPI
```

```
returnValue = instance.GetObjectHost(hostName,
    progID)
```

```
cOAPI^ GetObjectHost(
    String^ hostName,
    String^ progID
)
```

```
abstract GetObjectHost :
    hostName : string *
    progID : string -> cOAPI
```

Parameters

hostName

Type: $\hat{A}$ SystemString

The host computer name.

progID

Type: $\hat{A}$ SystemString

The program ID of the API object.

Return Value

Type: cOAPI

An instance of cOAPI if successful, nothing otherwise.

▲ **Remarks**

CSiAPIService.exe must be running on the host computer and listening to the default TCP port for the call to succeed.

The default TCP port can be overridden by setting the environment variable ETABSv1_cOAPI_DEFAULT_PORT on both the Main and the Host computers.

▲ **Examples**

VB

Copy

```
Public Sub Example()
    Dim myHelper As cHelper
    Dim SapModel As cSapModel
    Dim EtabsObject As cOAPI
    Dim ret As Integer = -1

    'create ETABS object
    myHelper = New Helper
    EtabsObject = myHelper.GetObjectHost("RemoteServer", "CSI.ETABS.API.ETABSObject")

    'create SapModel object
    SapModel = EtabsObject.SapModel

    'initialize model
    ret = SapModel.InitializeNewModel()

    'close ETABS
    EtabsObject.ApplicationExit(False)

    'clean up variables
    SapModel = Nothing
    EtabsObject = Nothing
    myHelper = Nothing
End Sub
```

Dim pid As Integer
Dim returnValue As c0API
```

```
returnValue = instance.GetObjectProcess(typeName,
    pid)
```

```
c0API^ GetObjectProcess(
    String^ typeName,
    int pid
)
```

```
abstract GetObjectProcess :
    typeName : string *
    pid : int -> c0API
```

Parameters

typeName

Type: [SystemString](#)

The program ID of the API object.

pid

Type: [SystemInt32](#)

The system-generated unique identifier (process ID) of the desired instance of the program as shown in Windows Task Manager and/or under [Tools](#) menu.

Return Value

Type: cOAPI

An instance of cOAPI if successful, nothing otherwise.

▲ Remarks

▲ Examples

VB

Copy

```
Public Sub Example()
    Dim myHelper As cHelper

CSI API ETABS v1

cLinkObj Interface

Namespace: ETABSV1

Assembly: ETABSV1 (in ETABSV1.dll) Version: 1.0.0.0 (1.24.0.0)

▲ Syntax

C#

VB

C++

F#

Copy

```
public interface cLinkObj
```

```
Public Interface cLinkObj
```

```
Dim instance As cLinkObj
```

```
public interface class cLinkObj
```

```
type cLinkObj = interface end
```

The cLinkObj type exposes the following members.

▲ Methods

<u>Â</u>	Name	Description
➤	<u>AddByCoord</u>	Adds a new link object whose end points are at the specified coordinates.
➤	<u>AddByPoint</u>	Adds a new link object whose end points are specified by name.
➤	<u>ChangeName</u>	Assigns a new name to an link object.
➤	<u>Count</u>	Retrieves the count of the link objects in the model.
➤	<u>Delete</u>	Deletes link objects.
➤	<u>GetElm</u>	Retrieves the name of the link element (analysis model link) associated with a specified link object in the object-based model.
➤	<u>GetGroupAssign</u>	Retrieves the groups to which a link object is assigned.
➤	<u>GetGUID</u>	Retrieves the GUID for the specified link object.
➤	<u>GetLocalAxes</u>	Retrieves the local axis angle assignment for link objects.
➤	<u>GetLocalAxesAdvanced</u>	Retrieves advanced local axes assignment for link objects.
➤	<u>GetNameList</u>	Retrieves the names of all defined link objects.
➤	<u>GetNameListOnStory</u>	Retrieves the names of the defined link objects on a given story.
➤	<u>GetPoints</u>	Retrieves the names of the point objects at each end of a specified link object. If names of the two point objects

are the same, the specified link object is a one-joint link object.

- ⇒ [GetProperty](#) Retrieves the link property assigned to a link object.
- ⇒ [GetSelected](#) Retrieves the selected status for a link object.
- ⇒ [GetTransformationMatrix](#) Retrieves the transformation matrix for a link object.
- ⇒ [SetGroupAssign](#) Adds/removes link objects to/from a specified group.
- ⇒ [SetGUID](#) Sets the GUID for the specified link object. If the GUID is passed in as a blank string, the program automatically creates a GUID for the object.
- ⇒ [SetLocalAxes](#) Assigns a local axis angle to link objects.
- ⇒ [SetLocalAxesAdvanced](#) Assigns advanced local axes to link objects
- ⇒ [SetProperty](#) Assigns a link property to link objects.
- ⇒ [SetSelected](#) Sets the selected status for link objects.

    ZJ As Double,
    ByRef Name As String,
    IsSingleJoint As Boolean = false,
    PropName As String = "Default",
    UserName As String = "",
    CSys As String = "Global"
) As Integer
```

```
Dim instance As cLinkObj
Dim XI As Double
Dim YI As Double
Dim ZI As Double
Dim XJ As Double
Dim YJ As Double
Dim ZJ As Double
Dim Name As String
Dim IsSingleJoint As Boolean
Dim PropName As String
Dim UserName As String
Dim CSys As String
Dim returnValue As Integer
```

cLinkObjid="LST30D8DEA0_0"AddLanguageSpecificTextSet("LST30D8DEA0_0?cpp=::|2372);AddBy

```
returnValue = instance.AddByCoord(XI,
YI, ZI, XJ, YJ, ZJ, Name, IsSingleJoint,
PropName, UserName, CSys)
```

```
int AddByCoord(
double XI,
double YI,
double ZI,
double XJ,
double YJ,
double ZJ,
String^% Name,
bool IsSingleJoint = false,
String^ PropName = L"Default",
String^ UserName = L"",
String^ CSys = L"Global"
)
```

```
abstract AddByCoord :
    XI : float *
    YI : float *
    ZI : float *
    XJ : float *
    YJ : float *
    ZJ : float *
    Name : string byref *
    ?IsSingleJoint : bool *
    ?PropName : string *
    ?UserName : string *
    ?CSys : string
(* Defaults:
    let _IsSingleJoint = defaultArg IsSingleJoint false
    let _PropName = defaultArg PropName "Default"
    let _UserName = defaultArg UserName ""
    let _CSys = defaultArg CSys "Global"
*)
-> int
```

Parameters

XI

Type:Â SystemDouble

The X coordinate of the I-End of the added link object in the coordinate system defined by the CSys item.

YI

Type:Â SystemDouble

The Y coordinate of the I-End of the added link object in the coordinate system defined by the CSys item.

ZI

Type:Â SystemDouble

The Z coordinate of the I-End of the added link object in the coordinate system defined by the CSys item.

XJ

Type:Â SystemDouble

The X coordinate of the J-End of the added link object in the coordinate system defined by the CSys item.

YJ

Type:Â SystemDouble

The Y coordinate of the J-End of the added link object in the coordinate system defined by the CSys item.

ZJ

Type:Â SystemDouble

The Z coordinate of the J-End of the added link object in the coordinate system defined by the CSys item.

Name

Type:Â SystemString

This is the name that the program ultimately assigns for the link object. If no UserName is specified, the program assigns a default name to the link object. If a UserName is specified and that name is not used for another link object, the UserName is assigned to the link object; otherwise a default name is assigned to the link object.

IsSingleJoint (Optional)

Type:Â SystemBoolean

This item is True if a one-joint link is added and False if a two-joint link is added.

PropName (Optional)

Type:Â SystemString

This is either Default or the name of a defined link property.

If it is Default the program assigns a default link property to the link object. If it is the name of a defined link property, that property is assigned to the link object

UserName (Optional)

Type:Â SystemString

CSys (Optional)

Type:Â SystemString

The name of the coordinate system in which the link object end point coordinates are defined.

Return Value

Type:Â Int32

Returns zero if the link object is successfully added; otherwise it returns a nonzero value.

▲Remarks

One-joint links are not supported in ETABS.

▲Examples

VB

Copy

```
Public Sub Example()
    Dim SapModel As cSapModel
    Dim EtabsObject As cOAPI
    Dim ret As Integer = -1
    Dim Name1 As String
    Dim Name2 As String

    'create ETABS object
    Dim myHelper as cHelper = New Helper
    EtabsObject = myHelper.CreateObjectProgID("CSI.ETABS.API.ETABSObject")
```

Return Value

Introduction

```
'start ETABS application
    ret = EtabsObject.ApplicationStart()

'create SapModel object
    SapModel = EtabsObject.SapModel

'initialize model
    ret = SapModel.InitializeNewModel()

'create steel deck template model
    ret = SapModel.File.NewSteelDeck(4,12,12,4,4,24,24)

'add link object by coordinates
    ret = SapModel.LinkObj.AddByCoord(-288, 0, 288, 0, 0, 0, Name1, True)
    ret = SapModel.LinkObj.AddByCoord(-288, 0, 0, 0, 0, 144, Name2)

'refresh view
    ret = SapModel.View.RefreshView

'close ETABS
    EtabsObject.ApplicationExit(False)

'clean up variables
    SapModel = Nothing
    EtabsObject = Nothing
End Sub
```

CSI API ETABS v1

cLinkObjAddLanguageSpecificTextSet("LST58F760AD_0") Method

Adds a new link object whose end points are specified by name.

Namespace: ETABSV1

Assembly: ETABSV1 (in ETABSV1.dll) Version: 1.0.0.0 (1.24.0.0)

Syntax

C#

VB

C++

F#

Copy

```
int AddByPoint(
    string Point1,
    string Point2,
    ref string Name,
    bool IsSingleJoint = false,
    string PropName = "Default",
    string UserName = ""
)
```

```
Function AddByPoint (
    Point1 As String,
    Point2 As String,
    ByRef Name As String,
    IsSingleJoint As Boolean = false,
    PropName As String = "Default",
    UserName As String = ""
) As Integer
```

```
Dim instance As cLinkObj
Dim Point1 As String
Dim Point2 As String
Dim Name As String
Dim IsSingleJoint As Boolean
Dim PropName As String
Dim UserName As String
Dim returnValue As Integer
```

```
returnValue = instance.AddByPoint(Point1,
    Point2, Name, IsSingleJoint, PropName,
    UserName)
```

```
int AddByPoint(
    String^ Point1,
    String^ Point2,
    String^% Name,
    bool IsSingleJoint = false,
    String^ PropName = L"Default",
    String^ UserName = L""
)
```

abstract AddByPoint :

cLinkObjid="LST58F760AD_0"AddLanguageSpecificTextSet("LST58F760AD_0?cpp=::|n2376AddByP

```

Point1 : string *
Point2 : string *
Name : string byref *
?IsSingleJoint : bool *
?PropName : string *
?UserName : string
(* Defaults:
    let _IsSingleJoint = defaultArg IsSingleJoint false
    let _PropName = defaultArg PropName "Default"
    let _UserName = defaultArg UserName ""
*)
-> int

```

Parameters

Point1

Type: SystemString

The name of a defined point object at the I-End of the added link object.

Point2

Type: SystemString

The name of a defined point object at the J-End of the added link object.

This item is ignored if the IsSingleJoint item is True.

Name

Type: SystemString

This is the name that the program ultimately assigns for the link object. If no UserName is specified, the program assigns a default name to the link object. If a UserName is specified and that name is not used for another link object, the UserName is assigned to the link object; otherwise a default name is assigned to the link object.

IsSingleJoint (Optional)

Type: SystemBoolean

This item is True if a one-joint link is added and False if a two-joint link is added.

PropName (Optional)

Type: SystemString

This is either Default or the name of a defined link property.

If it is Default the program assigns a default link property to the link object. If it is the name of a defined link property, that property is assigned to the link object

UserName (Optional)

Type: SystemString

Return Value

Type: Int32

Returns zero if the link object is successfully added; otherwise it returns a nonzero value.

Remarks

One-joint links are not supported in ETABS.

Examples

VB

Copy

```
Public Sub Example()
    Dim SapModel As cSapModel
    Dim EtabsObject As cOAPI
    Dim ret As Integer = -1
    Dim Name1 As String
    Dim Name2 As String

    'create ETABS object
    Dim myHelper as cHelper = New Helper
    EtabsObject = myHelper.CreateObjectProgID("CSI.ETABS.API.ETABSObject")

    'start ETABS application
    ret = EtabsObject.ApplicationStart()

    'create SapModel object
    SapModel = EtabsObject.SapModel

    'initialize model
    ret = SapModel.InitializeNewModel()

    'create steel deck template model
    ret = SapModel.File.NewSteelDeck(4,12,12,4,4,24,24)

    'add link object by points
    ret = SapModel.LinkObj.AddByPoint("2", "4", Name1)
    ret = SapModel.LinkObj.AddByPoint("1", "5", Name2)

    'refresh view
    ret = SapModel.View.RefreshView

    'close ETABS
    EtabsObject.ApplicationExit(False)

    'clean up variables
    SapModel = Nothing
    EtabsObject = Nothing
End Sub
```

CSI API ETABS v1

cLinkObjAddLanguageSpecificTextSet("LST2163EFFC_0") Method

Assigns a new name to an link object.

Namespace: ETABSv1

Assembly: ETABSv1 (in ETABSv1.dll) Version: 1.0.0.0 (1.24.0.0)

Syntax

C#

VB

C++

F#

Copy

```
int ChangeName(
    string Name,
    string NewName
)
```

```
Function ChangeName (
    Name As String,
    NewName As String
) As Integer
```

```
Dim instance As cLinkObj
Dim Name As String
Dim NewName As String
Dim returnValue As Integer
```

```
returnValue = instance.ChangeName(Name,
    NewName)
```

```
int ChangeName(
    String^ Name,
    String^ NewName
)
```

```
abstract ChangeName :
    Name : string *
    NewName : string -> int
```

Parameters

Name

Type: SystemString

The existing name of a defined link object.

NewName

Type: SystemString

The new name for the link object.

Return Value

Type: Int32

Returns zero if the new name is successfully assigned; otherwise it returns a nonzero value.

▀ **Remarks**

▀ **Examples**

VB

Copy

```
Public Sub Example()
    Dim SapModel As cSapModel
    Dim EtabsObject As cOAPI
    Dim ret As Integer = -1
    Dim Name As String

    'create ETABS object
    Dim myHelper as cHelper = New Helper
    EtabsObject = myHelper.CreateObjectProgID("CSI.ETABS.API.ETABSObject")

    'start ETABS application
    ret = EtabsObject.ApplicationStart()

    'create SapModel object
    SapModel = EtabsObject.SapModel

    'initialize model
    ret = SapModel.InitializeNewModel()

    'create steel deck template model
    ret = SapModel.File.NewSteelDeck(4,12,12,4,4,24,24)

    'add link object by points
    ret = SapModel.LinkObj.AddByPoint("1", "5", Name)

    'refresh view
    ret = SapModel.View.RefreshView

    'change name
    ret = SapModel.LinkObj.ChangeName(Name, "MyLink")

    'close ETABS
    EtabsObject.ApplicationExit(False)

    'clean up variables
    SapModel = Nothing
    EtabsObject = Nothing
End Sub
```

CSI API ETABS v1

cLinkObjAddLanguageSpecificTextSet("LST80A201A_0") Method

Retrieves the count of the link objects in the model.

Namespace: ETABSv1

Assembly: ETABSv1 (in ETABSv1.dll) Version: 1.0.0.0 (1.24.0.0)

▲ Syntax

C#

VB

C++

F#

Copy

```
int Count()
```

Function Count As Integer

```
Dim instance As cLinkObj
Dim returnValue As Integer
```

```
returnValue = instance.Count()
```

```
int Count()
```

```
abstract Count : unit -> int
```

Return Value

Type: Int32

returns a count of the link objects in the model.

▲ Remarks

▲ Examples

VB

Copy

```
Public Sub Example()
    Dim SapModel As cSapModel
    Dim EtabsObject As cOAPI
    Dim ret As Integer = -1
    Dim Name1 As String
    Dim Name2 As String
    Dim Count as Integer

    'create ETABS object
    Dim myHelper as cHelper = New Helper
    EtabsObject = myHelper.CreateObjectProgID("CSI.ETABS.API.ETABSObject")

    'start ETABS application
    ret = EtabsObject.ApplicationStart()

    'create SapModel object
    SapModel = EtabsObject.SapModel
```

Introduction

```
'initialize model
    ret = SapModel.InitializeNewModel()

'create steel deck template model
    ret = SapModel.File.NewSteelDeck(4,12,12,4,4,24,24)

'add link object by coordinates
    ret = SapModel.LinkObj.AddByCoord(-288, 0, 288, 0, 0, 0, Name1, True)
    ret = SapModel.LinkObj.AddByCoord(-288, 0, 0, 0, 0, 144, Name2)

'refresh view
    ret = SapModel.View.RefreshView

'get number of link objects
    Count = SapModel.LinkObj.Count

'close ETABS
    EtabsObject.ApplicationExit(False)

'clean up variables
    SapModel = Nothing
    EtabsObject = Nothing
End Sub
```

CSI API ETABS v1

cLinkObjAddLanguageSpecificTextSet("LSTC7CC91BE0") Method

Deletes link objects.

Namespace: ETABSv1

Assembly: ETABSv1 (in ETABSv1.dll) Version: 1.0.0.0 (1.24.0.0)

Syntax

C#

VB

C++

F#

Copy

```
int Delete(
    string Name,
    eItemType ItemType = eItemType.Objects
)
```

```
Function Delete (
    Name As String,
    ItemType As eItemType = eItemType.Objects
) As Integer
```

```
Dim instance As cLinkObj
Dim Name As String
Dim ItemType As eItemType
Dim returnValue As Integer
```

```
returnValue = instance.Delete(Name, ItemType)
```

```
int Delete(
    String^ Name,
    eItemType ItemType = eItemType::Objects
)
```

```
abstract Delete :
    Name : string *
    ?ItemType : eItemType
(* Defaults:
    let _ItemType = defaultArg ItemType eItemType.Objects
*)
-> int
```

Parameters

Name

Type: SystemString

The name of an existing link object or group, depending on the value of the ItemType item.

ItemType (Optional)

Type: ETABSv1eItemType

This is one of the items in the eItemType enumeration.

cLinkObjspan id="LSTC7CC91BE_0"AddLanguageSpecificTextSet("LSTC7CC91BE_0?cpp=::|0004");Delete

Introduction

If this item is Objects, the link object specified by the Name item is deleted.

If this item is Group, the all link objects in the group specified by the Name item are deleted.

If this item is SelectedObjects, all selected link objects are deleted, and the Name item is ignored.

Return Value

Type: Int32

Returns zero if the link objects are successfully deleted; otherwise it returns a nonzero value.

▲Remarks

▲Examples

VB

Copy

```
Public Sub Example()  
    Dim SapModel As cSapModel  
    Dim EtabsObject As cOAPI  
    Dim ret As Integer = -1  
    Dim Name1 As String  
    Dim Name2 As String  
  
    'create ETABS object  
    Dim myHelper as cHelper = New Helper  
    EtabsObject = myHelper.CreateObjectProgID("CSI.ETABS.API.ETABSObject")  
  
    'start ETABS application  
    ret = EtabsObject.ApplicationStart()  
  
    'create SapModel object  
    SapModel = EtabsObject.SapModel  
  
    'initialize model  
    ret = SapModel.InitializeNewModel()  
  
    'create steel deck template model  
    ret = SapModel.File.NewSteelDeck(4,12,12,4,4,24,24)  
  
    'add link object by points  
    ret = SapModel.LinkObj.AddByPoint("2", "4", Name1)  
    ret = SapModel.LinkObj.AddByPoint("1", "5", Name2)  
  
    'delete link object  
    ret = SapModel.LinkObj.Delete(Name1)  
  
    'refresh view  
    ret = SapModel.View.RefreshView  
  
    'close ETABS  
    EtabsObject.ApplicationExit(False)  
  
    'clean up variables  
    SapModel = Nothing  
    EtabsObject = Nothing  
End Sub
```

CSI API ETABS v1

cLinkObjAddLanguageSpecificTextSet("LSTCE9FE67D0") Method

Retrieves the name of the link element (analysis model link) associated with a specified link object in the object-based model.

Namespace: ETABSv1

Assembly: ETABSv1 (in ETABSv1.dll) Version: 1.0.0.0 (1.24.0.0)

Syntax

C#

VB

C++

F#

Copy

```
int GetElm(
    string Name,
    ref string Elm
)
```

```
Function GetElm (
    Name As String,
    ByRef Elm As String
) As Integer
```

```
Dim instance As cLinkObj
Dim Name As String
Dim Elm As String
Dim returnValue As Integer
```

```
returnValue = instance.GetElm(Name, Elm)
```

```
int GetElm(
    String^ Name,
    String^% Elm
)
```

```
abstract GetElm :
    Name : string *
    Elm : string byref -> int
```

Parameters

Name

Type: SystemString

The name of an existing link object.

Elm

Type: SystemString

The name of the link element created from the specified link object.

Return ValueType: Int32

Returns zero if the link element name is successfully retrieved; otherwise it returns nonzero. An error occurs if the analysis model does not exist.

▲ **Remarks**

▲ **Examples**

VB

Copy

```
Public Sub Example()
    Dim SapModel As cSapModel
    Dim EtabsObject As cOAPI
    Dim ret As Integer = -1
    Dim Name As String
    Dim Elm As String

    'create ETABS object
    Dim myHelper as cHelper = New Helper
    EtabsObject = myHelper.CreateObjectProgID("CSI.ETABS.API.ETABSObject")

    'start ETABS application
    ret = EtabsObject.ApplicationStart()

    'create SapModel object
    SapModel = EtabsObject.SapModel

    'initialize model
    ret = SapModel.InitializeNewModel()

    'create steel deck template model
    ret = SapModel.File.NewSteelDeck(4,12,12,4,4,24,24)

    'add link object by points
    ret = SapModel.LinkObj.AddByPoint("1", "5", Name)

    'create the analysis model
    ret = SapModel.Analyze.CreateAnalysisModel

    'get link element name
    ret = SapModel.LinkObj.GetElm(Name, Elm)

    'close ETABS
    EtabsObject.ApplicationExit(False)

    'clean up variables
    SapModel = Nothing
    EtabsObject = Nothing
End Sub
```

CSI API ETABS v1

cLinkObjAddLanguageSpecificTextSet("LST2EEE8AB50") Method

Retrieves the groups to which a link object is assigned.

Namespace: ETABSv1

Assembly: ETABSv1 (in ETABSv1.dll) Version: 1.0.0.0 (1.24.0.0)

Syntax

C#

VB

C++

F#

Copy

```
int GetGroupAssign(
    string Name,
    ref int NumberGroups,
    ref string[] Groups
)
```

```
Function GetGroupAssign (
    Name As String,
    ByRef NumberGroups As Integer,
    ByRef Groups As String()
) As Integer
```

```
Dim instance As cLinkObj
Dim Name As String
Dim NumberGroups As Integer
Dim Groups As String()
Dim returnValue As Integer
```

```
returnValue = instance.GetGroupAssign(Name,
    NumberGroups, Groups)
```

```
int GetGroupAssign(
    String^ Name,
    int% NumberGroups,
    array<String^>^% Groups
)
```

```
abstract GetGroupAssign :
    Name : string *
    NumberGroups : int byref *
    Groups : string[] byref -> int
```

Parameters

Name

Type: SystemString

The name of an existing link object.

NumberGroups

Type: SystemInt32

The number of group names retrieved.

Groups

Type: SystemString

This is an array of the names of the groups to which the link object is assigned.

Return Value

Type: Int32

Returns zero if the group assignments are successfully retrieved, otherwise it returns a nonzero value.

▲ Remarks

▲ Examples

VB

Copy

```
Public Sub Example()
    Dim SapModel As cSapModel
    Dim EtabsObject As cOAPI
    Dim ret As Integer = -1
    Dim Name As String
    Dim NumberGroups As Integer
    Dim Groups() as String

    'create ETABS object
    Dim myHelper as cHelper = New Helper
    EtabsObject = myHelper.CreateObjectProgID("CSI.ETABS.API.ETABSObject")

    'start ETABS application
    ret = EtabsObject.ApplicationStart()

    'create SapModel object
    SapModel = EtabsObject.SapModel

    'initialize model
    ret = SapModel.InitializeNewModel()

    'create steel deck template model
    ret = SapModel.File.NewSteelDeck(4, 12, 12, 4, 4, 24, 24)

    'add link object by points
    ret = SapModel.LinkObj.AddByPoint("1", "5", Name)

    'define new groups
    ret = SapModel.GroupDef.SetGroup("Group1")
    ret = SapModel.GroupDef.SetGroup("Group2")

    'add link object to groups
    ret = SapModel.LinkObj.SetGroupAssign(Name, "Group1")
    ret = SapModel.LinkObj.SetGroupAssign(Name, "Group2")

```

```
int GetGUID(
    String^ Name,
    String^% GUID
)
```

```
abstract GetGUID :
    Name : string *
    GUID : string byref -> int
```

Parameters

Name

Type: [SystemString](#)

The name of an existing link object.

GUID

Type: [SystemString](#)

The GUID (Global Unique ID) for the specified link object.

Return ValueType: Int32

Returns zero if the link object GUID is successfully retrieved; otherwise it returns nonzero.

▲ **Remarks**

CSI API ETABS v1

cLinkObjAddLanguageSpecificTextSet("LSTBEC53FE_0") Method

Retrieves the local axis angle assignment for link objects.

Namespace: [ETABSv1](#)

Assembly: [ETABSv1](#) (in ETABSv1.dll) Version: 1.0.0.0 (1.24.0.0)

Syntax

[C#](#)

[VB](#)

[C++](#)

[F#](#)

[Copy](#)

```
int GetLocalAxes(
    string Name,
    ref double Ang,
    ref bool Advanced
)
```

```
Function GetLocalAxes (
    Name As String,
    ByRef Ang As Double,
    ByRef Advanced As Boolean
) As Integer
```

```
Dim instance As cLinkObj
Dim Name As String
Dim Ang As Double
Dim Advanced As Boolean
Dim returnValue As Integer
```

```
returnValue = instance.GetLocalAxes(Name,
    Ang, Advanced)
```

```
int GetLocalAxes(
    String^ Name,
    double% Ang,
    bool% Advanced
)
```

```
abstract GetLocalAxes :
    Name : string *
    Ang : float byref *
    Advanced : bool byref -> int
```

Parameters

Name

Type: [SystemString](#)

The name of an existing link object.

Ang

Type: SystemDouble

This is the angle that the local 2 and 3 axes are rotated about the positive local 1 axis, from the default orientation. The rotation for a positive angle appears counter clockwise when the local +1 axis is pointing toward you. [deg].

Advanced

Type: SystemBoolean

This item is True if the link object local axes orientation was obtained using advanced local axes parameters.

Return Value

Type: Int32

Returns zero if the assignment is successfully retrieved; otherwise it returns a nonzero value.

▲ Remarks

▲ Examples

VB

Copy

```
Public Sub Example()
    Dim SapModel As cSapModel
    Dim EtabsObject As cOAPI
    Dim ret As Integer = -1
    Dim Name As String
    Dim Ang As Double
    Dim Advanced As boolean

    'create ETABS object
    Dim myHelper as cHelper = New Helper
    EtabsObject = myHelper.CreateObjectProgID("CSI.ETABS.API.ETABSObject")

    'start ETABS application
    ret = EtabsObject.ApplicationStart()

    'create SapModel object
    SapModel = EtabsObject.SapModel

    'initialize model
    ret = SapModel.InitializeNewModel()

    'create steel deck template model
    ret = SapModel.File.NewSteelDeck(4,12,12,4,4,24,24)

    'add link object by points
    ret = SapModel.LinkObj.AddByPoint("1", "5", Name)

    'assign link local axis angle
    ret = SapModel.LinkObj.SetLocalAxes(Name, 30)

    'get link local axis angle
    ret = SapModel.LinkObj.GetLocalAxes(Name, Ang, Advanced)

    'close ETABS
    EtabsObject.ApplicationExit(False)

    'clean up variables
    SapModel = Nothing
    EtabsObject = Nothing
End Sub
```

    PlCSys : string byref *
    PlDir : int[] byref *
    PlPt : string[] byref *
    PlVect : float[] byref -> int

```

Parameters

Name

Type: SystemString

The name of an existing link object.

Active

Type: SystemBoolean

This is True if advanced local axes exist

AxVectOpt

Type: SystemInt32

This is 1, 2, or 3, indicating the axis reference vector option. This item applies only when the Active item is True.

Value **AxVectOpt**

1 Coordinate direction

- 2 Two joints
- 3 User vector

AxCSSys

Type:Â SystemString

The coordinate system used to define the axis reference vector coordinate directions and the axis user vector. This item applies when the Active item is True and the AxVectOpt item is 1 or 3.

AxDir

Type:Â SystemInt32

AxPt

Type:Â SystemString

This is an array dimensioned to 1 (2 strings), indicating the labels of two joints that define the axis reference vector. Either of these joints may be specified as None to indicate the center of the specified object. If both joints are specified as None, they are not used to define the axis reference vector. This item applies when the Active item is True and the AxVectOpt item is 2.

AxVect

Type:Â SystemDouble

This is an array dimensioned to 2 (3 doubles) that defines the axis reference vector. This item applies when the Active item is True and the AxVectOpt item is 3.

Plane2

Type:Â SystemInt32

This is 12 or 13, indicating that the local plane determined by the plane reference vector is the 1-2 or 1-3 plane. This item applies only when the Active item is True.

PlVectOpt

Type:Â SystemInt32

This is 1, 2, or 3, indicating the plane reference vector option. This item applies only when the Active item is True.

Value	PlVectOpt
1	Coordinate direction
2	Two joints
3	User vector

PlCSys

Type:Â SystemString

PlDir

Type:Â SystemInt32

PlPt

Type:Â SystemString

This is an array dimensioned to 1 (2 strings), indicating the labels of two joints that define the plane reference vector. Either of these joints may be specified as None to indicate the center of the specified object. If both joints are specified as None, they are not used to define the plane reference vector. This item applies when the Active item is True and the PlVectOpt item is 2.

PlVect

Type:Â SystemDouble

This is an array dimensioned to 2 (3 doubles) that defines the plane reference vector. This item applies when the Active item is True and the PlVectOpt item is

3.

Return ValueType: Int32

Returns zero if the advanced local axes assignments are retrieved successfully; otherwise, it returns a nonzero value.

▲ **Remarks**

▲ **Examples**

    int% NumberNames,
    array<String^>^% MyName
)
```

```
abstract GetNameList :
    NumberNames : int byref *
    MyName : string[] byref -> int
```

Parameters

NumberNames

Type: [System.Int32](#)

The number of link object names retrieved by the program.

MyName

Type: [System.String](#)

This is a one-dimensional array of link object names. The MyName array is created as a dynamic, zero-based, array by the API user: Dim MyName() as String

The array is dimensioned to (NumberNames - 1) inside the program, filled with the names, and returned to the API user.

Return Value

Type: Int32

Returns zero if the names are successfully retrieved; otherwise it returns nonzero.

Retrieves the names of the defined link objects on a given story.

Namespace: [ETABSv1](#)

Assembly: [ETABSv1](#) (in ETABSv1.dll) Version: 1.0.0.0 (1.24.0.0)

Syntax

[C#](#)

[VB](#)

[C++](#)

[F#](#)

[Copy](#)

```
int GetNameListOnStory(
    string StoryName,
    ref int NumberNames,
    ref string[] MyName
)
```

```
Function GetNameListOnStory (
    StoryName As String,
    ByRef NumberNames As Integer,
    ByRef MyName As String()
) As Integer
```

```
Dim instance As cLinkObj
Dim StoryName As String
Dim NumberNames As Integer
Dim MyName As String()
Dim returnValue As Integer
```

```
returnValue = instance.GetNameListOnStory(StoryName,
    NumberNames, MyName)
```

```
int GetNameListOnStory(
    String^ StoryName,
    int% NumberNames,
    array<String^>^% MyName
)
```

```
abstract GetNameListOnStory :
    StoryName : string *
    NumberNames : int byref *
    MyName : string[] byref -> int
```

Parameters

StoryName

Type: [SystemString](#)

The name of an existing story.

NumberNames

Type: SystemInt32

The number of link object names retrieved by the program.

MyName

Type: SystemString

This is a one-dimensional array of link object names. The MyName array is created as a dynamic, zero-based, array by the API user: Dim MyName() as String

The array is dimensioned to (NumberNames - 1) inside the program, filled with the names, and returned to the API user.

Return Value

Type: Int32

Returns zero if the names are successfully retrieved; otherwise it returns nonzero.

▲ Remarks

▲ Examples

VB

Copy

```
Public Sub Example()
    Dim SapModel As cSapModel
    Dim EtabsObject As cOAPI
    Dim ret As Integer = -1
    Dim Name As String
    Dim NumberNames As Integer
    Dim MyName() As String

    'create ETABS object
    Dim myHelper as cHelper = New Helper
    EtabsObject = myHelper.CreateObjectProgID("CSI.ETABS.API.ETABSObject")

    'start ETABS application
    ret = EtabsObject.ApplicationStart()

    'create SapModel object
    SapModel = EtabsObject.SapModel

    'initialize model
    ret = SapModel.InitializeNewModel()

    'create steel deck template model
    ret = SapModel.File.NewSteelDeck(4,12,12,4,4,24,24)

    'add link object by points
    ret = SapModel.LinkObj.AddByPoint("2", "4", Name)
    ret = SapModel.LinkObj.AddByPoint("1", "5", Name)

    'get link object names
    ret = SapModel.LinkObj.GetNameListOnStory("Story4", NumberNames, MyName)

    'close ETABS
    EtabsObject.ApplicationExit(False)

    'clean up variables
    SapModel = Nothing
    EtabsObject = Nothing
End Sub
```

CSI API ETABS v1

cLinkObjAddLanguageSpecificTextSet("LST7A75A6_0") Method

Retrieves the names of the point objects at each end of a specified link object. If names of the two point objects are the same, the specified link object is a one-joint link object.

Namespace: [ETABSv1](#)

Assembly: [ETABSv1](#) (in ETABSv1.dll) Version: 1.0.0.0 (1.24.0.0)

Syntax

[C#](#)

[VB](#)

[C++](#)

[F#](#)

[Copy](#)

```
int GetPoints(
    string Name,
    ref string Point1,
    ref string Point2
)
```

```
Function GetPoints (
    Name As String,
    ByRef Point1 As String,
    ByRef Point2 As String
) As Integer
```

```
Dim instance As cLinkObj
Dim Name As String
Dim Point1 As String
Dim Point2 As String
Dim returnValue As Integer
```

```
returnValue = instance.GetPoints(Name,
    Point1, Point2)
```

```
int GetPoints(
    String^ Name,
    String^% Point1,
    String^% Point2
)
```

```
abstract GetPoints :
    Name : string *
    Point1 : string byref *
    Point2 : string byref -> int
```

Parameters

Name

Type: [System.String](#)

The name of a defined link object.

cLinkObjid="LST7A75A6_0"AddLanguageSpecificTextSet("LST7A75A6_0?cpp=::|nu=.");[GetPoints](#) Method

Point1

Type:Â SystemString

The name of the point object at the I-End of the specified link object.

Point2

Type:Â SystemString

The name of the point object at the J-End of the specified link object.

Return Value

Type:Â Int32

Returns zero if the point names are successfully retrieved; otherwise it returns a nonzero value.

▲ Remarks

▲ Examples

VB

Copy

```
Public Sub Example()
    Dim SapModel As cSapModel

CSI API ETABS v1

cLinkObjAddLanguageSpecificTextSet("LSTC7DE0416_0") Method

Retrieves the link property assigned to a link object.

Namespace: [ETABSv1](#)

Assembly: [ETABSv1](#) (in ETABSv1.dll) Version: 1.0.0.0 (1.24.0.0)

■ Syntax

[C#](#)

[VB](#)

[C++](#)

[F#](#)

[Copy](#)

```
int GetProperty(
    string Name,
    ref string PropName
)
```

```
Function GetProperty (
    Name As String,
    ByRef PropName As String
) As Integer
```

```
Dim instance As cLinkObj
Dim Name As String
Dim PropName As String
Dim returnValue As Integer
```

```
returnValue = instance.GetProperty(Name,
    PropName)
```

```
int GetProperty(
    String^ Name,
    String^% PropName
)
```

```
abstract GetProperty :
    Name : string *
    PropName : string byref -> int
```

Parameters

Name

Type: [SystemString](#)

The name of an existing link object.

PropName

Type: [SystemString](#)

This is the name of a link property assigned to the link object.

Return ValueType: Int32

Returns zero if the property is successfully retrieved; otherwise it returns a nonzero value.

▲ **Remarks**

▲ **Examples**

VB

Copy

```

CSI API ETABS v1

cLinkObjAddLanguageSpecificTextSet("LST8A19823D_0") Method

Retrieves the transformation matrix for a link object.

Namespace: ETABSv1

Assembly: ETABSv1 (in ETABSv1.dll) Version: 1.0.0.0 (1.24.0.0)

Syntax

C#

VB

C++

F#

Copy

```
int GetTransformationMatrix(
    string Name,
    ref double[] Value,
    bool IsGlobal = true
)
```

```
Function GetTransformationMatrix (
    Name As String,
    ByRef Value As Double(),
    IsGlobal As Boolean = true
) As Integer
```

```
Dim instance As cLinkObj
Dim Name As String
Dim Value As Double()
Dim IsGlobal As Boolean
Dim returnValue As Integer
```

```
returnValue = instance.GetTransformationMatrix(Name,
    Value, IsGlobal)
```

```
int GetTransformationMatrix(
    String^ Name,
    array<double>^% Value,
    bool IsGlobal = true
)
```

```
abstract GetTransformationMatrix :
    Name : string *
    Value : float[] byref *
    ?IsGlobal : bool
(* Defaults:
    let _IsGlobal = defaultArg IsGlobal true
*)
-> int
```

Parameters

Name

Type: SystemString

The name of an existing link object.

Value

Type: SystemDouble

Value is an array of nine direction cosines that define the transformation matrix.

The following matrix equation shows how the transformation matrix is used to convert items from the link object local coordinate system to the global coordinate system.

$$[c_0 \ c_1 \ c_2] [Local1] [GlobalX]$$

$$[c_3 \ c_4 \ c_5] * [Local2] = [GlobalY]$$

$$[c_6 \ c_7 \ c_8] [Local3] [Globalz]$$

In the equation, c0 through c8 are the nine values from the transformation array, (Local1, Local2, Local3) are an item (such as a load) in the object local coordinate system, and (GlobalX, GlobalY, GlobalZ) are the same item in the global coordinate system.

The transformation from the local coordinate system to the present coordinate system is the same as that shown above for the global system if you substitute the present system for the global system.

IsGlobal (Optional)

Type: SystemBoolean

If this item is True, the transformation matrix is between the Global coordinate system and the link object local coordinate system. If this item is False, the transformation matrix is between the present coordinate system, and the link object local coordinate system.

Return Value

Type: Int32

Returns zero if the link object transformation matrix is successfully retrieved; otherwise it returns a nonzero value.

▲ Remarks

▲ Examples

VB

Copy

```
Public Sub Example()
    Dim SapModel As cSapModel
    Dim EtabsObject As cOAPI
    Dim ret As Integer = -1
    Dim Name As String
    Dim Value() As Double

    'create ETABS object
    Dim myHelper as cHelper = New Helper
    EtabsObject = myHelper.CreateObjectProgID("CSI.ETABS.API.ETABSObject")

    'start ETABS application
    ret = EtabsObject.ApplicationStart()
```

Introduction

```
'create SapModel object
  SapModel = EtabsObject.SapModel

'initialize model
  ret = SapModel.InitializeNewModel()

'create steel deck template model
  ret = SapModel.File.NewSteelDeck(4,12,12,4,4,24,24)

'add link object by points
  ret = SapModel.LinkObj.AddByPoint("1", "5", Name)

'get link object transformation matrix
  ReDim Value(8)
  ret = SapModel.LinkObj.GetTransformationMatrix(Name, Value)

'close ETABS
  EtabsObject.ApplicationExit(False)

'clean up variables
  SapModel = Nothing
  EtabsObject = Nothing
End Sub
```

CSI API ETABS v1

cLinkObjAddLanguageSpecificTextSet("LST1DCE8616_0") Method

Adds/removes link objects to/from a specified group.

Namespace: ETABSv1

Assembly: ETABSv1 (in ETABSv1.dll) Version: 1.0.0.0 (1.24.0.0)

Syntax

C#

VB

C++

F#

Copy

```
int SetGroupAssign(
    string Name,
    string GroupName,
    bool Remove = false,
    eItemType ItemType = eItemType.Objects
)
```

```
Function SetGroupAssign (
    Name As String,
    GroupName As String,
    Remove As Boolean = false,
    ItemType As eItemType = eItemType.Objects
) As Integer
```

```
Dim instance As cLinkObj
Dim Name As String
Dim GroupName As String
Dim Remove As Boolean
Dim ItemType As eItemType
Dim returnValue As Integer
```

```
returnValue = instance.SetGroupAssign(Name,
    GroupName, Remove, ItemType)
```

```
int SetGroupAssign(
    String^ Name,
    String^ GroupName,
    bool Remove = false,
    eItemType ItemType = eItemType::Objects
)
```

```
abstract SetGroupAssign :
    Name : string *
    GroupName : string *
    ?Remove : bool *
    ?ItemType : eItemType
(* Defaults:
    let _Remove = defaultArg Remove false
    let _ItemType = defaultArg ItemType eItemType.Objects
*)
-> int
```

cLinkObjid="LST1DCE8616_0"AddLanguageSpecificTextSet("LST1DCE8616_0?cpp=::|n2422;SetGro

Parameters**Name**

Type:Â SystemString

The name of an existing link object or group, depending on the value of the ItemType item.

GroupName

Type:Â SystemString

The name of an existing group to which the assignment is made.

Remove (Optional)

Type:Â SystemBoolean

If this item is False, the specified link objects are added to the group specified by the GroupName item. If it is True, the link objects are removed from the group.

ItemType (Optional)

Type:Â ETABSv1eItemType

This is one of the items in the eItemType enumeration.

If this item is Objects, the link object specified by the Name item is added/removed to/from the group specified by the GroupName item.

If this item is Group, the link objects in the group specified by the Name item is added/removed to/from the group specified by the GroupName item.

If this item is SelectedObjects, all selected link objects are added/removed to/from the group specified by the GroupName item, and the Name item is ignored.

Return Value

Type:Â Int32

Returns zero if the group assignment is successful; otherwise it returns a nonzero value.

CSI API ETABS v1

cLinkObjAddLanguageSpecificTextSet("LSTC6A30F1_0")

Method

Sets the GUID for the specified link object. If the GUID is passed in as a blank string, the program automatically creates a GUID for the object.

Namespace: $\hat{A}$ ETABSV1

Assembly: $\hat{A}$ ETABSV1 (in ETABSV1.dll) Version: 1.0.0.0 (1.24.0.0)

Syntax

C#

VB

C++

F#

Copy

```
int SetGUID(
    string Name,
    string GUID = ""
)
```

```
Function SetGUID (
    Name As String,
    GUID As String = ""
) As Integer
```

```
Dim instance As cLinkObj
Dim Name As String
Dim GUID As String
Dim returnValue As Integer
```

```
returnValue = instance.SetGUID(Name, GUID)
```

```
int SetGUID(
    String^ Name,
    String^ GUID = L""
)
```

```
abstract SetGUID :
    Name : string *
    ?GUID : string
(* Defaults:
    let _GUID = defaultArg GUID ""
*)
-> int
```

Parameters

Name

Type: $\hat{A}$ SystemString

The name of an existing link object.

GUID (Optional)

Type: $\hat{A}$ SystemString

The GUID (Global Unique ID) for the specified link object.

cLinkObjid="LSTC6A30F1_0"AddLanguageSpecificTextSet("LSTC6A30F1_0?cpp=::|nu=2435")SetGUID I

Return ValueType: Int32

Returns zero if the link object GUID is successfully set; otherwise it returns nonzero.

▲ **Remarks**▲ **Examples**

VB

Copy

CSI API ETABS v1

cLinkObjAddLanguageSpecificTextSet("LST18B8F629_0") Method

Assigns a local axis angle to link objects.

Namespace: [ETABSV1](#)

Assembly: [ETABSV1](#) (in ETABSV1.dll) Version: 1.0.0.0 (1.24.0.0)

Syntax

[C#](#)

[VB](#)

[C++](#)

[F#](#)

[Copy](#)

```
int SetLocalAxes(
    string Name,
    double Ang,
    eItemType ItemType = eItemType.Objects
)
```

```
Function SetLocalAxes (
    Name As String,
    Ang As Double,
    Optional ItemType As eItemType = eItemType.Objects
) As Integer
```

```
Dim instance As cLinkObj
Dim Name As String
Dim Ang As Double
Dim ItemType As eItemType
Dim returnValue As Integer
```

```
returnValue = instance.SetLocalAxes(Name,
    Ang, ItemType)
```

```
int SetLocalAxes(
    String^ Name,
    double Ang,
    eItemType ItemType = eItemType::Objects
)
```

```
abstract SetLocalAxes :
    Name : string *
    Ang : float *
    ?ItemType : eItemType
(* Defaults:
    let _ItemType = defaultArg ItemType eItemType.Objects
*)
-> int
```

Parameters

Name

Type:Â SystemString

The name of an existing link object or group, depending on the value of the ItemType item.

Ang

Type:Â SystemDouble

This is the angle that the local 2 and 3 axes are rotated about the positive local 1 axis, from the default orientation. The rotation for a positive angle appears counter clockwise when the local +1 axis is pointing toward you. [deg].

ItemType (Optional)

Type:Â ETABSV1eItemType

This is one of the items in the eItemType enumeration.

If this item is Objects, the assignment is made to the link object specified by the Name item.

If this item is Group, the assignment is made to all link objects in the group specified by the Name item.

If this item is SelectedObjects, the assignment is made to all selected link objects, and the Name item is ignored.

Return Value

Type:Â Int32

Returns zero if the local axis angle is successfully assigned; otherwise it returns a nonzero value.

▲ Remarks

▲ Examples

VB

Copy

```
Public Sub Example()
    Dim SapModel As cSapModel
    Dim EtabsObject As cOAPI
    Dim ret As Integer = -1
    Dim Name As String

    'create ETABS object
    Dim myHelper as cHelper = New Helper
    EtabsObject = myHelper.CreateObjectProgID("CSI.ETABS.API.ETABSObject")

    'start ETABS application
    ret = EtabsObject.ApplicationStart()

    'create SapModel object
    SapModel = EtabsObject.SapModel

    'initialize model
    ret = SapModel.InitializeNewModel()

    'create steel deck template model
    ret = SapModel.File.NewSteelDeck(4,12,12,4,4,24,24)

    'add link object by points
    ret = SapModel.LinkObj.AddByPoint("1", "5", Name)

    'assign link local axis angle
```

Introduction

```
ret = SapModel.LinkObj.SetLocalAxes(Name, 30)

'close ETABS
  EtabsObject.ApplicationExit(False)

'clean up variables
  SapModel = Nothing
  EtabsObject = Nothing
End Sub
```

CSI API ETABS v1

cLinkObjAddLanguageSpecificTextSet("LSTF696B4D6_0?cpp=::|nu24.3)|SetLocalAxesAdvanced")

Method

Assigns advanced local axes to link objects

Namespace: ETABSV1

Assembly: ETABSV1 (in ETABSV1.dll) Version: 1.0.0.0 (1.24.0.0)

Syntax

C#

VB

C++

F#

Copy

```
int SetLocalAxesAdvanced(
    string Name,
    bool Active,
    int AxVectOpt,
    string AxCSys,
    ref int[] AxDir,
    ref string[] AxPt,
    ref double[] AxVect,
    int Plane2,
    int PlVectOpt,
    string PlCSys,
    ref int[] PlDir,
    ref string[] PlPt,
    ref double[] PlVect,
    eItemType ItemType = eItemType.Objects
)
```

```
Function SetLocalAxesAdvanced (
    Name As String,
    Active As Boolean,
    AxVectOpt As Integer,
    AxCSys As String,

    PlVect : float[] byref *
    ?ItemType : eItemType
(* Defaults:
    let _ItemType = defaultArg ItemType eItemType.Objects
*)
-> int
```

Parameters

Name

Type: SystemString

The name of an existing link object or group depending on the value of the ItemType item.

Active

Type:Â SystemBoolean

This is True if advanced local axes exist

AxVectOpt

Type:Â SystemInt32

This is 1, 2, or 3, indicating the axis reference vector option. This item applies only when the Active item is True.

Value AxVectOpt

- 1 Coordinate direction
- 2 Two joints
- 3 User vector

AxCSSys

Type:Â SystemString

The coordinate system used to define the axis reference vector coordinate directions and the axis user vector. This item applies when the Active item is True and the AxVectOpt item is 1 or 3.

AxDir

Type:Â SystemInt32

AxPt

Type:Â SystemString

This is an array dimensioned to 1 (2 strings), indicating the labels of two joints that define the axis reference vector. Either of these joints may be specified as None to indicate the center of the specified object. If both joints are specified as None, they are not used to define the axis reference vector. This item applies when the Active item is True and the AxVectOpt item is 2.

AxVect

Type:Â SystemDouble

This is an array dimensioned to 2 (3 doubles) that defines the axis reference vector. This item applies when the Active item is True and the AxVectOpt item is 3.

Plane2

Type:Â SystemInt32

This is 12 or 13, indicating that the local plane determined by the plane reference vector is the 1-2 or 1-3 plane. This item applies only when the Active item is True.

PlVectOpt

Type:Â SystemInt32

This is 1, 2, or 3, indicating the plane reference vector option. This item applies only when the Active item is True.

Value PlVectOpt

- 1 Coordinate direction
- 2 Two joints
- 3 User vector

PlCSys

Type:Â SystemString

PlDir

Type:Â SystemInt32

PlPt

Type:Â SystemString

This is an array dimensioned to 1 (2 strings), indicating the labels of two joints

that define the plane reference vector. Either of these joints may be specified as None to indicate the center of the specified object. If both joints are specified as None, they are not used to define the plane reference vector. This item applies when the Active item is True and the PlVectOpt item is 2.

PlVect

Type:Â SystemDouble

This is an array dimensioned to 2 (3 doubles) that defines the plane reference vector. This item applies when the Active item is True and the PlVectOpt item is 3.

ItemType (Optional)

Type:Â ETABSv1eItemType

This is one of the items in the eItemType enumeration.

If this item is Objects, the assignment is made to the link object specified by the Name item.

If this item is Group, the assignment is made to the all link objects in the group specified by the Name item.

If this item is SelectedObjects, the assignment is made to all selected link objects, and the Name item is ignored.

Return Value

Type:Â Int32

Returns zero if the advanced local axes assignments are assigned successfully; otherwise, it returns a nonzero value.

▲ Remarks

▲ Examples

VB

Copy

```
Public Sub Example()
    Dim SapModel As cSapModel
    Dim EtabsObject As cOAPI
    Dim ret As Integer = -1
    Dim MyName As String
    Dim MyAxDi(1) As Integer
    Dim MyAxPt(1) As String
    Dim MyAxVect(2) As Double
    Dim MyPlDi(1) As Integer
    Dim MyPlPt(1) As String
    Dim MyPlVect(2) As Double

    'create ETABS object
    Dim myHelper as cHelper = New Helper
    EtabsObject = myHelper.CreateObjectProgID("CSI.ETABS.API.ETABSObject")

    'start ETABS application
    ret = EtabsObject.ApplicationStart()

    'create SapModel object
    SapModel = EtabsObject.SapModel

    'initialize model
```

Introduction

```
ret = SapModel.InitializeNewModel()

'create steel deck template model
ret = SapModel.File.NewSteelDeck(4,12,12,4,4,24,24)

'add link object by points
ret = SapModel.LinkObj.AddByPoint("1", "5", MyName)

'assign link advanced local axes
MyAxVect(0)=0.707
MyAxVect(1)=0.707
MyAxVect(2)=0
MyPlDir(0) = 2
MyPlDir(1) = 3
ret = SapModel.LinkObj.SetLocalAxesAdvanced(MyName, True, 3, "Global", MyAxDir, MyAxPt, MyPlDir)

'close ETABS
EtabsObject.ApplicationExit(False)

'clean up variables
SapModel = Nothing
EtabsObject = Nothing
End Sub
```

CSI API ETABS v1

cLinkObjAddLanguageSpecificTextSet("LST94599681_0") Method

Assigns a link property to link objects.

Namespace: [ETABSV1](#)

Assembly: [ETABSV1](#) (in ETABSV1.dll) Version: 1.0.0.0 (1.24.0.0)

Syntax

[C#](#)

[VB](#)

[C++](#)

[F#](#)

[Copy](#)

```
int SetProperty(
    string Name,
    string PropName,
    eItemType ItemType = eItemType.Objects
)
```

```
Function SetProperty (
    Name As String,
    PropName As String,
    ?ItemType As eItemType = eItemType.Objects
) As Integer
```

```
Dim instance As cLinkObj
Dim Name As String
Dim PropName As String
Dim ItemType As eItemType
Dim returnValue As Integer
```

```
returnValue = instance.SetProperty(Name,
    PropName, ItemType)
```

```
int SetProperty(
    String^ Name,
    String^ PropName,
    eItemType ItemType = eItemType::Objects
)
```

```
abstract SetProperty :
    Name : string *
    PropName : string *
    ?ItemType : eItemType
(* Defaults:
    let _ItemType = defaultArg ItemType eItemType.Objects
*)
-> int
```

Parameters

Name

Type: SystemString

The name of an existing link object or group, depending on the value of the ItemType item.

PropName

Type: SystemString

This is the name of a link property to be assigned to the specified link object(s).

ItemType (Optional)

Type: ETABSv1eItemType

This is one of the items in the eItemType enumeration.

If this item is Objects, the assignment is made to the link object specified by the Name item.

If this item is Group, the assignment is made to all link objects in the group specified by the Name item.

If this item is SelectedObjects, the assignment is made to all selected link objects, and the Name item is ignored.

Return Value

Type: Int32

Returns zero if the property is successfully assigned; otherwise it returns a nonzero value.

▲ Remarks

▲ Examples

CSI API ETABS v1

cLinkObjAddLanguageSpecificTextSet("LST64549485_0") Method

Sets the selected status for link objects.

Namespace: [ETABSv1](#)

Assembly: [ETABSv1](#) (in ETABSv1.dll) Version: 1.0.0.0 (1.24.0.0)

Syntax

[C#](#)

[VB](#)

[C++](#)

[F#](#)

[Copy](#)

```
int SetSelected(
    string Name,
    bool Selected,
    eItemType ItemType = eItemType.Objects
)
```

```
Function SetSelected (
    Name As String,
    Selected As Boolean,
    ?ItemType As eItemType = eItemType.Objects
) As Integer
```

```
Dim instance As cLinkObj
Dim Name As String
Dim Selected As Boolean
Dim ItemType As eItemType
Dim returnValue As Integer
```

```
returnValue = instance.SetSelected(Name,
    Selected, ItemType)
```

```
int SetSelected(
    String^ Name,
    bool Selected,
    eItemType ItemType = eItemType::Objects
)
```

```
abstract SetSelected :
    Name : string *
    Selected : bool *
    ?ItemType : eItemType
(* Defaults:
    let _ItemType = defaultArg ItemType eItemType.Objects
*)
-> int
```

Parameters

Name

Type: SystemString

The name of an existing link object or group, depending on the value of the ItemType item.

Selected

Type: SystemBoolean

This item is True if the specified link object is selected; otherwise it is False.

ItemType (Optional)

Type: ETABSv1eItemType

This is one of the items in the eItemType enumeration.

If this item is Objects, the selected status is set for the link object specified by the Name item.

If this item is Group, the selected status is set for all link objects in the group specified by the Name item.

If this item is SelectedObjects, the selected status is set for all selected link objects, and the Name item is ignored.

Return Value

Type: Int32

Returns zero if the selected status is successfully set; otherwise it returns a nonzero value.

Dim Name As String
Dim returnValue As Integer
```

```
returnValue = instance.Delete(Name)
```

```
int Delete(
    String^ Name
)
```

```
abstract Delete :
    Name : string -> int
```

Parameters

Name

Type: [SystemString](#)

The name of an existing load case.

Return Value

Type: [Int32](#)

Returns zero if the load case is successfully deleted, otherwise it returns a nonzero value.

▲ Remarks

▲ Examples

VB

[Copy](#)

```
Public Sub Example()
```

```
cLoadCases.AddLanguageSpecificTextSet("LSTD2D3042_0?cpp=::|2462");Delete
```

Introduction

```
Dim SapModel As cSapModel
Dim EtabsObject As cOAPI
Dim ret As Integer = -1

'create ETABS object
Dim myHelper as cHelper = New Helper
EtabsObject = myHelper.CreateObjectProgID("CSI.ETABS.API.ETABSObject")

'start ETABS application
ret = EtabsObject.ApplicationStart()

'create SapModel object
SapModel = EtabsObject.SapModel

'initialize model
ret = SapModel.InitializeNewModel()

'create steel deck template model
ret = SapModel.File.NewSteelDeck(4,12,12,4,4,24,24)

'delete load case
ret = SapModel.LoadCases.Delete("DEAD")

'close ETABS
EtabsObject.ApplicationExit(False)

'clean up variables
SapModel = Nothing
EtabsObject = Nothing
End Sub
```

CSI API ETABS v1

cLoadCasesAddLanguageSpecificTextSet("LST52B729F_0?cpp=:2404.")

Method

Retrieves the names of all defined load cases of the specified type.

Namespace: [ETABSv1](#)

Assembly: [ETABSv1](#) (in ETABSv1.dll) Version: 1.0.0.0 (1.24.0.0)

Syntax

[C#](#)

[VB](#)

[C++](#)

[F#](#)

[Copy](#)

```
int GetNameList(
    ref int NumberNames,
    ref string[] MyName,
    eLoadCaseType CaseType =
)
```

```
Function GetNameList (
    ByRef NumberNames As Integer,
    ByRef MyName As String(),
    Optional CaseType As eLoadCaseType =
0 As Integer
) As Integer
```

```
Dim instance As cLoadCases
Dim NumberNames As Integer
Dim MyName As String()
Dim CaseType As eLoadCaseType
Dim returnValue As Integer
```

```
returnValue = instance.GetNameList(NumberNames,
MyName, CaseType)
```

```
int GetNameList(
    int% NumberNames,
    array<String^>^% MyName,
    eLoadCaseType CaseType =
)
```

```
abstract GetNameList :
    NumberNames : int byref *
    MyName : string[] byref *
    ?CaseType : eLoadCaseType
(* Defaults:
    let _CaseType = defaultArg CaseType
*)
-> int
```

Parameters

NumberNames

Type: SystemInt32

The number of load case names retrieved by the program.

MyName

Type: SystemString

This is a one-dimensional array of area object names. The MyName array is created as a dynamic, zero-based, array by the API user:

```
Dim MyName() as String
```

The array is dimensioned to (NumberNames + 1) inside the ETABS program, filled with the names, and returned to the API user.

CaseType (Optional)

Type: ETABSv1eLoadCaseType

Return Value

Type: Int32

Returns zero if the names are successfully retrieved, otherwise it returns nonzero.

▲ Remarks

▲ Examples

VB

Copy

```
Public Sub Example()
    Dim SapModel As cSapModel
    Dim EtabsObject As cOAPI
    Dim ret As Integer = -1
    Dim NumberNames As Integer
    Dim MyName() As String

    'create ETABS object
    Dim myHelper as cHelper = New Helper
    EtabsObject = myHelper.CreateObjectProgID("CSI.ETABS.API.ETABSObject")

    'start ETABS application
    ret = EtabsObject.ApplicationStart()

    'create SapModel object
    SapModel = EtabsObject.SapModel

    'initialize model
    ret = SapModel.InitializeNewModel()

    'create steel deck template model
    ret = SapModel.File.NewSteelDeck(4,12,12,4,4,24,24)

    'get load case names
    ret = SapModel.LoadCases.GetNameList(NumberNames, MyName)

    'close ETABS
    EtabsObject.ApplicationExit(False)

    'clean up variables
    SapModel = Nothing
    EtabsObject = Nothing
End Sub
```

cLoadCasesAddLanguageSpecificTextSet("LST4887C2BA_0?cpp=2469-");Get

```
Name : string *
CaseType : eLoadCaseType byref *
SubType : int byref *
DesignType : eLoadPatternType byref *
DesignTypeOption : int byref *
Auto : int byref -> int
```

Parameters

Name

Type:Â SystemString

The name of an existing load case

CaseType

Type:Â ETABSv1eLoadCaseType

This is one of the items in the eLoadCaseType enumeration

SubType

Type:Â SystemInt32

This is an integer representing the load case sub type. This item applies only for certain case types.

For NonlinearStatic

1. Nonlinear
2. Nonlinear staged construction

For Modal

1. Eigen
2. Ritz

For LinearHistory

1. Transient
2. Periodic

DesignType

Type:Â ETABSv1eLoadPatternType

This is one of the items in the eLoadPatternType enumeration

DesignTypeOption

Type:Â SystemInt32

This is one of the following options for the DesignType item

0 = Program determined

1 = User specified

Auto

Type:Â SystemInt32

This is one of the following values indicating if the load case has been automatically created

0 = Not automatically created

1 = Automatically created

Return Value

Type: Int32

Returns zero if the type is successfully retrieved; otherwise it returns nonzero

▲ Remarks

This function supercedes GetTypeOAPI(String, eLoadCaseType, Int32)

CSI API ETABS v1

cLoadPatternsAddLanguageSpecificTextSet("LST7D2FF18D_0?cpu=.") Method

Adds a new load pattern.

Namespace: [ETABSv1](#)

Assembly: [ETABSv1](#) (in ETABSv1.dll) Version: 1.0.0.0 (1.24.0.0)

Syntax

[C#](#)

[VB](#)

[C++](#)

[F#](#)

[Copy](#)

```
int Add(
    string Name,
    eLoadPatternType MyType,
    double SelfWTMultiplier = 0,
    bool AddAnalysisCase = true
)
```

```
Function Add (
    Name As String,
    MyType As eLoadPatternType,
    SelfWTMultiplier As Double = 0,
    AddAnalysisCase As Boolean = true
) As Integer
```

```
Dim instance As cLoadPatterns
Dim Name As String
Dim MyType As eLoadPatternType
Dim SelfWTMultiplier As Double
Dim AddAnalysisCase As Boolean
Dim returnValue As Integer
```

```
returnValue = instance.Add(Name, MyType,
    SelfWTMultiplier, AddAnalysisCase)
```

```
int Add(
    String^ Name,
    eLoadPatternType MyType,
    double SelfWTMultiplier = 0,
    bool AddAnalysisCase = true
)
```

```
abstract Add :
    Name : string *
    MyType : eLoadPatternType *
    ?SelfWTMultiplier : float *
    ?AddAnalysisCase : bool
(* Defaults:
    let _SelfWTMultiplier = defaultArg SelfWTMultiplier 0
    let _AddAnalysisCase = defaultArg AddAnalysisCase true
*)
-> int
```

cLoadPatternsid="LST7D2FF18D_0"AddLanguageSpecificTextSet("LST7D2FF18D_0?cpu=.")

Parameters

Name

Type: SystemString

The name for the new load pattern.

MyType

Type: ETABSv1eLoadPatternTypeThis is one of the items in the eLoadPatternType enumeration.

SelfWTMultiplier (Optional)

Type: SystemDouble

The self weight multiplier for the new load pattern.

AddAnalysisCase (Optional)

Type: SystemBoolean

If this item is True, a linear static load case corresponding to the new load pattern is added.

Return ValueType: Int32

Returns 0 if the load pattern is successfully added; otherwise it returns nonzero.

▲ **Remarks**

An error is returned if the Name item is already used for an existing load pattern.

▲ **Examples**

VB

Copy

```
Public Sub Example()
    Dim SapModel As cSapModel
    Dim EtabsObject As cOAPI
    Dim ret As Integer = -1

    'create ETABS object
    Dim myHelper as cHelper = New Helper
    EtabsObject = myHelper.CreateObjectProgID("CSI.ETABS.API.ETABSObject")

    'start ETABS application
    ret = EtabsObject.ApplicationStart()

    'create SapModel object
    SapModel = EtabsObject.SapModel

    'initialize model
    ret = SapModel.InitializeNewModel()

    'create steel deck template model
    ret = SapModel.File.NewSteelDeck(4,12,12,4,4,24,24)

    'add new load pattern
    ret = SapModel.LoadPatterns.Add("LIVE1A", eLoadPatternType.Live)

    'close ETABS
    EtabsObject.ApplicationExit(False)

    'clean up variables
    SapModel = Nothing
    EtabsObject = Nothing
End Sub
```

CSI API ETABS v1

cLoadPatternsAddLanguageSpecificTextSet("LST888A Method

Applies a new name to a load pattern.

Namespace: ETABSv1

Assembly: ETABSv1 (in ETABSv1.dll) Version: 1.0.0.0 (1.24.0.0)

Syntax

C#

VB

C++

F#

Copy

```
int ChangeName(
    string Name,
    string NewName
)
```

```
Function ChangeName (
    Name As String,
    NewName As String
) As Integer
```

```
Dim instance As cLoadPatterns
Dim Name As String
Dim NewName As String
Dim returnValue As Integer
```

```
returnValue = instance.ChangeName(Name,
    NewName)
```

```
int ChangeName(
    String^ Name,
    String^ NewName
)
```

```
abstract ChangeName :
    Name : string *
    NewName : string -> int
```

Parameters

Name

Type: SystemString

The name of a defined load pattern.

NewName

Type: SystemString

The new name for the load pattern.

Return ValueType: Int32

Returns zero if the new name is successfully applied; otherwise it returns a nonzero value.

▲ **Remarks**

▲ **Examples**

VB

Copy

```
Public Sub Example()
    Dim SapModel As cSapModel
    Dim EtabsObject As cOAPI
    Dim ret As Integer = -1

    'create ETABS object
    Dim myHelper as cHelper = New Helper
    EtabsObject = myHelper.CreateObjectProgID("CSI.ETABS.API.ETABSObject")

    'start ETABS application
    ret = EtabsObject.ApplicationStart()

    'create SapModel object
    SapModel = EtabsObject.SapModel

    'initialize model
    ret = SapModel.InitializeNewModel()

    'create steel deck template model
    ret = SapModel.File.NewSteelDeck(4,12,12,4,4,24,24)

    'change name
    ret = SapModel.LoadPatterns.ChangeName("DEAD", "DL")

    'close ETABS
    EtabsObject.ApplicationExit(False)

    'clean up variables
    SapModel = Nothing
    EtabsObject = Nothing
End Sub
```

CSI API ETABS v1

cLoadPatternsAddLanguageSpecificTextSet("LST512283DD_0?cp2485u=");C

Method

Retrieves the number of defined load patterns.

Namespace: [ETABSv1](#)

Assembly: [ETABSv1](#) (in ETABSv1.dll) Version: 1.0.0.0 (1.24.0.0)

▲ Syntax

[C#](#)

[VB](#)

[C++](#)

[F#](#)

[Copy](#)

```
int Count()
```

Function Count As Integer

```
Dim instance As cLoadPatterns
```

```
Dim returnValue As Integer
```

```
returnValue = instance.Count()
```

```
int Count()
```

```
abstract Count : unit -> int
```

Return Value

Type: [Int32](#)

Returns the number of defined load patterns.

▲ Remarks

▲ Examples

VB

[Copy](#)

```
Public Sub Example()
    Dim SapModel As cSapModel
    Dim EtabsObject As cOAPI
    Dim ret As Integer = -1

    'create ETABS object
    Dim myHelper as cHelper = New Helper
    EtabsObject = myHelper.CreateObjectProgID("CSI.ETABS.API.ETABSObject")

    'start ETABS application
    ret = EtabsObject.ApplicationStart()

    'create SapModel object
    SapModel = EtabsObject.SapModel

    'initialize model
    ret = SapModel.InitializeNewModel()
```

Introduction

```
'create steel deck template model
    ret = SapModel.File.NewSteelDeck(4,12,12,4,4,24,24)

'get number of defined load patterns
    ret = SapModel.LoadPatterns.Count

'close ETABS
    EtabsObject.ApplicationExit(False)

'clean up variables
    SapModel = Nothing
    EtabsObject = Nothing
End Sub
```

CSI API ETABS v1

cLoadPatternsAddLanguageSpecificTextSet("LSTE33D6E89_0") Method

Deletes the specified load pattern.

Namespace: [ETABSv1](#)

Assembly: [ETABSv1](#) (in ETABSv1.dll) Version: 1.0.0.0 (1.24.0.0)

▲ Syntax

[C#](#)

[VB](#)

[C++](#)

[F#](#)

[Copy](#)

```
int Delete(
    string Name
)
```

```
Function Delete (
    Name As String
) As Integer
```

```
Dim instance As cLoadPatterns
Dim Name As String
Dim returnValue As Integer
```

```
returnValue = instance.Delete(Name)
```

```
int Delete(
    String^ Name
)
```

```
abstract Delete :
    Name : string -> int
```

Parameters

Name

Type: [SystemString](#)

The name of an existing load pattern.

Return Value

Type: [Int32](#)

Returns zero if the load pattern is successfully deleted, otherwise it returns a nonzero value.

▲ Remarks

The load pattern is not deleted and the function returns an error if the load pattern is assigned to an load case or if it is the only defined load pattern.

▲ Examples

VB

cLoadPatternsAddLanguageSpecificTextSet("LSTE33D6E89_0?cp24877u=.");D

Copy

```
Public Sub Example()
    Dim SapModel As cSapModel
    Dim EtabsObject As cOAPI
    Dim ret As Integer = -1

    'create ETABS object
    Dim myHelper as cHelper = New Helper
    EtabsObject = myHelper.CreateObjectProgID("CSI.ETABS.API.ETABSObject")

    'start ETABS application
    ret = EtabsObject.ApplicationStart()

    'create SapModel object
    SapModel = EtabsObject.SapModel

    'initialize model
    ret = SapModel.InitializeNewModel()

    'create steel deck template model
    ret = SapModel.File.NewSteelDeck(4,12,12,4,4,24,24)

    'delete load case
    ret = SapModel.LoadPatterns.Delete("DEAD")

    'Note: ret in the above line returns 1, indicating an error.
    'This is because the load pattern DEAD is assigned to
    'load case DEAD.

    'close ETABS
    EtabsObject.ApplicationExit(False)

    'clean up variables
    SapModel = Nothing
    EtabsObject = Nothing
End Sub
```

CSI API ETABS v1

cLoadPatternsAddLanguageSpecificTextSet("LST15968960_0?cpp=2480=.");GetAutoSeismicCode

Method

Retrieves the code name used for auto seismic parameters in Quake-type load patterns.

Namespace: [ETABSv1](#)

Assembly: [ETABSv1](#) (in ETABSv1.dll) Version: 1.0.0.0 (1.24.0.0)

Syntax

[C#](#)

[VB](#)

[C++](#)

[F#](#)

[Copy](#)

```
int GetAutoSeismicCode(
    string Name,
    ref string CodeName
)
```

```
Function GetAutoSeismicCode (
    Name As String,
    ByRef CodeName As String
) As Integer
```

```
Dim instance As cLoadPatterns
Dim Name As String
Dim CodeName As String
Dim returnValue As Integer
```

```
returnValue = instance.GetAutoSeismicCode(Name,
    CodeName)
```

```
int GetAutoSeismicCode(
    String^ Name,
    String^% CodeName
)
```

```
abstract GetAutoSeismicCode :
    Name : string *
    CodeName : string byref -> int
```

Parameters

Name

Type: [SystemString](#)

The name of an existing Quake-type load pattern.

CodeName

Type: [SystemString](#)

This is either blank or the name code used for the auto seismic parameters.

Blank means no auto seismic load is specified for the Quake-type load pattern.

cLoadPatternsspan id="LST15968960_0"AddLanguageSpecificTextSet("LST15968960_0?cpp=2480=.");GetAutoSeismicCode

Return Value

Type: Int32

Returns zero if the code is successfully retrieved; otherwise it returns a nonzero value.

▲ **Remarks**

An error is returned if the specified load pattern is not a Quake-type load pattern.

▲ **Examples**

VB

Copy

```
Public Sub Example()
    Dim SapModel As cSapModel
    Dim EtabsObject As cOAPI
    Dim ret As Integer = -1
    Dim CodeName As String

    'create ETABS object
    Dim myHelper as cHelper = New Helper
    EtabsObject = myHelper.CreateObjectProgID("CSI.ETABS.API.ETABSObject")

    'start ETABS application
    ret = EtabsObject.ApplicationStart()

    'create SapModel object
    SapModel = EtabsObject.SapModel

    'initialize model
    ret = SapModel.InitializeNewModel()

    'create steel deck template model
    ret = SapModel.File.NewSteelDeck(4,12,12,4,4,24,24)

    'add new load pattern
    ret = SapModel.LoadPatterns.Add("EQX", LTYPE_QUAKE)

    'assign BOCA96 parameters
    ret = SapModel.LoadPatterns.AutoSeismic.SetBOCA96("EQX", 1, 0.05, 1, 0.035, 0, False, 0, 0)

    'get auto seismic code
    ret = SapModel.LoadPatterns.GetAutoSeismicCode("EQX", CodeName)

    'close ETABS
    EtabsObject.ApplicationExit(False)

    'clean up variables
    SapModel = Nothing
    EtabsObject = Nothing
End Sub
```

CSI API ETABS v1

cLoadPatternsAddLanguageSpecificTextSet("LST7D848DA0_0?cpu=.") Method

Retrieves the names of all defined load cases.

Namespace: ETABSv1

Assembly: ETABSv1 (in ETABSv1.dll) Version: 1.0.0.0 (1.24.0.0)

Syntax

C#

VB

C++

F#

Copy

```
int GetNameList(
    ref int NumberNames,
    ref string[] MyName
)
```

```
Function GetNameList (
    ByRef NumberNames As Integer,
    ByRef MyName As String()
) As Integer
```

```
Dim instance As cLoadPatterns
Dim NumberNames As Integer
Dim MyName As String()
Dim returnValue As Integer
```

```
returnValue = instance.GetNameList(NumberNames,
    MyName)
```

```
int GetNameList(
    int% NumberNames,
    array<String^>^% MyName
)
```

```
abstract GetNameList :
    NumberNames : int byref *
    MyName : string[] byref -> int
```

Parameters

NumberNames

Type: System.Int32

The number of load pattern names retrieved by the program.

MyName

Type: System.String

This is a one-dimensional array of load pattern names. The MyName array is created as a dynamic, zero-based, array by the API user:

```
Dim MyName() as String
```

Introduction

The array is dimensioned to (NumberNames + 1) inside the ETABS program, filled with the names, and returned to the API user.

Return Value

Type: Int32

Returns zero if the names are successfully retrieved, otherwise it returns nonzero.

▲ Remarks

▲ Examples

VB

Copy

```
Public Sub Example()  
    Dim SapModel As cSapModel  
    Dim EtabsObject As cOAPI  
    Dim ret As Integer = -1  
    Dim NumberNames As Integer  
    Dim MyName() As String  
  
    'create ETABS object  
    Dim myHelper as cHelper = New Helper  
    EtabsObject = myHelper.CreateObjectProgID("CSI.ETABS.API.ETABSObject")  
  
    'start ETABS application  
    ret = EtabsObject.ApplicationStart()  
  
    'create SapModel object  
    SapModel = EtabsObject.SapModel  
  
    'initialize model  
    ret = SapModel.InitializeNewModel()  
  
    'create steel deck template model  
    ret = SapModel.File.NewSteelDeck(4,12,12,4,4,24,24)  
  
    'get load pattern names  
    ret = SapModel.LoadPatterns.GetNameList(NumberNames, MyName)  
  
    'close ETABS  
    EtabsObject.ApplicationExit(False)  
  
    'clean up variables  
    SapModel = Nothing  
    EtabsObject = Nothing  
End Sub
```

CSI API ETABS v1

cLoadPatternsAddLanguageSpecificTextSet("LSTA8BE7313_0?cpa=.")

Method

Retrieves the self weight multiplier for a specified load pattern.

Namespace: [ETABSv1](#)

Assembly: [ETABSv1](#) (in ETABSv1.dll) Version: 1.0.0.0 (1.24.0.0)

Syntax

[C#](#)

[VB](#)

[C++](#)

[F#](#)

[Copy](#)

```
int GetSelfWTMultiplier(
    string Name,
    ref double SelfWTMultiplier
)
```

```
Function GetSelfWTMultiplier (
    Name As String,
    ByRef SelfWTMultiplier As Double
) As Integer
```

```
Dim instance As cLoadPatterns
Dim Name As String
Dim SelfWTMultiplier As Double
Dim returnValue As Integer
```

```
returnValue = instance.GetSelfWTMultiplier(Name,
    SelfWTMultiplier)
```

```
int GetSelfWTMultiplier(
    String^ Name,
    double% SelfWTMultiplier
)
```

```
abstract GetSelfWTMultiplier :
    Name : string *
    SelfWTMultiplier : float byref -> int
```

Parameters

Name

Type: [SystemString](#)

The name of an existing load pattern.

SelfWTMultiplier

Type: [SystemDouble](#)

The self weight multiplier for the specified load pattern.

Return Value

Type: Int32

Returns zero if the multiplier is successfully retrieved; otherwise it returns a nonzero value.

▲ **Remarks**

▲ **Examples**

VB

Copy

```
Public Sub Example()
    Dim SapModel As cSapModel
    Dim EtabsObject As cOAPI
    Dim ret As Integer = -1
    Dim SelfWTMultiplier As Double

    'create ETABS object
    Dim myHelper as cHelper = New Helper
    EtabsObject = myHelper.CreateObjectProgID("CSI.ETABS.API.ETABSObject")

    'start ETABS application
    ret = EtabsObject.ApplicationStart()

    'create SapModel object
    SapModel = EtabsObject.SapModel

    'initialize model
    ret = SapModel.InitializeNewModel()

    'create steel deck template model
    ret = SapModel.File.NewSteelDeck(4,12,12,4,4,24,24)

    'get self weight multiplier
    ret = SapModel.LoadPatterns.GetSelfWtMultiplier("DEAD", SelfWTMultiplier)

    'close ETABS
    EtabsObject.ApplicationExit(False)

    'clean up variables
    SapModel = Nothing
    EtabsObject = Nothing
End Sub
```

CSI API ETABS v1

cLoadPatternsAddLanguageSpecificTextSet("LSTD5D833F7_0?cpu=.");S

Method

Assigns a load type to a load pattern.

Namespace: ETABSv1

Assembly: ETABSv1 (in ETABSv1.dll) Version: 1.0.0.0 (1.24.0.0)

Syntax

C#

VB

C++

F#

Copy

```
int SetLoadType(
    string Name,
    eLoadPatternType MyType
)
```

```
Function SetLoadType (
    Name As String,
    MyType As eLoadPatternType
) As Integer
```

```
Dim instance As cLoadPatterns
Dim Name As String
Dim MyType As eLoadPatternType
Dim returnValue As Integer
```

```
returnValue = instance.SetLoadType(Name,
    MyType)
```

```
int SetLoadType(
    String^ Name,
    eLoadPatternType MyType
)
```

```
abstract SetLoadType :
    Name : string *
    MyType : eLoadPatternType -> int
```

Parameters

Name

Type: SystemString

The name of an existing load pattern.

MyType

Type: ETABSv1eLoadPatternType

This is one of the items in the eLoadPatternType enumeration.

Return Value

Type: Int32

Returns zero if the load type is successfully assigned; otherwise it returns a nonzero value.

▀ **Remarks**

▀ **Examples**

VB

Copy

```
Public Sub Example()
    Dim SapModel As cSapModel
    Dim EtabsObject As cOAPI
    Dim ret As Integer = -1
    Dim MyType As eLoadPatternType

    'create ETABS object
    Dim myHelper as cHelper = New Helper
    EtabsObject = myHelper.CreateObjectProgID("CSI.ETABS.API.ETABSObject")

    'start ETABS application
    ret = EtabsObject.ApplicationStart()

    'create SapModel object
    SapModel = EtabsObject.SapModel

    'initialize model
    ret = SapModel.InitializeNewModel()

    'create steel deck template model
    ret = SapModel.File.NewSteelDeck(4,12,12,4,4,24,24)

    'assign load type
    ret = SapModel.LoadPatterns.SetLoadType("DEAD", eLoadPatternType.SuperDead)

    'get load pattern type
    ret = SapModel.LoadPatterns.GetLoadType("DEAD", MyType)

    'close ETABS
    EtabsObject.ApplicationExit(False)

    'clean up variables
    SapModel = Nothing
    EtabsObject = Nothing
End Sub
```

CSI API ETABS v1

cLoadPatternsAddLanguageSpecificTextSet("LSTD713570_0?cpp=:2502");SetS

Method

Assigns a self weight multiplier to a load case.

Namespace: ETABSv1

Assembly: ETABSv1 (in ETABSv1.dll) Version: 1.0.0.0 (1.24.0.0)

Syntax

C#

VB

C++

F#

Copy

```
int SetSelfWTMultiplier(
    string Name,
    double SelfWTMultiplier
)
```

```
Function SetSelfWTMultiplier (
    Name As String,
    SelfWTMultiplier As Double
) As Integer
```

```
Dim instance As cLoadPatterns
Dim Name As String
Dim SelfWTMultiplier As Double
Dim returnValue As Integer
```

```
returnValue = instance.SetSelfWTMultiplier(Name,
    SelfWTMultiplier)
```

```
int SetSelfWTMultiplier(
    String^ Name,
    double SelfWTMultiplier
)
```

```
abstract SetSelfWTMultiplier :
    Name : string *
    SelfWTMultiplier : float -> int
```

Parameters

Name

Type: SystemString

The name of an existing load pattern.

SelfWTMultiplier

Type: SystemDouble

The self weight multiplier for the specified load pattern.

Return Value

Type: Int32

Returns zero if the multiplier is successfully retrieved; otherwise it returns a nonzero value.

▀ **Remarks**

▀ **Examples**

VB

Copy

```
Public Sub Example()
    Dim SapModel As cSapModel
    Dim EtabsObject As cOAPI
    Dim ret As Integer = -1
    Dim SelfWTMultiplier As Double

    'create ETABS object
    Dim myHelper as cHelper = New Helper
    EtabsObject = myHelper.CreateObjectProgID("CSI.ETABS.API.ETABSObject")

    'start ETABS application
    ret = EtabsObject.ApplicationStart()

    'create SapModel object
    SapModel = EtabsObject.SapModel

    'initialize model
    ret = SapModel.InitializeNewModel()

    'create steel deck template model
    ret = SapModel.File.NewSteelDeck(4,12,12,4,4,24,24)

    'assign self weight multiplier
    ret = SapModel.LoadPatterns.SetSelfWtMultiplier("DEAD", 2)

    'get self weight multiplier
    ret = SapModel.LoadPatterns.GetSelfWtMultiplier("DEAD", SelfWTMultiplier)

    'close ETABS
    EtabsObject.ApplicationExit(False)

    'clean up variables
    SapModel = Nothing
    EtabsObject = Nothing
End Sub
```

CSI API ETABS v1

cOAPI Interface

Namespace: $\hat{A}$ ETABSV1

Assembly: $\hat{A}$ ETABSV1 (in ETABSV1.dll) Version: 1.0.0.0 (1.24.0.0)

▲ Syntax

C#

VB

C++

F#

Copy

```
public interface cOAPI
```

```
Public Interface cOAPI
```

```
Dim instance As cOAPI
```

```
public interface class cOAPI
```

```
type cOAPI = interface end
```

The cOAPI type exposes the following members.

▲ Properties

$\hat{A}$	Name	Description
-----------	------	-------------

	<u>SapModel</u>	Gets a reference to <u>cSapModel</u> .
---	-----------------	--

Top

▲ Methods

$\hat{A}$	Name	Description
-----------	------	-------------

	<u>ApplicationExit</u>	Exits the application.
---	------------------------	------------------------

	<u>ApplicationStart</u>	This function starts the application.
---	-------------------------	---------------------------------------

	<u>GetOAPIVersionNumber</u>	Retrieves the API version number implemented by the GUI.
---	-----------------------------	--

	<u>Hide</u>	This function hides the application. When the application is hidden it is not visible on the screen or on the Windows task bar.
---	-------------	---

	<u>InternalExec</u>	For internal use.
---	---------------------	-------------------

	<u>SetActiveObject</u>	This function sets the active ETABSObject instance in the system Running Object Table (ROT), replacing the previous instance (if any).
---	------------------------	--

	<u>Unhide</u>	This function unhides the application, that is, it makes it visible. When the application is hidden, it is not visible on the screen or on the Windows task bar.
---	---------------	--

	<u>UnSetActiveObject</u>	This function removes the ETABSObject instance from the system Running Object Table (ROT).
---	--------------------------	--

	<u>Visible</u>	This function gets the application visibility.
---	----------------	--

CSI API ETABS v1

cOAPIAddLanguageSpecificTextSet("LST38FC36A7_0? Method

Exits the application.

Namespace: ETABSv1

Assembly: ETABSv1 (in ETABSv1.dll) Version: 1.0.0.0 (1.24.0.0)

▲ Syntax

C#

VB

C++

F#

Copy

```
int ApplicationExit(
    bool FileSave
)
```

```
Function ApplicationExit (
    FileSave As Boolean
) As Integer
```

```
Dim instance As cOAPI
Dim FileSave As Boolean
Dim returnValue As Integer
```

```
returnValue = instance.ApplicationExit(FileSave)
```

```
int ApplicationExit(
    bool FileSave
)
```

```
abstract ApplicationExit :
    FileSave : bool -> int
```

Parameters

FileSave

Type: SystemBoolean

If this item is True the existing model file is saved prior to closing the application.

Return Value

Type: Int32

This function returns zero if the function succeeds and nonzero if it fails.

▲ Remarks

If the model file is saved then it is saved with its current name. Any instance of cSapModel should be set to nothing after calling this function.

▲ Examples

cOAPIspan id="LST38FC36A7_0"AddLanguageSpecificTextSet("LST38FC36A7_0?cpp=::|nu=2510Application

VB

Copy

```
Public Sub Example()  
    Dim SapModel As cSapModel  
    Dim EtabsObject As cOAPI  
    Dim ret As Integer = -1  
  
    'create ETABS object  
    Dim myHelper as cHelper = New Helper  
    EtabsObject = myHelper.CreateObjectProgID("CSI.ETABS.API.ETABSObject")  
  
    'start ETABS application  
    ret = EtabsObject.ApplicationStart()  
  
    'close ETABS  
    EtabsObject.ApplicationExit(False)  
  
    'clean up variables  
    SapModel = Nothing  
    EtabsObject = Nothing  
End Sub
```

CSI API ETABS v1

cOAPIAddLanguageSpecificTextSet("LST3351E757_0? Method

This function starts the application.

Namespace: ETABSV1

Assembly: ETABSV1 (in ETABSV1.dll) Version: 1.0.0.0 (1.24.0.0)

▲ Syntax

C#

VB

C++

F#

Copy

```
int ApplicationStart()
```

Function ApplicationStart As Integer

```
Dim instance As cOAPI
```

```
Dim returnValue As Integer
```

```
returnValue = instance.ApplicationStart()
```

```
int ApplicationStart()
```

```
abstract ApplicationStart : unit -> int
```

Return Value

Type: Int32

This function returns zero if the application successfully starts and nonzero if it fails.

▲ Remarks

When the model is not visible it does not appear on screen and it does not appear in the Windows task bar.

▲ Examples

VB

Copy

```
Public Sub Example()
    Dim SapModel As cSapModel
    Dim EtabsObject As cOAPI
    Dim ret As Integer = -1

    'create ETABS object
    Dim myHelper as cHelper = New Helper
    EtabsObject = myHelper.CreateObjectProgID("CSI.ETABS.API.ETABSObject")

    'start ETABS application
    ret = EtabsObject.ApplicationStart()

    'close ETABS
    EtabsObject.ApplicationExit(False)
```

```
'clean up variables  
  SapModel = Nothing  
  EtabsObject = Nothing  
End Sub
```

CSI API ETABS v1

cOAPIAddLanguageSpecificTextSet("LST1F19D410_0? Method

This function hides the application. When the application is hidden it is not visible on the screen or on the Windows task bar.

Namespace: ETABSv1

Assembly: ETABSv1 (in ETABSv1.dll) Version: 1.0.0.0 (1.24.0.0)

▲ Syntax

C#

VB

C++

F#

Copy

```
int Hide()
```

Function Hide As Integer

```
Dim instance As cOAPI
```

```
Dim returnValue As Integer
```

```
returnValue = instance.Hide()
```

```
int Hide()
```

```
abstract Hide : unit -> int
```

Return Value

Type: Int32

The function returns zero if the application is successfully hidden and nonzero if the function fails. If the application is already hidden, calling this function returns an error.

▲ Remarks

▲ Examples

VB

Copy

```
Public Sub Example()
```

```
    Dim SapModel As cSapModel
```

```
    Dim EtabsObject As cOAPI
```

```
    Dim ret As Integer = -1
```

```
    'create ETABS object
```

```
    Dim myHelper as cHelper = New Helper
```

```
    EtabsObject = myHelper.CreateObjectProgID("CSI.ETABS.API.ETABSObject")
```

```
    'start ETABS application
```

```
    ret = EtabsObject.ApplicationStart()
```

```
    'create SapModel object
```

```
    SapModel = EtabsObject.SapModel
```

Introduction

```
'initialize model
    ret = SapModel.InitializeNewModel()

'create steel deck template model
    ret = SapModel.File.NewSteelDeck(4,12,12,4,4,24,24)

'hide application
    ret = SapObject.Hide

'unhide application
    ret = SapObject.Unhide

'close ETABS
    EtabsObject.ApplicationExit(False)

'clean up variables
    SapModel = Nothing
    EtabsObject = Nothing
End Sub
```

CSI API ETABS v1

cOAPIAddLanguageSpecificTextSet("LST2633D627_0?Method

This function sets the active ETABSObject instance in the system Running Object Table (ROT), replacing the previous instance (if any).

Namespace: ETABSv1

Assembly: ETABSv1 (in ETABSv1.dll) Version: 1.0.0.0 (1.24.0.0)

▲ Syntax

C#

VB

C++

F#

Copy

```
int SetAsActiveObject()
```

```
Function SetAsActiveObject As Integer
```

```
Dim instance As cOAPI
```

```
Dim returnValue As Integer
```

```
returnValue = instance.SetAsActiveObject()
```

```
int SetAsActiveObject()
```

```
abstract SetAsActiveObject : unit -> int
```

Return Value

Type: Int32

This function returns zero if the current instance is successfully added to the system ROT and nonzero if it fails.

▲ Remarks

When a new ETABSObject is created using the API, it is automatically added to the system ROT if none is already present. Creation of subsequent ETABSObject instances does not alter the ROT as long as at least one active instance is present in the ROT. GetObject(String) can be used to attach to the active ETABSObject instance registered in the ROT.

▲ Examples

VB

Copy

```
Public Sub Example()
```

```
    Dim EtabsObject As cOAPI
```

```
    Dim ret As Integer = -1
```

```
    'create ETABS object
```

```
    Dim myHelper as cHelper = New Helper
```

```
    EtabsObject = myHelper.CreateObjectProgID("CSI.ETABS.API.ETABSObject")
```

Introduction

```
'start ETABS application
    ret = EtabsObject.ApplicationStart()

'set as active instance
    ret = EtabsObject.SetAsActiveObject

'close ETABS
    EtabsObject.ApplicationExit(False)

'clean up variables
    EtabsObject = Nothing
End Sub
```

CSI API ETABS v1

cOAPIAddLanguageSpecificTextSet("LSTA921DB41_0") Method

This function unhides the application, that is, it makes it visible. When the application is hidden, it is not visible on the screen or on the Windows task bar.

Namespace: $\hat{A}$ ETABSV1

Assembly: $\hat{A}$ ETABSV1 (in ETABSV1.dll) Version: 1.0.0.0 (1.24.0.0)

▲ Syntax

C#

VB

C++

F#

Copy

```
int Unhide()
```

```
Function Unhide As Integer
```

```
Dim instance As cOAPI
```

```
Dim returnValue As Integer
```

```
returnValue = instance.Unhide()
```

```
int Unhide()
```

```
abstract Unhide : unit -> int
```

Return Value

Type: $\hat{A}$ Int32

The function returns zero if the application is successfully unhidden (set visible) and nonzero if the function fails. If the application is already visible (not hidden) calling this function returns an error.

▲ Remarks

▲ Examples

VB

Copy

```
Public Sub Example()
    Dim SapModel As cSapModel
    Dim EtabsObject As cOAPI
    Dim ret As Integer = -1

    'create ETABS object
    Dim myHelper as cHelper = New Helper
    EtabsObject = myHelper.CreateObjectProgID("CSI.ETABS.API.ETABSObject")

    'start ETABS application
    ret = EtabsObject.ApplicationStart()

    'create SapModel object
    SapModel = EtabsObject.SapModel
```

Introduction

```
'initialize model
    ret = SapModel.InitializeNewModel()

'create steel deck template model
    ret = SapModel.File.NewSteelDeck(4,12,12,4,4,24,24)

'hide application
    ret = SapObject.Hide

'unhide application
    ret = SapObject.Unhide

'close ETABS
    EtabsObject.ApplicationExit(False)

'clean up variables
    SapModel = Nothing
    EtabsObject = Nothing
End Sub
```

CSI API ETABS v1

cOAPIAddLanguageSpecificTextSet("LSTA7572DA7_01") Method

This function gets the application visibility.

Namespace: ETABSv1

Assembly: ETABSv1 (in ETABSv1.dll) Version: 1.0.0.0 (1.24.0.0)

▲ Syntax

C#

VB

C++

F#

Copy

bool Visible()

Function Visible As Boolean

Dim instance As cOAPI

Dim returnValue As Boolean

returnValue = instance.Visible()

bool Visible()

abstract Visible : unit -> bool

Return Value

Type: Boolean

Returns True if the application is visible on the screen, otherwise it returns False.

▲ Remarks

▲ Examples

VB

Copy

```
Public Sub Example()
    Dim SapModel As cSapModel
    Dim EtabsObject As cOAPI
    Dim ret As Integer = -1
    Dim Visible as Boolean

    'create ETABS object
    Dim myHelper as cHelper = New Helper
    EtabsObject = myHelper.CreateObjectProgID("CSI.ETABS.API.ETABSObject")

    'start ETABS application
    ret = EtabsObject.ApplicationStart()

    'create SapModel object
    SapModel = EtabsObject.SapModel

    'initialize model
    ret = SapModel.InitializeNewModel()
```

cOAPIspan id="LSTA7572DA7_0"AddLanguageSpecificTextSet("LSTA7572DA7_0?cpp=::|nu=2525"Visible M

Introduction

```
'create steel deck template model
  ret = SapModel.File.NewSteelDeck(4,12,12,4,4,24,24)

'get application visibility
  Visible = SapObject.Visible

'close ETABS
  EtabsObject.ApplicationExit(False)

'clean up variables
  SapModel = Nothing
  EtabsObject = Nothing
End Sub
```

CSI API ETABS v1

cPierLabelAddLanguageSpecificTextSet("LSTC4C88E6A_0?cpp=:2509.");Char

Method

Changes the name of a defined Pier Label

Namespace: ETABSv1

Assembly: ETABSv1 (in ETABSv1.dll) Version: 1.0.0.0 (1.24.0.0)

Syntax

C#

VB

C++

F#

Copy

```
int ChangeName(
    string Name,
    string NewName
)
```

```
Function ChangeName (
    Name As String,
    NewName As String
) As Integer
```

```
Dim instance As cPierLabel
Dim Name As String
Dim NewName As String
Dim returnValue As Integer
```

```
returnValue = instance.ChangeName(Name,
    NewName)
```

```
int ChangeName(
    String^ Name,
    String^ NewName
)
```

```
abstract ChangeName :
    Name : string *
    NewName : string -> int
```

Parameters

Name

Type: SystemString

The existing name of a defined Pier Label

NewName

Type: SystemString

The new name for the Pier Label

Return Value

Type: Int32

Returns zero if the new name is successfully applied, otherwise it returns a nonzero value.

▀ **Remarks**

▀ **Examples**

VB

Copy

```
Public Sub Example()
    Dim SapModel As cSapModel
    Dim EtabsObject As cOAPI
    Dim ret As Integer = -1

    'create ETABS object
    Dim myHelper as cHelper = New Helper
    EtabsObject = myHelper.CreateObjectProgID("CSI.ETABS.API.ETABSObject")

    'start ETABS application
    ret = EtabsObject.ApplicationStart()

    'create SapModel object
    SapModel = EtabsObject.SapModel

    'initialize model
    ret = SapModel.InitializeNewModel()

    'create steel deck template model
    ret = SapModel.File.NewSteelDeck(4, 12, 12, 4, 4, 24, 24)

    'define new pier label
    ret = SapModel.PierLabel.SetPier("MyPier")

    'change pier label
    ret = SapModel.PierLabel.ChangeName("MyPier", "Pier1A")

    'close ETABS
    EtabsObject.ApplicationExit(False)

    'clean up variables
    SapModel = Nothing
    EtabsObject = Nothing

End Sub
```

Dim returnValue As Integer
```

```
returnValue = instance.Delete(Name)
```

```
int Delete(
    String^ Name
)
```

```
abstract Delete :
    Name : string -> int
```

Parameters

Name

Type: [SystemString](#)

The name of an existing Pier Label

Return Value

Type: [Int32](#)

Returns zero if the Pier Label is successfully deleted, otherwise it returns a nonzero value.

▲ Remarks

▲ Examples

VB

[Copy](#)

```
Public Sub Example()

CSI API ETABS v1

cPierLabelAddLanguageSpecificTextSet("LST2D3E917F_0") Method

Retrieves the names of all defined Pier Labels

Namespace: [ETABSV1](#)

Assembly: [ETABSV1](#) (in ETABSV1.dll) Version: 1.0.0.0 (1.24.0.0)

Syntax

[C#](#)

[VB](#)

[C++](#)

[F#](#)

[Copy](#)

```
int GetNameList(
    ref int NumberNames,
    ref string[] MyName
)
```

```
Function GetNameList (
    ByRef NumberNames As Integer,
    ByRef MyName As String()
) As Integer
```

```
Dim instance As cPierLabel
Dim NumberNames As Integer
Dim MyName As String()
Dim returnValue As Integer
```

```
returnValue = instance.GetNameList(NumberNames,
    MyName)
```

```
int GetNameList(
    int% NumberNames,
    array<String^>^% MyName
)
```

```
abstract GetNameList :
    NumberNames : int byref *
    MyName : string[] byref -> int
```

Parameters

NumberNames

Type: [System.Int32](#)

The number of Pier Labels defined in the program

MyName

Type: [System.String](#)

This is a one-dimensional array of coordinate system names. The MyName array is created as a dynamic, zero-based, array by the API user:

```
Dim MyName() as String
```

The array is dimensioned to (NumberNames + 1) inside the ETABS program, filled with the names, and returned to the API user.

Return Value

Type: Int32

Returns zero if the names are successfully retrieved, otherwise it returns nonzero.

▲ **Remarks**

▲ **Examples**

VB

Copy

```
Public Sub Example()
    Dim SapModel As cSapModel
    Dim EtabsObject As cOAPI
    Dim ret As Integer = -1
    Dim NumberNames As Integer
    Dim MyName As String()

    'create ETABS object
    Dim myHelper as cHelper = New Helper
    EtabsObject = myHelper.CreateObjectProgID("CSI.ETABS.API.ETABSObject")

    'start ETABS application
    ret = EtabsObject.ApplicationStart()

    'create SapModel object
    SapModel = EtabsObject.SapModel

    'initialize model
    ret = SapModel.InitializeNewModel()

    'create steel deck template model
    ret = SapModel.File.NewSteelDeck(4, 12, 12, 4, 4, 24, 24)

    'define new pier label
    ret = SapModel.PierLabel.SetPier("MyPier")

    'get names
    ret = SapModel.PierLabel.GetNameList(NumberNames, MyName)

    'close ETABS
    EtabsObject.ApplicationExit(False)

    'clean up variables
    SapModel = Nothing
    EtabsObject = Nothing

End Sub
```

```

```
CGTopY : float[] byref *
CGTopZ : float[] byref -> int
```

Parameters

Name

Type:Â SystemString

The name of an existing pier.

NumberStories

Type:Â SystemInt32

The number of stories that the pier exists on and for which section properties are provided.

StoryName

Type:Â SystemString

This is an array that includes the story names at which the pier exists.

AxisAngle

Type:Â SystemDouble

This is an array that includes the pier local axis angle at each story, defined as the angle between the global x-axis and the pier local 2-axis.

NumAreaObjs

Type:Â SystemInt32

This is an array that includes the number of area objects in the pier at each story.

NumLineObjs

Type:Â SystemInt32

This is an array that includes the number of line objects in the pier at each story.

WidthBot

Type:Â SystemDouble

This is an array that includes the width of the pier at the bottom of each story.

ThicknessBot

Type:Â SystemDouble

This is an array that includes the thickness of the pier at the bottom of each story.

WidthTop

Type:Â SystemDouble

This is an array that includes the width of the pier at the top of each story.

ThicknessTop

Type:Â SystemDouble

This is an array that includes the thickness of the pier at the top of each story.

MatProp

Type:Â SystemString

This is an array that includes the name of the pier material property at each story.

CGBotX

Type:Â SystemDouble

This is an array that includes the x-coordinate of the pier center of gravity at the bottom of each story.

CGBotY

Type:Â SystemDouble

This is an array that includes the y-coordinate of the pier center of gravity at the

bottom of each story.

CGBotZ

Type: SystemDouble

This is an array that includes the z-coordinate of the pier center of gravity at the bottom of each story.

CGTopX

Type: SystemDouble

This is an array that includes the x-coordinate of the pier center of gravity at the top of each story.

CGTopY

Type: SystemDouble

This is an array that includes the y-coordinate of the pier center of gravity at the top of each story.

CGTopZ

Type: SystemDouble

This is an array that includes the z-coordinate of the pier center of gravity at the top of each story.

Return Value

Type: Int32

Returns zero if the data is successfully retrieved; otherwise it returns a nonzero value.

CSI API ETABS v1

cPluginCallbackAddLanguageSpecificTextSet("LST2A436DA8_0?cpi=1547|nu=."); Property

Indicates whether the plugin is finished

Namespace: [ETABSv1](#)

Assembly: [ETABSv1](#) (in ETABSv1.dll) Version: 1.0.0.0 (1.24.0.0)

▲ Syntax

[C#](#)

[VB](#)

[C++](#)

[F#](#)

[Copy](#)

```
bool Finished { get; }
```

ReadOnly Property Finished As Boolean
Get

```
Dim instance As cPluginCallback
Dim value As Boolean
```

```
value = instance.Finished
```

```
property bool Finished {
    bool get ();
}
```

```
abstract Finished : bool with get
```

Return Value

Type: [Boolean](#)

True if the plugin is finished; else False

CSI API ETABS v1

cPluginCallbackAddLanguageSpecificTextSet("LST8F5D6FCE_0?2549:|nu=.") Method

This method must be called when the plugin has finished.

Namespace: [ETABSv1](#)

Assembly: [ETABSv1](#) (in ETABSv1.dll) Version: 1.0.0.0 (1.24.0.0)

▲ Syntax

[C#](#)

[VB](#)

[C++](#)

[F#](#)

[Copy](#)

```
void Finish(
    int iVal
)
```

```
Sub Finish (
    iVal As Integer
)
```

```
Dim instance As cPluginCallback
Dim iVal As Integer
```

```
instance.Finish(iVal)
```

```
void Finish(
    int iVal
)
```

```
abstract Finish :
    iVal : int -> unit
```

Parameters

iVal

Type: [System.Int32](#)

Sets the [ErrorFlag](#) property

CSI API ETABS v1

cPluginContractAddLanguageSpecificTextSet("LSTD95B3204_0?cnu=.") Method

Provides information about the plugin

Namespace: [ETABSv1](#)

Assembly: [ETABSv1](#) (in ETABSv1.dll) Version: 1.0.0.0 (1.24.0.0)

▲ Syntax

[C#](#)

[VB](#)

[C++](#)

[F#](#)

[Copy](#)

```
int Info(
    ref string Text
)
```

```
Function Info (
    ByRef Text As String
) As Integer
```

```
Dim instance As cPluginContract
Dim Text As String
Dim returnValue As Integer
```

```
returnValue = instance.Info(Text)
```

```
int Info(
    String^% Text
)
```

```
abstract Info :
    Text : string byref -> int
```

Parameters

Text

Type: [SystemString](#)

Information about the plugin, e.g. author, version, description

Return Value

Type: [Int32](#)

Returns zero if the information is successfully retrieved; otherwise it returns a nonzero value

CSI API ETABS v1

cPluginContractAddLanguageSpecificTextSet("LST997E8963_0") Method

The entry point for launching the plugin

Namespace: [ETABSv1](#)

Assembly: [ETABSv1](#) (in ETABSv1.dll) Version: 1.0.0.0 (1.24.0.0)

▲ Syntax

[C#](#)

[VB](#)

[C++](#)

[F#](#)

[Copy](#)

```
void Main(
    ref cSapModel SapModel,
    ref cPluginCallback ISapPlugin
)
```

```
Sub Main (
    ByRef SapModel As cSapModel,
    ByRef ISapPlugin As cPluginCallback
)
```

```
Dim instance As cPluginContract
Dim SapModel As cSapModel
Dim ISapPlugin As cPluginCallback
```

```
instance.Main(SapModel, ISapPlugin)
```

```
void Main(
    cSapModel^% SapModel,
    cPluginCallback^% ISapPlugin
)
```

```
abstract Main :
    SapModel : cSapModel byref *
    ISapPlugin : cPluginCallback byref -> unit
```

Parameters

SapModel

Type: [ETABSv1cSapModel](#)

A reference to the SapModel object upon which all operations will be performed

ISapPlugin

Type: [ETABSv1cPluginCallback](#)

A reference to the callback object, used to retrieve the plugin status and notify the program when the plugin is closed

CSI API ETABS v1

cPointObj Interface

Namespace: [ETABSV1](#)

Assembly: [ETABSV1](#) (in ETABSV1.dll) Version: 1.0.0.0 (1.24.0.0)

▲ Syntax

[C#](#)

[VB](#)

[C++](#)

[F#](#)

[Copy](#)

```
public interface cPointObj
```

```
Public Interface cPointObj
```

```
Dim instance As cPointObj
```

```
public interface class cPointObj
```

```
type cPointObj = interface end
```

The cPointObj type exposes the following members.

▲ Methods

▲	Name	Description
⇒	AddCartesian	Adds a point object to a model. The added point object will be tagged as a Special Point except if it was merged with another point object. Special points are allowed to exist in the model with no objects connected to them.
⇒	ChangeName	
⇒	Count	
⇒	CountLoadDispl	
⇒	CountLoadForce	
⇒	CountPanelZone	
⇒	CountRestraint	
⇒	CountSpring	
⇒	DeleteLoadDispl	Deletes all ground displacement load assignments, for the specified load pattern, from the specified point object(s).
⇒	DeleteLoadForce	Deletes all point force load assignments, for the specified load pattern, from the specified point object(s).
⇒	DeleteMass	
⇒	DeletePanelZone	
⇒	DeleteRestraint	Deletes all restraint assignments from the specified point object(s).

Introduction

⇒ <u>DeleteSpecialPoint</u>	Deletes special point objects that have no other objects connected to them.
⇒ <u>DeleteSpring</u>	Deletes all point spring assignments from the specified point object(s).
⇒ <u>GetAllPoints</u>	Retrieves selected data for all point objects in the model
⇒ <u>GetCommonTo</u>	
⇒ <u>GetConnectivity</u>	Retrieves a list of objects connected to a specified point object
⇒ <u>GetCoordCartesian</u>	Retrieves the x, y and z coordinates of the specified point object in the Present Units.
⇒ <u>GetCoordCylindrical</u>	
⇒ <u>GetCoordSpherical</u>	
⇒ <u>GetDiaphragm</u>	Retrieves the diaphragm for a specified point object
⇒ <u>GetElm</u>	
⇒ <u>GetGroupAssign</u>	Retrieves the groups to which a point object is assigned.
⇒ <u>GetGUID</u>	Retrieves the GUID for specified point object.
⇒ <u>GetLabelFromName</u>	Retrieves the label and story for a unique point object name
⇒ <u>GetLabelNameList</u>	Retrieves the names and labels of all defined point objects.
⇒ <u>GetLoadDispl</u>	Retrieves the ground displacement load assignments to point objects.
⇒ <u>GetLoadForce</u>	Retrieves the joint force load assignments to point objects.
⇒ <u>GetLocalAxes</u>	Retrieves the local axis angles for a point object.
⇒ <u>GetMass</u>	
⇒ <u>GetNameFromLabel</u>	Retrieves the unique name of a point object, given the label and story level
⇒ <u>GetNameList</u>	Retrieves the names of all defined point objects.
⇒ <u>GetNameListOnStory</u>	Retrieves the names of the defined point objects on a given story.
⇒ <u>GetPanelZone</u>	
⇒ <u>GetRestraint</u>	Retrieves the restraint assignments for a point object. The restraint assignments are always returned in the point local coordinate system.
⇒ <u>GetSelected</u>	
⇒ <u>GetSpecialPoint</u>	
⇒ <u>GetSpring</u>	Retrieves uncoupled spring stiffness assignments for a point object, that is, it retrieves the diagonal terms in the 6x6 spring matrix for the point object.
⇒ <u>GetSpringAssignment</u>	Retrieves the named point spring property assignment for a point object
⇒ <u>GetSpringCoupled</u>	
⇒ <u>GetTransformationMatrix</u>	

 <u>IsSpringCoupled</u>	
 <u>SetDiaphragm</u>	Assigns a diaphragm to a point object
 <u>SetGroupAssign</u>	Adds or removes point objects from a specified group.
 <u>SetGUID</u>	Sets the GUID for specified point object. If the GUID is passed in as a blank string, the program automatically creates a GUID for the object.
 <u>SetLoadDispl</u>	Makes ground displacement load assignments to point objects.
 <u>SetLoadForce</u>	Makes point force load assignments to point objects.
 <u>SetMass</u>	
 <u>SetMassByVolume</u>	
 <u>SetMassByWeight</u>	
 <u>SetPanelZone</u>	
 <u>SetRestraint</u>	Assigns the restraint assignments for a point object. The restraint assignments are always set in the point local coordinate system.
 <u>SetSelected</u>	Sets the selected status for a point object.
 <u>SetSpecialPoint</u>	Sets the special point status for a point object.
 <u>SetSpring</u>	Assigns coupled springs to a point object.
 <u>SetSpringAssignment</u>	Assigns an existing named point spring property to point objects
 <u>SetSpringCoupled</u>

⇒	<u>DeletePanelZone</u>	
⇒	<u>DeleteRestraint</u>	Deletes all restraint assignments from the specified point object(s).
⇒	<u>DeleteSpecialPoint</u>	Deletes special point objects that have no other objects connected to them.
⇒	<u>DeleteSpring</u>	Deletes all point spring assignments from the specified point object(s).
⇒	<u>GetAllPoints</u>	Retrieves selected data for all point objects in the model
⇒	<u>GetCommonTo</u>	
⇒	<u>GetConnectivity</u>	Retrieves a list of objects connected to a specified point object
⇒	<u>GetCoordCartesian</u>	Retrieves the x, y and z coordinates of the specified point object in the Present Units.
⇒	<u>GetCoordCylindrical</u>	
⇒	<u>GetCoordSpherical</u>	
⇒	<u>GetDiaphragm</u>	Retrieves the diaphragm for a specified point object
⇒	<u>GetElm</u>	
⇒	<u>GetGroupAssign</u>	Retrieves the groups to which a point object is assigned.
⇒	<u>GetGUID</u>	Retrieves the GUID for specified point object.

Introduction

⇒ <u>GetLabelFromName</u>	Retrieves the label and story for a unique point object name
⇒ <u>GetLabelNameList</u>	Retrieves the names and labels of all defined point objects.
⇒ <u>GetLoadDispl</u>	Retrieves the ground displacement load assignments to point objects.
⇒ <u>GetLoadForce</u>	Retrieves the joint force load assignments to point objects.
⇒ <u>GetLocalAxes</u>	Retrieves the local axis angles for a point object.
⇒ <u>GetMass</u>	
⇒ <u>GetNameFromLabel</u>	Retrieves the unique name of a point object, given the label and story level
⇒ <u>GetNameList</u>	Retrieves the names of all defined point objects.
⇒ <u>GetNameListOnStory</u>	Retrieves the names of the defined point objects on a given story.
⇒ <u>GetPanelZone</u>	
⇒ <u>GetRestraint</u>	Retrieves the restraint assignments for a point object. The restraint assignments are always returned in the point local coordinate system.
⇒ <u>GetSelected</u>	
⇒ <u>GetSpecialPoint</u>	
⇒ <u>GetSpring</u>	Retrieves uncoupled spring stiffness assignments for a point object, that is, it retrieves the diagonal terms in the 6x6 spring matrix for the point object.
⇒ <u>GetSpringAssignment</u>	Retrieves the named point spring property assignment for a point object
⇒ <u>GetSpringCoupled</u>	
⇒ <u>GetTransformationMatrix</u>	
⇒ <u>IsSpringCoupled</u>	
⇒ <u>SetDiaphragm</u>	Assigns a diaphragm to a point object
⇒ <u>SetGroupAssign</u>	Adds or removes point objects from a specified group.
⇒ <u>SetGUID</u>	Sets the GUID for specified point object. If the GUID is passed in as a blank string, the program automatically creates a GUID for the object.
⇒ <u>SetLoadDispl</u>	Makes ground displacement load assignments to point objects.
⇒ <u>SetLoadForce</u>	Makes point force load assignments to point objects.
⇒ <u>SetMass</u>	
⇒ <u>SetMassByVolume</u>	
⇒ <u>SetMassByWeight</u>	
⇒ <u>SetPanelZone</u>	
⇒ <u>SetRestraint</u>	Assigns the restraint assignments for a point object. The restraint assignments are always set in the point local coordinate system.

Introduction

- ⇒ [SetSelected](#) Sets the selected status for a point object.
- ⇒ [SetSpecialPoint](#) Sets the special point status for a point object.
- ⇒ [SetSpring](#) Assigns coupled springs to a point object.
- ⇒ [SetSpringAssignment](#) Assigns an existing named point spring property to point objects
- ⇒ [SetSpringCoupled](#)

CSI API ETABS v1

cPointObjAddLanguageSpecificTextSet("LST95D093BA_0")

Method

Adds a point object to a model. The added point object will be tagged as a Special Point except if it was merged with another point object. Special points are allowed to exist in the model with no objects connected to them.

Namespace: ETABSv1

Assembly: ETABSv1 (in ETABSv1.dll) Version: 1.0.0.0 (1.24.0.0)

▲ Syntax

C#

VB

C++

F#

Copy

```
int AddCartesian(
    double X,
    double Y,
    double Z,
    ref string Name,
    string UserName = "",
    string CSys = "Global",
    bool MergeOff = false,
    int MergeNumber = 0
)
```

```
Function AddCartesian (
    X As Double,
    Y As Double,
    Z As Double,
    ByRef Name As String,
    Optional Name As String = "",
    Optional CSys As String = "Global",
    Optional MergeOff As Boolean = false,
    Optional MergeNumber As Integer = 0
) As Integer
```

```
Dim instance As cPointObj
Dim X As Double
Dim Y As Double
Dim Z As Double
Dim Name As String
Dim UserName As String
Dim CSys As String
Dim MergeOff As Boolean
Dim MergeNumber As Integer
Dim returnValue As Integer
```

```
returnValue = instance.AddCartesian(X,
    Y, Z, Name, UserName, CSys, MergeOff,
    MergeNumber)
```

```
int AddCartesian(
    double X,
```

cPointObjspan id="LST95D093BA_0"AddLanguageSpecificTextSet("LST95D093BA_0?cpp=::|2694);AddCa

```

double Y,
double Z,
String^% Name,
String^ UserName = L"",
String^ CSys = L"Global",
bool MergeOff = false,
int MergeNumber = 0
)

abstract AddCartesian :
    X : float *
    Y : float *
    Z : float *
    Name : string byref *
    ?UserName : string *
    ?CSys : string *
    ?MergeOff : bool *
    ?MergeNumber : int
(* Defaults:
    let _UserName = defaultArg UserName ""
    let _CSys = defaultArg CSys "Global"
    let _MergeOff = defaultArg MergeOff false
    let _MergeNumber = defaultArg MergeNumber 0
*)
-> int

```

Parameters

X

Type: SystemDouble

The X-coordinate of the added point object in the specified coordinate system.
[L]

Y

Type: SystemDouble

The Y-coordinate of the added point object in the specified coordinate system.
[L]

Z

Type: SystemDouble

The Z-coordinate of the added point object in the specified coordinate system.
[L]

Name

Type: SystemString

This is the name that the program ultimately assigns for the point object. If no userName is specified, the program assigns a default name to the point object. If a userName is specified and that name is not used for another point, the userName is assigned to the point; otherwise a default name is assigned to the point.

If a point is merged with another point, this will be the name of the point object with which it was merged.

UserName (Optional)

Type: SystemString

This is an optional user specified name for the point object. If a UserName is specified and that name is already used for another point object, the program ignores the UserName.

CSys (Optional)

Type:Â SystemString

The name of the coordinate system in which the joint coordinates are defined.

MergeOff (Optional)

Type:Â SystemBoolean

If this item is False, a new point object that is added at the same location as an existing point object will be merged with the existing point object (assuming the two point objects have the same MergeNumber) and thus only one point object will exist at the location.

If this item is True, the points will not merge and two point objects will exist at the same location.

MergeNumber (Optional)

Type:Â SystemInt32

Two points objects in the same location will merge only if their merge number assignments are the same. By default all pointobjects have a merge number of zero.

Return Value

Type:Â Int32

Returns zero if the point object is successfully added or merged, otherwise it returns a nonzero value.

▲Remarks

▲Examples

VB

Copy

```
Public Sub Example()
    Dim SapModel As cSapModel
    Dim EtabsObject As cOAPI
    Dim ret As Integer = -1
    Dim x As Double, y As Double, z As Double
    Dim Name As String
    Dim MyName As String

    'create ETABS object
    Dim myHelper as cHelper = New Helper
    EtabsObject = myHelper.CreateObjectProgID("CSI.ETABS.API.ETABSObject")

    'start ETABS application
    ret = EtabsObject.ApplicationStart()

    'create SapModel object
    SapModel = EtabsObject.SapModel

    'initialize model
    ret = SapModel.InitializeNewModel()

    'create steel deck template model
    ret = SapModel.File.NewSteelDeck(4, 12, 12, 4, 4, 24, 24)

    'add point object to model
    x = 12
    y = 37
    z = 0
    MyName = "A1"
```

Introduction

```
ret = SapModel.PointObj.AddCartesian(x, y, z, Name, MyName)

'close ETABS
  EtabsObject.ApplicationExit(False)

'clean up variables
  SapModel = Nothing
  EtabsObject = Nothing
End Sub
```

CSI API ETABS v1

cPointObjAddLanguageSpecificTextSet("LSTB119591D_0") Method

Deletes all ground displacement load assignments, for the specified load pattern, from the specified point object(s).

Namespace: [ETABSv1](#)

Assembly: [ETABSv1](#) (in ETABSv1.dll) Version: 1.0.0.0 (1.24.0.0)

Syntax

[C#](#)

[VB](#)

[C++](#)

[F#](#)

[Copy](#)

```
int DeleteLoadDispl(
    string Name,
    string LoadPat,
    eItemType ItemType = eItemType.Objects
)
```

```
Function DeleteLoadDispl (
    Name As String,
    LoadPat As String,
    ItemType As eItemType = eItemType.Objects
) As Integer
```

```
Dim instance As cPointObj
Dim Name As String
Dim LoadPat As String
Dim ItemType As eItemType
Dim returnValue As Integer
```

```
returnValue = instance.DeleteLoadDispl(Name,
    LoadPat, ItemType)
```

```
int DeleteLoadDispl(
    String^ Name,
    String^ LoadPat,
    eItemType ItemType = eItemType::Objects
)
```

```
abstract DeleteLoadDispl :
    Name : string *
    LoadPat : string *
    ?ItemType : eItemType
(* Defaults:
    let _ItemType = defaultArg ItemType eItemType.Objects
*)
-> int
```

Parameters**Name**

Type: SystemString

The name of an existing point object or group depending on the value of the ItemType item.

LoadPat

Type: SystemString

The name of the load pattern for the ground displacement load.

ItemType (Optional)

Type: ETABSV1eItemType

This is one of the following items in the eItemType enumeration:

◊ Object = 0

◊ Group = 1

◊ SelectedObjects = 2

If Objects is selected, the Name item refers to a point object. The load assignments, for the specified load pattern, made to that point object, are removed.

If Group is selected, the Name item refers to a group. The load assignments, for the specified load pattern, made to all point objects in the group, are removed.

If SelectedObjects is selected, the Name item is ignored. The load assignments, for the specified load pattern, made to all selected point objects, are removed.

Return Value

Type: Int32

Returns zero if the load assignments are successfully deleted, otherwise it returns a nonzero value.

Remarks**Examples**

VB

Copy

```
Public Sub Example()
    Dim SapModel As cSapModel
    Dim EtabsObject As cOAPI
    Dim ret As Integer = -1
    Dim Value as Double()

    'create ETABS object
    Dim myHelper as cHelper = New Helper
    EtabsObject = myHelper.CreateObjectProgID("CSI.ETABS.API.ETABSObject")

    'start ETABS application
    ret = EtabsObject.ApplicationStart()

    'create SapModel object
    SapModel = EtabsObject.SapModel

    'initialize model
    ret = SapModel.InitializeNewModel()

    'create steel deck template model
    ret = SapModel.File.NewSteelDeck(4, 12, 12, 4, 4, 24, 24)
```

Introduction

```
'add ground displacement load
  Redim Value(5)
  Value(0) = 10
  ret = SapModel.PointObj.SetLoadDispl("1", "DEAD", Value)

'delete ground displacement load
  ret = SapModel.PointObj.DeleteLoadDispl("1", "DEAD")

'close ETABS
  EtabsObject.ApplicationExit(False)

'clean up variables
  SapModel = Nothing
  EtabsObject = Nothing
End Sub
```

CSI API ETABS v1

cPointObjAddLanguageSpecificTextSet("LSTEC80F889_0")

Method

Deletes all point force load assignments, for the specified load pattern, from the specified point object(s).

Namespace: $\hat{A}$ ETABSV1

Assembly: $\hat{A}$ ETABSV1 (in ETABSV1.dll) Version: 1.0.0.0 (1.24.0.0)

▲ Syntax

C#

VB

C++

F#

Copy

```
int DeleteLoadForce(
    string Name,
    string LoadPat,
    eItemType ItemType = eItemType.Objects
)
```

```
Function DeleteLoadForce (
    Name As String,
    LoadPat As String,
    ItemType As eItemType = eItemType.Objects
) As Integer
```

```
Dim instance As cPointObj
Dim Name As String
Dim LoadPat As String
Dim ItemType As eItemType
Dim returnValue As Integer
```

```
returnValue = instance.DeleteLoadForce(Name,
    LoadPat, ItemType)
```

```
int DeleteLoadForce(
    String^ Name,
    String^ LoadPat,
    eItemType ItemType = eItemType::Objects
)
```

```
abstract DeleteLoadForce :
    Name : string *
    LoadPat : string *
    ?ItemType : eItemType
(* Defaults:
    let _ItemType = defaultArg ItemType eItemType.Objects
*)
-> int
```

Parameters**Name**

Type: SystemString

The name of an existing point object or group depending on the value of the ItemType item.

LoadPat

Type: SystemString

The name of the load pattern for the point force load.

ItemType (Optional)

Type: ETABSV1eItemType

This is one of the following items in the eItemType enumeration:

◊ Object = 0

◊ Group = 1

◊ SelectedObjects = 2

If Objects is selected, the Name item refers to a point object. The load assignments, for the specified load pattern, made to that point object, are removed.

If Group is selected, the Name item refers to a group. The load assignments, for the specified load pattern, made to all point objects in the group, are removed.

If SelectedObjects is selected, the Name item is ignored. The load assignments, for the specified load pattern, made to all selected point objects, are removed.

Return Value

Type: Int32

Returns zero if the load assignments are successfully deleted, otherwise it returns a nonzero value.

Remarks**Examples**

VB

Copy

```
Public Sub Example()
    Dim SapModel As cSapModel
    Dim EtabsObject As cOAPI
    Dim ret As Integer = -1
    Dim Value as Double()

    'create ETABS object
    Dim myHelper as cHelper = New Helper
    EtabsObject = myHelper.CreateObjectProgID("CSI.ETABS.API.ETABSObject")

    'start ETABS application
    ret = EtabsObject.ApplicationStart()

    'create SapModel object
    SapModel = EtabsObject.SapModel

    'initialize model
    ret = SapModel.InitializeNewModel()

    'create steel deck template model
    ret = SapModel.File.NewSteelDeck(4, 12, 12, 4, 4, 24, 24)
```

Introduction

```
'add point load
  Redim Value(5)
  Value(0) = 10
  ret = SapModel.PointObj.SetLoadForce("2", "DEAD", Value)

'delete point load
  ret = SapModel.PointObj.DeleteLoadForce("2", "DEAD")

'close ETABS
  EtabsObject.ApplicationExit(False)

'clean up variables
  SapModel = Nothing
  EtabsObject = Nothing
End Sub
```

CSI API ETABS v1

cPointObjAddLanguageSpecificTextSet("LST46737A3A") Method

Deletes all restraint assignments from the specified point object(s).

Namespace: [ETABSv1](#)

Assembly: [ETABSv1](#) (in ETABSv1.dll) Version: 1.0.0.0 (1.24.0.0)

Syntax

[C#](#)

[VB](#)

[C++](#)

[F#](#)

[Copy](#)

```
int DeleteRestraint(
    string Name,
    eItemType ItemType = eItemType.Objects
)
```

```
Function DeleteRestraint (
    Name As String,
    ?ItemType As eItemType = eItemType.Objects
) As Integer
```

```
Dim instance As cPointObj
Dim Name As String
Dim ItemType As eItemType
Dim returnValue As Integer
```

```
returnValue = instance.DeleteRestraint(Name,
    ItemType)
```

```
int DeleteRestraint(
    String^ Name,
    eItemType ItemType = eItemType::Objects
)
```

```
abstract DeleteRestraint :
    Name : string *
    ?ItemType : eItemType
(* Defaults:
    let _ItemType = defaultArg ItemType eItemType.Objects
*)
-> int
```

Parameters

Name

Type: [SystemString](#)

The name of an existing point object or group depending on the value of the ItemType item.

ItemType (Optional)

Type: ETABSv1eItemType

This is one of the following items in the eItemType enumeration:

- ◊ Object = 0
- ◊ Group = 1
- ◊ SelectedObjects = 2

If Objects is selected, the Name item refers to a point object. The restraint assignments for that point object are removed.

If Group is selected, the Name item refers to a group. The restraint assignments for all point objects in the group are removed.

If SelectedObjects is selected, the Name item is ignored. The restraint assignments for all selected point objects are removed.

Return Value

Type: Int32

Returns zero if the restraint assignments are successfully deleted, otherwise it returns a nonzero value.

▲ Remarks

▲ Examples

VB

Copy

```
Public Sub Example()
    Dim SapModel As cSapModel
    Dim EtabsObject As cOAPI
    Dim ret As Integer = -1

    'create ETABS object
    Dim myHelper as cHelper = New Helper
    EtabsObject = myHelper.CreateObjectProgID("CSI.ETABS.API.ETABSObject")

    'start ETABS application
    ret = EtabsObject.ApplicationStart()

    'create SapModel object
    SapModel = EtabsObject.SapModel

    'initialize model
    ret = SapModel.InitializeNewModel()

    'create steel deck template model
    ret = SapModel.File.NewSteelDeck(4, 12, 12, 4, 4, 24, 24)

    'delete joint restraint assignment
    ret = SapModel.PointObj.DeleteRestraint("65")

    'close ETABS
    EtabsObject.ApplicationExit(False)

    'clean up variables
    SapModel = Nothing
    EtabsObject = Nothing
End Sub
```

CSI API ETABS v1

cPointObjAddLanguageSpecificTextSet("LSTC6F467E_0") Method

Deletes special point objects that have no other objects connected to them.

Namespace: [ETABSv1](#)

Assembly: [ETABSv1](#) (in ETABSv1.dll) Version: 1.0.0.0 (1.24.0.0)

Syntax

[C#](#)

[VB](#)

[C++](#)

[F#](#)

[Copy](#)

```
int DeleteSpecialPoint(
    string Name,
    eItemType ItemType = eItemType.Objects
)
```

```
Function DeleteSpecialPoint (
    Name As String,
    ?ItemType As eItemType = eItemType.Objects
) As Integer
```

```
Dim instance As cPointObj
Dim Name As String
Dim ItemType As eItemType
Dim returnValue As Integer
```

```
returnValue = instance.DeleteSpecialPoint(Name,
    ItemType)
```

```
int DeleteSpecialPoint(
    String^ Name,
    eItemType ItemType = eItemType::Objects
)
```

```
abstract DeleteSpecialPoint :
    Name : string *
    ?ItemType : eItemType
(* Defaults:
    let _ItemType = defaultArg ItemType eItemType.Objects
*)
-> int
```

Parameters

Name

Type: [SystemString](#)

The name of an existing point object or group depending on the value of the ItemType item.

ItemType (Optional)

Type: ETABSv1eItemType

This is one of the following items in the eItemType enumeration:

- ◊ Object = 0
- ◊ Group = 1
- ◊ SelectedObjects = 2

If Objects is selected, the deletion applies to the point object specified by the Name item.

If Group is selected, the deletion applies to all point objects in the group specified by the Name item.

If SelectedObjects is selected, the deletion applies to all selected point objects, and the Name item is ignored.

Return Value

Type: Int32

Returns zero if the function completes successfully, otherwise it returns a nonzero value.

Remarks

Point objects can be deleted only if they have no other objects (e.g., frame, cable, tendon, area, solid link) connected to them. If a point object is not specified to be a Special Point, the program automatically deletes that point object when it has no other objects connected to it. If a point object is specified to be a Special Point, to delete it, first delete all other objects connected to the point and then call this function to delete the point.

Examples

VB

Copy

```
Public Sub Example()
    Dim SapModel As cSapModel
    Dim EtabsObject As cOAPI
    Dim ret As Integer = -1

    'create ETABS object
    Dim myHelper as cHelper = New Helper
    EtabsObject = myHelper.CreateObjectProgID("CSI.ETABS.API.ETABSObject")

    'start ETABS application
    ret = EtabsObject.ApplicationStart()

    'create SapModel object
    SapModel = EtabsObject.SapModel

    'initialize model
    ret = SapModel.InitializeNewModel()

    'create steel deck template model
    ret = SapModel.File.NewSteelDeck(4, 12, 12, 4, 4, 24, 24)

    'set as special point
    ret = SapModel.PointObj.SetSpecialPoint("3", True)

    'delete frame objects
    ret = SapModel.FrameObj.Delete("2")
    ret = SapModel.FrameObj.Delete("8")
end Sub
```

Introduction

```
'delete special point object
    ret = SapModel.PointObj.DeleteSpecialPoint("3")

'close ETABS
    EtabsObject.ApplicationExit(False)

'clean up variables
    SapModel = Nothing
    EtabsObject = Nothing
End Sub
```

CSI API ETABS v1

cPointObjAddLanguageSpecificTextSet("LST6BE565590") Method

Deletes all point spring assignments from the specified point object(s).

Namespace: [ETABSv1](#)

Assembly: [ETABSv1](#) (in ETABSv1.dll) Version: 1.0.0.0 (1.24.0.0)

Syntax

[C#](#)

[VB](#)

[C++](#)

[F#](#)

[Copy](#)

```
int DeleteSpring(
    string Name,
    eItemType ItemType = eItemType.Objects
)
```

```
Function DeleteSpring (
    Name As String,
    ?ItemType As eItemType = eItemType.Objects
) As Integer
```

```
Dim instance As cPointObj
Dim Name As String
Dim ItemType As eItemType
Dim returnValue As Integer
```

```
returnValue = instance.DeleteSpring(Name,
    ItemType)
```

```
int DeleteSpring(
    String^ Name,
    eItemType ItemType = eItemType::Objects
)
```

```
abstract DeleteSpring :
    Name : string *
    ?ItemType : eItemType
(* Defaults:
    let _ItemType = defaultArg ItemType eItemType.Objects
*)
-> int
```

Parameters

Name

Type: [SystemString](#)

The name of an existing point object or group depending on the value of the ItemType item.

ItemType (Optional)

Type: ETABSv1eItemType

This is one of the following items in the eItemType enumeration:

- ◊ Object = 0
- ◊ Group = 1
- ◊ SelectedObjects = 2

If Objects is selected, the Name item refers to a point object. The point spring assignments for that point object are removed.

If Group is selected, the Name item refers to a group. The point spring assignments for all point objects in the group are removed.

If SelectedObjects is selected, the Name item is ignored. The point spring assignments for all selected point objects are removed.

Return Value

Type: Int32

Returns zero if the restraint assignments are successfully deleted, otherwise it returns a nonzero value.

▲ Remarks

cPointObjid="LST7525B610_0"AddLanguageSpecificTextSet("LST7525B610_0?cpp=::|num=264)|GetCon

PointNumber : int[] byref -> int

Parameters

Name

Type: SystemString

The name of an existing point object

NumberItems

Type: SystemInt32

This is the total number of objects connected to the specified point object

ObjectType

Type: SystemInt32

This is an array that includes the object type of each object connected to the specified point object.

2 Frame object

3 Cable object

4 Tendon object

5 Area object

6 Solid object

7 Link object

ObjectName

Type: SystemString

This is an array that includes the object name of each object connected to the specified point object

PointNumber

Type: SystemInt32

This is an array that includes the point number within the considered object that corresponds to the specified point object

Return Value

Type: Int32

Returns zero if the list is successfully filled; otherwise it returns nonzero

CSI API ETABS v1

cPointObjAddLanguageSpecificTextSet("LST8A4796A8_0") Method

Retrieves the x, y and z coordinates of the specified point object in the Present Units.

Namespace: ETABSv1

Assembly: ETABSv1 (in ETABSv1.dll) Version: 1.0.0.0 (1.24.0.0)

Syntax

C#

VB

C++

F#

Copy

```
int GetCoordCartesian(
    string Name,
    ref double X,
    ref double Y,
    ref double Z,
    string CSys = "Global"
)
```

```
Function GetCoordCartesian (
    Name As String,
    ByRef X As Double,
    ByRef Y As Double,
    ByRef Z As Double,
    Optional CSys As String = "Global"
) As Integer
```

```
Dim instance As cPointObj
Dim Name As String
Dim X As Double
Dim Y As Double
Dim Z As Double
Dim CSys As String
Dim returnValue As Integer
```

```
returnValue = instance.GetCoordCartesian(Name,
    X, Y, Z, CSys)
```

```
int GetCoordCartesian(
    String^ Name,
    double% X,
    double% Y,
    double% Z,
    String^ CSys = L"Global"
)
```

```
abstract GetCoordCartesian :
    Name : string *
    X : float byref *
    Y : float byref *
    Z : float byref *
    ?CSys : string
```

cPointObjid="LST8A4796A8_0"AddLanguageSpecificTextSet("LST8A4796A8_0?cpp=::|n2643;GetCo

```
(* Defaults:
    let _CSys = defaultArg CSys "Global"
*)
-> int
```

Parameters

Name

Type:Â SystemString
The name of a defined point object.

X

Type:Â SystemDouble
The X-coordinate of the specified point object in the specified coordinate system. [L]

Y

Type:Â SystemDouble
The Y-coordinate of the specified point object in the specified coordinate system. [L]

Z

Type:Â SystemDouble
The Z-coordinate of the specified point object in the specified coordinate system. [L]

CSys (Optional)

Type:Â SystemString
The name of a defined coordinate system. If Csys is not specified, the Global coordinate system is assumed.

Return Value

Type:Â Int32

Returns zero if the coordinates are successfully returned; otherwise it returns nonzero.

▲ Remarks

The coordinates are reported in the coordinate system specified by CSys.

▲ Examples

VB

Copy

```
Public Sub Example()
    Dim SapModel As cSapModel
    Dim EtabsObject As cOAPI
    Dim ret As Integer = -1
    Dim x As Double, y As Double, z As Double

    'create ETABS object

CSI API ETABS v1

cPointObjAddLanguageSpecificTextSet("LST2397FCC2_0")

Method

Retrieves the diaphragm for a specified point object

Namespace: ETABSv1

Assembly: ETABSv1 (in ETABSv1.dll) Version: 1.0.0.0 (1.24.0.0)

Syntax

C#

VB

C++

F#

Copy

```
int GetDiaphragm(
    string Name,
    ref eDiaphragmOption DiaphragmOption,
    ref string DiaphragmName
)
```

```
Function GetDiaphragm (
    Name As String,
    ByRef DiaphragmOption As eDiaphragmOption,
    ByRef DiaphragmName As String
) As Integer
```

```
Dim instance As cPointObj
Dim Name As String
Dim DiaphragmOption As eDiaphragmOption
Dim DiaphragmName As String
Dim returnValue As Integer
```

```
returnValue = instance.GetDiaphragm(Name,
    DiaphragmOption, DiaphragmName)
```

```
int GetDiaphragm(
    String^ Name,
    eDiaphragmOption% DiaphragmOption,
    String^% DiaphragmName
)
```

```
abstract GetDiaphragm :
    Name : string *
    DiaphragmOption : eDiaphragmOption byref *
    DiaphragmName : string byref -> int
```

Parameters

Name

Type: SystemString

The name of an existing point object

DiaphragmOption

Type: ETABSv1eDiaphragmOption

This is an item from the eDiaphragmOption enumeration

If this item is Disconnect then the point object is disconnected from any diaphragm

If this item is FromShellObject then the point object inherits the diaphragm assignment of its bounding area object.

If this item is DefinedDiaphragm then the point object is assigned to the existing diaphragm specified by DiaphragmName

DiaphragmName

Type: SystemString

The name of an existing diaphragm. This item will only be filled if DiaphragmOption is DefinedDiaphragm

Return Value

Type: Int32

Returns zero if the diaphragm assignment is successfully retrieved, otherwise it returns a nonzero value.

▲ Remarks

▲ Examples

VB

Copy

```
Public Sub Example()
    Dim SapModel As cSapModel
    Dim EtabsObject As cOAPI
    Dim ret As Integer = -1
    Dim DiaphragmOption As eDiaphragmOption
    Dim DiaphragmName As String

    'create ETABS object
    Dim myHelper as cHelper = New Helper
    EtabsObject = myHelper.CreateObjectProgID("CSI.ETABS.API.ETABSObject")

    'start ETABS application
    ret = EtabsObject.ApplicationStart()

    'create SapModel object
    SapModel = EtabsObject.SapModel

    'initialize model
    ret = SapModel.InitializeNewModel()

    'create steel deck template model
    ret = SapModel.File.NewSteelDeck(4, 12, 12, 4, 4, 24, 24)

    'define a new diaphragm
    ret = SapModel.Diaphragm.SetDiaphragm("MyDiaph1A", True)

    'assign diaphragm to point
    ret = SapModel.PointObj.SetDiaphragm("1", eDiaphragmOption.DefinedDiaphragm, "MyDiaph1A")

    'get point diaphragm assignment
    ret = SapModel.PointObj.GetDiaphragm("1", DiaphragmOption, DiaphragmName)
```

Introduction

```
'close ETABS
  EtabsObject.ApplicationExit(False)

'clean up variables
  SapModel = Nothing
  EtabsObject = Nothing
End Sub
```

CSI API ETABS v1

cPointObjAddLanguageSpecificTextSet("LSTA8763D8F0")

Method

Retrieves the groups to which a point object is assigned.

Namespace: [ETABSv1](#)

Assembly: [ETABSv1](#) (in ETABSv1.dll) Version: 1.0.0.0 (1.24.0.0)

Syntax

[C#](#)

[VB](#)

[C++](#)

[F#](#)

[Copy](#)

```
int GetGroupAssign(
    string Name,
    ref int NumberGroups,
    ref string[] Groups
)
```

```
Function GetGroupAssign (
    Name As String,
    ByRef NumberGroups As Integer,
    ByRef Groups As String()
) As Integer
```

```
Dim instance As cPointObj
Dim Name As String
Dim NumberGroups As Integer
Dim Groups As String()
Dim returnValue As Integer
```

```
returnValue = instance.GetGroupAssign(Name,
    NumberGroups, Groups)
```

```
int GetGroupAssign(
    String^ Name,
    int% NumberGroups,
    array<String^>^% Groups
)
```

```
abstract GetGroupAssign :
    Name : string *
    NumberGroups : int byref *
    Groups : string[] byref -> int
```

Parameters

Name

Type: [SystemString](#)

The name of an existing point object.

NumberGroups

Type: SystemInt32

The number of group names retrieved.

Groups

Type: SystemString

This is an array of the names of the groups to which the point object is assigned.

Return Value

Type: Int32

Returns zero if the group assignments are successfully retrieved, otherwise it returns a nonzero value.

▀ Remarks

▀ Examples

VB

Copy

```
Public Sub Example()
    Dim SapModel As cSapModel
    Dim EtabsObject As cOAPI
    Dim ret As Integer = -1
    Dim NumberGroups As Integer
    Dim Groups() as String

    'create ETABS object
    Dim myHelper as cHelper = New Helper
    EtabsObject = myHelper.CreateObjectProgID("CSI.ETABS.API.ETABSObject")

    'start ETABS application
    ret = EtabsObject.ApplicationStart()

    'create SapModel object
    SapModel = EtabsObject.SapModel

    'initialize model
    ret = SapModel.InitializeNewModel()

    'create steel deck template model
    ret = SapModel.File.NewSteelDeck(4, 12, 12, 4, 4, 24, 24)

    'define new groups
    ret = SapModel.GroupDef.SetGroup("Group1")
    ret = SapModel.GroupDef.SetGroup("Group2")

    'add point object to groups
    ret = SapModel.PointObj.SetGroupAssign("3", "Group1")
    ret = SapModel.PointObj.SetGroupAssign("3", "Group2")

    'get point object groups
    ret = SapModel.PointObj.GetGroupAssign("3", NumberGroups, Groups)

    'close ETABS
    EtabsObject.ApplicationExit(False)

    'clean up variables
    SapModel = Nothing
    EtabsObject = Nothing
End Sub
```

CSI API ETABS v1

cPointObjAddLanguageSpecificTextSet("LSTEC6350B9_0?cpp=::|2658);GetGUID")

Method

Retrieves the GUID for specified point object.

Namespace: ETABSv1

Assembly: ETABSv1 (in ETABSv1.dll) Version: 1.0.0.0 (1.24.0.0)

Syntax

C#

VB

C++

F#

Copy

```
int GetGUID(
    string Name,
    ref string GUID
)
```

```
Function GetGUID (
    Name As String,
    ByRef GUID As String
) As Integer
```

```
Dim instance As cPointObj
Dim Name As String
Dim GUID As String
Dim returnValue As Integer
```

```
returnValue = instance.GetGUID(Name, GUID)
```

```
int GetGUID(
    String^ Name,
    String^% GUID
)
```

```
abstract GetGUID :
    Name : string *
    GUID : string byref -> int
```

Parameters

Name

Type: SystemString

The name of an existing point object.

GUID

Type: SystemString

The GUID (Global Unique ID) for the specified point object.

Return Value

Type: Int32

Returns zero if the point object GUID is successfully retrieved; otherwise it returns nonzero.

▀ **Remarks**

▀ **Examples**

VB

Copy

```
Public Sub Example()
    Dim SapModel As cSapModel
    Dim EtabsObject As cOAPI
    Dim ret As Integer = -1
    Dim GUID As String

    'create ETABS object
    Dim myHelper as cHelper = New Helper
    EtabsObject = myHelper.CreateObjectProgID("CSI.ETABS.API.ETABSObject")

    'start ETABS application
    ret = EtabsObject.ApplicationStart()

    'create SapModel object
    SapModel = EtabsObject.SapModel

    'initialize model
    ret = SapModel.InitializeNewModel()

    'create steel deck template model
    ret = SapModel.File.NewSteelDeck(4, 12, 12, 4, 4, 24, 24)

    'get GUID
    ret = SapModel.PointObj.GetGUID("1", GUID)

    'close ETABS
    EtabsObject.ApplicationExit(False)

    'clean up variables
    SapModel = Nothing
    EtabsObject = Nothing

End Sub
```

CSI API ETABS v1

cPointObjAddLanguageSpecificTextSet("LST5AD85C6D_0?cpp=::2660");GetL

Method

Retrieves the label and story for a unique point object name

Namespace: [ETABSV1](#)

Assembly: [ETABSV1](#) (in ETABSV1.dll) Version: 1.0.0.0 (1.24.0.0)

▲ Syntax

[C#](#)

[VB](#)

[C++](#)

[F#](#)

[Copy](#)

```
int GetLabelFromName(
    string Name,
    ref string Label,
    ref string Story
)
```

```
Function GetLabelFromName (
    Name As String,
    ByRef Label As String,
    ByRef Story As String
) As Integer
```

```
Dim instance As cPointObj
Dim Name As String
Dim Label As String
Dim Story As String
Dim returnValue As Integer
```

```
returnValue = instance.GetLabelFromName(Name,
    Label, Story)
```

```
int GetLabelFromName(
    String^ Name,
    String^% Label,
    String^% Story
)
```

```
abstract GetLabelFromName :
    Name : string *
    Label : string byref *
    Story : string byref -> int
```

Parameters

Name

Type: [SystemString](#)

The name of the point object

Label

Type:Â SystemString
 The point object label

Story

Type:Â SystemString
 The point object story level

Return Value

Type:Â Int32
 Returns zero if the data is successfully retrieved, otherwise it returns nonzero.

Remarks

Examples

VB

Copy

```
Public Sub Example()
    Dim SapModel As cSapModel
    Dim EtabsObject As cOAPI
    Dim ret As Integer = -1
    Dim NumberNames As Integer
    Dim Label As String
    Dim Story As String

    'create ETABS object
    Dim myHelper as cHelper = New Helper
    EtabsObject = myHelper.CreateObjectProgID("CSI.ETABS.API.ETABSObject")

    'start ETABS application
    ret = EtabsObject.ApplicationStart()

    'create SapModel object
    SapModel = EtabsObject.SapModel

    'initialize model
    ret = SapModel.InitializeNewModel()

    'create steel deck template model
    ret = SapModel.File.NewSteelDeck(4, 12, 12, 4, 4, 24, 24)

    'get area object data
    ret = SapModel.PointObj.GetLabelFromName("42", Label, Story)

    'close ETABS
    EtabsObject.ApplicationExit(False)

    'clean up variables
    SapModel = Nothing
    EtabsObject = Nothing
End Sub
```

CSI API ETABS v1

cPointObjAddLanguageSpecificTextSet("LST7A2E94E3_0") Method

Retrieves the names and labels of all defined point objects.

Namespace: ETABSv1

Assembly: ETABSv1 (in ETABSv1.dll) Version: 1.0.0.0 (1.24.0.0)

▲ Syntax

C#

VB

C++

F#

Copy

```
int GetLabelNameList(
    ref int NumberNames,
    ref string[] MyName,
    ref string[] MyLabel,
    ref string[] MyStory
)
```

```
Function GetLabelNameList (
    ByRef NumberNames As Integer,
    ByRef MyName As String(),
    ByRef MyLabel As String(),
    ByRef MyStory As String()
) As Integer
```

```
Dim instance As cPointObj
Dim NumberNames As Integer
Dim MyName As String()
Dim MyLabel As String()
Dim MyStory As String()
Dim returnValue As Integer
```

```
returnValue = instance.GetLabelNameList(NumberNames,
    MyName, MyLabel, MyStory)
```

```
int GetLabelNameList(
    int% NumberNames,
    array<String^>^% MyName,
    array<String^>^% MyLabel,
    array<String^>^% MyStory
)
```

```
abstract GetLabelNameList :
    NumberNames : int byref *
    MyName : string[] byref *
    MyLabel : string[] byref *
    MyStory : string[] byref -> int
```

Parameters**NumberNames**

Type: SystemInt32

The number of point object names retrieved by the program.

MyName

Type: SystemString

This is a one-dimensional array of point object names. The MyName array is created as a dynamic, zero-based, array by the API user:

```
Dim MyName() as String
```

The array is dimensioned to (NumberNames + 1) inside the program, filled with the names, and returned to the API user.

MyLabel

Type: SystemString

This is a one-dimensional array of point object labels. The MyLabel array is created as a dynamic, zero-based, array by the API user:

```
Dim MyLabel() as String
```

The array is dimensioned to (NumberNames + 1) inside the program, filled with the labels, and returned to the API user.

MyStory

Type: SystemString

This is a one-dimensional array of the story levels of the point objects. The MyStory array is created as a dynamic, zero-based, array by the API user:

```
Dim MyStory() as String
```

The array is dimensioned to (NumberNames + 1) inside the program, filled with the story levels, and returned to the API user.

Return Value

Type: Int32

Returns zero if the data is successfully retrieved, otherwise it returns nonzero.

▲ Remarks

▲ Examples

VB

Copy

```
Public Sub Example()
    Dim SapModel As cSapModel
    Dim EtabsObject As cOAPI
    Dim ret As Integer = -1
    Dim NumberNames As Integer
    Dim MyName() As String
    Dim MyLabel() As String
    Dim MyStory() As String

    'create ETABS object
    Dim myHelper as cHelper = New Helper
    EtabsObject = myHelper.CreateObjectProgID("CSI.ETABS.API.ETABSObject")
```

```
'start ETABS application
  ret = EtabsObject.ApplicationStart()

'create SapModel object
  SapModel = EtabsObject.SapModel

'initialize model
  ret = SapModel.InitializeNewModel()

'create steel deck template model
  ret = SapModel.File.NewSteelDeck(4, 12, 4, 4, 24, 24)

'get area object data
  ret = SapModel.PointObj.GetLabelNameList(NumberNames, MyName, MyLabel, MyStory)

'close ETABS
  EtabsObject.ApplicationExit(False)

'clean up variables
  SapModel = Nothing
  EtabsObject = Nothing

End Sub
```

    R3 : float[] byref *
    ?ItemType : eItemType
(* Defaults:
    let _ItemType = defaultArg ItemType eItemType.Objects
*)
-> int
```

Parameters

Name

Type:Â SystemString

The name of an existing point object or group depending on the value of the ItemType item.

NumberItems

Type:Â SystemInt32

This is the total number of joint ground displacement assignments returned.

PointName

Type:Â SystemString

This is an array that includes the name of the point object to which the specified

ground displacement assignment applies.

LoadPat

Type: SystemString

This is an array that includes the name of the load pattern for the ground displacement load.

LcStep

Type: SystemInt32

CSys

Type: SystemString

This is an array that includes the name of the coordinate system for the ground displacement load. This is Local or the name of a defined coordinate system.

U1

Type: SystemDouble

This is an array that includes the assigned translational ground displacement in the local 1-axis or coordinate system X-axis direction, depending on the specified CSys. [L]

U2

Type: SystemDouble

This is an array that includes the assigned translational ground displacement in the local 2-axis or coordinate system Y-axis direction, depending on the specified CSys. [L]

U3

Type: SystemDouble

R1

Type: SystemDouble

This is an array that includes the assigned rotational ground displacement about the local 1-axis or coordinate system X-axis, depending on the specified CSys. [rad]

R2

Type: SystemDouble

This is an array that includes the assigned rotational ground displacement about the local 2-axis or coordinate system Y-axis, depending on the specified CSys. [rad]

R3

Type: SystemDouble

This is an array that includes the assigned rotational ground displacement about the local 3-axis or coordinate system Z-axis, depending on the specified CSys. [rad]

ItemType (Optional)

Type: ETABSv1eItemType

This is one of the following items in the eItemType enumeration:

◊ Object = 0

◊ Group = 1

◊ SelectedObjects = 2

If this item is Objects, the load assignments are retrieved for the point object specified by the Name item.

If this item is Group, the load assignments are retrieved for all point objects in the group specified by the Name item.

If this item is SelectedObjects, the load assignments are retrieved for all selected point objects and the Name item is ignored.

Return Value

Type: Int32

Returns zero if the load assignments are successfully retrieved, otherwise it returns a nonzero value.

▲ Remarks

▲ Examples

VB

Copy

```
Public Sub Example()
    Dim SapModel As cSapModel
    Dim EtabsObject As cOAPI

    F3 : float[] byref *
    M1 : float[] byref *
    M2 : float[] byref *
    M3 : float[] byref *
    ?ItemType : eItemType
(* Defaults:
    let _ItemType = defaultArg ItemType eItemType.Objects
*)
-> int
```

Parameters

Name

Type: [SystemString](#)

The name of an existing point object or group depending on the value of the ItemType item.

NumberItems

Type: [SystemInt32](#)

This is the total number of joint force load assignments returned.

PointName

Type: [SystemString](#)

This is an array that includes the name of the point object to which the specified

joint force load assignment applies.

LoadPat

Type:Â SystemString

This is an array that includes the name of the load pattern for the joint force load.

LcStep

Type:Â SystemInt32

CSys

Type:Â SystemString

This is an array that includes the name of the coordinate system for the joint force load. This is Local or the name of a defined coordinate system.

F1

Type:Â SystemDouble

This is an array that includes the assigned translational force in the local 1-axis or coordinate system X-axis direction, depending on the specified CSys. [L]

F2

Type:Â SystemDouble

This is an array that includes the assigned translational force in the local 2-axis or coordinate system Y-axis direction, depending on the specified CSys. [L]

F3

Type:Â SystemDouble

This is an array that includes the assigned translational force in the local 3-axis or coordinate system Z-axis direction, depending on the specified CSys. [L]

M1

Type:Â SystemDouble

This is an array that includes the assigned moment about the local 1-axis or coordinate system X-axis, depending on the specified CSys. [rad]

M2

Type:Â SystemDouble

This is an array that includes the assigned moment about the local 2-axis or coordinate system Y-axis, depending on the specified CSys. [rad]

M3

Type:Â SystemDouble

This is an array that includes the assigned moment about the local 3-axis or coordinate system Z-axis, depending on the specified CSys. [rad]

ItemType (Optional)

Type:Â ETABSv1eItemType

This is one of the following items in the eItemType enumeration:

◊ Object = 0

◊ Group = 1

◊ SelectedObjects = 2

If this item is Objects, the load assignments are retrieved for the point object specified by the Name item.

If this item is Group, the load assignments are retrieved for all point objects in the group specified by the Name item.

If this item is SelectedObjects, the load assignments are retrieved for all selected point objects and the Name item is ignored.

Return ValueType: Int32

Returns zero if the load assignments are successfully retrieved, otherwise it returns a nonzero value.

▲ **Remarks**

▲ **Examples**

VB

Copy

```
Public Sub Example()
    Dim SapModel As cSapModel
    Dim EtabsObject As cOAPI
    Dim ret As Integer = -1
    Dim NumberItems As Integer
    Dim PointName() As String
    Dim LoadPat() As String
    Dim LCStep() As Integer
    Dim CSys() As String
    Dim F1() As Double
    Dim F2() As Double
    Dim F3() As Double
    Dim M1() As Double
    Dim M2() As Double
    Dim M3() As Double
    Dim Value() As Double

    'create ETABS object
    Dim myHelper as cHelper = New Helper
    EtabsObject = myHelper.CreateObjectProgID("CSI.ETABS.API.ETABSObject")

    'start ETABS application
    ret = EtabsObject.ApplicationStart()

    'create SapModel object
    SapModel = EtabsObject.SapModel

    'initialize model
    ret = SapModel.InitializeNewModel()

    'create steel deck template model
    ret = SapModel.File.NewSteelDeck(4, 12, 12, 4, 4, 24, 24)

    'add joint force load
    Redim Value(5)
    Value(0) = 10
    ret = SapModel.PointObj.SetLoadForce("1", "DEAD", Value)

    'get joint force load
    ret = SapModel.PointObj.GetLoadForce("ALL", NumberItems, PointName, LoadPat, LCStep, CSys, F1,

    'close ETABS
    EtabsObject.ApplicationExit(False)

    'clean up variables
    SapModel = Nothing
    EtabsObject = Nothing

End Sub
```

CSI API ETABS v1

cPointObjAddLanguageSpecificTextSet("LSTFA79583E0") Method

Retrieves the local axis angles for a point object.

Namespace: [ETABSv1](#)

Assembly: [ETABSv1](#) (in ETABSv1.dll) Version: 1.0.0.0 (1.24.0.0)

Syntax

[C#](#)

[VB](#)

[C++](#)

[F#](#)

[Copy](#)

```
int GetLocalAxes(
    string Name,
    ref double A,
    ref double B,
    ref double C,
    ref bool Advanced
)
```

```
Function GetLocalAxes (
    Name As String,
    ByRef A As Double,
    ByRef B As Double,
    ByRef C As Double,
    ByRef Advanced As Boolean
) As Integer
```

```
Dim instance As cPointObj
Dim Name As String
Dim A As Double
Dim B As Double
Dim C As Double
Dim Advanced As Boolean
Dim returnValue As Integer
```

```
returnValue = instance.GetLocalAxes(Name,
    A, B, C, Advanced)
```

```
int GetLocalAxes(
    String^ Name,
    double% A,
    double% B,
    double% C,
    bool% Advanced
)
```

```
abstract GetLocalAxes :
    Name : string *
    A : float byref *
    B : float byref *
    C : float byref *
    Advanced : bool byref -> int
```

Parameters

Name

Type: SystemString

The name of an existing point object.

A

Type: SystemDouble

The local axes of the point are defined by first setting the positive local 1, 2 and 3 axes the same as the positive global X, Y and Z axes and then doing the following: [deg]

1. Rotate about the 3 axis by angle a.
2. Rotate about the resulting 2 axis by angle b.
3. Rotate about the resulting 1 axis by angle c.

B

Type: SystemDouble

The local axes of the point are defined by first setting the positive local 1, 2 and 3 axes the same as the positive global X, Y and Z axes and then doing the following: [deg]

1. Rotate about the 3 axis by angle a.
2. Rotate about the resulting 2 axis by angle b.
3. Rotate about the resulting 1 axis by angle c.

C

Type: SystemDouble

The local axes of the point are defined by first setting the positive local 1, 2 and 3 axes the same as the positive global X, Y and Z axes and then doing the following: [deg]

1. Rotate about the 3 axis by angle a.
2. Rotate about the resulting 2 axis by angle b.
3. Rotate about the resulting 1 axis by angle c.

Advanced

Type: SystemBoolean

This item is True if the point object local axes orientation was obtained using advanced local axes parameters.

Return ValueType: Int32

Returns zero if the local axes angles are successfully retrieved, otherwise it returns a nonzero value.

▲ Remarks

▲ Examples

VB

CSI API ETABS v1

cPointObjAddLanguageSpecificTextSet("LST2A9D9825_0")

Method

Retrieves the names of all defined point objects.

Namespace: [ETABSv1](#)

Assembly: [ETABSv1](#) (in ETABSv1.dll) Version: 1.0.0.0 (1.24.0.0)

Syntax

[C#](#)

[VB](#)

[C++](#)

[F#](#)

[Copy](#)

```
int GetNameList(
    ref int NumberNames,
    ref string[] MyName
)
```

```
Function GetNameList (
    ByRef NumberNames As Integer,
    ByRef MyName As String()
) As Integer
```

```
Dim instance As cPointObj
Dim NumberNames As Integer
Dim MyName As String()
Dim returnValue As Integer
```

```
returnValue = instance.GetNameList(NumberNames,
    MyName)
```

```
int GetNameList(
    int% NumberNames,
    array<String^>^% MyName
)
```

```
abstract GetNameList :
    NumberNames : int byref *
    MyName : string[] byref -> int
```

Parameters

NumberNames

Type: [System.Int32](#)

The number of point object names retrieved by the program.

MyName

Type: [System.String](#)

This is a one-dimensional array of point object names. The MyName array is created as a dynamic, zero-based, array by the API user:

```
Dim MyName() as String
```

The array is dimensioned to (NumberNames + 1) inside the ETABS program, filled with the names, and returned to the API user.

Return Value

Type: Int32

Returns zero if the names are successfully retrieved, otherwise it returns nonzero.

▲ **Remarks**

▲ **Examples**

VB

Copy

```
Public Sub Example()  
    Dim SapModel As cSapModel  
    Dim EtabsObject As cOAPI  
    Dim ret As Integer = -1  
  
    'create ETABS object  
    Dim myHelper as cHelper = New Helper  
    EtabsObject = myHelper.CreateObjectProgID("CSI.ETABS.API.ETABSObject")  
  
    'start ETABS application  
    ret = EtabsObject.ApplicationStart()  
  
    'create SapModel object  
    SapModel = EtabsObject.SapModel  
  
    'initialize model  
    ret = SapModel.InitializeNewModel()  
  
    'create steel deck template model  
    ret = SapModel.File.NewSteelDeck(4, 12, 12, 4, 4, 24, 24)  
  
    'get point object names  
    ret = SapModel.PointObj.GetNameList(NumberNames, MyName)  
  
    'close ETABS  
    EtabsObject.ApplicationExit(False)  
  
    'clean up variables  
    SapModel = Nothing  
    EtabsObject = Nothing  
  
End Sub
```

CSI API ETABS v1

cPointObjAddLanguageSpecificTextSet("LSTD20D4CB2_0?cpp=::2686");GetN Method

Retrieves the names of the defined point objects on a given story.

Namespace: [ETABSv1](#)

Assembly: [ETABSv1](#) (in ETABSv1.dll) Version: 1.0.0.0 (1.24.0.0)

Syntax

[C#](#)

[VB](#)

[C++](#)

[F#](#)

[Copy](#)

```
int GetNameListOnStory(
    string StoryName,
    ref int NumberNames,
    ref string[] MyName
)
```

```
Function GetNameListOnStory (
    StoryName As String,
    ByRef NumberNames As Integer,
    ByRef MyName As String()
) As Integer
```

```
Dim instance As cPointObj
Dim StoryName As String
Dim NumberNames As Integer
Dim MyName As String()
Dim returnValue As Integer
```

```
returnValue = instance.GetNameListOnStory(StoryName,
    NumberNames, MyName)
```

```
int GetNameListOnStory(
    String^ StoryName,
    int% NumberNames,
    array<String^>^% MyName
)
```

```
abstract GetNameListOnStory :
    StoryName : string *
    NumberNames : int byref *
    MyName : string[] byref -> int
```

Parameters

StoryName

Type: [SystemString](#)

The name of an existing story.

NumberNames

Type: SystemInt32

The number of point object names retrieved by the program.

MyName

Type: SystemString

This is a one-dimensional array of point object names. The MyName array is created as a dynamic, zero-based, array by the API user:

```
Dim MyName() as String
```

The array is dimensioned to (NumberNames + 1) inside the ETABS program, filled with the names, and returned to the API user.

Return Value

Type: Int32

Returns zero if the names are successfully retrieved, otherwise it returns nonzero.

▲ Remarks

CSI API ETABS v1

cPointObjAddLanguageSpecificTextSet("LST3F06C192_0")

Method

Retrieves the restraint assignments for a point object. The restraint assignments are always returned in the point local coordinate system.

Namespace: ETABSv1

Assembly: ETABSv1 (in ETABSv1.dll) Version: 1.0.0.0 (1.24.0.0)

Syntax

C#

VB

C++

F#

Copy

```
int GetRestraint(
    string Name,
    ref bool[] Value
)
```

```
Function GetRestraint (
    Name As String,
    ByRef Value As Boolean()
) As Integer
```

```
Dim instance As cPointObj
Dim Name As String
Dim Value As Boolean()
Dim returnValue As Integer
```

```
returnValue = instance.GetRestraint(Name,
    Value)
```

```
int GetRestraint(
    String^ Name,
    array<bool>^% Value
)
```

```
abstract GetRestraint :
    Name : string *
    Value : bool[] byref -> int
```

Parameters

Name

Type: SystemString

The name of an existing point object.

Value

Type: SystemBoolean

This is an array of six restraint values.

◊ Value(0) = U1

◊ Value(1) = U2

◇ Value(2) = U3
 ◇ Value(3) = R1
 ◇ Value(4) = R2
 ◇ Value(5) = R3

Return Value

Type: Int32

Returns zero if the restraint assignments are successfully retrieved, otherwise it returns a nonzero value.

▲ Remarks

▲ Examples

VB

Copy

```
Public Sub Example()
    Dim SapModel As cSapModel
    Dim EtabsObject As cOAPI
    Dim ret As Integer = -1

    'create ETABS object
    Dim myHelper as cHelper = New Helper
    EtabsObject = myHelper.CreateObjectProgID("CSI.ETABS.API.ETABSObject")

    'start ETABS application
    ret = EtabsObject.ApplicationStart()

    'create SapModel object
    SapModel = EtabsObject.SapModel

    'initialize model
    ret = SapModel.InitializeNewModel()

    'create steel deck template model

CSI API ETABS v1

cPointObjAddLanguageSpecificTextSet("LST3942726C Method

Retrieves uncoupled spring stiffness assignments for a point object, that is, it retrieves the diagonal terms in the 6x6 spring matrix for the point object.

Namespace: $\hat{A}$ ETABSv1

Assembly: $\hat{A}$ ETABSv1 (in ETABSv1.dll) Version: 1.0.0.0 (1.24.0.0)

■ Syntax

C#

VB

C++

F#

Copy

```
int GetSpring(
    string Name,
    ref double[] K
)
```

```
Function GetSpring (
    Name As String,
    ByRef K As Double()
) As Integer
```

```
Dim instance As cPointObj
Dim Name As String
Dim K As Double()
Dim returnValue As Integer
```

```
returnValue = instance.GetSpring(Name,
    K)
```

```
int GetSpring(
    String^ Name,
    array<double>^% K
)
```

```
abstract GetSpring :
    Name : string *
    K : float[] byref -> int
```

Parameters

Name

Type: $\hat{A}$ SystemString

The name of an existing point object.

K

Type: $\hat{A}$ SystemDouble

This is an array of six spring stiffness values.

◊ Value(0) = U1 [F/L]

◊ Value(1) = U2 [F/L]

- ◇ Value(2) = U3 [F/L]
- ◇ Value(3) = R1 [FL/rad]
- ◇ Value(4) = R2 [FL/rad]
- ◇ Value(5) = R3 [FL/rad]

Return Value

Type: $\hat{A}$ Int32

Returns zero if the stiffnesses are successfully retrieved, otherwise it returns a nonzero value. If no springs exist at the point object, the function returns a nonzero value.

Remarks

The spring stiffnesses reported are the sum of all springs assigned to the point object. The spring stiffness values are reported in the point local coordinate system.

Examples

VB

Copy

```
Public Sub Example()
    Dim SapModel As cSapModel
    Dim EtabsObject As cOAPI
    Dim ret As Integer = -1

    'create ETABS object
    Dim myHelper as cHelper = New Helper
    EtabsObject = myHelper.CreateObjectProgID("CSI.ETABS.API.ETABSObject")

    'start ETABS application
    ret = EtabsObject.ApplicationStart()

    'create SapModel object
    SapModel = EtabsObject.SapModel

    'initialize model
    ret = SapModel.InitializeNewModel()

    'create steel deck template model
    ret = SapModel.File.NewSteelDeck(4, 12, 12, 4, 4, 24, 24)

    'assign spring to a point
    ReDim k(5)
    k(2) = 10
    ret = SapModel.PointObj.SetSpring("3", k)

    'get spring values
    ReDim k(5)
    ret = SapModel.PointObj.GetSpring("3", k)

    'close ETABS
    EtabsObject.ApplicationExit(False)

    'clean up variables
    SapModel = Nothing
    EtabsObject = Nothing
End Sub
```

CSI API ETABS v1

cPointObjAddLanguageSpecificTextSet("LST21307CA90") Method

Retrieves the named point spring property assignment for a point object

Namespace: [ETABSv1](#)

Assembly: [ETABSv1](#) (in ETABSv1.dll) Version: 1.0.0.0 (1.24.0.0)

Syntax

[C#](#)

[VB](#)

[C++](#)

[F#](#)

[Copy](#)

```
int GetSpringAssignment(
    string Name,
    ref string SpringProp
)
```

```
Function GetSpringAssignment (
    Name As String,
    ByRef SpringProp As String
) As Integer
```

```
Dim instance As cPointObj
Dim Name As String
Dim SpringProp As String
Dim returnValue As Integer
```

```
returnValue = instance.GetSpringAssignment(Name,
    SpringProp)
```

```
int GetSpringAssignment(
    String^ Name,
    String^% SpringProp
)
```

```
abstract GetSpringAssignment :
    Name : string *
    SpringProp : string byref -> int
```

Parameters

Name

Type: [SystemString](#)

The name of an existing point object

SpringProp

Type: [SystemString](#)

The name of an existing point spring property

Return Value

Type: Int32

Returns zero if the assignment is successfully retrieved, otherwise it returns a nonzero value

▀ **Remarks**

▀ **Examples**

VB

Copy

```
Public Sub Example()
    Dim SapModel As cSapModel
    Dim EtabsObject As cOAPI
    Dim ret As Integer = -1
    Dim SpringProp As String

    'create ETABS object
    Dim myHelper as cHelper = New Helper
    EtabsObject = myHelper.CreateObjectProgID("CSI.ETABS.API.ETABSObject")

    'start ETABS application
    ret = EtabsObject.ApplicationStart()

    'create SapModel object
    SapModel = EtabsObject.SapModel

    'initialize model
    ret = SapModel.InitializeNewModel()

    'create steel deck template model
    ret = SapModel.File.NewSteelDeck(4, 12, 4, 4, 24, 24)

    'define new spring property
    Dim k() as Double
    ReDim k(5)
    k(2) = 1
    ret = SapModel.PropPointSpring.SetPointSpringProp("mySpringProp1", 1, k)

    'assign property
    ret = SapModel.PointObj.SetSpringAssignment("1", "mySpringProp1")

    'get assigned property
    Dim prop as String
    ret = SapModel.PointObj.GetSpringAssignment("1", prop)

    'close ETABS
    EtabsObject.ApplicationExit(False)

    'clean up variables
    SapModel = Nothing
    EtabsObject = Nothing

End Sub
```

CSI API ETABS v1

cPointObjAddLanguageSpecificTextSet("LSTD3BB0553_0") Method

Assigns a diaphragm to a point object

Namespace: ETABSv1

Assembly: ETABSv1 (in ETABSv1.dll) Version: 1.0.0.0 (1.24.0.0)

Syntax

C#

VB

C++

F#

Copy

```
int SetDiaphragm(
    string Name,
    eDiaphragmOption DiaphragmOption,
    string DiaphragmName = ""
)
```

```
Function SetDiaphragm (
    Name As String,
    DiaphragmOption As eDiaphragmOption,
    DiaphragmName As String = ""
) As Integer
```

```
Dim instance As cPointObj
Dim Name As String
Dim DiaphragmOption As eDiaphragmOption
Dim DiaphragmName As String
Dim returnValue As Integer
```

```
returnValue = instance.SetDiaphragm(Name,
    DiaphragmOption, DiaphragmName)
```

```
int SetDiaphragm(
    String^ Name,
    eDiaphragmOption DiaphragmOption,
    String^ DiaphragmName = L""
)
```

```
abstract SetDiaphragm :
    Name : string *
    DiaphragmOption : eDiaphragmOption *
    ?DiaphragmName : string
(* Defaults:
    let _DiaphragmName = defaultArg DiaphragmName ""
*)
-> int
```

Parameters

Name

Type:Â SystemString

The name of an existing point object

DiaphragmOption

Type:Â ETABSv1eDiaphragmOption

This is an item from the eDiaphragmOption enumeration

If this item is Disconnect then the point object will be disconnected from any diaphragm

If this item is FromShellObject then the point object will inherit the diaphragm assignment of its bounding area object.

If this item is DefinedDiaphragm then the point object will be assigned the existing diaphragm specified by DiaphragmName

DiaphragmName (Optional)

Type:Â SystemString

The name of an existing diaphragm

Return Value

Type:Â Int32

Returns zero if the diaphragm assignment is successfully made, otherwise it returns a nonzero value.

▲Remarks

▲Examples

VB

Copy

```
Public Sub Example()
    Dim SapModel As cSapModel
    Dim EtabsObject As cOAPI
    Dim ret As Integer = -1
    Dim DiaphragmOption As eDiaphragmOption
    Dim DiaphragmName As String

    'create ETABS object
    Dim myHelper as cHelper = New Helper
    EtabsObject = myHelper.CreateObjectProgID("CSI.ETABS.API.ETABSObject")

    'start ETABS application
    ret = EtabsObject.ApplicationStart()

    'create SapModel object
    SapModel = EtabsObject.SapModel

    'initialize model
    ret = SapModel.InitializeNewModel()

    'create steel deck template model
    ret = SapModel.File.NewSteelDeck(4, 12, 12, 4, 4, 24, 24)

    'define a new diaphragm
    ret = SapModel.Diaphragm.SetDiaphragm("MyDiaph1A", True)

    'assign diaphragm to point
    ret = SapModel.PointObj.SetDiaphragm("1", eDiaphragmOption.DefinedDiaphragm, "MyDiaph1A")
```

Introduction

```
'get point diaphragm assignment
  ret = SapModel.PointObj.GetDiaphragm("1", DiaphragmOption, DiaphragmName)

'close ETABS
  EtabsObject.ApplicationExit(False)

'clean up variables
  SapModel = Nothing
  EtabsObject = Nothing
End Sub
```

CSI API ETABS v1

cPointObjAddLanguageSpecificTextSet("LSTCBC2E4F Method

Adds or removes point objects from a specified group.

Namespace: ETABSv1

Assembly: ETABSv1 (in ETABSv1.dll) Version: 1.0.0.0 (1.24.0.0)

Syntax

C#

VB

C++

F#

Copy

```
int SetGroupAssign(
    string Name,
    string GroupName,
    bool Remove = false,
    eItemType ItemType = eItemType.Objects
)
```

```
Function SetGroupAssign (
    Name As String,
    GroupName As String,
    Remove As Boolean = false,
    ItemType As eItemType = eItemType.Objects
) As Integer
```

```
Dim instance As cPointObj
Dim Name As String
Dim GroupName As String
Dim Remove As Boolean
Dim ItemType As eItemType
Dim returnValue As Integer
```

```
returnValue = instance.SetGroupAssign(Name,
    GroupName, Remove, ItemType)
```

```
int SetGroupAssign(
    String^ Name,
    String^ GroupName,
    bool Remove = false,
    eItemType ItemType = eItemType::Objects
)
```

```
abstract SetGroupAssign :
    Name : string *
    GroupName : string *
    ?Remove : bool *
    ?ItemType : eItemType
(* Defaults:
    let _Remove = defaultArg Remove false
    let _ItemType = defaultArg ItemType eItemType.Objects
*)
-> int
```

cPointObjid="LSTCBC2E4FE_0"AddLanguageSpecificTextSet("LSTCBC2E4FE_0?cpp=:2714.");SetG

Parameters

Name

Type:Â SystemString

The name of an existing point object or group depending on the value of the ItemType item.

GroupName

Type:Â SystemString

The name of an existing group to which the assignment is made.

Remove (Optional)

Type:Â SystemBoolean

ItemType (Optional)

Type:Â ETABSv1eItemType

This is one of the following items in the eItemType enumeration:

◊ Object = 0

◊ Group = 1

◊ SelectedObjects = 2

If this item is Objects, the point object specified by the Name item is added or removed from the group specified by the GroupName item.

If this item is Group, all point objects in the group specified by the Name item are added or removed from the group specified by the GroupName item.

If this item is SelectedObjects, all selected point objects are added or removed from the group specified by the GroupName item and the Name item is ignored.

Return ValueType:Â Int32

Returns zero if the group assignment is successful, otherwise it returns a nonzero value.

▲ Remarks

CSI API ETABS v1

cPointObjAddLanguageSpecificTextSet("LST9E75B03C_0")

Method

Sets the GUID for specified point object. If the GUID is passed in as a blank string, the program automatically creates a GUID for the object.

Namespace: ETABSv1

Assembly: ETABSv1 (in ETABSv1.dll) Version: 1.0.0.0 (1.24.0.0)

Syntax

C#

VB

C++

F#

Copy

```
int SetGUID(
    string Name,
    string GUID = ""
)
```

```
Function SetGUID (
    Name As String,
    GUID As String = ""
) As Integer
```

```
Dim instance As cPointObj
Dim Name As String
Dim GUID As String
Dim returnValue As Integer
```

```
returnValue = instance.SetGUID(Name, GUID)
```

```
int SetGUID(
    String^ Name,
    String^ GUID = L""
)
```

```
abstract SetGUID :
    Name : string *
    ?GUID : string
(* Defaults:
    let _GUID = defaultArg GUID ""
*)
-> int
```

Parameters

Name

Type: SystemString

The name of an existing point object.

GUID (Optional)

Type: SystemString

The GUID (Global Unique ID) for the specified point object.

cPointObjid="LST9E75B03C_0"AddLanguageSpecificTextSet("LST9E75B03C_0?cpp=::|274.7);SetGL

Return Value

Type: Int32

Returns zero if the point object GUID is successfully set; otherwise it returns nonzero.

▲ **Remarks**

▲ **Examples**

VB

Copy

```
Public Sub Example()
    Dim SapModel As cSapModel
    Dim EtabsObject As cOAPI
    Dim ret As Integer = -1
    Dim GUID As String

    'create ETABS object
    Dim myHelper as cHelper = New Helper
    EtabsObject = myHelper.CreateObjectProgID("CSI.ETABS.API.ETABSObject")

    'start ETABS application
    ret = EtabsObject.ApplicationStart()

    'create SapModel object
    SapModel = EtabsObject.SapModel

    'initialize model
    ret = SapModel.InitializeNewModel()

    'create steel deck template model
    ret = SapModel.File.NewSteelDeck(4, 12, 12, 4, 4, 24, 24)

    'set program created GUID
    ret = SapModel.PointObj.SetGUID("1")

    'close ETABS
    EtabsObject.ApplicationExit(False)

    'clean up variables
    SapModel = Nothing
    EtabsObject = Nothing

End Sub
```

```

```
int SetLoadDispl(
    String^ Name,
    String^ LoadPat,
    array<double>^% Value,
    bool Replace = false,
    String^ CSys = L"Local",
    eItemType ItemType = eItemType::Objects
)
```

```
abstract SetLoadDispl :
    Name : string *
```

cPointObjspan id="LST9B98AC7C_0"AddLanguageSpecificTextSet("LST9B98AC7C_0?cpp=::2719");SetLoad

```

LoadPat : string *
Value : float[] byref *
?Replace : bool *
?CSys : string *
?ItemType : eItemType
(* Defaults:
    let _Replace = defaultArg Replace false
    let _CSys = defaultArg CSys "Local"
    let _ItemType = defaultArg ItemType eItemType.Objects
*)
-> int

```

Parameters

Name

Type: SystemString

The name of an existing point object or group depending on the value of the ItemType item.

LoadPat

Type: SystemString

The name of the load pattern for the ground displacement load.

Value

Type: SystemDouble

This is an array of six point load values.

- ◊ Value(0) = U1 [L]
- ◊ Value(1) = U2 [L]
- ◊ Value(2) = U3 [L]
- ◊ Value(3) = R1 [rad]
- ◊ Value(4) = R2 [rad]
- ◊ Value(5) = R3 [rad]

Replace (Optional)

Type: SystemBoolean

If this item is True, all previous ground displacement loads, if any, assigned to the specified point object(s) in the specified load pattern are deleted before making the new assignment.

CSys (Optional)

Type: SystemString

The name of the coordinate system for the considered ground displacement load. This is Local or the name of a defined coordinate system.

ItemType (Optional)

Type: ETABSv1eItemType

This is one of the following items in the eItemType enumeration:

- ◊ Object = 0
- ◊ Group = 1
- ◊ SelectedObjects = 2

If this item is Objects, the load assignment is made to the point object specified by the Name item.

If this item is Group, the load assignment is made to all point objects in the group specified by the Name item.

If this item is SelectedObjects, the load assignment is made to all selected point objects and the Name item is ignored.

Return Value

Type: Int32

Returns zero if the load assignments are successfully made, otherwise it returns a nonzero value.

▲ **Remarks**

▲ **Examples**

VB

Copy

```
Public Sub Example()
    Dim SapModel As cSapModel
    Dim EtabsObject As cOAPI
    Dim ret As Integer = -1
    Dim Value as Double()

    'create ETABS object
    Dim myHelper as cHelper = New Helper
    EtabsObject = myHelper.CreateObjectProgID("CSI.ETABS.API.ETABSObject")

    'start ETABS application
    ret = EtabsObject.ApplicationStart()

    'create SapModel object
    SapModel = EtabsObject.SapModel

    'initialize model
    ret = SapModel.InitializeNewModel()

    'create steel deck template model
    ret = SapModel.File.NewSteelDeck(4, 12, 12, 4, 4, 24, 24)

    'add ground displacement load
    Redim Value(5)
    Value(0) = 10
    ret = SapModel.PointObj.SetLoadDispl("1", "DEAD", Value)

    'close ETABS
    EtabsObject.ApplicationExit(False)

    'clean up variables
    SapModel = Nothing
    EtabsObject = Nothing
End Sub
```

(* Defaults:
    let _Replace = defaultArg Replace false
    let _CSys = defaultArg CSys "Global"
    let _ItemType = defaultArg ItemType eItemType.Objects
*)
-> int

```

Parameters

Name

Type: SystemString

The name of an existing point object or group depending on the value of the ItemType item.

LoadPat

Type: SystemString

The name of the load pattern for the point force load.

Value

Type: SystemDouble

This is an array of six point load values.

◊ Value(0) = F1 [F]

◊ Value(1) = F2 [F]

◊ Value(2) = F3 [F]

◊ Value(3) = M1 [FL]

◊ Value(4) = M2 [FL]

◊ Value(5) = M3 [FL]

Replace (Optional)

Type: SystemBoolean

If this item is True, all previous point force loads, if any, assigned to the specified point object(s) in the specified load pattern are deleted before making the new assignment.

CSys (Optional)

Type: SystemString

The name of the coordinate system for the considered point force load. This is Local or the name of a defined coordinate system.

ItemType (Optional)

Type: ETABSv1eItemType

This is one of the following items in the eItemType enumeration:

◊ Object = 0

◊ Group = 1

◊ SelectedObjects = 2

If this item is Objects, the load assignment is made to the point object specified by the Name item.

If this item is Group, the load assignment is made to all point objects in the group specified by the Name item.

If this item is SelectedObjects, the load assignment is made to all selected point objects and the Name item is ignored.

Return Value

Type: Int32

Returns zero if the load assignments are successfully made, otherwise it returns a nonzero value.

CSI API ETABS v1

cPointObjAddLanguageSpecificTextSet("LSTEBDD5271_0?cpp=::2734");SetRe

Method

Assigns the restraint assignments for a point object. The restraint assignments are always set in the point local coordinate system.

Namespace: Â ETABSv1

Assembly: Â ETABSv1 (in ETABSv1.dll) Version: 1.0.0.0 (1.24.0.0)

Syntax

C#

VB

C++

F#

Copy

```
int SetRestraint(
    string Name,
    ref bool[] Value,
    eItemType ItemType = eItemType.Objects
)
```

```
Function SetRestraint (
    Name As String,
    ByRef Value As Boolean(),
    Optional ItemType As eItemType = eItemType.Objects
) As Integer
```

```
Dim instance As cPointObj
Dim Name As String
Dim Value As Boolean()
Dim ItemType As eItemType
Dim returnValue As Integer
```

```
returnValue = instance.SetRestraint(Name,
    Value, ItemType)
```

```
int SetRestraint(
    String^ Name,
    array<bool>^% Value,
    eItemType ItemType = eItemType::Objects
)
```

```
abstract SetRestraint :
    Name : string *
    Value : bool[] byref *
    ?ItemType : eItemType
(* Defaults:
    let _ItemType = defaultArg ItemType eItemType.Objects
*)
-> int
```

Parameters**Name**

Type:Â SystemString

The name of an existing point object or group depending on the value of the ItemType item.

Value

Type:Â SystemBoolean

This is an array of six restraint values.

◇ Value(0) = U1

◇ Value(1) = U2

◇ Value(2) = U3

◇ Value(3) = R1

◇ Value(4) = R2

◇ Value(5) = R3

ItemType (Optional)

Type:Â ETABSv1eItemType

This is one of the following items in the eItemType enumeration:

◇ Object = 0

◇ Group = 1

◇ SelectedObjects = 2

If this item is Objects, the restraint assignment is made to the point object specified by the Name item.

If this item is Group, the restraint assignment is made to all point objects in the group specified by the Name item.

If this item is SelectedObjects, the restraint assignment is made to all selected point objects and the Name item is ignored.

Return Value

Type:Â Int32

Returns zero if the restraint assignments are successfully assigned, otherwise it returns a nonzero value.

▲ **Remarks**▲ **Examples**

VB

Copy

```
Public Sub Example()
    Dim SapModel As cSapModel
    Dim EtabsObject As cOAPI
    Dim ret As Integer = -1
    Dim Value as Boolean()

    'create ETABS object
    Dim myHelper as cHelper = New Helper
    EtabsObject = myHelper.CreateObjectProgID("CSI.ETABS.API.ETABSObject")

    'start ETABS application
    ret = EtabsObject.ApplicationStart()

    'create SapModel object
    SapModel = EtabsObject.SapModel
```

Introduction

```
'initialize model
    ret = SapModel.InitializeNewModel()

'create steel deck template model
    ret = SapModel.File.NewSteelDeck(4, 12, 12, 4, 4, 24, 24)

'assign point object restraints
    ReDim Value(5)
    For i = 0 To 5
        Value(i) = True
    Next i
    ret = SapModel.PointObj.SetRestraint("1", Value)

'close ETABS
    EtabsObject.ApplicationExit(False)

'clean up variables
    SapModel = Nothing
    EtabsObject = Nothing
End Sub
```

CSI API ETABS v1

cPointObjAddLanguageSpecificTextSet("LST229B9AE9_0") Method

Sets the selected status for a point object.

Namespace: [ETABSv1](#)

Assembly: [ETABSv1](#) (in ETABSv1.dll) Version: 1.0.0.0 (1.24.0.0)

Syntax

[C#](#)

[VB](#)

[C++](#)

[F#](#)

[Copy](#)

```
int SetSelected(
    string Name,
    bool Selected,
    eItemType ItemType = eItemType.Objects
)
```

```
Function SetSelected (
    Name As String,
    Selected As Boolean,
    ?ItemType As eItemType = eItemType.Objects
) As Integer
```

```
Dim instance As cPointObj
Dim Name As String
Dim Selected As Boolean
Dim ItemType As eItemType
Dim returnValue As Integer
```

```
returnValue = instance.SetSelected(Name,
    Selected, ItemType)
```

```
int SetSelected(
    String^ Name,
    bool Selected,
    eItemType ItemType = eItemType::Objects
)
```

```
abstract SetSelected :
    Name : string *
    Selected : bool *
    ?ItemType : eItemType
(* Defaults:
    let _ItemType = defaultArg ItemType eItemType.Objects
*)
-> int
```

Parameters

Name

Type: SystemString

The name of an existing point object or group depending on the value of the ItemType item.

Selected

Type: SystemBoolean

This item is True if the specified point object is selected, otherwise it is False.

ItemType (Optional)

Type: ETABSv1eItemType

This is one of the following items in the eItemType enumeration:

◊ Object = 0

◊ Group = 1

◊ SelectedObjects = 2

If this item is Objects, the selected status is set for the point object specified by the Name item.

If this item is Group, the selected status is set for all point objects in the group specified by the Name item.

If this item is SelectedObjects, the selected status is set for all selected point objects and the Name item is ignored.

Return Value

Type: Int32

Returns zero if the selected status is successfully set, otherwise it returns a nonzero value.

CSI API ETABS v1

cPointObjAddLanguageSpecificTextSet("LST631133A0 Method

Sets the special point status for a point object.

Namespace: ETABSv1

Assembly: ETABSv1 (in ETABSv1.dll) Version: 1.0.0.0 (1.24.0.0)

■ Syntax

C#

VB

C++

F#

Copy

```
int SetSpecialPoint(
    string Name,
    bool SpecialPoint,
    eItemType ItemType = eItemType.Objects
)
```

```
Function SetSpecialPoint (
    Name As String,
    SpecialPoint As Boolean,
    ?ItemType As eItemType = eItemType.Objects
) As Integer
```

```
Dim instance As cPointObj
Dim Name As String
Dim SpecialPoint As Boolean
Dim ItemType As eItemType
Dim returnValue As Integer
```

```
returnValue = instance.SetSpecialPoint(Name,
    SpecialPoint, ItemType)
```

```
int SetSpecialPoint(
    String^ Name,
    bool SpecialPoint,
    eItemType ItemType = eItemType::Objects
)
```

```
abstract SetSpecialPoint :
    Name : string *
    SpecialPoint : bool *
    ?ItemType : eItemType
(* Defaults:
    let _ItemType = defaultArg ItemType eItemType.Objects
*)
-> int
```

Parameters

Name

Type:Â SystemString

The name of an existing point object or group depending on the value of the ItemType item.

SpecialPoint

Type:Â SystemBoolean

This item is True if the point object is specified as a special point, otherwise it is False.

ItemType (Optional)

Type:Â ETABSv1eItemType

This is one of the following items in the eItemType enumeration:

◊ Object = 0

◊ Group = 1

◊ SelectedObjects = 2

If this item is Objects, the special point status is set for the point object specified by the Name item.

If this item is Group, the special point status is set for all point objects in the group specified by the Name item.

If this item is SelectedObjects, the special point status is set for all selected point objects and the Name item is ignored.

Return Value

Type:Â Int32

Returns zero if the special point status is successfully set, otherwise it returns a nonzero value.

Remarks

Special points are allowed to exist in the model even if no objects (line, area, solid, link) are connected to them. Points that are not special are automatically deleted if no objects connect to them.

Examples

VB

Copy

```
Public Sub Example()
    Dim SapModel As cSapModel
    Dim EtabsObject As cOAPI
    Dim ret As Integer = -1

    'create ETABS object
    Dim myHelper as cHelper = New Helper
    EtabsObject = myHelper.CreateObjectProgID("CSI.ETABS.API.ETABSObject")

    'start ETABS application
    ret = EtabsObject.ApplicationStart()

    'create SapModel object
    SapModel = EtabsObject.SapModel

    'initialize model
    ret = SapModel.InitializeNewModel()

    'create steel deck template model
    ret = SapModel.File.NewSteelDeck(4, 12, 12, 4, 4, 24, 24)
```

Introduction

```
'set as special point
    ret = SapModel.PointObj.SetSpecialPoint("3", True)

'close ETABS
    EtabsObject.ApplicationExit(False)

'clean up variables
    SapModel = Nothing
    EtabsObject = Nothing
End Sub
```

Namespace: ETABSv1

▲ Syntax

C#

VBC++

F#

Copy

```
Function SetSpring (
Name As String,
ByRef K As Double(),
Optional eItemType As eItemType = eItemType.Objects,
Optional CSys As Boolean = true,
Optional RepNode As Boolean = false
) As Integer
```

```
returnValue = instance.SetSpring(Name,
K, ItemType, IsLocalCSys, Replace)
```

```
int SetSpring(
String^ Name,
array<double>% K,
eItemType ItemType = eItemType::Objects,
bool IsLocalCSys = true,
bool Replace = false
)
```

cPointObj

```
(* Defaults:
    let _ItemType = defaultArg ItemType eItemType.Objects
    let _IsLocalCSys = defaultArg IsLocalCSys true
    let _Replace = defaultArg Replace false
*)
-> int
```

Parameters

Name

Type:Â SystemString

The name of an existing point object or group depending on the value of the ItemType item.

K

Type:Â SystemDouble

This is an array of six spring stiffness values.

◇ Value(0) = U1 [F/L]

◇ Value(1) = U2 [F/L]

◇ Value(2) = U3 [F/L]

◇ Value(3) = R1 [FL/rad]

◇ Value(4) = R2 [FL/rad]

◇ Value(5) = R3 [FL/rad]

ItemType (Optional)

Type:Â ETABSv1eItemType

This is one of the following items in the eItemType enumeration:

◇ Object = 0

◇ Group = 1

◇ SelectedObjects = 2

If this item is Object, the spring assignment is made to the point object specified by the Name item.

If this item is Group, the spring assignment is made to all point objects in the group specified by the Name item.

If this item is SelectedObjects, the spring assignment is made to all selected point objects and the Name item is ignored.

IsLocalCSys (Optional)

Type:Â SystemBoolean

If this item is True, the specified spring assignments are in the point object local coordinate system. If it is False, the assignments are in the Global coordinate system.

Replace (Optional)

Type:Â SystemBoolean

If this item is True, all existing point spring assignments to the specified point object(s) are deleted prior to making the assignment. If it is False, the spring assignments are added to any existing assignments.

Return Value

Type:Â Int32

Returns zero if the stiffnesses are successfully assigned, otherwise it returns a nonzero value.

Remarks

Examples

VB

Copy

```
Public Sub Example()
    Dim SapModel As cSapModel
    Dim EtabsObject As cOAPI
    Dim ret As Integer = -1

    'create ETABS object
    Dim myHelper as cHelper = New Helper
    EtabsObject = myHelper.CreateObjectProgID("CSI.ETABS.API.ETABSObject")

    'start ETABS application
    ret = EtabsObject.ApplicationStart()

    'create SapModel object
    SapModel = EtabsObject.SapModel

    'initialize model
    ret = SapModel.InitializeNewModel()

    'create steel deck template model
    ret = SapModel.File.NewSteelDeck(4, 12, 12, 4, 4, 24, 24)

    'assign spring to a point
    ReDim k(5)
    k(2) = 10
    ret = SapModel.PointObj.SetSpring("3", k)

    'get spring values
    ReDim k(5)
    ret = SapModel.PointObj.GetSpring("3", k)

    'close ETABS
    EtabsObject.ApplicationExit(False)

    'clean up variables
    SapModel = Nothing
    EtabsObject = Nothing
End Sub
```

CSI API ETABS v1

cPointObjAddLanguageSpecificTextSet("LSTFD83B008_0") Method

Assigns an existing named point spring property to point objects

Namespace: ETABSv1

Assembly: ETABSv1 (in ETABSv1.dll) Version: 1.0.0.0 (1.24.0.0)

Syntax

C#

VB

C++

F#

Copy

```
int SetSpringAssignment(
    string Name,
    string SpringProp,
    eItemType ItemType = eItemType.Objects
)
```

```
Function SetSpringAssignment (
    Name As String,
    SpringProp As String,
    ?ItemType As eItemType = eItemType.Objects
) As Integer
```

```
Dim instance As cPointObj
Dim Name As String
Dim SpringProp As String
Dim ItemType As eItemType
Dim returnValue As Integer
```

```
returnValue = instance.SetSpringAssignment(Name,
    SpringProp, ItemType)
```

```
int SetSpringAssignment(
    String^ Name,
    String^ SpringProp,
    eItemType ItemType = eItemType::Objects
)
```

```
abstract SetSpringAssignment :
    Name : string *
    SpringProp : string *
    ?ItemType : eItemType
(* Defaults:
    let _ItemType = defaultArg ItemType eItemType.Objects
*)
-> int
```

Parameters

Name

Type: SystemString

The name of an existing point object or group depending on the value of the ItemType item.

SpringProp

Type: SystemString

The name of an existing point spring property

ItemType (Optional)

Type: ETABSv1eItemType

This is one of the following items in the eItemType enumeration:

◊ Object = 0

◊ Group = 1

◊ SelectedObjects = 2

If this item is Objects, the property assignment is made to the point object specified by the Name item.

If this item is Group, the property assignment is made to all point objects in the group specified by the Name item.

If this item is SelectedObjects, the property assignment is made to all selected point objects and the Name item is ignored.

Return Value

Type: Int32

Returns zero if the property is successfully assigned, otherwise it returns a nonzero value

▲ Remarks

▲ Examples

VB

Copy

```
Public Sub Example()
    Dim SapModel As cSapModel
    Dim EtabsObject As cOAPI
    Dim ret As Integer = -1
    Dim SpringProp As String

    'create ETABS object
    Dim myHelper as cHelper = New Helper
    EtabsObject = myHelper.CreateObjectProgID("CSI.ETABS.API.ETABSObject")

    'start ETABS application
    ret = EtabsObject.ApplicationStart()

    'create SapModel object
    SapModel = EtabsObject.SapModel

    'initialize model
    ret = SapModel.InitializeNewModel()

    'create steel deck template model
    ret = SapModel.File.NewSteelDeck(4, 12, 12, 4, 4, 24, 24)

    'define new spring property
    Dim k() as Double
    ReDim k(5)
    k(2) = 1
```

Parameters

Introduction

```
ret = SapModel.PropPointSpring.SetPointSpringProp("mySpringProp1", 1, k)

'assign property
ret = SapModel.PointObj.SetSpringAssignment("1", "mySpringProp1")

'close ETABS
EtabsObject.ApplicationExit(False)

'clean up variables
SapModel = Nothing
EtabsObject = Nothing

End Sub
```

CSI API ETABS v1

cPropArea Interface

Namespace: Â ETABSV1

Assembly: Â ETABSV1 (in ETABSV1.dll) Version: 1.0.0.0 (1.24.0.0)

▲ Syntax

C#

VB

C++

F#

Copy

```
public interface cPropArea
```

```
Public Interface cPropArea
```

```
Dim instance As cPropArea
```

```
public interface class cPropArea
```

```
type cPropArea = interface end
```

The cPropArea type exposes the following members.

▲ Methods

Â	Name	Description
⇒	<u>ChangeName</u>	Changes the name of an existing area property.
⇒	<u>Count</u>	Returns the total number of defined area properties in the model. If desired, counts can be returned for all area properties of a specified type in the model.
⇒	<u>Delete</u>	Deletes a specified area property.
⇒	<u>GetDeck</u>	Retrieves property data for a deck section.
⇒	<u>GetDeckFilled</u>	Retrieves property data for a filled deck section.
⇒	<u>GetDeckSolidSlab</u>	Retrieves property data for a solid-slab deck section.
⇒	<u>GetDeckUnfilled</u>	Retrieves property data for an unfilled deck section.
⇒	<u>GetModifiers</u>	Retrieves the modifier assignments for an area property.
⇒	<u>GetNameList</u>	Retrieves the names of all defined area properties of the specified type.
⇒	<u>GetShellDesign</u>	Retrieves area property design parameters for a shell-type area section.
⇒	<u>GetShellLayer</u>	Retrieves area property layer parameters for a shell-type area section.
⇒	<u>GetShellLayer_1</u>	Retrieves area property layer parameters for a shell-type area section.
⇒	<u>GetShellLayer_2</u>	Retrieves area property layer parameters for a shell-type area section.
⇒	<u>GetSlab</u>	Retrieves property data for a slab section.

Introduction

⇒ <u>GetSlabRibbed</u>	Retrieves property data for a ribbed slab section.
⇒ <u>GetSlabWaffle</u>	Retrieves property data for a waffle slab section.
⇒ <u>GetTypeOAPI</u>	Retrieves the property type for the specified area property.
⇒ <u>GetWall</u>	Retrieves property data for a wall section.
⇒ <u>GetWallAutoSelectList</u>	Retrieves property data for an auto select list wall section.
⇒ <u>SetDeck</u>	Initializes a deck property.
⇒ <u>SetDeckFilled</u>	Initializes a filled deck property
⇒ <u>SetDeckSolidSlab</u>	Initializes a solid-slab deck property
⇒ <u>SetDeckUnfilled</u>	Initializes an unfilled deck property
⇒ <u>SetModifiers</u>	Assigns property modifiers to an area property.
⇒ <u>SetShellDesign</u>	Assigns the design parameters for shell-type area properties.
⇒ <u>SetShellLayer</u>	Assigns the layer parameters for shell-type area properties
⇒ <u>SetShellLayer_1</u>	Assigns the layer parameters for shell-type area properties
⇒ <u>SetShellLayer_2</u>	Assigns the layer parameters for shell-type area properties
⇒ <u>SetSlab</u>	Initializes a slab property.
⇒ <u>SetSlabRibbed</u>	Initializes a ribbed slab section.
⇒ <u>SetSlabWaffle</u>	Initializes a waffle slab section.
⇒ <u>SetWall</u>	Initializes property data for a wall section.
⇒ <u>SetWallAutoSelectList</u>	Initializes property data for an auto select list wall section.

CSI API ETABS v1

cPropAreaAddLanguageSpecificTextSet("LST1AE65486_0?cpp=::|2755);ChangeName(Method

Changes the name of an existing area property.

Namespace: ETABSv1

Assembly: ETABSv1 (in ETABSv1.dll) Version: 1.0.0.0 (1.24.0.0)

Syntax

C#

VB

C++

F#

Copy

```
int ChangeName(  
    string Name,  
    string NewName  
)
```

```
Function ChangeName (  
    Name As String,  
    NewName As String  
) As Integer
```

```
Dim instance As cPropArea  
Dim Name As String  
Dim NewName As String  
Dim returnValue As Integer
```

```
returnValue = instance.ChangeName(Name,  
    NewName)
```

```
int ChangeName(  
    String^ Name,  
    String^ NewName  
)
```

```
abstract ChangeName :  
    Name : string *  
    NewName : string -> int
```

Parameters

Name

Type: SystemString

The existing name of a defined area property.

NewName

Type: SystemString

The new name for the area property.

Return Value

Type: Int32

Returns zero if the new name is successfully applied; otherwise it returns a nonzero value.

▲ **Remarks**

▲ **Examples**

VB

Copy

```
Public Sub Example()
    Dim SapModel As cSapModel
    Dim EtabsObject As cOAPI
    Dim ret As Integer = -1

    'create ETABS object
    Dim myHelper as cHelper = New Helper
    EtabsObject = myHelper.CreateObjectProgID("CSI.ETABS.API.ETABSObject")

    'start ETABS application
    ret = EtabsObject.ApplicationStart()

    'create SapModel object
    SapModel = EtabsObject.SapModel

    'initialize model
    ret = SapModel.InitializeNewModel()

    'create steel deck template model
    ret = SapModel.File.NewSteelDeck(4,12,12,4,4,24,24)

    'change name of area property
    ret = SapModel.PropArea.ChangeName("SLAB1", "MyArea")

    'close ETABS
    EtabsObject.ApplicationExit(False)

    'clean up variables
    SapModel = Nothing
    EtabsObject = Nothing
End Sub
```

CSI API ETABS v1

cPropAreaAddLanguageSpecificTextSet("LSTFD578D3A_0") Method

Returns the total number of defined area properties in the model. If desired, counts can be returned for all area properties of a specified type in the model.

Namespace: ETABSv1

Assembly: ETABSv1 (in ETABSv1.dll) Version: 1.0.0.0 (1.24.0.0)

Syntax

C#

VB

C++

F#

Copy

```
int Count(
    int PropType = 0
)
```

```
Function Count (
    Optional PropType As Integer = 0
) As Integer
```

```
Dim instance As cPropArea
Dim PropType As Integer
Dim returnValue As Integer
```

```
returnValue = instance.Count(PropType)
```

```
int Count(
    int PropType = 0
)
```

```
abstract Count :
    ?PropType : int
(* Defaults:
    let _PropType = defaultArg PropType 0
*)
-> int
```

Parameters

PropType (Optional)

Type: System.Int32

This optional value is 0, 1, 2 or 3, indicating the type of area properties included in the count.

Value Type

0	All
1	Shell
2	Plane
3	Asolid

cPropAreaid="LSTFD578D3A_0"AddLanguageSpecificTextSet("LSTFD578D3A_0?cpp=:2757.");Cour

Return Value

Type: Int32

The total number of defined area properties in the model.

▲ **Remarks**

Plane and Asolid area properties are not supported in ETABS.

▲ **Examples**

VB

Copy

```
Public Sub Example()
    Dim SapModel As cSapModel
    Dim EtabsObject As cOAPI
    Dim ret As Integer = -1
    Dim Count as Integer

    'create ETABS object
    Dim myHelper as cHelper = New Helper
    EtabsObject = myHelper.CreateObjectProgID("CSI.ETABS.API.ETABSObject")

    'start ETABS application
    ret = EtabsObject.ApplicationStart()

    'create SapModel object
    SapModel = EtabsObject.SapModel

    'initialize model
    ret = SapModel.InitializeNewModel()

    'create steel deck template model
    ret = SapModel.File.NewSteelDeck(4,12,12,4,4,24,24)

    'return number of defined area properties of all types
    Count = SapModel.PropArea.Count

    'close ETABS
    EtabsObject.ApplicationExit(False)

    'clean up variables
    SapModel = Nothing
    EtabsObject = Nothing
End Sub
```

CSI API ETABS v1

cPropAreaAddLanguageSpecificTextSet("LSTFD232EF0_0") Method

Deletes a specified area property.

Namespace: [ETABSv1](#)

Assembly: [ETABSv1](#) (in ETABSv1.dll) Version: 1.0.0.0 (1.24.0.0)

▲ Syntax

[C#](#)

[VB](#)

[C++](#)

[F#](#)

[Copy](#)

```
int Delete(
    string Name
)
```

```
Function Delete (
    Name As String
) As Integer
```

```
Dim instance As cPropArea
Dim Name As String
Dim returnValue As Integer
```

```
returnValue = instance.Delete(Name)
```

```
int Delete(
    String^ Name
)
```

```
abstract Delete :
    Name : string -> int
```

Parameters

Name

Type: [SystemString](#)

The name of an existing area property.

Return Value

Type: [Int32](#)

Returns zero if the area property is successfully deleted; otherwise it returns a nonzero value

▲ Remarks

Returns an error if the specified area property can not be deleted, for example, if it is being used by an area object.

▲ Examples

VB

cPropAreaspan id="LSTFD232EF0_0"AddLanguageSpecificTextSet("LSTFD232EF0_0?cpp=::2759");Delete

Copy

```
Public Sub Example()
    Dim SapModel As cSapModel

CSI API ETABS v1

cPropAreaAddLanguageSpecificTextSet("LST16651BC6_0?cpp=::|276.1");GetDeck

Method

Retrieves property data for a deck section.

Namespace: ETABSv1

Assembly: ETABSv1 (in ETABSv1.dll) Version: 1.0.0.0 (1.24.0.0)

■ Syntax

C#

VB

C++

F#

Copy

```
int GetDeck(
    string Name,
    ref eDeckType DeckType,
    ref eShellType ShellType,
    ref string MatProp,
    ref double Thickness,
    ref int color,
    ref string notes,
    ref string GUID
)
```

```
Function GetDeck (
    Name As String,
    ByRef DeckType As eDeckType,
    ByRef ShellType As eShellType,
    ByRef MatProp As String,
    ByRef Thickness As Double,
    ByRef color As Integer,
    ByRef notes As String,
    ByRef GUID As String
) As Integer
```

```
Dim instance As cPropArea
Dim Name As String
Dim DeckType As eDeckType
Dim ShellType As eShellType
Dim MatProp As String
Dim Thickness As Double
Dim color As Integer
Dim notes As String
Dim GUID As String
Dim returnValue As Integer
```

```
returnValue = instance.GetDeck(Name, DeckType,
    ShellType, MatProp, Thickness, color,
    notes, GUID)
```

```
int GetDeck(
    String^ Name,
    eDeckType% DeckType,
    eShellType% ShellType,
```

cPropAreaAddLanguageSpecificTextSet("LST16651BC6_0?cpp=::|276.1");GetDeck

Parameters

Type: SystemInt32
The display color assigned to the property.

notes

Type:Â SystemString

The notes, if any, assigned to the property.

GUID

Type:Â SystemString

The GUID (global unique identifier), if any, assigned to the property.

Return Value

Type:Â Int32

The function returns zero if the property data is successfully retrieved; otherwise it returns a nonzero value.

▲ Remarks

CSI API ETABS v1

cPropAreaAddLanguageSpecificTextSet("LST5D60D387_0") Method

Retrieves the modifier assignments for an area property.

Namespace: [ETABSv1](#)

Assembly: [ETABSv1](#) (in ETABSv1.dll) Version: 1.0.0.0 (1.24.0.0)

Syntax

[C#](#)

[VB](#)

[C++](#)

[F#](#)

[Copy](#)

```
int GetModifiers(
    string Name,
    ref double[] Value
)
```

```
Function GetModifiers (
    Name As String,
    ByRef Value As Double()
) As Integer
```

```
Dim instance As cPropArea
Dim Name As String
Dim Value As Double()
Dim returnValue As Integer
```

```
returnValue = instance.GetModifiers(Name,
    Value)
```

```
int GetModifiers(
    String^ Name,
    array<double>^% Value
)
```

```
abstract GetModifiers :
    Name : string *
    Value : float[] byref -> int
```

Parameters

Name

Type: [System.String](#)

The name of an existing area property.

Value

Type: [System.Double](#)

An array of 10 unitless modifiers.

Value	Modifier
Value(0)	Membrane f11 modifier

Value(1) Membrane f22 modifier
 Value(2) Membrane f12 modifier
 Value(3) Bending m11 modifier
 Value(4) Bending m22 modifier
 Value(5) Bending m12 modifier
 Value(6) Shear v13 modifier
 Value(7) Shear v23 modifier
 Value(8) Mass modifier
 Value(9) Weight modifier

Return Value

Type: $\hat{A}$ Int32

Returns zero if the modifier assignments are successfully retrieved; otherwise it returns a nonzero value.

Remarks

The default value for all modifiers is one.

Examples

VB

Copy

```
Public Sub Example()
    Dim SapModel As cSapModel
    Dim EtabsObject As cOAPI
    Dim ret As Integer = -1
    Dim i As Integer
    Dim MyValue() As Double
    Dim Value() As Double

    'create ETABS object
    Dim myHelper as cHelper = New Helper
    EtabsObject = myHelper.CreateObjectProgID("CSI.ETABS.API.ETABSObject")

    'start ETABS application
    ret = EtabsObject.ApplicationStart()

    'create SapModel object
    SapModel = EtabsObject.SapModel

    'initialize model
    ret = SapModel.InitializeNewModel()

    'create steel deck template model
    ret = SapModel.File.NewSteelDeck(4,12,12,4,4,24,24)

    'assign modifiers
    ReDim MyValue(9)
    For i = 0 To 9
        MyValue(i) = 1
    Next i
    MyValue(0) = 0.1
    ret = SapModel.PropArea.SetModifiers("SLAB1", MyValue)

    'get modifiers
    ret = SapModel.PropArea.GetModifiers("SLAB1", Value)
```

Introduction

```
'close ETABS
  EtabsObject.ApplicationExit(False)

'clean up variables
  SapModel = Nothing
  EtabsObject = Nothing
End Sub
```

CSI API ETABS v1

cPropAreaAddLanguageSpecificTextSet("LST50E855E Method

Retrieves the names of all defined area properties of the specified type.

Namespace: [ETABSv1](#)

Assembly: [ETABSv1](#) (in ETABSv1.dll) Version: 1.0.0.0 (1.24.0.0)

Syntax

[C#](#)

[VB](#)

[C++](#)

[F#](#)

[Copy](#)

```
int GetNameList(
    ref int NumberNames,
    ref string[] MyName,
    int PropType = 0
)
```

```
Function GetNameList (
    ByRef NumberNames As Integer,
    ByRef MyName As String(),
    PropType As Integer = 0
) As Integer
```

```
Dim instance As cPropArea
Dim NumberNames As Integer
Dim MyName As String()
Dim PropType As Integer
Dim returnValue As Integer
```

```
returnValue = instance.GetNameList(NumberNames,
    MyName, PropType)
```

```
int GetNameList(
    int% NumberNames,
    array<String^>^% MyName,
    int PropType = 0
)
```

```
abstract GetNameList :
    NumberNames : int byref *
    MyName : string[] byref *
    ?PropType : int
(* Defaults:
    let _PropType = defaultArg PropType 0
*)
-> int
```

Parameters

NumberNames

Type: SystemInt32

The number of area property names retrieved by the program.

MyName

Type: SystemString

One-dimensional array of area property names. The MyName array is created as a dynamic, zero-based, array by the API user:

```
Dim MyName() as String
```

The array is dimensioned to (NumberNames - 1) inside the program, filled with the names, and returned to the API user.

PropType (Optional)

Type: SystemInt32

This optional value is 0, 1, 2 or 3, indicating the type of area properties included in the name list.

Value Type

0	All
1	Shell
2	Plane
3	Asolid

Return Value

Type: Int32

Returns zero if the names are successfully retrieved; otherwise it returns nonzero

CSI API ETABS v1

cPropAreaAddLanguageSpecificTextSet("LSTACD90FBB_0") Method

Retrieves area property design parameters for a shell-type area section.

Namespace: ETABSV1

Assembly: ETABSV1 (in ETABSV1.dll) Version: 1.0.0.0 (1.24.0.0)

Syntax

C#

VB

C++

F#

Copy

```
int GetShellDesign(
    string Name,
    ref string MatProp,
    ref int SteelLayoutOption,
    ref double DesignCoverTopDir1,
    ref double DesignCoverTopDir2,
    ref double DesignCoverBotDir1,
    ref double DesignCoverBotDir2
)
```

```
Function GetShellDesign (
    Name As String,

    double% DesignCoverTopDir2,
```

cPropAreaspan id="LSTACD90FBB_0"AddLanguageSpecificTextSet("LSTACD90FBB_0?cpp=2781-.");Get

```
double% DesignCoverBotDir1,
double% DesignCoverBotDir2
)
```

```
abstract GetShellDesign :
    Name : string *
    MatProp : string byref *
    SteelLayoutOption : int byref *
    DesignCoverTopDir1 : float byref *
    DesignCoverTopDir2 : float byref *
    DesignCoverBotDir1 : float byref *
    DesignCoverBotDir2 : float byref -> int
```

Parameters

Name

Type:Â SystemString

The name of an existing shell-type area property.

MatProp

Type:Â SystemString

The name of the material property for the area property.

SteelLayoutOption

Type:Â SystemInt32

This is 0, 1 or 2 indicating, the rebar layout option.

Value Layout

0 Default

1 One layer

2 Two layers

DesignCoverTopDir1

Type:Â SystemDouble

The cover to the centroid of the top reinforcing steel running in the local 1 axis direction of the area object. [L]

This item applies only when SteelLayoutOption = 1 or 2.

DesignCoverTopDir2

Type:Â SystemDouble

The cover to the centroid of the top reinforcing steel running in the local 2 axis direction of the area object. [L]

This item applies only when SteelLayoutOption = 1 or 2.

DesignCoverBotDir1

Type:Â SystemDouble

The cover to the centroid of the bottom reinforcing steel running in the local 1 axis direction of the area object. [L]

This item applies only when SteelLayoutOption = 2.

DesignCoverBotDir2

Type:Â SystemDouble

The cover to the centroid of the bottom reinforcing steel running in the local 2 axis direction of the area object. [L]

This item applies only when SteelLayoutOption = 2.

Return Value

Type: Int32

Returns zero if the parameters are successfully retrieved; otherwise it returns a nonzero value.

▲ **Remarks**

▲ **Examples**

VB

Copy

```
Public Sub Example()
    Dim SapModel As cSapModel
    Dim EtabsObject As cOAPI
    Dim ret As Integer = -1
    Dim MatProp As String
    Dim SteelLayoutOption As integer
    Dim DesignCoverTopDir1 As Double
    Dim DesignCoverTopDir2 As Double
    Dim DesignCoverBotDir1 As Double
    Dim DesignCoverBotDir2 As Double

    'create ETABS object
    Dim myHelper as cHelper = New Helper
    EtabsObject = myHelper.CreateObjectProgID("CSI.ETABS.API.ETABSObject")

    'start ETABS application
    ret = EtabsObject.ApplicationStart()

    'create SapModel object
    SapModel = EtabsObject.SapModel

    'initialize model
    ret = SapModel.InitializeNewModel()

    'create steel deck template model
    ret = SapModel.File.NewSteelDeck(4,12,12,4,4,24,24)

    'get area property design parameters
    ret = SapModel.PropArea.GetShellDesign("SLAB1", MatProp, SteelLayoutOption, DesignCoverTopDir1, DesignCoverTopDir2, DesignCoverBotDir1, DesignCoverBotDir2)

    'close ETABS
    EtabsObject.ApplicationExit(False)

    'clean up variables
    SapModel = Nothing
    EtabsObject = Nothing
End Sub
```

    Nonlinear : bool[] byref *
    MatAng : float[] byref *
    NumIntegrationPts : int[] byref -> int
```

Parameters

Name

Type:Â SystemString

The name of an existing shell-type area property that is specified to be a layered shell property.

NumberLayers

Type:Â SystemInt32

The number of layers in the area property.

LayerName

Type:Â SystemString

This is an array that includes the name of each layer.

Dist

Type:Â SystemDouble

This is an array that includes the distance from the area reference surface (area object joint location plus offsets) to the mid-height of the layer. [L]

Thickness

Type:Â SystemDouble

This is an array that includes the thickness of each layer. [L]

MatProp

Type:Â SystemString

This is an array that includes the name of the material property for the layer.

Nonlinear

Type:Â SystemBoolean

MatAng

Type:Â SystemDouble

This is an array that includes the material angle for the layer. [deg]

NumIntegrationPts

Type:Â SystemInt32

The number of integration points in the thickness direction for the layer. The locations are determined by the program using standard Gauss-quadrature rules.

Return Value

Type: Int32

Returns zero if the parameters are successfully retrieved, otherwise it returns a nonzero value.

The function returns an error if the specified area property is not a shell-type property specified to be a layered shell.

    S12Type : int[] byref -> int

```

Parameters

Name

Type:Â SystemString

The name of an existing shell-type area property that is specified to be a layered shell property.

NumberLayers

Type:Â SystemInt32

The number of layers in the area property.

LayerName

Type:Â SystemString

This is an array that includes the name of each layer.

Dist

Type:Â SystemDouble

This is an array that includes the distance from the area reference surface (area object joint location plus offsets) to the mid-height of the layer. [L]

Thickness

Type:Â SystemDouble

This is an array that includes the thickness of each layer. [L]

MyTypeType:Â SystemInt32

This is an array that includes 1, 2 or 3, indicating the layer type.

Value Type

1	Shell
2	Membrane
3	Plate

NumIntegrationPtsType:Â SystemInt32

The number of integration points in the thickness direction for the layer. The locations are determined by the program using standard Guass-quadrature rules.

MatPropType:Â SystemString

This is an array that includes the name of the material property for the layer.

MatAngType:Â SystemDouble

This is an array that includes the material angle for the layer. [deg]

S11TypeType:Â SystemInt32

This is an array that includes 0, 1 or 2, indicating the material component behavior.

Value S11Type

0	Inactive
1	Linear
2	Nonlinear

S22TypeType:Â SystemInt32

This is an array that includes 0, 1 or 2, indicating the material component behavior.

Value S22Type

0	Inactive
1	Linear
2	Nonlinear

S12TypeType:Â SystemInt32

This is an array that includes 0, 1 or 2, indicating the material component behavior.

Value S12Type

0	Inactive
1	Linear
2	Nonlinear

Return ValueType:Â Int32

Returns zero if the parameters are successfully retrieved, otherwise it returns a

nonzero value.

The function returns an error if the specified area property is not a shell-type property specified to be a layered shell.

Parameters

Name

Type:Â [SystemString](#)

The name of an existing shell-type area property that is specified to be a layered shell property.

NumberLayers

Type:Â [SystemInt32](#)

The number of layers in the area property.

LayerName

Type:Â [SystemString](#)

This is an array that includes the name of each layer.

Dist

Type: SystemDouble

This is an array that includes the distance from the area reference surface (area object joint location plus offsets) to the mid-height of the layer. [L]

Thickness

Type: SystemDouble

This is an array that includes the thickness of each layer. [L]

MyType

Type: SystemInt32

This is an array that includes 1, 2 or 3, indicating the layer type.

Value Type

1	Shell
2	Membrane
3	Plate

NumIntegrationPts

Type: SystemInt32

The number of integration points in the thickness direction for the layer. The locations are determined by the program using standard Guass-quadrature rules.

MatProp

Type: SystemString

This is an array that includes the name of the material property for the layer.

MatAng

Type: SystemDouble

This is an array that includes the material angle for the layer. [deg]

MatBehavior

Type: SystemInt32

This is an array that includes 0 or 1 indicating the material behavior type of the layer.

Value Type

0	Directional
1	Coupled

S11Type

Type: SystemInt32

This is an array that includes 0, 1 or 2, indicating the material component behavior.

Value S11Type

0	Inactive
1	Linear
2	Nonlinear

S22Type

Type: SystemInt32

This is an array that includes 0, 1 or 2, indicating the material component behavior.

Value S22Type

0	Inactive
1	Linear
2	Nonlinear

S12TypeType: SystemInt32

This is an array that includes 0, 1 or 2, indicating the material component behavior.

Value S12Type

0	Inactive
1	Linear
2	Nonlinear

Return ValueType: Int32

Returns zero if the parameters are successfully retrieved, otherwise it returns a nonzero value.

The function returns an error if the specified area property is not a shell-type property specified to be a layered shell.

▲Remarks

▲Examples

    notes : string byref *
    GUID : string byref -> int
```

Parameters

Name

Type:Â SystemString

The name of an existing slab property.

SlabType

Type:Â ETABSv1eSlabType

This is one of the items in the eSlabType enumeration.

If this item is Ribbed, use the GetSlabRibbed(String, Double, Double, Double, Double, Double, Int32) function to get additional parameters.

If this item is Waffle, use the GetSlabWaffle(String, Double, Double, Double, Double, Double, Double) function to get additional parameters.

ShellType

Type:Â ETABSv1eShellType

This is one of the items in the eShellType enumeration.

MatProp

Type:Â SystemString

The name of the material property for the area property.

This item does not apply when ShellType is Layered.

Thickness

Type:Â SystemDouble

The membrane thickness. [L]

This item does not apply when ShellType is Layered.

color

Type:Â SystemInt32

The display color assigned to the property.

notes

Type:Â SystemString

The notes, if any, assigned to the property.

GUID

Type:Â SystemString

The GUID (global unique identifier), if any, assigned to the property.

Return ValueType: Int32

The function returns zero if the property data is successfully retrieved; otherwise it returns a nonzero value.

▲ **Remarks**

▲ **Examples**

    StemWidthTop : float byref *
    StemWidthBot : float byref *
    RibSpacing : float byref *
    RibsParallelTo : int byref -> int

```

Parameters

Name

Type:Â [SystemString](#)

The name of an existing ribbed slab property.

OverallDepth

Type:Â [SystemDouble](#)

Overall Depth

SlabThickness

Type:Â [SystemDouble](#)

Slab Thickness

StemWidthTop

Type:Â [SystemDouble](#)

Stem Width at Top

StemWidthBot

Type:Â [SystemDouble](#)

Stem Width at Bottom

RibSpacing

Type:Â [SystemDouble](#)

Rib Spacing (Perpendicular to Rib Direction)

RibsParallelTo

Type:Â [SystemInt32](#)

This is the Local Axis that the Rib Direction is Parallel to

This value is 1 for the Local 1 Axis, and 2 for the Local 2 Axis.

Return Value

Type:Â [Int32](#)

The function returns zero if the property data is successfully retrieved; otherwise it returns a nonzero value.

    StemWidthTop : float byref *
    StemWidthBot : float byref *
    RibSpacingDir1 : float byref *
    RibSpacingDir2 : float byref -> int
```

Parameters

Name

Type:Â SystemString

The name of an existing waffle slab property.

OverallDepth

Type:Â SystemDouble

Overall Depth

SlabThickness

Type:Â SystemDouble

Slab Thickness

StemWidthTop

Type:Â SystemDouble

Stem Width at Top

StemWidthBot

Type:Â SystemDouble

Stem Width at Bottom

RibSpacingDir1

Type:Â SystemDouble

Spacing of Ribs that are Parallel to Slab 1-Axis

RibSpacingDir2

Type:Â SystemDouble

Spacing of Ribs that are Parallel to Slab 2-Axis

Return Value

Type:Â Int32

The function returns zero if the property data is successfully retrieved; otherwise it returns a nonzero value.

Namespace: ETABSv1

▲ Syntax

C#

VBC++F#

Copy

```
Function GetTypeOAPI (
  Name As String,
  ByRef PropType As Integer
) As Integer
```

```
returnValue = instance.GetType0API(Name,
PropType)
```

```
abstract GetTypeOAPI :
  Name : string *
  PropType : int byref -> int
```

Name

Type:Â SystemString

The name of an existing area property.

PropType

Type: SystemInt32

This is 1, 2 or 3, indicating the type of area property.

Value Type

1 Shell

- 2 Plane
- 3 Asolid

Return Value

Type: Int32

Returns zero if the type is successfully retrieved; otherwise it returns nonzero.

Remarks

Plane and Asolid area properties are not supported in ETABS.

Dim MatProp As String
Dim Thickness As Double
Dim color As Integer
Dim notes As String
Dim GUID As String
Dim returnValue As Integer
```

```
returnValue = instance.GetWall(Name, WallPropType,
    ShellType, MatProp, Thickness, color,
    notes, GUID)
```

```
int GetWall(
    String^ Name,
    eWallPropType% WallPropType,
    eShellType% ShellType,
```

cPropAreaspan id="LSTA88ADD15_0"AddLanguageSpecificTextSet("LSTA88ADD15_0?cpp=:2814.");GetWall

```
String^% MatProp,
double% Thickness,
int% color,
String^% notes,
String^% GUID
)
```

```
abstract GetWall :
    Name : string *
    WallPropType : eWallPropType byref *
    ShellType : eShellType byref *
    MatProp : string byref *
    Thickness : float byref *
    color : int byref *
    notes : string byref *
    GUID : string byref -> int
```

Parameters

Name

Type:Â SystemString

The name of an existing wall property.

WallPropType

Type:Â ETABSv1eWallPropType

This is one of the items in the eWallPropType enumeration.

If this item is AutoSelectList, use the GetWallAutoSelectList(String,String,String) function to get additional parameters.

ShellType

Type:Â ETABSv1eShellType

This is one of the items in the eShellType enumeration.

MatProp

Type:Â SystemString

The name of the material property for the area property.

This item does not apply when ShellType is Layered.

Thickness

Type:Â SystemDouble

The membrane thickness. [L]

This item does not apply when ShellType is Layered.

color

Type:Â SystemInt32

The display color assigned to the property.

notes

Type:Â SystemString

The notes, if any, assigned to the property.

GUID

Type:Â SystemString

The GUID (global unique identifier), if any, assigned to the property.

Return Value

Type: Int32

The function returns zero if the property data is successfully retrieved; otherwise it returns a nonzero value.

▲ **Remarks**

▲ **Examples**

VB

Copy

```
Public Sub Example()
    Dim SapModel As cSapModel
    Dim EtabsObject As cOAPI
    Dim ret As Integer = -1
    Dim WallPropType As eWallPropType
    Dim ShellType As eShellType
    Dim MatProp As String
    Dim Thickness As Double
    Dim Color As Integer
    Dim Notes As String
    Dim GUID As String

    'create ETABS object
    Dim myHelper as cHelper = New Helper
    EtabsObject = myHelper.CreateObjectProgID("CSI.ETABS.API.ETABSObject")

    'start ETABS application
    ret = EtabsObject.ApplicationStart()

    'create SapModel object
    SapModel = EtabsObject.SapModel

    'initialize model
    ret = SapModel.InitializeNewModel()

    'create steel deck template model
    ret = SapModel.File.NewSteelDeck(4,12,12,4,4,24,24)

    'set new area property
    ret = SapModel.PropArea.SetWall("MyShellProp1A", eWallPropType.Specified, eShellType.Shell

    'get area property data
    ret = SapModel.PropArea.GetWall("MyShellProp1A", WallPropType, ShellType, MatProp, Thickne

    'close ETABS
    EtabsObject.ApplicationExit(False)

    'clean up variables
    SapModel = Nothing
    EtabsObject = Nothing
End Sub
```

CSI API ETABS v1

cPropAreaAddLanguageSpecificTextSet("LSTBD1458B Method

Retrieves property data for an auto select list wall section.

Namespace: ETABSv1

Assembly: ETABSv1 (in ETABSv1.dll) Version: 1.0.0.0 (1.24.0.0)

■ Syntax

C#

VB

C++

F#

Copy

```
int GetWallAutoSelectList(
    string Name,
    ref string[] AutoSelectList,
    ref string StartingProperty
)
```

```
Function GetWallAutoSelectList (
    Name As String,
    ByRef AutoSelectList As String(),
    ByRef StartingProperty As String
) As Integer
```

```
Dim instance As cPropArea
Dim Name As String
Dim AutoSelectList As String()
Dim StartingProperty As String
Dim returnValue As Integer
```

```
returnValue = instance.GetWallAutoSelectList(Name,
    AutoSelectList, StartingProperty)
```

```
int GetWallAutoSelectList(
    String^ Name,
    array<String^>^% AutoSelectList,
    String^% StartingProperty
)
```

```
abstract GetWallAutoSelectList :
    Name : string *
    AutoSelectList : string[] byref *
    StartingProperty : string byref -> int
```

Parameters

Name

Type: SystemString

The name of an existing auto select list wall property.

AutoSelectList

Type: SystemString

This is an array of the names of the wall properties included in the auto select list.

StartingProperty

Type: SystemString

This is Median or the name of a wall property in the AutoSelectList array. It is the starting section for the auto select list.

Median indicates the Median Property by Thickness

Return Value

Type: Int32

The function returns zero if the property data is successfully retrieved; otherwise it returns a nonzero value.

▲ Remarks

▲ Examples

VB

Copy

```
Public Sub Example()
    Dim SapModel As cSapModel
    Dim EtabsObject As cOAPI
    Dim ret As Integer = -1

CSI API ETABS v1

cPropAreaAddLanguageSpecificTextSet("LST3CB46314_0?cpp=::|282.1");SetDeck

Method

Initializes a deck property.

Namespace: ETABSv1

Assembly: ETABSv1 (in ETABSv1.dll) Version: 1.0.0.0 (1.24.0.0)

Syntax

C#

VB

C++

F#

Copy

```
int SetDeck(
    string Name,
    eDeckType DeckType,
    eShellType ShellType,
    string MatProp,
    double Thickness,
    int color = -1,
    string notes = "",
    string GUID = ""
)
```

```
Function SetDeck (
    Name As String,
    DeckType As eDeckType,
    ShellType As eShellType,
    MatProp As String,
    Thickness As Double,
    Optional color As Integer = -1,
    Optional notes As String = "",
    Optional GUID As String = ""
) As Integer
```

```
Dim instance As cPropArea
Dim Name As String
Dim DeckType As eDeckType
Dim ShellType As eShellType
Dim MatProp As String
Dim Thickness As Double
Dim color As Integer
Dim notes As String
Dim GUID As String
Dim returnValue As Integer
```

```
returnValue = instance.SetDeck(Name, DeckType,
    ShellType, MatProp, Thickness, color,
    notes, GUID)
```

```
int SetDeck(
    String^ Name,
    eDeckType DeckType,
    eShellType ShellType,
```

cPropAreaAddLanguageSpecificTextSet("LST3CB46314_0?cpp=::|282.1");SetDeck

```

String^ MatProp,
double Thickness,
int color = -1,
String^ notes = L"",
String^ GUID = L""
)

abstract SetDeck :
    Name : string *
    DeckType : eDeckType *
    ShellType : eShellType *
    MatProp : string *
    Thickness : float *
    ?color : int *
    ?notes : string *
    ?GUID : string
(* Defaults:
    let _color = defaultArg color -1
    let _notes = defaultArg notes ""
    let _GUID = defaultArg GUID ""
*)
-> int

```

Parameters

Name

Type:Â SystemString

The name of a deck property. If this is an existing property, that property is modified; otherwise, a new property is added.

DeckType

Type:Â ETABSv1eDeckType

This is one of the following items in the eDeckType enumeration.

If this item is Filled, use the SetDeckFilled(String, Double, Double, Double, Double, Double, Double, Double, Double, Double) function to get additional parameters.

If this item is Unfilled, use the SetDeckUnfilled(String, Double, Double, Double, Double, Double, Double) function to get additional parameters.

If this item is SolidSlab, use the SetDeckSolidSlab(String, Double, Double, Double, Double) function to get additional parameters.

ShellType

Type:Â ETABSv1eShellType

This is one of the items in the eShellType enumeration.

Please note that for deck properties, this is always Membrane

MatProp

Type:Â SystemString

The name of the material property for the area property.

This item does not apply when ShellType = 6.

Thickness

Type:Â SystemDouble

The membrane thickness. [L]

Introduction

This item does not apply when ShellType = 6.

color (Optional)

Type:Â SystemInt32

The display color assigned to the property.

notes (Optional)

Type:Â SystemString

The notes, if any, assigned to the property.

GUID (Optional)

Type:Â SystemString

The GUID (global unique identifier), if any, assigned to the property.

Return Value

Type:Â Int32

Returns zero if the property is successfully initialized; otherwise it returns a nonzero value.

▲ Remarks

▲ Examples

VB

Copy

```
Public Sub Example()  
    Dim SapModel As cSapModel  
    Dim EtabsObject As cOAPI  
    Dim ret As Integer = -1  
    Dim DeckType As eDeckType  
    Dim ShellType As eShellType  
    Dim MatProp As String  
    Dim Thickness As Double  
    Dim Color As Integer  
    Dim Notes As String  
    Dim GUID As String  
  
    'create ETABS object  
    Dim myHelper as cHelper = New Helper  
    EtabsObject = myHelper.CreateObjectProgID("CSI.ETABS.API.ETABSObject")  
  
    'start ETABS application  
    ret = EtabsObject.ApplicationStart()  
  
    'create SapModel object  
    SapModel = EtabsObject.SapModel  
  
    'initialize model  
    ret = SapModel.InitializeNewModel()  
  
    'create steel deck template model  
    ret = SapModel.File.NewSteelDeck(4,12,12,4,4,24,24)  
  
    'set new area property  
    ret = SapModel.PropArea.SetDeck("MyShellProp1A", eDeckType.Filled, eShellType.ShellThin, '  
  
    'get area property data  
    ret = SapModel.PropArea.GetDeck("MyShellProp1A", DeckType, ShellType, MatProp, Thickness, '  
  
    'close ETABS  
    EtabsObject.ApplicationExit(False)  
  
    'clean up variables
```

Introduction

```
SapModel = Nothing  
EtabsObject = Nothing  
End Sub

```

Parameters

Name

Type:Â SystemString

The name of an existing deck property created with the SetDeck(String, eDeckType, eShellType, String, Double, Int32, String, String) function.

SlabDepth

Type:Â SystemDouble

Slab Depth, tc

RibDepth

Type:Â SystemDouble

Rib Depth, hr

RibWidthTop

Type:Â SystemDouble

Rib Width Top, wrt

RibWidthBot

Type:Â SystemDouble

Rib Width Bottom, wrb

RibSpacing

Type:Â SystemDouble

Rib Spacing, sr

ShearThickness

Type: SystemDouble
 Deck Shear Thickness
 UnitWeight
 Type: SystemDouble
 Deck Unit Weight
 ShearStudDia
 Type: SystemDouble
 Shear Stud Diameter
 ShearStudHt
 Type: SystemDouble
 Shear Stud Height, hs
 ShearStudFu
 Type: SystemDouble
 Shear Stud Tensile Strength, Fu

Return Value

Type: Int32

Returns zero if the property is successfully initialized; otherwise it returns a nonzero value.

CSI API ETABS v1

cPropAreaAddLanguageSpecificTextSet("LST45589621_0") Method

Assigns property modifiers to an area property.

Namespace: ETABSv1

Assembly: ETABSv1 (in ETABSv1.dll) Version: 1.0.0.0 (1.24.0.0)

Syntax

C#

VB

C++

F#

Copy

```
int SetModifiers(
    string Name,
    ref double[] Value
)
```

```
Function SetModifiers (
    Name As String,
    ByRef Value As Double()
) As Integer
```

```
Dim instance As cPropArea
Dim Name As String
Dim Value As Double()
Dim returnValue As Integer
```

```
returnValue = instance.SetModifiers(Name,
    Value)
```

```
int SetModifiers(
    String^ Name,
    array<double>^% Value
)
```

```
abstract SetModifiers :
    Name : string *
    Value : float[] byref -> int
```

Parameters

Name

Type: SystemString

The name of an existing area property.

Value

Type: SystemDouble

An array of 10 unitless modifiers.

Value	Modifier
Value(0)	Membrane f11 modifier

Value(1) Membrane f22 modifier
 Value(2) Membrane f12 modifier
 Value(3) Bending m11 modifier
 Value(4) Bending m22 modifier
 Value(5) Bending m12 modifier
 Value(6) Shear v13 modifier
 Value(7) Shear v23 modifier
 Value(8) Mass modifier
 Value(9) Weight modifier

Return Value

Type: Int32

Returns zero if the modifiers are successfully assigned; otherwise it returns a nonzero value.

Remarks

The default value for all modifiers is one.

Examples

VB

Copy

```
Public Sub Example()
    Dim SapModel As cSapModel
    Dim EtabsObject As cOAPI
    Dim ret As Integer = -1
    Dim i As Integer
    Dim MyValue() As Double

    'create ETABS object
    Dim myHelper as cHelper = New Helper
    EtabsObject = myHelper.CreateObjectProgID("CSI.ETABS.API.ETABSObject")

    'start ETABS application
    ret = EtabsObject.ApplicationStart()

    'create SapModel object
    SapModel = EtabsObject.SapModel

    'initialize model
    ret = SapModel.InitializeNewModel()

    'create steel deck template model
    ret = SapModel.File.NewSteelDeck(4,12,12,4,4,24,24)

    'assign modifiers
    ReDim MyValue(9)
    For i = 0 To 9
        MyValue(i) = 1
    Next i
    MyValue(0) = 0.1
    ret = SapModel.PropArea.SetModifiers("SLAB1", MyValue)

    'close ETABS
    EtabsObject.ApplicationExit(False)

    'clean up variables
```

Introduction

```
SapModel = Nothing  
EtabsObject = Nothing  
End Sub
```

Dim returnValue As Integer
```

```
returnValue = instance.SetShellDesign(Name,
    MatProp, SteelLayoutOption, DesignCoverTopDir1,
    DesignCoverTopDir2, DesignCoverBotDir1,
    DesignCoverBotDir2)
```

```
int SetShellDesign(
    String^ Name,
    String^ MatProp,
    int SteelLayoutOption,
    double DesignCoverTopDir1,
    double DesignCoverTopDir2,
```

cPropAreaspan id="LSTEA7F57E8_0"AddLanguageSpecificTextSet("LSTEA7F57E8_0?cpp=::2808");SetShellDesign

```

double DesignCoverBotDir1,
double DesignCoverBotDir2
)

abstract SetShellDesign :
    Name : string *
    MatProp : string *
    SteelLayoutOption : int *
    DesignCoverTopDir1 : float *
    DesignCoverTopDir2 : float *
    DesignCoverBotDir1 : float *
    DesignCoverBotDir2 : float -> int

```

Parameters

Name

Type:Â SystemString

The name of an existing shell-type area property.

MatProp

Type:Â SystemString

The name of the material property for the area property.

SteelLayoutOption

Type:Â SystemInt32

This is 0, 1 or 2 indicating, the rebar layout option.

Value Layout

0 Default

1 One layer

2 Two layers

DesignCoverTopDir1

Type:Â SystemDouble

The cover to the centroid of the top reinforcing steel running in the local 1 axis direction of the area object. [L]

This item applies only when SteelLayoutOption = 1 or 2.

DesignCoverTopDir2

Type:Â SystemDouble

The cover to the centroid of the top reinforcing steel running in the local 2 axis direction of the area object. [L]

This item applies only when SteelLayoutOption = 1 or 2.

DesignCoverBotDir1

Type:Â SystemDouble

The cover to the centroid of the bottom reinforcing steel running in the local 1 axis direction of the area object. [L]

This item applies only when SteelLayoutOption = 2.

DesignCoverBotDir2

Type:Â SystemDouble

The cover to the centroid of the bottom reinforcing steel running in the local 2 axis direction of the area object. [L]

This item applies only when SteelLayoutOption = 2.

Return Value

Type: Int32

Returns zero if the parameters are successfully assigned; otherwise it returns a nonzero value.

▲ **Remarks**

▲ **Examples**

VB

Copy

```
Public Sub Example()
    Dim SapModel As cSapModel

    MatProp : string[] byref *
    Nonlinear : bool[] byref *
    MatAng : float[] byref *
    NumIntegrationPts : int[] byref -> int
```

Parameters

Name

Type:Â SystemString

The name of an existing shell-type area property that is specified to be a layered shell property.

NumberLayers

Type:Â SystemInt32

The number of layers in the area property.

LayerName

Type:Â SystemString

This is an array that includes the name of each layer.

Dist

Type:Â SystemDouble

This is an array that includes the distance from the area reference surface (area object joint location plus offsets) to the mid-height of the layer. [L]

Thickness

Type:Â SystemDouble

This is an array that includes the thickness of each layer. [L]

MatProp

Type:Â SystemString

This is an array that includes the name of the material property for the layer.

Nonlinear

Type:Â SystemBoolean

MatAng

Type:Â SystemDouble

This is an array that includes the material angle for the layer. [deg]

NumIntegrationPts

Type:Â SystemInt32

The number of integration points in the thickness direction for the layer. The locations are determined by the program using standard Gauss-quadrature rules.

Return Value

Type: Int32

Returns zero if the parameters are successfully assigned; otherwise it returns a nonzero value.

The function returns an error if the specified area property is not a shell-type property specified to be a layered shell.

▲ **Remarks**

▲ **Examples**

    MatAng : float[] byref *
    S11Type : int[] byref *
    S22Type : int[] byref *
    S12Type : int[] byref -> int

```

Parameters

Name

Type:Â SystemString

The name of an existing shell-type area property that is specified to be a layered shell property.

NumberLayers

Type:Â SystemInt32

The number of layers in the area property.

LayerName

Type:Â SystemString

This is an array that includes the name of each layer.

Dist

Type:Â SystemDouble

This is an array that includes the distance from the area reference surface (area object joint location plus offsets) to the mid-height of the layer. [L]

Thickness

Type:Â SystemDouble

This is an array that includes the thickness of each layer. [L]

MyTypeType:Â SystemInt32

This is an array that includes 1, 2 or 3, indicating the layer type.

Value Type

1	Shell
2	Membrane
3	Plate

NumIntegrationPtsType:Â SystemInt32

The number of integration points in the thickness direction for the layer. The locations are determined by the program using standard Guass-quadrature rules.

MatPropType:Â SystemString

This is an array that includes the name of the material property for the layer.

MatAngType:Â SystemDouble

This is an array that includes the material angle for the layer. [deg]

S11TypeType:Â SystemInt32

This is an array that includes 0, 1 or 2, indicating the material component behavior.

Value S11Type

0	Inactive
1	Linear
2	Nonlinear

S22TypeType:Â SystemInt32

This is an array that includes 0, 1 or 2, indicating the material component behavior.

Value S22Type

0	Inactive
1	Linear
2	Nonlinear

S12TypeType:Â SystemInt32

This is an array that includes 0, 1 or 2, indicating the material component behavior.

Value S12Type

0	Inactive
1	Linear
2	Nonlinear

Return ValueType:Â Int32

Returns zero if the parameters are successfully assigned; otherwise it returns a

nonzero value.

The function returns an error if the specified area property is not a shell-type property specified to be a layered shell.

Remarks

Examples

    S11Type : int[] byref *
    S22Type : int[] byref *
    S12Type : int[] byref -> int

```

Parameters

Name

Type:Â SystemString

The name of an existing shell-type area property that is specified to be a layered shell property.

NumberLayers

Type:Â SystemInt32

The number of layers in the area property.

LayerName

Type:Â SystemString

This is an array that includes the name of each layer.

Dist

Type: SystemDouble

This is an array that includes the distance from the area reference surface (area object joint location plus offsets) to the mid-height of the layer. [L]

Thickness

Type: SystemDouble

This is an array that includes the thickness of each layer. [L]

MyType

Type: SystemInt32

This is an array that includes 1, 2 or 3, indicating the layer type.

Value Type

1 Shell

2 Membrane

3 Plate

NumIntegrationPts

Type: SystemInt32

The number of integration points in the thickness direction for the layer. The locations are determined by the program using standard Guass-quadrature rules.

MatProp

Type: SystemString

This is an array that includes the name of the material property for the layer.

MatAng

Type: SystemDouble

This is an array that includes the material angle for the layer. [deg]

MatBehavior

Type: SystemInt32

This is an array that includes 0 or 1 indicating the material behavior type of the layer.

Value Type

0 Directional

1 Coupled

S11Type

Type: SystemInt32

This is an array that includes 0, 1 or 2, indicating the material component behavior.

Value S11Type

0 Inactive

1 Linear

2 Nonlinear

S22Type

Type: SystemInt32

This is an array that includes 0, 1 or 2, indicating the material component behavior.

Value S22Type

0 Inactive

1 Linear

2 Nonlinear

S12TypeType: SystemInt32

This is an array that includes 0, 1 or 2, indicating the material component behavior.

Value S12Type

0	Inactive
1	Linear
2	Nonlinear

Return ValueType: Int32

Returns zero if the parameters are successfully assigned; otherwise it returns a nonzero value.

The function returns an error if the specified area property is not a shell-type property specified to be a layered shell.

▲Remarks

```

String^ MatProp,
double Thickness,
int color = -1,
String^ notes = L"",
String^ GUID = L""
)

abstract SetSlab :
    Name : string *
    SlabType : eSlabType *
    ShellType : eShellType *
    MatProp : string *
    Thickness : float *
    ?color : int *
    ?notes : string *
    ?GUID : string
(* Defaults:
    let _color = defaultArg color -1
    let _notes = defaultArg notes ""
    let _GUID = defaultArg GUID ""
*)
-> int

```

Parameters

Name

Type:Â SystemString

The name of a slab property. If this is an existing property, that property is modified; otherwise, a new property is added.

SlabType

Type:Â ETABSv1eSlabType

This is one of the items in the eSlabType enumeration.

If this item is Ribbed, use the GetSlabRibbed(String, Double, Double, Double, Double, Double, Int32) function to get additional parameters.

If this item is Waffle, use the GetSlabWaffle(String, Double, Double, Double, Double, Double, Double) function to get additional parameters.

ShellType

Type:Â ETABSv1eShellType

This is one of the items in the eShellType enumeration.

MatProp

Type:Â SystemString

The name of the material property for the area property.

This item does not apply when ShellType is Layered.

Thickness

Type:Â SystemDouble

The membrane thickness. [L]

This item does not apply when ShellType is Layered.

color (Optional)

Type:Â SystemInt32

The display color assigned to the property.

notes (Optional)

Type:Â SystemString

The notes, if any, assigned to the property.

GUID (Optional)

Type:Â SystemString

The GUID (global unique identifier), if any, assigned to the property.

Return Value

Type:Â Int32

Returns zero if the property is successfully initialized; otherwise it returns a nonzero value.

▀ Remarks

▀ Examples

VB

Copy

```
Public Sub Example()
    Dim SapModel As cSapModel
    Dim EtabsObject As cOAPI
    Dim ret As Integer = -1
    Dim SlabType As eSlabType
    Dim ShellType As eShellType
    Dim MatProp As String

    SlabThickness : float *
    StemWidthTop : float *
    StemWidthBot : float *
    RibSpacing : float *
    RibsParallelTo : int -> int

```

Parameters

Name

Type:Â SystemString

The name of an existing ribbed slab property.

OverallDepth

Type:Â SystemDouble

Overall Depth

SlabThickness

Type:Â SystemDouble

Slab Thickness

StemWidthTop

Type:Â SystemDouble

Stem Width at Top

StemWidthBot

Type:Â SystemDouble

Stem Width at Bottom

RibSpacing

Type:Â SystemDouble

Rib Spacing (Perpendicular to Rib Direction)

RibsParallelTo

Type:Â SystemInt32

This is the Local Axis that the Rib Direction is Parallel to

This value is 1 for the Local 1 Axis, and 2 for the Local 2 Axis.

Return Value

Type:Â Int32

The function returns zero if the property data is successfully initialized; otherwise it returns a nonzero value.

int color = -1,
String^ notes = L"",
String^ GUID = L""
)

abstract SetWall :
    Name : string *
    WallPropType : eWallPropType *
    ShellType : eShellType *
    MatProp : string *
    Thickness : float *
    ?color : int *
    ?notes : string *
    ?GUID : string
(* Defaults:
    let _color = defaultArg color -1
    let _notes = defaultArg notes ""
    let _GUID = defaultArg GUID ""
*)
-> int

```

Parameters

Name

Type:Â [SystemString](#)
The name of an existing wall property.

WallPropType

Type:Â [ETABSv1eWallPropType](#)
This is one of the items in the [eWallPropType](#) enumeration.

If this item is [AutoSelectList](#), use the [GetWallAutoSelectList\(String,String,String\)](#) function to get additional parameters.

ShellType

Type:Â [ETABSv1eShellType](#)
This is one of the items in the [eShellType](#) enumeration.

MatProp

Type:Â [SystemString](#)
The name of the material property for the area property.

This item does not apply when ShellType is [Layered](#).

Thickness

Type:Â [SystemDouble](#)
The membrane thickness. [L]

This item does not apply when ShellType is [Layered](#).

color (Optional)

Type:Â [SystemInt32](#)
The display color assigned to the property.

notes (Optional)

Type:Â [SystemString](#)
The notes, if any, assigned to the property.

GUID (Optional)

Type: SystemString

The GUID (global unique identifier), if any, assigned to the property.

Return Value

Type: Int32

The function returns zero if the property data is successfully initialized; otherwise it returns a nonzero value.

▲ Remarks

▲ Examples

VB

Copy

```
Public Sub Example()
    Dim SapModel As cSapModel
    Dim EtabsObject As cOAPI
    Dim ret As Integer = -1
    Dim WallPropType As eWallPropType
    Dim ShellType As eShellType
    Dim MatProp As String
    Dim Thickness As Double
    Dim Color As Integer
    Dim Notes As String
    Dim GUID As String

    'create ETABS object
    Dim myHelper as cHelper = New Helper
    EtabsObject = myHelper.CreateObjectProgID("CSI.ETABS.API.ETABSObject")

    'start ETABS application
    ret = EtabsObject.ApplicationStart()

    'create SapModel object
    SapModel = EtabsObject.SapModel

    'initialize model
    ret = SapModel.InitializeNewModel()

    'create steel deck template model
    ret = SapModel.File.NewSteelDeck(4,12,12,4,4,24,24)

    'set new area property
    ret = SapModel.PropArea.SetWall("MyShellProp1A", eWallPropType.Specified, eShellType.ShellType)

    'get area property data
    ret = SapModel.PropArea.GetWall("MyShellProp1A", WallPropType, ShellType, MatProp, Thickness)

    'close ETABS
    EtabsObject.ApplicationExit(False)

    'clean up variables
    SapModel = Nothing
    EtabsObject = Nothing
End Sub
```

CSI API ETABS v1

cPropAreaAddLanguageSpecificTextSet("LSTFEB33746_0?cpp=::|287.1");SetWallAutoSelectList

Method

Initializes property data for an auto select list wall section.

Namespace: ETABSv1

Assembly: ETABSv1 (in ETABSv1.dll) Version: 1.0.0.0 (1.24.0.0)

Syntax

C#

VB

C++

F#

Copy

```
int SetWallAutoSelectList(
    string Name,
    string[] AutoSelectList,
    string StartingProperty = "Median"
)
```

```
Function SetWallAutoSelectList (
    Name As String,
    AutoSelectList As String(),
    StartingProperty As String = "Median"
) As Integer
```

```
Dim instance As cPropArea
Dim Name As String
Dim AutoSelectList As String()
Dim StartingProperty As String
Dim returnValue As Integer
```

```
returnValue = instance.SetWallAutoSelectList(Name,
    AutoSelectList, StartingProperty)
```

```
int SetWallAutoSelectList(
    String^ Name,
    array<String^>^ AutoSelectList,
    String^ StartingProperty = L"Median"
)
```

```
abstract SetWallAutoSelectList :
    Name : string *
    AutoSelectList : string[] *
    ?StartingProperty : string
(* Defaults:
    let _StartingProperty = defaultArg StartingProperty "Median"
*)
-> int
```

Parameters

Name

cPropAreaAddLanguageSpecificTextSet("LSTFEB33746_0?cpp=::|287.1");SetWallAutoSelectList

Type:Â SystemString

The name of an existing auto select list wall property.

AutoSelectList

Type:Â SystemString

This is an array of the names of the wall properties included in the auto select list.

StartingProperty (Optional)

Type:Â SystemString

This is Median or the name of a wall property in the AutoSelectList array. It is the starting section for the auto select list.

Median indicates the Median Property by Thickness

Return Value

Type:Â Int32

The function returns zero if the property data is successfully initialized; otherwise it returns a nonzero value.

▲Remarks

▲Examples

VB

Copy

```
Public Sub Example()

CSI API ETABS v1

cPropAreaSpringAddLanguageSpecificTextSet("LST885D47BF_0") Method

Changes the name of a defined area spring property

Namespace: ETABSv1

Assembly: ETABSv1 (in ETABSv1.dll) Version: 1.0.0.0 (1.24.0.0)

Syntax

C#

VB

C++

F#

Copy

```
int ChangeName(
    string Name,
    string NewName
)
```

```
Function ChangeName (
    Name As String,
    NewName As String
) As Integer
```

```
Dim instance As cPropAreaSpring
Dim Name As String
Dim NewName As String
Dim returnValue As Integer
```

```
returnValue = instance.ChangeName(Name,
    NewName)
```

```
int ChangeName(
    String^ Name,
    String^ NewName
)
```

```
abstract ChangeName :
    Name : string *
    NewName : string -> int
```

Parameters

Name

Type: SystemString

The existing name of a defined area spring property

NewName

Type: SystemString

The new name for the area spring property

Return Value

Type: Int32

Returns zero if the new name is successfully applied, otherwise it returns a nonzero value.

▀ **Remarks**

▀ **Examples**

VB

Copy

```
Public Sub Example()
    Dim SapModel As cSapModel
    Dim EtabsObject As cOAPI
    Dim ret As Integer = -1

    'create ETABS object
    Dim myHelper as cHelper = New Helper
    EtabsObject = myHelper.CreateObjectProgID("CSI.ETABS.API.ETABSObject")

    'start ETABS application
    ret = EtabsObject.ApplicationStart()

    'create SapModel object
    SapModel = EtabsObject.SapModel

    'initialize model
    ret = SapModel.InitializeNewModel()

    'create steel deck template model
    ret = SapModel.File.NewSteelDeck(4, 12, 12, 4, 4, 24, 24)

    'define new spring property
    ret = SapModel.PropAreaSpring.SetAreaSpringProp("mySpringProp1", 0, 0, 100, 0)

    'change property name
    ret = SapModel.PropAreaSpring.ChangeName("mySpringProp1", "prop1")

    'close ETABS
    EtabsObject.ApplicationExit(False)

    'clean up variables
    SapModel = Nothing
    EtabsObject = Nothing
End Sub
```

CSI API ETABS v1

cPropAreaSpringAddLanguageSpecificTextSet("LSTBC2F20AD_02878") Method

Deletes the specified area spring property

Namespace: ETABSv1

Assembly: ETABSv1 (in ETABSv1.dll) Version: 1.0.0.0 (1.24.0.0)

▲ Syntax

C#

VB

C++

F#

Copy

```
int Delete(
    string Name
)
```

```
Function Delete (
    Name As String
) As Integer
```

```
Dim instance As cPropAreaSpring
Dim Name As String
Dim returnValue As Integer
```

```
returnValue = instance.Delete(Name)
```

```
int Delete(
    String^ Name
)
```

```
abstract Delete :
    Name : string -> int
```

Parameters

Name

Type: SystemString

The name of an existing area spring property

Return Value

Type: Int32

Returns zero if the area spring property is successfully deleted, otherwise it returns a nonzero value.

▲ Remarks

▲ Examples

VB

Copy

    ByRef NonlinearOption3 As Integer,
    ByRef SpringOption As Integer,
    ByRef SoilProfile As String,
    ByRef EndLengthRatio As Double,
    ByRef Period As Double,
    ByRef color As Integer,
    ByRef notes As String,
    ByRef iGUID As String
) As Integer
```

```
Dim instance As cPropAreaSpring
Dim Name As String
Dim U1 As Double
Dim U2 As Double
Dim U3 As Double
Dim NonlinearOption3 As Integer
Dim SpringOption As Integer
Dim SoilProfile As String
Dim EndLengthRatio As Double
Dim Period As Double
Dim color As Integer
```

cPropAreaSpringid="LST99955FCF_0"AddLanguageSpecificTextSet("LST99955FCF_0?2880:|nu=.")

Introduction

```
Dim notes As String
Dim iGUID As String
Dim returnValue As Integer

returnValue = instance.GetAreaSpringProp(Name,
U1, U2, U3, NonlinearOption3, SpringOption,
SoilProfile, EndLengthRatio, Period,
color, notes, iGUID)

int GetAreaSpringProp(
String^ Name,
double% U1,
double% U2,
double% U3,
int% NonlinearOption3,
int% SpringOption,
String^% SoilProfile,
double% EndLengthRatio,
double% Period,
int% color,
String^% notes,
String^% iGUID
)

abstract GetAreaSpringProp :
    Name : string *
    U1 : float byref *
    U2 : float byref *
    U3 : float byref *
    NonlinearOption3 : int byref *
    SpringOption : int byref *
    SoilProfile : string byref *
    EndLengthRatio : float byref *
    Period : float byref *
    color : int byref *
    notes : string byref *
    iGUID : string byref -> int
```

Parameters

Name

Type:Â SystemString

The name of the area spring property.

U1

Type:Â SystemDouble

The spring stiffness per unit area in the local 1 direction [F/L3]

U2

Type:Â SystemDouble

The spring stiffness per unit area in the local 2 direction [F/L3]

U3

Type:Â SystemDouble

The spring stiffness per unit area in the local 3 direction [F/L3]

NonlinearOption3

Type:Â SystemInt32

The nonlinear option for the local 3 direction, this is one of the following values:

- ◊ 0 = (None) Linear - Resists Tension and Compression
- ◊ 1 = Resists Compression only

◇ 2 = Resists Tension only

SpringOption

Type:Â SystemInt32

This argument is for a future release, however a placeholder of type Integer is required

SoilProfile

Type:Â SystemString

This argument is for a future release, however a placeholder of type String is required

EndLengthRatio

Type:Â SystemDouble

This argument is for a future release, however a placeholder of type Double is required

Period

Type:Â SystemDouble

This argument is for a future release, however a placeholder of type Double is required

color

Type:Â SystemInt32

The display color for the property specified as an integer

notes

Type:Â SystemString

The notes, if any, assigned to the property

iGUID

Type:Â SystemString

The GUID (global unique identifier), if any, assigned to the property

Return Value

Type:Â Int32

Returns zero if the property is successfully set, otherwise returns nonzero

▲ Remarks

▲ Examples

VB

Copy

```
Public Sub Example()

CSI API ETABS v1

cPropAreaSpringAddLanguageSpecificTextSet("LSTA5 Method

Retrieves the names of all defined area spring property

Namespace: ETABSV1

Assembly: ETABSV1 (in ETABSV1.dll) Version: 1.0.0.0 (1.24.0.0)

Syntax

C#

VB

C++

F#

Copy

```
int GetNameList(
    ref int NumberNames,
    ref string[] MyName
)
```

```
Function GetNameList (
    ByRef NumberNames As Integer,
    ByRef MyName As String()
) As Integer
```

```
Dim instance As cPropAreaSpring
Dim NumberNames As Integer
Dim MyName As String()
Dim returnValue As Integer
```

```
returnValue = instance.GetNameList(NumberNames,
    MyName)
```

```
int GetNameList(
    int% NumberNames,
    array<String^>^% MyName
)
```

```
abstract GetNameList :
    NumberNames : int byref *
    MyName : string[] byref -> int
```

Parameters

NumberNames

Type: SystemInt32

The number of area spring property defined in the program

MyName

Type: SystemString

This is a one-dimensional array of area spring property names. The MyName array is created as a dynamic, zero-based, array by the API user:

```
Dim MyName() as String
```

The array is dimensioned to (NumberNames + 1) inside the program, filled with the names, and returned to the API user.

Return Value

Type: Int32

Returns zero if the names are successfully retrieved, otherwise it returns nonzero.

▲ Remarks

▲ Examples

VB

Copy

```
Public Sub Example()
    Dim SapModel As cSapModel
    Dim EtabsObject As cOAPI
    Dim ret As Integer = -1

    'create ETABS object
    Dim myHelper as cHelper = New Helper
    EtabsObject = myHelper.CreateObjectProgID("CSI.ETABS.API.ETABSObject")

Parameters

Name

Type:Â SystemString

The name of the area spring property. If this is an existing property, that property is modified; otherwise, a new property is added.

U1

Type:Â SystemDouble

The spring stiffness per unit area in the local 1 direction [F/L3]

U2

Type:Â SystemDouble
 The spring stiffness per unit area in the local 2 direction [F/L3]

U3
 Type:Â SystemDouble
 The spring stiffness per unit area in the local 3 direction [F/L3]

NonlinearOption3
 Type:Â SystemInt32
 The nonlinear option for the local 3 direction, this is one of the following values:
 ◊ 0 = (None) Linear - Resists Tension and Compression
 ◊ 1 = Resists Compression only
 ◊ 2 = Resists Tension only

SpringOption (Optional)
 Type:Â SystemInt32
 This optional argument is for a future release

SoilProfile (Optional)
 Type:Â SystemString
 This optional argument is for a future release

EndLengthRatio (Optional)
 Type:Â SystemDouble
 This optional argument is for a future release

Period (Optional)
 Type:Â SystemDouble
 This optional argument is for a future release

color (Optional)
 Type:Â SystemInt32
 The display color for the property specified as an integer

notes (Optional)
 Type:Â SystemString
 The notes, if any, assigned to the property

iGUID (Optional)
 Type:Â SystemString
 The GUID (global unique identifier), if any, assigned to the property

Return Value

Type:Â Int32
 Returns zero if the property is successfully set, otherwise returns nonzero

▲ Remarks

▲ Examples

VB

Copy

```
Public Sub Example()
    Dim SapModel As cSapModel
    Dim EtabsObject As cOAPI
    Dim ret As Integer = -1

    'create ETABS object
    Dim myHelper as cHelper = New Helper
    EtabsObject = myHelper.CreateObjectProgID("CSI.ETABS.API.ETABSObject")

    'start ETABS application
    ret = EtabsObject.ApplicationStart()
```

Introduction

```
'create SapModel object
  SapModel = EtabsObject.SapModel

'initialize model
  ret = SapModel.InitializeNewModel()

'create steel deck template model
  ret = SapModel.File.NewSteelDeck(4, 12, 12, 4, 4, 24, 24)

'define new spring property
  ret = SapModel.PropAreaSpring.SetAreaSpringProp("mySpringProp1", 0, 0, 100, 0)

'close ETABS
  EtabsObject.ApplicationExit(False)

'clean up variables
  SapModel = Nothing
  EtabsObject = Nothing

End Sub
```

Description

 [SDShape](#) Gives access to API calls related to Section Designer sections.

[Top](#)

▲ Methods

Â Name

 ChangeName	Changes the name of an existing frame section property.
 Count	Retrieves the total number of defined frame section properties
 Delete	Deletes a specified frame section property.
 GetAllFrameProperties	Retrieves select data for all frame properties in the model
 GetAllFrameProperties_2	Retrieves select data for all frame properties in the model, super
 GetAngle	Retrieves frame section property data for an angle-type frame s
 GetAutoSelectSteel	Retrieves frame section property data for a steel auto select list
 GetChannel	Retrieves frame section property data for an channel-type frame
 GetCircle	Retrieves frame section property data for a circular frame secti
 GetConcreteL	Retrieves frame section property data for a concrete L frame se
 GetConcreteTee	Retrieves frame section property data for a concrete tee frame s
 GetCoverPlatedI	retrieves frame section property data for a cover plated I-type f
 GetDbAngle	Retrieves frame section property data for a double angle-type fr
 GetDbChannel	Retrieves frame section property data for a double channel-type
 GetGeneral	Retrieves frame section property data for a general frame secti
 GetISection	Retrieves frame section property data for an I-type frame section

⇒ <u>GetMaterial</u>	Retrieves the material property of a defined frame section
⇒ <u>GetModifiers</u>	Retrieves the modifier assignments for a frame section property
⇒ <u>GetNameInPropFile</u>	Retrieves the names of the section property file from which an i
⇒ <u>GetNameList</u>	Retrieves the names of all defined frame section properties of th
⇒ <u>GetNonPrismatic</u>	Assigns data to a nonprismatic frame section property.
⇒ <u>GetPipe</u>	Retrieves frame section property data for a pipe-type frame sec
⇒ <u>GetPlate</u>	Retrieves frame section property data for a plate frame section.
⇒ <u>GetPropFileNameList</u>	Retrieves the names of all defined frame section properties of a
⇒ <u>GetRebarBeam</u>	Retrieves beam rebar data for frame sections.
⇒ <u>GetRebarColumn</u>	Retrieves column rebar data for frame sections.
⇒ <u>GetRebarColumn_1</u>	
⇒ <u>GetRectangle</u>	Retrieves frame section property data for a rectangular frame s
⇒ <u>GetRod</u>	Retrieves frame section property data for a rod frame section.
⇒ <u>GetSDSection</u>	Retrieves section property data for a section designer section
⇒ <u>GetSectProps</u>	
⇒ <u>GetSteelAngle</u>	Retrieves frame section property data for a steel angle frame se

⇒	<u>GetPropFileNameList</u>	Retrieves the names of all defined frame section properties of a
⇒	<u>GetRebarBeam</u>	Retrieves beam rebar data for frame sections.
⇒	<u>GetRebarColumn</u>	Retrieves column rebar data for frame sections.
⇒	<u>GetRebarColumn_1</u>	
⇒	<u>GetRectangle</u>	Retrieves frame section property data for a rectangular frame s
⇒	<u>GetRod</u>	Retrieves frame section property data for a rod frame section.
⇒	<u>GetSDSection</u>	Retrieves section property data for a section designer section
⇒	<u>GetSectProps</u>	
⇒	<u>GetSteelAngle</u>	Retrieves frame section property data for a steel angle frame se
⇒	<u>GetSteelTee</u>	Retrieves frame section property data for a steel tee frame sect
⇒	<u>GetTee</u>	Retrieves frame section property data for a tee-type frame secti
⇒	<u>GetTrapezoidal</u>	

⇒ <u>GetTube</u>	Retrieves frame section property data for a tube-type frame section.
⇒ <u>GetTypeOAPI</u>	Retrieves the property type for the specified frame section property.
⇒ <u>GetTypeRebar</u>	Retrieves the rebar design type for the specified frame section property.
⇒ <u>ImportProp</u>	Imports a frame section property from a property file.
⇒ <u>SetAngle</u>	Initializes an angle-type frame section property. If this function is called with no arguments, it initializes a solid angle frame section property.
⇒ <u>SetAutoSelectSteel</u>	Assigns frame section properties to an auto select list. If this function is called with no arguments, it assigns all frame section properties to the list.
⇒ <u>SetChannel</u>	Initializes an channel-type frame section property. If this function is called with no arguments, it initializes a solid channel frame section property.
⇒ <u>SetCircle</u>	Initializes a solid circular frame section property. If this function is called with no arguments, it initializes a solid circular frame section property.
⇒ <u>SetConcreteL</u>	Initializes a concrete L frame section property. If this function is called with no arguments, it initializes a concrete L frame section property.
⇒ <u>SetConcreteTee</u>	Initializes a concrete tee frame section property. If this function is called with no arguments, it initializes a concrete tee frame section property.
⇒ <u>SetCoverPlatedI</u>	Initializes a cover plated I-type frame section property. If this function is called with no arguments, it initializes a cover plated I-type frame section property.
⇒ <u>SetDblAngle</u>	Initializes a double angle-type frame section property. If this function is called with no arguments, it initializes a double angle-type frame section property.
⇒ <u>SetDblChannel</u>	Initializes a double channel-type frame section property. If this function is called with no arguments, it initializes a double channel-type frame section property.
⇒ <u>SetGeneral</u>	Initializes a general frame section property. If this function is called with no arguments, it initializes a general frame section property.
⇒ <u>SetISection</u>	Initializes an I-type frame section property. If this function is called with no arguments, it initializes an I-type frame section property.
⇒ <u>SetMaterial</u>	Sets the material property of a defined frame section.
⇒ <u>SetModifiers</u>	Assigns property modifiers to a frame section property. The default modifiers are: 1, 2, 3, 4, 5, 6, 7, 8, 9, 10, 11, 12, 13, 14, 15, 16, 17, 18, 19, 20, 21, 22, 23, 24, 25, 26, 27, 28, 29, 30, 31, 32, 33, 34, 35, 36, 37, 38, 39, 40, 41, 42, 43, 44, 45, 46, 47, 48, 49, 50, 51, 52, 53, 54, 55, 56, 57, 58, 59, 60, 61, 62, 63, 64, 65, 66, 67, 68, 69, 70, 71, 72, 73, 74, 75, 76, 77, 78, 79, 80, 81, 82, 83, 84, 85, 86, 87, 88, 89, 90, 91, 92, 93, 94, 95, 96, 97, 98, 99, 100.
⇒ <u>SetNonPrismatic</u>	Assigns data to a nonprismatic frame section property.
⇒ <u>SetPipe</u>	Initializes a pipe-type frame section property. If this function is called with no arguments, it initializes a solid pipe frame section property.
⇒ <u>SetPlate</u>	Initializes a solid plate frame section property. If this function is called with no arguments, it initializes a solid plate frame section property.
⇒ <u>SetRebarBeam</u>	Assigns beam rebar data to frame sections.
⇒ <u>SetRebarColumn</u>	Assigns column rebar data to frame sections.
⇒ <u>SetRectangle</u>	Initializes a solid rectangular frame section property. If this function is called with no arguments, it initializes a solid rectangular frame section property.
⇒ <u>SetRod</u>	Initializes a solid rod frame section property. If this function is called with no arguments, it initializes a solid rod frame section property.
⇒ <u>SetSDSection</u>	Initializes a solid section frame section property. If this function is called with no arguments, it initializes a solid section frame section property.
⇒ <u>SetSteelAngle</u>	Initializes a steel angle frame section property. If this function is called with no arguments, it initializes a steel angle frame section property.
⇒ <u>SetSteelTee</u>	Initializes a steel tee frame section property. If this function is called with no arguments, it initializes a steel tee frame section property.
⇒ <u>SetTee</u>	Initializes a tee-type frame section property. If this function is called with no arguments, it initializes a tee-type frame section property.
⇒ <u>SetTrapezoidal</u>	Initializes a trapezoidal frame section property. If this function is called with no arguments, it initializes a trapezoidal frame section property.
⇒ <u>SetTube</u>	Initializes a tube-type frame section property. If this function is called with no arguments, it initializes a tube-type frame section property.

CSI API ETABS v1

cPropFrameAddLanguageSpecificTextSet("LSTB3D7E23D_0?cpp2898=.");Ch

Method

Changes the name of an existing frame section property.

Namespace: ETABSv1

Assembly: ETABSv1 (in ETABSv1.dll) Version: 1.0.0.0 (1.24.0.0)

Syntax

C#

VB

C++

F#

Copy

```
int ChangeName(
    string Name,
    string NewName
)
```

```
Function ChangeName (
    Name As String,
    NewName As String
) As Integer
```

```
Dim instance As cPropFrame
Dim Name As String
Dim NewName As String
Dim returnValue As Integer
```

```
returnValue = instance.ChangeName(Name,
    NewName)
```

```
int ChangeName(
    String^ Name,
    String^ NewName
)
```

```
abstract ChangeName :
    Name : string *
    NewName : string -> int
```

Parameters

Name

Type: SystemString

The existing name of a defined frame section property.

NewName

Type: SystemString

The new name for the frame section property.

Return ValueType: Int32

Returns zero if the new name is successfully applied; otherwise it returns a nonzero value.

▀ **Remarks**

▀ **Examples**

VB

Copy

```
Public Sub Example()
    Dim SapModel As cSapModel
    Dim EtabsObject As cOAPI
    Dim ret As Integer = -1

    'create ETABS object
    Dim myHelper as cHelper = New Helper
    EtabsObject = myHelper.CreateObjectProgID("CSI.ETABS.API.ETABSObject")

    'start ETABS application
    ret = EtabsObject.ApplicationStart()

    'create SapModel object
    SapModel = EtabsObject.SapModel

    'initialize model
    ret = SapModel.InitializeNewModel()

    'create steel deck template model
    ret = SapModel.File.NewSteelDeck(4,12,12,4,4,24,24)

    'set new frame section property
    ret = SapModel.PropFrame.SetAngle("ANGLE1", "A992Fy50", 6, 4, 0.5, 0.5)

    'change name of frame section property
    ret = SapModel.PropFrame.ChangeName("ANGLE1", "MySection")

    'close ETABS
    EtabsObject.ApplicationExit(False)

    'clean up variables
    SapModel = Nothing
    EtabsObject = Nothing
End Sub
```

CSI API ETABS v1

cPropFrameAddLanguageSpecificTextSet("LSTA30C5BC8_0?cpp2900=.")

Method

Retrieves the total number of defined frame section properties in the model.

Namespace: ETABSv1

Assembly: ETABSv1 (in ETABSv1.dll) Version: 1.0.0.0 (1.24.0.0)

Syntax

C#

VB

C++

F#

Copy

```
int Count(
    eFramePropType PropType =
)
```

```
Function Count (
    ?PropType As eFramePropType =
) As Integer
```

```
Dim instance As cPropFrame
Dim PropType As eFramePropType
Dim returnValue As Integer
```

```
returnValue = instance.Count(PropType)
```

```
int Count(
    eFramePropType PropType =
)
```

```
abstract Count :
    ?PropType : eFramePropType
(* Defaults:
    let _PropType = defaultArg PropType
*)
-> int
```

Parameters

PropType (Optional)

Type: ETABSv1eFramePropType

This optional value is one of the items in the eFramePropType enumeration.

If no value is input for PropType, a count is returned for all frame section properties in the model regardless of type.

Return Value

Type: Int32

Returns the total number of defined frame section properties in the model. If desired,

cPropFramespan id="LSTA30C5BC8_0"AddLanguageSpecificTextSet("LSTA30C5BC8_0?cpp2900=.");Co

counts can be returned for all frame section properties of a specified type in the model.

Remarks

Examples

VB

Copy

```
Public Sub Example()  
    Dim SapModel As cSapModel  
    Dim EtabsObject As cOAPI  
    Dim ret As Integer = -1  
    Dim Count As Integer  
  
    'create ETABS object  
    Dim myHelper as cHelper = New Helper  
    EtabsObject = myHelper.CreateObjectProgID("CSI.ETABS.API.ETABSObject")  
  
    'start ETABS application  
    ret = EtabsObject.ApplicationStart()  
  
    'create SapModel object  
    SapModel = EtabsObject.SapModel  
  
    'initialize model  
    ret = SapModel.InitializeNewModel()  
  
    'create steel deck template model  
    ret = SapModel.File.NewSteelDeck(4,12,12,4,4,24,24)  
  
    'return number of defined frame section properties of all types  
    Count = SapModel.PropFrame.Count  
  
    'close ETABS  
    EtabsObject.ApplicationExit(False)  
  
    'clean up variables  
    SapModel = Nothing  
    EtabsObject = Nothing  
End Sub
```

CSI API ETABS v1

cPropFrameAddLanguageSpecificTextSet("LST2432E0D4_0") Method

Deletes a specified frame section property.

Namespace: ETABSv1

Assembly: ETABSv1 (in ETABSv1.dll) Version: 1.0.0.0 (1.24.0.0)

▲ Syntax

C#

VB

C++

F#

Copy

```
int Delete(
    string Name
)
```

```
Function Delete (
    Name As String
) As Integer
```

```
Dim instance As cPropFrame
Dim Name As String
Dim returnValue As Integer
```

```
returnValue = instance.Delete(Name)
```

```
int Delete(
    String^ Name
)
```

```
abstract Delete :
    Name : string -> int
```

Parameters

Name

Type: SystemString

The name of an existing frame section property.

Return Value

Type: Int32

Returns zero if the frame section property is successfully deleted; otherwise it returns a nonzero value. It returns an error if the specified frame section property can not be deleted; for example, if it is being used by a frame object.

▲ Remarks

▲ Examples

VB

Copy

cPropFramespan id="LST2432E0D4_0"AddLanguageSpecificTextSet("LST2432E0D4_0?cpp=2902.");Delete

Introduction

```
Public Sub Example()

CSI API ETABS v1

cPropFrameAddLanguageSpecificTextSet("LSTFA31F02_0") Method

Retrieves frame section property data for an angle-type frame section.

Namespace: [ETABSv1](#)

Assembly: [ETABSv1](#) (in ETABSv1.dll) Version: 1.0.0.0 (1.24.0.0)

Syntax

[C#](#)

[VB](#)

[C++](#)

[F#](#)

[Copy](#)

```
int GetAngle(
    string Name,
    ref string FileName,
    ref string MatProp,
    ref double T3,
    ref double T2,
    ref double Tf,
    ref double Tw,
    ref int Color,
    ref string Notes,
    ref string GUID
)
```

```
Function GetAngle (
    Name As String,
    ByRef FileName As String,
    ByRef MatProp As String,
    ByRef T3 As Double,
    ByRef T2 As Double,
    ByRef Tf As Double,
    ByRef Tw As Double,
    ByRef Color As Integer,
    ByRef Notes As String,
    ByRef GUID As String
) As Integer
```

```
Dim instance As cPropFrame
Dim Name As String
Dim FileName As String
Dim MatProp As String
Dim T3 As Double
Dim T2 As Double
Dim Tf As Double
Dim Tw As Double
Dim Color As Integer
Dim Notes As String
Dim GUID As String
Dim returnValue As Integer
```

```
returnValue = instance.GetAngle(Name,
    FileName, MatProp, T3, T2, Tf, Tw, Color,
```

cPropFrameid="LSTFA31F02_0"AddLanguageSpecificTextSet("LSTFA31F02_0?cpp=::|n2910;GetAng

Notes, GUID)

```
int GetAngle(
String^ Name,
String^% FileName,
String^% MatProp,
double% T3,
double% T2,
double% Tf,
double% Tw,
int% Color,
String^% Notes,
String^% GUID
)
```

```
abstract GetAngle :
    Name : string *
    FileName : string byref *
    MatProp : string byref *
    T3 : float byref *
    T2 : float byref *
    Tf : float byref *
    Tw : float byref *
    Color : int byref *
    Notes : string byref *
    GUID : string byref -> int
```

Parameters

Name

Type:Â SystemString

The name of an existing frame section property.

FileName

Type:Â SystemString

MatProp

Type:Â SystemString

The name of the material property for the section.

T3

Type:Â SystemDouble

T2

Type:Â SystemDouble

Tf

Type:Â SystemDouble

Tw

Type:Â SystemDouble

Color

Type:Â SystemInt32

Notes

Type:Â SystemString

GUID

Type:Â SystemString

The GUID (global unique identifier), if any, assigned to the section.

Return Value

Type: Int32

returns zero if the section property data is successfully retrieved; otherwise it returns a nonzero value.

▲ **Remarks**

This function is obsolete and has been superseded by GetSteelAngle(String, String, String, Double, Double, Double, Double, Double, Boolean, Boolean, Int32, String, String) and GetConcreteL(String, String, String, Double, Double, Double, Double, Double, Boolean, Boolean, Int32, String, String) as of version 16.0.0. This function is maintained for backwards compatibility.

▲ **Examples**

VB

Copy

```
Public Sub Example()
    Dim SapModel As cSapModel
    Dim EtabsObject As cOAPI
    Dim ret As Integer = -1
    Dim Name As String
    Dim FileName As String
    Dim MatProp As String
    Dim t3 As Double
    Dim t2 As Double
    Dim tf As Double
    Dim tw As Double
    Dim Color As Integer
    Dim Notes As String
    Dim GUID As String

    'create ETABS object
    Dim myHelper as cHelper = New Helper
    EtabsObject = myHelper.CreateObjectProgID("CSI.ETABS.API.ETABSObject")

    'start ETABS application
    ret = EtabsObject.ApplicationStart()

    'create SapModel object
    SapModel = EtabsObject.SapModel

    'initialize model
    ret = SapModel.InitializeNewModel()

    'create steel deck template model
    ret = SapModel.File.NewSteelDeck(4,12,12,4,4,24,24)

    'set new frame section property
    ret = SapModel.PropFrame.SetAngle("ANGLE1", "A992Fy50", 6, 4, 0.5, 0.5)

    'get frame section property data
    ret = SapModel.PropFrame.GetAngle("ANGLE1", FileName, MatProp, t3, t2, tf, tw, Color, Notes)

    'close ETABS
    EtabsObject.ApplicationExit(False)

    'clean up variables
    SapModel = Nothing
    EtabsObject = Nothing
End Sub
```

CSI API ETABS v1

cPropFrameAddLanguageSpecificTextSet("LST6F8C2137_0?cpp=2014.");GetAutoSelectSteel Method

Retrieves frame section property data for a steel auto select lists.

Namespace: ETABSV1

Assembly: ETABSV1 (in ETABSV1.dll) Version: 1.0.0.0 (1.24.0.0)

■ Syntax

C#

VB

C++

F#

Copy

```
int GetAutoSelectSteel(
    string Name,
    ref int NumberItems,
    ref string[] SectName,
    ref string AutoStartSection,
    ref string Notes,
    ref string GUID
)
```

```
Function GetAutoSelectSteel (
    Name As String,
    ByRef NumberItems As Integer,
    ByRef SectName As String(),
    ByRef AutoStartSection As String,
    ByRef Notes As String,
    ByRef GUID As String
) As Integer
```

```
Dim instance As cPropFrame
Dim Name As String
Dim NumberItems As Integer
Dim SectName As String()
Dim AutoStartSection As String
Dim Notes As String
Dim GUID As String
Dim returnValue As Integer
```

```
returnValue = instance.GetAutoSelectSteel(Name,
    NumberItems, SectName, AutoStartSection,
    Notes, GUID)
```

```
int GetAutoSelectSteel(
    String^ Name,
    int% NumberItems,
    array<String^>^% SectName,
    String^% AutoStartSection,
    String^% Notes,
    String^% GUID
)
```

abstract GetAutoSelectSteel :

cPropFrameid="LST6F8C2137_0"AddLanguageSpecificTextSet("LST6F8C2137_0?cpp=2014.");GetAutoSelectSteel

```

Name : string *
NumberItems : int byref *
SectName : string[] byref *
AutoStartSection : string byref *
Notes : string byref *
GUID : string byref -> int

```

Parameters

Name

Type:Â SystemString

The name of an existing auto select section listâ type frame section property.

NumberItems

Type:Â SystemInt32

The number of frame section properties included in the auto select list.

SectName

Type:Â SystemString

This is an array of the names of the frame section properties included in the auto select list.

AutoStartSection

Type:Â SystemString

This is either Median or the name of a frame section property in the SectName array. It is the starting section for the auto select list.

Notes

Type:Â SystemString

The notes, if any, assigned to the section.

GUID

Type:Â SystemString

The GUID (global unique identifier), if any, assigned to the section.

Return Value

Type:Â Int32

Returns zero if the data is successfully retrieved; otherwise it returns a nonzero value.

▲Remarks

▲Examples

VB

Copy

```

Public Sub Example()
    Dim SapModel As cSapModel
    Dim EtabsObject As cOAPI
    Dim ret As Integer = -1

    Tf : float byref *
    Tw : float byref *
    Color : int byref *
    Notes : string byref *
    GUID : string byref -> int
```

Parameters

Name

Type:Â SystemString

The name of an existing frame section property.

FileName

Type:Â SystemString

MatProp

Type:Â SystemString

The name of the material property for the section.

T3

Type:Â SystemDouble

T2

Type:Â SystemDouble

Tf

Type:Â SystemDouble

Tw

Type:Â SystemDouble

Color

Type:Â SystemInt32

Notes

Type:Â SystemString

GUID

Type:Â SystemString

The GUID (global unique identifier), if any, assigned to the section.

Return Value

Type: $\hat{A}$ Int32

returns zero if the section property data is successfully retrieved; otherwise it returns a nonzero value.

    MatProp : string byref *
    T3 : float byref *
    Color : int byref *
    Notes : string byref *
    GUID : string byref -> int
```

Parameters

Name

Type:Â [SystemString](#)

The name of an existing circular frame section property.

FileName

Type:Â [SystemString](#)

If the section property was imported from a property file, this is the name of that file. If the section property was not imported, this item is blank.

MatProp

Type:Â [SystemString](#)

The name of the material property for the section.

T3

Type:Â [SystemDouble](#)

Color

Type:Â [SystemInt32](#)

Notes

Type:Â [SystemString](#)

GUID

Type:Â [SystemString](#)

The GUID (global unique identifier), if any, assigned to the section.

Return Value

Type:Â [Int32](#)

Returns zero if the section property data is successfully retrieved; otherwise it returns a nonzero value.

Parameters

Name

Type:Â SystemString

The name of an existing frame section property.

FileName

Type:Â SystemString

If the section property was imported from a property file, this is the name of that file. If the section property was not imported, this item is blank.

MatProp

Type:Â SystemString

The name of the material property for the section.

T3

Type:Â SystemDouble

T2

Tf	Type:Â <u>SystemDouble</u>
TwC	Type:Â <u>SystemDouble</u> The vertical leg thickness at the corner. [L]
TwT	Type:Â <u>SystemDouble</u> The vertical leg thickness at the tip. [L]
MirrorAbout2	Type:Â <u>SystemBoolean</u> Indicates whether the section is mirrored about the local 2-axis.
MirrorAbout3	Type:Â <u>SystemBoolean</u> Indicates whether the section is mirrored about the local 3-axis.
Color	Type:Â <u>SystemInt32</u>
Notes	Type:Â <u>SystemString</u>
GUID	Type:Â <u>SystemString</u> The GUID (global unique identifier), if any, assigned to the section.

Return Value

Type:Â Int32
returns zero if the section property data is successfully retrieved; otherwise it returns a nonzero value.

▲ **Remarks**

This function supersedes GetAngle(String, String, String, Double, Double, Double, Double, Int32, String, String).

▲ **Examples**

VB

Copy

```
Public Sub Example()
    Dim SapModel As cSapModel
    Dim EtabsObject As cOAPI
    Dim ret As Integer = -1
    Dim Name As String
    Dim FileName As String
    Dim MatProp As String
    Dim t3 As Double
    Dim t2 As Double
    Dim tf As Double
    Dim twc As Double
    Dim twt As Double
    Dim mirror2 As Boolean
    Dim mirror3 As Boolean
    Dim Color As Integer
    Dim Notes As String
    Dim GUID As String

    'create ETABS object
    Dim myHelper as cHelper = New Helper
    EtabsObject = myHelper.CreateObjectProgID("CSI.ETABS.API.ETABSObject")
```

Return Value

Introduction

```
'start ETABS application
    ret = EtabsObject.ApplicationStart()

'create SapModel object
    SapModel = EtabsObject.SapModel

'initialize model
    ret = SapModel.InitializeNewModel()

'create steel deck template model
    ret = SapModel.File.NewSteelDeck(4,12,12,4,4,24,24)

'set new frame section property
    ret = SapModel.PropFrame.SetConcreteL("ANGLE1", "4000Psi", 30, 36, 8, 7, 5, False, True)

'get frame section property data
    ret = SapModel.PropFrame.GetConcreteL("ANGLE1", FileName, MatProp, t3, t2, tf, twc, twt, m

'close ETABS
    EtabsObject.ApplicationExit(False)

'clean up variables
    SapModel = Nothing
    EtabsObject = Nothing
End Sub
```

    TwT : float byref *
    MirrorAbout3 : bool byref *
    Color : int byref *
    Notes : string byref *
    GUID : string byref -> int
```

Parameters

Name

Type:Â SystemString

The name of an existing frame section property.

FileName

Type:Â SystemString

If the section property was imported from a property file, this is the name of that file. If the section property was not imported, this item is blank.

MatProp

Type:Â SystemString

The name of the material property for the section.

T3

Type:Â SystemDouble

T2

Type:Â SystemDouble

Tf

Type:Â SystemDouble

TwF

Type:Â SystemDouble
 The web thickness at the flange. [L]

TwT
 Type:Â SystemDouble
 The web thickness at the tip. [L]

MirrorAbout3
 Type:Â SystemBoolean
 Indicates whether the section is mirrored about the local 3-axis.

Color
 Type:Â SystemInt32

Notes
 Type:Â SystemString

GUID
 Type:Â SystemString
 The GUID (global unique identifier), if any, assigned to the section.

Return Value

Type:Â Int32
 Returns zero if the section property is successfully retrieved; otherwise it returns a nonzero value.

Remarks

This function supersedes GetTee(String, String, String, Double, Double, Double, Double, Int32, String, String).

    MatPropBot : string byref *
    Color : int byref *
    Notes : string byref *
    GUID : string byref -> int
```

Parameters

Name

Type:Â SystemString

The name of an existing frame section property.

SectName

Type:Â SystemString

FyTopFlange

Type:Â SystemDouble

The yield strength of the top flange of the I-section. [F/L2]

Introduction

If this item is 0, the yield strength of the I-section specified by the SectName item is used.

FyWeb

Type:Â SystemDouble

The yield strength of the web of the I-section. [F/L2]

If this item is 0, the yield strength of the I-section specified by the SectName item is used.

FyBotFlange

Type:Â SystemDouble

The yield strength of the bottom flange of the I-section. [F/L2]

If this item is 0, the yield strength of the I-section specified by the SectName item is used.

Tc

Type:Â SystemDouble

Bc

Type:Â SystemDouble

MatPropTop

Type:Â SystemString

The name of the material property for the bottom cover plate.

This item applies only if both the tcb and the bcb items are greater than 0.

Tcb

Type:Â SystemDouble

Bcb

Type:Â SystemDouble

MatPropBot

Type:Â SystemString

The name of the material property for the bottom cover plate.

This item applies only if both the tcb and the bcb items are greater than 0.

Color

Type:Â SystemInt32

Notes

Type:Â SystemString

GUID

Type:Â SystemString

The GUID (global unique identifier), if any, assigned to the section.

Return Value

Type:Â Int32

Returns zero if the section property is successfully initialized; otherwise it returns a nonzero value.

    Color : int byref *
    Notes : string byref *
    GUID : string byref -> int
```

Parameters

Name

Type:Â SystemString

The name of an existing frame section property.

FileName

Type:Â SystemString

If the section property was imported from a property file, this is the name of that file. If the section property was not imported, this item is blank.

MatProp

Type:Â SystemString

The name of the material property for the section.

T3

Type:Â SystemDouble

T2

Type:Â SystemDouble

Tf

Type:Â SystemDouble

Tw

Type:Â SystemDouble

Dis

Type:Â SystemDouble

Color

Type:Â SystemInt32

Notes

Type:Â SystemString

GUID

Type:Â SystemString

The GUID (global unique identifier), if any, assigned to the section.

Return ValueType:Â Int32

returns zero if the section property data is successfully retrieved; otherwise it returns a nonzero value.

Parameters

Name

Type:Â SystemString

The name of an existing frame section property.

FileName

Type:Â SystemString

If the section property was imported from a property file, this is the name of that file. If the section property was not imported, this item is blank.

MatProp

Type:Â SystemString

The name of the material property for the section.

T3

Type:Â SystemDouble

T2

Type:Â SystemDouble

Area

Type:Â SystemDouble

The cross-sectional area. [L2]

As2

Type:Â SystemDouble

The shear area for forces in the section local 2-axis direction. [L2]

As3

Type:Â SystemDouble

The shear area for forces in the section local 3-axis direction. [L2]

Torsion

Type:Â SystemDouble

The torsional constant. [L4]

I22

Type:Â SystemDouble

The moment of inertia for bending about the local 2 axis. [L4]

I33

Type:Â SystemDouble

The moment of inertia for bending about the local 3 axis. [L4]

S22

Type:Â SystemDouble

The section modulus for bending about the local 2 axis. [L3]

S33	Type:Â <u>SystemDouble</u> The section modulus for bending about the local 3 axis. [L3]
Z22	Type:Â <u>SystemDouble</u> The plastic modulus for bending about the local 2 axis. [L3]
Z33	Type:Â <u>SystemDouble</u> The plastic modulus for bending about the local 3 axis. [L3]
R22	Type:Â <u>SystemDouble</u> The radius of gyration about the local 2 axis. [L]
R33	Type:Â <u>SystemDouble</u> The radius of gyration about the local 3 axis. [L]
Color	Type:Â <u>SystemInt32</u>
Notes	Type:Â <u>SystemString</u>
GUID	Type:Â <u>SystemString</u> The GUID (global unique identifier), if any, assigned to the section.

Return ValueType:Â Int32

Returns zero if the section property data is successfully retrieved; otherwise it returns a nonzero value.

CSI API ETABS v1

cPropFrameAddLanguageSpecificTextSet("LSTA5C13085_0")

Method

Retrieves the modifier assignments for a frame section property. The default value for all modifiers is one.

Namespace: $\hat{A}$ ETABSV1

Assembly: $\hat{A}$ ETABSV1 (in ETABSV1.dll) Version: 1.0.0.0 (1.24.0.0)

Syntax

C#

VB

C++

F#

Copy

```
int GetModifiers(
    string Name,
    ref double[] Value
)
```

```
Function GetModifiers (
    Name As String,
    ByRef Value As Double()
) As Integer
```

```
Dim instance As cPropFrame
Dim Name As String
Dim Value As Double()
Dim returnValue As Integer
```

```
returnValue = instance.GetModifiers(Name,
    Value)
```

```
int GetModifiers(
    String^ Name,
    array<double>^% Value
)
```

```
abstract GetModifiers :
    Name : string *
    Value : float[] byref -> int
```

Parameters

Name

Type: $\hat{A}$ SystemString

The name of an existing frame section property.

Value

Type: $\hat{A}$ SystemDouble

This is an array of eight unitless modifiers:

Value

Modifier

Value(0) Cross sectional area modifier

cPropFramespan id="LSTA5C13085_0"AddLanguageSpecificTextSet("LSTA5C13085_0?cpp=2956.");GetL

Introduction

Value(1) Shear area in local 2 direction modifier
Value(2) Shear area in local 3 direction modifier
Value(3) Torsional constant modifier
Value(4) Moment of inertia about local 2 axis modifier
Value(5) Moment of inertia about local 3 axis modifier
Value(6) Mass modifier
Value(7) Weight modifier

Return Value

Type: Int32

Returns zero if the modifier assignments are successfully retrieved; otherwise it returns a nonzero value.

▲ Remarks

▲ Examples

VB

Copy

```
Public Sub Example()  
    Dim SapModel As cSapModel  
    Dim EtabsObject As cOAPI  
    Dim ret As Integer = -1

    MatProp : string byref *
```

cPropFrameAddLanguageSpecificTextSet("LSTFA77A12_0?cpp=::|n2959;GetNa

PropType : eFramePropType byref -> int

Parameters

Name

Type:Â SystemString

The name of an existing frame section property.

NameInFile

Type:Â SystemString

The name of the specified frame section property in the frame section property file.

FileName

Type:Â SystemString

The name of the frame section property file from which the specified frame section property was obtained.

MatProp

Type:Â SystemString

The name of the material property for the section.

PropType

Type:Â ETABSv1eFramePropType

This is one of the items in the eFramePropType enumeration.

Return Value

Type:Â Int32

Returns zero if the names are successfully retrieved; otherwise it returns nonzero.

▲Remarks

If the specified frame section property was not imported, blank strings are returned for NameInFile and FileName.

▲Examples

VB

Copy

```
Public Sub Example()
    Dim SapModel As cSapModel
    Dim EtabsObject As cOAPI
    Dim ret As Integer = -1
    Dim NameInFile As String
    Dim FileName As String
    Dim MatProp As String
    Dim PropType As eFramePropType

    'create ETABS object
    Dim myHelper as cHelper = New Helper
    EtabsObject = myHelper.CreateObjectProgID("CSI.ETABS.API.ETABSObject")

    'start ETABS application
    ret = EtabsObject.ApplicationStart()

    'create SapModel object
    SapModel = EtabsObject.SapModel

    'initialize model
    ret = SapModel.InitializeNewModel()

    'create steel deck template model
```

Introduction

```
ret = SapModel.File.NewSteelDeck(4,12,12,4,4,24,24)

'import new frame section property
ret = SapModel.PropFrame.ImportProp("MyFrame", "A992Fy50", "Sections8.pro", "W18X35")

'get frame property name in file
ret = SapModel.PropFrame.GetNameInPropFile("MyFrame", NameInFile, FileName, MatProp, PropT

'close ETABS
EtabsObject.ApplicationExit(False)

'clean up variables
SapModel = Nothing
EtabsObject = Nothing
End Sub
```

CSI API ETABS v1

cPropFrameAddLanguageSpecificTextSet("LSTD11EF676_0") Method

Retrieves the names of all defined frame section properties of the specified type.

Namespace: [ETABSv1](#)

Assembly: [ETABSv1](#) (in ETABSv1.dll) Version: 1.0.0.0 (1.24.0.0)

Syntax

[C#](#)

[VB](#)

[C++](#)

[F#](#)

[Copy](#)

```
int GetNameList(
    ref int NumberNames,
    ref string[] MyName,
    eFramePropType PropType =
)
```

```
Function GetNameList (
    ByRef NumberNames As Integer,
    ByRef MyName As String(),
    Optional PropType As eFramePropType =
) As Integer
```

```
Dim instance As cPropFrame
Dim NumberNames As Integer
Dim MyName As String()
Dim PropType As eFramePropType
Dim returnValue As Integer
```

```
returnValue = instance.GetNameList(NumberNames,
MyName, PropType)
```

```
int GetNameList(
    int% NumberNames,
    array<String^>^% MyName,
    eFramePropType PropType =
)
```

```
abstract GetNameList :
    NumberNames : int byref *
    MyName : string[] byref *
    ?PropType : eFramePropType
(* Defaults:
    let _PropType = defaultArg PropType
*)
-> int
```

Parameters

NumberNames

Type: SystemInt32

The number of frame section property names retrieved by the program.

MyName

Type: SystemString

This is a one-dimensional array of frame section property names. The MyName array is created as a dynamic, zero-based, array by the API user:

```
Dim MyName() as String
```

The array is dimensioned to (NumberNames - 1) inside the program, filled with the names, and returned to the API user.

PropType (Optional)

Type: ETABSv1eFramePropType

This optional value is one of the items in the eFramePropType enumeration.

If no value is input for PropType, names are returned for all frame section properties in the model regardless of type.

Return Value

Type: Int32

Returns zero if the names are successfully retrieved; otherwise it returns nonzero.

▲ Remarks

▲ Examples

VB

Copy

```
Public Sub Example()
    Dim SapModel As cSapModel

CSI API ETABS v1

cPropFrameAddLanguageSpecificTextSet("LST25ADC0B8_0?cpp2965=.");Ge

Method

Assigns data to a nonprismatic frame section property.

Namespace: ETABSv1

Assembly: ETABSv1 (in ETABSv1.dll) Version: 1.0.0.0 (1.24.0.0)

▲ Syntax

C#

VB

C++

F#

Copy

```
int GetNonPrismatic(
    string Name,
    ref int NumberItems,
    ref string[] StartSec,
    ref string[] EndSec,
    ref double[] MyLength,
    ref int[] MyType,
    ref int[] EI33,
    ref int[] EI22,
    ref int Color,
    ref string Notes,
    ref string GUID
)
```

```
Function GetNonPrismatic (
    Name As String,
    ByRef NumberItems As Integer,
    ByRef StartSec As String(),
    ByRef EndSec As String(),
    ByRef MyLength As Double(),
    ByRef MyType As Integer(),
    ByRef EI33 As Integer(),
    ByRef EI22 As Integer(),
    ByRef Color As Integer,
    ByRef Notes As String,
    ByRef GUID As String
) As Integer
```

```
Dim instance As cPropFrame
Dim Name As String
Dim NumberItems As Integer
Dim StartSec As String()
Dim EndSec As String()
Dim MyLength As Double()
Dim MyType As Integer()
Dim EI33 As Integer()
Dim EI22 As Integer()
Dim Color As Integer
Dim Notes As String
Dim GUID As String
Dim returnValue As Integer
```

cPropFrameAddLanguageSpecificTextSet("LST25ADC0B8_0?cpp2965=.");Ge

```
returnValue = instance.GetNonPrismatic(Name,
NumberItems, StartSec, EndSec, MyLength,
MyType, EI33, EI22, Color, Notes, GUID)
```

```
int GetNonPrismatic(
String^ Name,
int% NumberItems,
array<String^>^% StartSec,
array<String^>^% EndSec,
array<double>^% MyLength,
array<int>^% MyType,
array<int>^% EI33,
array<int>^% EI22,
int% Color,
String^% Notes,
String^% GUID
)
```

```
abstract GetNonPrismatic :
    Name : string *
    NumberItems : int byref *
    StartSec : string[] byref *
    EndSec : string[] byref *
    MyLength : float[] byref *
    MyType : int[] byref *
    EI33 : int[] byref *
    EI22 : int[] byref *
    Color : int byref *
    Notes : string byref *
    GUID : string byref -> int
```

Parameters

Name

Type:Â [SystemString](#)

The name of an existing frame section property.

NumberItems

Type:Â [SystemInt32](#)

The number of segments assigned to the nonprismatic section.

StartSec

Type:Â [SystemString](#)

This is an array of the names of the frame section properties at the start of each segment.

EndSec

Type:Â [SystemString](#)

This is an array of the names of the frame section properties at the end of each segment.

MyLength

Type:Â [SystemDouble](#)

This is an array that includes the length of each segment. The length may be variable or absolute as indicated by the MyType item. [L] when length is absolute.

MyType

Type:Â [SystemInt32](#)

This is an array of either 1 or 2, indicating the length type for each segment:

	Value	MyType
	1	Variable (relative length)
	2	Absolute
EI33	Type:Â <u>SystemInt32</u> This is an array of 1, 2 or 3, indicating the variation type for EI33 in each segment:	
	Value	EI33
	1	Linear
	2	Parabolic
	2	Cubic
EI22	Type:Â <u>SystemInt32</u> This is an array of 1, 2 or 3, indicating the variation type for EI22 in each segment:	
	Value	EI22
	1	Linear
	2	Parabolic
	2	Cubic
Color	Type:Â <u>SystemInt32</u>	
Notes	Type:Â <u>SystemString</u>	
GUID	Type:Â <u>SystemString</u> The GUID (global unique identifier), if any, assigned to the section.	

Return ValueType:Â Int32

Returns zero if the data is successfully retrieved; otherwise it returns a nonzero value.

▲Remarks

▲Examples

VB

Copy

```

CSI API ETABS v1

cPropFrameAddLanguageSpecificTextSet("LST59882A01_0?cpp=:2079.");GetPipe

Method

Retrieves frame section property data for a pipe-type frame section.

Namespace: [ETABSV1](#)

Assembly: [ETABSV1](#) (in ETABSV1.dll) Version: 1.0.0.0 (1.24.0.0)

▲ Syntax

[C#](#)

[VB](#)

[C++](#)

[F#](#)

[Copy](#)

```
int GetPipe(
    string Name,
    ref string FileName,
    ref string MatProp,
    ref double T3,
    ref double TW,
    ref int Color,
    ref string Notes,
    ref string GUID
)
```

```
Function GetPipe (
    Name As String,
    ByRef FileName As String,
    ByRef MatProp As String,
    ByRef T3 As Double,
    ByRef TW As Double,
    ByRef Color As Integer,
    ByRef Notes As String,
    ByRef GUID As String
) As Integer
```

```
Dim instance As cPropFrame
Dim Name As String
Dim FileName As String
Dim MatProp As String
Dim T3 As Double
Dim TW As Double
Dim Color As Integer
Dim Notes As String
Dim GUID As String
Dim returnValue As Integer
```

```
returnValue = instance.GetPipe(Name, FileName,
    MatProp, T3, TW, Color, Notes, GUID)
```

```
int GetPipe(
    String^ Name,
    String^% FileName,
    String^% MatProp,
    double% T3,
```

cPropFrameid="LST59882A01_0"AddLanguageSpecificTextSet("LST59882A01_0?cpp=:2079.");GetP

```
double% TW,
int% Color,
String^% Notes,
String^% GUID
)

abstract GetPipe :
    Name : string *
    FileName : string byref *
    MatProp : string byref *
    T3 : float byref *
    TW : float byref *
    Color : int byref *
    Notes : string byref *
    GUID : string byref -> int
```

Parameters

Name

Type:Â SystemString

The name of an existing frame section.

FileName

Type:Â SystemString

If the section property was imported from a property file, this is the name of that file. If the section property was not imported, this item is blank.

MatProp

Type:Â SystemString

The name of the material property for the section.

T3

Type:Â SystemDouble

TW

Type:Â SystemDouble

The wall thickness. [L]

Color

Type:Â SystemInt32

Notes

Type:Â SystemString

GUID

Type:Â SystemString

The GUID (global unique identifier), if any, assigned to the section.

Return Value

Type:Â Int32

Returns zero if the section property data is successfully retrieved; otherwise it returns a nonzero value.

▲Remarks

▲Examples

CSI API ETABS v1

cPropFrameAddLanguageSpecificTextSet("LSTFAD1E58F_0?cpp=2976=.");Get

Method

Retrieves the names of all defined frame section properties of a specified type in a specified frame section property file.

Namespace: $\hat{A}$ ETABSV1

Assembly: $\hat{A}$ ETABSV1 (in ETABSV1.dll) Version: 1.0.0.0 (1.24.0.0)

▲ Syntax

C#

VB

C++

F#

Copy

```
int GetPropFileNameList(
    string FileName,
    ref int NumberNames,
    ref string[] MyName,
    ref eFramePropType[] MyPropType,
    eFramePropType PropType =
)
```

```
Function GetPropFileNameList (
    FileName As String,
    ByRef NumberNames As Integer,
    ByRef MyName As String(),
    ByRef MyPropType As eFramePropType(),
    PropType As eFramePropType =
) As Integer
```

```
Dim instance As cPropFrame
Dim FileName As String
Dim NumberNames As Integer
Dim MyName As String()
Dim MyPropType As eFramePropType()
Dim PropType As eFramePropType
Dim returnValue As Integer
```

```
returnValue = instance.GetPropFileNameList(FileName,
    NumberNames, MyName, MyPropType,
    PropType)
```

```
int GetPropFileNameList(
    String^ FileName,
    int% NumberNames,
    array<String^>^% MyName,
    array<eFramePropType>^% MyPropType,
    eFramePropType PropType =
)
```

```
abstract GetPropFileNameList :
    FileName : string *
    NumberNames : int byref *
    MyName : string[] byref *
```

cPropFramespan id="LSTFAD1E58F_0"AddLanguageSpecificTextSet("LSTFAD1E58F_0?cpp=2976=.");Get

Introduction

```
MyPropType : eFramePropType[] byref *
?PropType : eFramePropType
(* Defaults:
    let _PropType = defaultArg PropType
*)
-> int
```

Parameters

FileName

Type:Â SystemString

The name of the frame section property file from which to get the name list.

In most cases, inputting only the name of the property file (e.g. Sections8.pro) is required, and the program will be able to find it. In some cases, inputting the full path to the property file may be necessary.

NumberNames

Type:Â SystemInt32

The number of frame section property names retrieved by the program.

MyName

Type:Â SystemString

This is an array that includes the property names obtained from the frame section property file.

MyPropType

Type:Â ETABSv1eFramePropType

This is an array that includes the property type for each property obtained from the frame section property file.

PropType (Optional)

Type:Â ETABSv1eFramePropType

This optional value is one of the items in the eFramePropType enumeration.

If no value is input for PropType, names are returned for all frame section properties in the specified file regardless of type.

Return Value

Type:Â Int32

Returns zero if the names are successfully retrieved; otherwise it returns a nonzero value

▲ Remarks

▲ Examples

VB

Copy

```
Public Sub Example()

CSI API ETABS v1

cPropFrameAddLanguageSpecificTextSet("LST55DAC1F3_0?cpp=2979=");GetRebarBeam Method

Retrieves beam rebar data for frame sections.

Namespace: ETABSv1

Assembly: ETABSv1 (in ETABSv1.dll) Version: 1.0.0.0 (1.24.0.0)

■ Syntax

C#

VB

C++

F#

Copy

```
int GetRebarBeam(
    string Name,
    ref string MatPropLong,
    ref string MatPropConfine,
    ref double CoverTop,
    ref double CoverBot,
    ref double TopLeftArea,
    ref double TopRightArea,
    ref double BotLeftArea,
    ref double BotRightArea
)
```

```
Function GetRebarBeam (
    Name As String,
    ByRef MatPropLong As String,
    ByRef MatPropConfine As String,
    ByRef CoverTop As Double,
    ByRef CoverBot As Double,
    ByRef TopLeftArea As Double,
    ByRef TopRightArea As Double,
    ByRef BotLeftArea As Double,
    ByRef BotRightArea As Double
) As Integer
```

```
Dim instance As cPropFrame
Dim Name As String
Dim MatPropLong As String
Dim MatPropConfine As String
Dim CoverTop As Double
Dim CoverBot As Double
Dim TopLeftArea As Double
Dim TopRightArea As Double
Dim BotLeftArea As Double
Dim BotRightArea As Double
Dim returnValue As Integer
```

```
returnValue = instance.GetRebarBeam(Name,
    MatPropLong, MatPropConfine, CoverTop,
    CoverBot, TopLeftArea, TopRightArea,
    BotLeftArea, BotRightArea)
```

```
int GetRebarBeam(
String^ Name,
String^% MatPropLong,
String^% MatPropConfine,
double% CoverTop,
double% CoverBot,
double% TopLeftArea,
double% TopRightArea,
double% BotLeftArea,
double% BotRightArea
)
```

```
abstract GetRebarBeam :
    Name : string *
    MatPropLong : string byref *
    MatPropConfine : string byref *
    CoverTop : float byref *
    CoverBot : float byref *
    TopLeftArea : float byref *
    TopRightArea : float byref *
    BotLeftArea : float byref *
    BotRightArea : float byref -> int
```

Parameters

Name

Type:Â SystemString

The name of an existing frame section property.

MatPropLong

Type:Â SystemString

The name of the rebar material property for the longitudinal rebar.

MatPropConfine

Type:Â SystemString

The name of the rebar material property for the confinement rebar.

CoverTop

Type:Â SystemDouble

The distance from the top of the beam to the centroid of the top longitudinal reinforcement. [L]

CoverBot

Type:Â SystemDouble

The distance from the bottom of the beam to the centroid of the bottom longitudinal reinforcement. [L]

TopLeftArea

Type:Â SystemDouble

The total area of longitudinal reinforcement at the top left end of the beam. [L2]

TopRightArea

Type:Â SystemDouble

The total area of longitudinal reinforcement at the top right end of the beam. [L2]

BotLeftArea

Type:Â SystemDouble

The total area of longitudinal reinforcement at the bottom left end of the beam. [L2]

BotRightArea

Type: SystemDouble

The total area of longitudinal reinforcement at the bottom right end of the beam. [L2]

Return Value

Type: Int32

Returns zero if the rebar data is successfully retrieved; otherwise it returns a nonzero value.

Remarks

This function applies only to the following section types. Calling this function for any other type of frame section property returns an error.

- I
- Angle
- Rectangular
- Circle

The material assigned to the specified frame section property must be concrete or this function returns an error.

Examples

VB

Copy

```
Public Sub Example()
    Dim SapModel As cSapModel
    Dim EtabsObject As cOAPI
    Dim ret As Integer = -1
    Dim RebarName As String
    Dim MatPropLong As String
    Dim MatPropConfine As String
    Dim CoverTop As Double
    Dim CoverBot As Double
    Dim TopLeftArea As Double
    Dim TopRightArea As Double
    Dim BotLeftArea As Double
    Dim BotRightArea As Double

    'create ETABS object
    Dim myHelper as cHelper = New Helper
    EtabsObject = myHelper.CreateObjectProgID("CSI.ETABS.API.ETABSObject")

    'start ETABS application
    ret = EtabsObject.ApplicationStart()

    'create SapModel object
    SapModel = EtabsObject.SapModel

    'initialize model
    ret = SapModel.InitializeNewModel()

    'create steel deck template model
    ret = SapModel.File.NewSteelDeck(4,12,12,4,4,24,24)

    'set new frame section property
    ret = SapModel.PropFrame.SetRectangle("R1", "4000Psi", 20, 12)
```

Introduction

```
'add ASTM A706 rebar material
    ret = SapModel.PropMaterial.AddQuick(RebarName, eMatType.Rebar, , , , eMatTypeRebar.ASTM

'set beam rebar data
    ret = SapModel.PropFrame.SetRebarBeam("R1", RebarName, RebarName, 3.5, 3, 4.1, 4.2, 4.3, 4

'get beam rebar data
    ret = SapModel.PropFrame.GetRebarBeam("R1", MatPropLong, MatPropConfine, CoverTop, CoverBo

'close ETABS

    Number2DirTieBars : int byref *
    Number3DirTieBars : int byref *
    ToBeDesigned : bool byref -> int

```

Parameters

Name

Type: SystemString

The name of an existing frame section property.

MatPropLongType: SystemString

The name of the rebar material property for the longitudinal rebar.

MatPropConfineType: SystemString

The name of the rebar material property for the confinement rebar.

PatternType: SystemInt32

This is either 1 or 2, indicating the rebar configuration.

Value Pattern

1 Rectangular

2 Circular

For circular frame section properties this item must be 2; otherwise an error is returned.

ConfineTypeType: SystemInt32

This is either 1 or 2, indicating the confinement bar type.

Value Type

1 Ties

2 Spiral

This item applies only when Pattern = 2. If Pattern = 1, the confinement bar type is assumed to be ties.

CoverType: SystemDouble

The clear cover for the confinement steel (ties). In the special case of circular reinforcement in a rectangular column, this is the minimum clear cover. [L]

NumberCBarsType: SystemInt32

This item applies to a circular rebar configuration, Pattern = 2. It is the total number of longitudinal reinforcing bars in the column.

NumberR3BarsType: SystemInt32

This item applies to a rectangular rebar configuration, Pattern = 1. It is the number of longitudinal bars (including the corner bar) on each face of the column that is parallel to the local 3-axis of the column.

NumberR2BarsType: SystemInt32

This item applies to a rectangular rebar configuration, Pattern = 1. It is the number of longitudinal bars (including the corner bar) on each face of the column that is parallel to the local 2-axis of the column.

RebarSizeType: SystemString

The rebar name for the longitudinal rebar in the column.

TieSizeType: SystemString

The rebar name for the confinement rebar in the column.

TieSpacingLongitType: SystemDouble

The longitudinal spacing of the confinement bars (ties). [L]

Number2DirTieBarsType: SystemInt32

This item applies to a rectangular reinforcing configuration, Pattern = 1. It is the number of confinement bars (tie legs) running in the local 2-axis direction of the column.

Number3DirTieBarsType: SystemInt32

This item applies to a rectangular reinforcing configuration, Pattern = 1. It is the number of confinement bars (tie legs) running in the local 3-axis direction of the column.

ToBeDesignedType: SystemBoolean

If this item is True, the column longitudinal rebar is to be designed; otherwise it is to be checked.

Return ValueType: Int32

Returns zero if the rebar data is successfully retrieved; otherwise it returns a nonzero value.

Remarks

This function applies only to the following section types. Calling this function for any other type of frame section property returns an error.

- Rectangular
- Circle

The material assigned to the specified frame section property must be concrete or this function returns an error.

Examples

VB

Copy

```
Public Sub Example()
    Dim SapModel As cSapModel
    Dim EtabsObject As cOAPI
    Dim ret As Integer = -1
    Dim RebarName As String
    Dim MatPropLong As String
    Dim MatPropConfine As String
    Dim Pattern As Integer
    Dim ConfineType As Integer
    Dim Cover As Double
    Dim NumberCBars As Integer
    Dim NumberR3Bars As Integer
    Dim NumberR2Bars As Integer
    Dim RebarSize As String
    Dim TieSize As String
    Dim TieSpacingLongit As Double
    Dim Number2DirTieBars As Integer
    Dim Number3DirTieBars As Integer
    Dim ToBeDesigned As Boolean

    'create ETABS object
    Dim myHelper as cHelper = New Helper
```

Introduction

```
EtabsObject = myHelper.CreateObjectProgID("CSI.ETABS.API.ETABSObject")

'start ETABS application
ret = EtabsObject.ApplicationStart()

'create SapModel object
SapModel = EtabsObject.SapModel

'initialize model
ret = SapModel.InitializeNewModel()

'create steel deck template model
ret = SapModel.File.NewSteelDeck(4,12,12,4,4,24,24)

'set new frame section property
ret = SapModel.PropFrame.SetRectangle("R1", "4000Psi", 20, 12)

'add ASTM A706 rebar material
ret = SapModel.PropMaterial.AddQuick(RebarName, eMatType.Rebar, , , , eMatTypeRebar.ASTM

'set column rebar data
ret = SapModel.PropFrame.SetRebarColumn("R1", RebarName, RebarName, 2, 2, 2, 10, 0, 0, "#1

'get column rebar data
ret = SapModel.PropFrame.GetRebarColumn("R1", MatPropLong, MatPropConfine, Pattern, Confir

'close ETABS
EtabsObject.ApplicationExit(False)

'clean up variables
SapModel = Nothing
EtabsObject = Nothing
End Sub
```

)

abstract GetRectangle :
    Name : string *
    FileName : string byref *
    MatProp : string byref *
    T3 : float byref *
    T2 : float byref *
    Color : int byref *
    Notes : string byref *
    GUID : string byref -> int
```

Parameters

Name

Type:Â SystemString

The name of an existing or new frame section.

FileName

Type:Â SystemString

If the section property was imported from a property file, this is the name of that file. If the section property was not imported, this item is blank.

MatProp

Type:Â SystemString

The name of the material property for the section.

T3

Type:Â SystemDouble

T2

Type:Â SystemDouble

Color

Type:Â SystemInt32

Notes

Type:Â SystemString

GUID

Type:Â SystemString

The GUID (global unique identifier), if any, assigned to the section.

Return Value

Type:Â Int32

Returns zero if the section property is successfully retrieved; otherwise it returns a nonzero value.

▲ Remarks

▲ Examples

VB

Copy

```
Public Sub Example()
    Dim SapModel As cSapModel
    Dim EtabsObject As cOAPI
    Dim ret As Integer = -1
```

    MyType : int[] byref *
    DesignType : int byref *
    Color : int byref *
    Notes : string byref *
    GUID : string byref -> int

```

Parameters

Name

Type:Â SystemString

The name of an existing section designer property

MatProp

Type:Â SystemString

The name of the base material property for the section

NumberItems

Type:Â SystemInt32

The number of shapes defined in the section designer section

ShapeName

Type:Â SystemString

This is an array that includes the name of each shape in the section designer section

MyType

Type:Â SystemInt32

This is an array that includes the type of each shape in the section designer section

- 1 I-Section
- 2 Channel
- 3 Tee
- 4 Angle
- 5 Double Angle
- 6 Box
- 7 Pipe
- 8 Plate
- 61 Concrete Tee
- 62 Concrete L

- 63 Concrete Box
- 64 Concrete Pipe
- 65 Concrete Cross
- 101 Solid Rectangle
- 102 Solid Circle
- 103 Solid Segment
- 104 Solid Sector
- 201 Polygon
- 301 Reinforcing Single
- 302 Reinforcing Line
- 303 Reinforcing Rectangle
- 304 Reinforcing Circle
- 401 Reference Line
- 402 Reference Circle

DesignType

Type: SystemInt32

This is 0, 1, 2 or 3, indicating the design option for the section

- 0 No design
- 1 Design as general steel section
- 2 Design as a concrete column; check the reinforcing
- 3 Design as a concrete column; design the reinforcing

Color

Type: SystemInt32

The display color assigned to the section

Notes

Type: SystemString

The notes, if any, assigned to the section

GUID

Type: SystemString

The GUID (global unique identifier), if any, assigned to the section

Return Value

Type: Int32

Returns zero if the section property data is successfully retrieved; otherwise it returns a nonzero value

    MirrorAbout2 : bool byref *
    MirrorAbout3 : bool byref *
    Color : int byref *
    Notes : string byref *
    GUID : string byref -> int
```

Parameters

Name

Type:Â SystemString

The name of an existing frame section property.

FileName

Type:Â SystemString

If the section property was imported from a property file, this is the name of that file. If the section property was not imported, this item is blank.

MatProp

Type:Â SystemString

The name of the material property for the section.

T3

Type:Â SystemDouble

T2

Tf	Type:Â <u>SystemDouble</u>
Tw	Type:Â <u>SystemDouble</u>
r	Type:Â <u>SystemDouble</u> The fillet radius. [L]
MirrorAbout2	Type:Â <u>SystemBoolean</u> Indicates whether the section is mirrored about the local 2-axis.
MirrorAbout3	Type:Â <u>SystemBoolean</u> Indicates whether the section is mirrored about the local 3-axis.
Color	Type:Â <u>SystemInt32</u>
Notes	Type:Â <u>SystemString</u>
GUID	Type:Â <u>SystemString</u> The GUID (global unique identifier), if any, assigned to the section.

Return Value

Type:Â Int32

returns zero if the section property data is successfully retrieved; otherwise it returns a nonzero value.

Remarks

This function supersedes GetAngle(String, String, String, Double, Double, Double, Double, Int32, String, String).

Examples

VB

Copy

```
Public Sub Example()
    Dim SapModel As cSapModel
    Dim EtabsObject As cOAPI
    Dim ret As Integer = -1
    Dim Name As String
    Dim FileName As String
    Dim MatProp As String
    Dim t3 As Double
    Dim t2 As Double
    Dim tf As Double
    Dim tw As Double
    Dim r As Double
    Dim mirror2 As Boolean
    Dim mirror3 As Boolean
    Dim Color As Integer
    Dim Notes As String
    Dim GUID As String

    'create ETABS object
    Dim myHelper as cHelper = New Helper
    EtabsObject = myHelper.CreateObjectProgID("CSI.ETABS.API.ETABSObject")
```

Introduction

```
'start ETABS application
    ret = EtabsObject.ApplicationStart()

'create SapModel object
    SapModel = EtabsObject.SapModel

'initialize model
    ret = SapModel.InitializeNewModel()

'create steel deck template model
    ret = SapModel.File.NewSteelDeck(4,12,12,4,4,24,24)

'set new frame section property
    ret = SapModel.PropFrame.SetSteelAngle("ANGLE1", "A992Fy50", 6, 4, 0.5, 0.5, 0.5, False, F

'get frame section property data
    ret = SapModel.PropFrame.GetSteelAngle("ANGLE1", FileName, MatProp, t3, t2, tf, tw, r, mi

'close ETABS
    EtabsObject.ApplicationExit(False)

'clean up variables
    SapModel = Nothing
    EtabsObject = Nothing
End Sub
```

    Tf : float byref *
    Tw : float byref *
    Color : int byref *
    Notes : string byref *
    GUID : string byref -> int
```

Parameters

Name

Type:Â SystemString

The name of an existing frame section property.

FileName

Type:Â SystemString

MatProp

Type:Â SystemString

The name of the material property for the section.

T3

Type:Â SystemDouble

T2

Type:Â SystemDouble

Tf

Type:Â SystemDouble

Tw

Type:Â SystemDouble

Color

Type:Â SystemInt32

Notes

Type:Â SystemString

GUID

Type:Â SystemString

The GUID (global unique identifier), if any, assigned to the section.

Return Value

Type: Int32

Returns zero if the section property is successfully retrieved; otherwise it returns a nonzero value.

Remarks

This function is obsolete and has been superseded by GetSteelTee(String, String, String, Double, Double, Double, Double, Double, Boolean, Int32, String, String) and GetConcreteTee(String, String, String, Double, Double, Double, Double, Double, Boolean, Int32, String, String) as of version 16.0.0. This function is maintained for backwards compatibility.

The name of an existing frame section property.

FileName

Type:Â SystemString

If the section property was imported from a property file, this is the name of that file. If the section property was not imported, this item is blank.

MatProp

Type:Â SystemString

The name of the material property for the section.

T3

Type:Â SystemDouble

T2

Type:Â SystemDouble

Tf

Type:Â SystemDouble

Tw

Type:Â SystemDouble

Color

Type:Â SystemInt32

Notes

Type:Â SystemString

GUID

Type:Â SystemString

The GUID (global unique identifier), if any, assigned to the section.

Return Value

Type: Int32

Returns zero if the section property data is successfully retrieved; otherwise it returns a nonzero value.

▲ **Remarks**

▲ **Examples**

VB

Copy

```
Public Sub Example()
    Dim SapModel As cSapModel
    Dim EtabsObject As cOAPI
    Dim ret As Integer = -1

    'create ETABS object
    Dim myHelper as cHelper = New Helper
    EtabsObject = myHelper.CreateObjectProgID("CSI.ETABS.API.ETABSObject")

    'start ETABS application
    ret = EtabsObject.ApplicationStart()

    'create SapModel object
    SapModel = EtabsObject.SapModel

    'initialize model
    ret = SapModel.InitializeNewModel()

    'create steel deck template model
    ret = SapModel.File.NewSteelDeck(4,12,12,4,4,24,24)

    'set new frame section property
    ret = SapModel.PropFrame.SetTube("TUBE1", "A992Fy50", 8, 6, 0.5, 0.5)

    'close ETABS
    EtabsObject.ApplicationExit(False)

    'clean up variables
    SapModel = Nothing
    EtabsObject = Nothing
End Sub
```

CSI API ETABS v1

cPropFrameAddLanguageSpecificTextSet("LSTD11E5A Method

Retrieves the property type for the specified frame section property.

Namespace: ETABSv1

Assembly: ETABSv1 (in ETABSv1.dll) Version: 1.0.0.0 (1.24.0.0)

Syntax

C#

VB

C++

F#

Copy

```
int GetType0API(
    string Name,
    ref eFramePropType PropType
)
```

```
Function GetType0API (
    Name As String,
    ByRef PropType As eFramePropType
) As Integer
```

```
Dim instance As cPropFrame
Dim Name As String
Dim PropType As eFramePropType
Dim returnValue As Integer
```

```
returnValue = instance.GetType0API(Name,
    PropType)
```

```
int GetType0API(
    String^ Name,
    eFramePropType% PropType
)
```

```
abstract GetType0API :
    Name : string *
    PropType : eFramePropType byref -> int
```

Parameters

Name

Type: SystemString

The name of an existing frame section property.

PropType

Type: ETABSv1eFramePropType

This is one of the items in the eFramePropType enumeration.

Return ValueType: Int32

Returns zero if the type is successfully retrieved; otherwise it returns nonzero.

▀ **Remarks**▀ **Examples**

VB

Copy

```
Public Sub Example()
    Dim SapModel As cSapModel

CSI API ETABS v1

cPropFrameAddLanguageSpecificTextSet("LST50AA3E9_0") Method

Retrieves the rebar design type for the specified frame section property

Namespace: [ETABSV1](#)

Assembly: [ETABSV1](#) (in ETABSV1.dll) Version: 1.0.0.0 (1.24.0.0)

Syntax

[C#](#)

[VB](#)

[C++](#)

[F#](#)

[Copy](#)

```
int GetTypeRebar(
    string Name,
    ref int MyType
)
```

```
Function GetTypeRebar (
    Name As String,
    ByRef MyType As Integer
) As Integer
```

```
Dim instance As cPropFrame
Dim Name As String
Dim MyType As Integer
Dim returnValue As Integer
```

```
returnValue = instance.GetTypeRebar(Name,
    MyType)
```

```
int GetTypeRebar(
    String^ Name,
    int% MyType
)
```

```
abstract GetTypeRebar :
    Name : string *
    MyType : int byref -> int
```

Parameters

Name

Type: [SystemString](#)

The name of an existing frame section property

MyType

Type: [SystemInt32](#)

This is 0, 1 or 2, indicating the rebar design type.

0 None

1 Column

2 Beam

Return Value

Type: Int32

Returns zero if the type is successfully retrieved; otherwise it returns nonzero

▀ **Remarks**

This function applies only to the following section property types. Calling this function for any other type of frame section property returns an error.

- Concrete Tee
- Concrete Angle
- Concrete Rectangle
- Concrete Circle

A nonzero rebar type is returned only if the frame section property has a concrete material.

CSI API ETABS v1

cPropFrameAddLanguageSpecificTextSet("LSTD6581C63_0?cpp=3027-")

Method

Imports a frame section property from a property file.

Namespace: ETABSv1

Assembly: ETABSv1 (in ETABSv1.dll) Version: 1.0.0.0 (1.24.0.0)

Syntax

C#

VB

C++

F#

Copy

```
int ImportProp(
    string Name,
    string MatProp,
    string FileName,
    string PropName,
    int Color = -1,
    string Notes = "",
    string GUID = ""
)
```

```
Function ImportProp (
    Name As String,
    MatProp As String,
    FileName As String,
    PropName As String,
    Optional As Integer = -1,
    Optional As String = "",
    Optional As String = ""
) As Integer
```

```
Dim instance As cPropFrame
Dim Name As String
Dim MatProp As String
Dim FileName As String
Dim PropName As String
Dim Color As Integer
Dim Notes As String
Dim GUID As String
Dim returnValue As Integer
```

```
returnValue = instance.ImportProp(Name,
    MatProp, FileName, PropName, Color,
    Notes, GUID)
```

```
int ImportProp(
    String^ Name,
    String^ MatProp,
    String^ FileName,
    String^ PropName,
    int Color = -1,
    String^ Notes = L"",
```

cPropFrameid="LSTD6581C63_0"AddLanguageSpecificTextSet("LSTD6581C63_0?cpp=3027-");Imp

```

String^ GUID = L""
)

abstract ImportProp :
    Name : string *
    MatProp : string *
    FileName : string *
    PropName : string *
    ?Color : int *
    ?Notes : string *
    ?GUID : string
(* Defaults:
    let _Color = defaultArg Color -1
    let _Notes = defaultArg Notes ""
    let _GUID = defaultArg GUID ""
*)
-> int

```

Parameters

Name

Type:Â SystemString

The name of an existing or new frame section property. If this is an existing property, that property is modified; otherwise, a new property is added. This name does not need to be the same as the PropName item.

MatProp

Type:Â SystemString

The name of the material property for the section.

FileName

Type:Â SystemString

The name of the frame section property file from which to get the frame section property specified by the PropName item.

In most cases you can input just the name of the property file (e.g.

"AISC14.xml") and the program will be able to find it. In some cases you may have to input the full path to the property file.

PropName

Type:Â SystemString

The name of the frame section property, inside the property file specified by the FileName item, that is to be imported.

Color (Optional)

Type:Â SystemInt32

Notes (Optional)

Type:Â SystemString

GUID (Optional)

Type:Â SystemString

The GUID (global unique identifier), if any, assigned to the section. If this item is input as Default, the program assigns a GUID to the section.

Return Value

Type:Â Int32

Returns zero if the section property is successfully initialized; otherwise it returns a nonzero value.

Remarks

If the property file is not found, or the specified property name is not found in the property file, the section is set to be a general section with default properties.

Examples

VB

Copy

```
Public Sub Example()
    Dim SapModel As cSapModel
    Dim EtabsObject As cOAPI
    Dim ret As Integer = -1

    'create ETABS object
    Dim myHelper as cHelper = New Helper
    EtabsObject = myHelper.CreateObjectProgID("CSI.ETABS.API.ETABSObject")

    'start ETABS application
    ret = EtabsObject.ApplicationStart()

    'create SapModel object
    SapModel = EtabsObject.SapModel

    'initialize model
    ret = SapModel.InitializeNewModel()

    'create steel deck template model
    ret = SapModel.File.NewSteelDeck(4,12,12,4,4,24,24)

    'import new frame section property
    ret = SapModel.PropFrame.ImportProp("W18X35", "A992Fy50", "Sections8.pro", "W18X35")

    'close ETABS
    EtabsObject.ApplicationExit(False)

    'clean up variables
    SapModel = Nothing
    EtabsObject = Nothing
End Sub
```

returnValue = instance.SetAngle(Name,
    MatProp, T3, T2, Tf, Tw, Color, Notes,
    GUID)
```

cPropFramespan id="LST8B4B1A3B_0"AddLanguageSpecificTextSet("LST8B4B1A3B_0?cpp=3060=.");Set

```

int SetAngle(
String^ Name,
String^ MatProp,
double T3,
double T2,
double Tf,
double Tw,
int Color = -1,
String^ Notes = L"",
String^ GUID = L""
)

```

```

abstract SetAngle :
    Name : string *
    MatProp : string *
    T3 : float *
    T2 : float *
    Tf : float *
    Tw : float *
    ?Color : int *
    ?Notes : string *
    ?GUID : string
(* Defaults:
    let _Color = defaultArg Color -1
    let _Notes = defaultArg Notes ""
    let _GUID = defaultArg GUID ""
*)
-> int

```

Parameters

Name

Type:Â SystemString

The name of an existing or new frame section property. If this is an existing property, that property is modified; otherwise, a new property is added.

MatProp

Type:Â SystemString

The name of the material property for the section.

T3

Type:Â SystemDouble

T2

Type:Â SystemDouble

Tf

Type:Â SystemDouble

Tw

Type:Â SystemDouble

Color (Optional)

Type:Â SystemInt32

Notes (Optional)

Type:Â SystemString

GUID (Optional)

Type:Â SystemString

The GUID (global unique identifier), if any, assigned to the section. If this item is input as Default, then the program assigns a GUID to the section.

Return Value

Type: Int32

returns zero if the section property is successfully initialized; otherwise it returns a nonzero value.

▲ **Remarks**

This function is obsolete and has been superseded by SetSteelAngle(String, String, Double, Double, Double, Double, Double, Boolean, Boolean, Int32, String, String) and SetConcreteL(String, String, Double, Double, Double, Double, Double, Boolean, Boolean, Int32, String, String) as of version 16.0.0. This function is maintained for backwards compatibility.

▲ **Examples**

VB

Copy

```
Public Sub Example()
    Dim SapModel As cSapModel
    Dim EtabsObject As cOAPI
    Dim ret As Integer = -1

    'create ETABS object
    Dim myHelper as cHelper = New Helper
    EtabsObject = myHelper.CreateObjectProgID("CSI.ETABS.API.ETABSObject")

CSI API ETABS v1

cPropFrameAddLanguageSpecificTextSet("LST2B03D61B_0?cpp=3034") Method

Assigns frame section properties to an auto select list. If this function is called for an existing frame section property, all items for the section are reset to their default value.

Namespace: ETABSv1

Assembly: ETABSv1 (in ETABSv1.dll) Version: 1.0.0.0 (1.24.0.0)

Syntax

C#

VB

C++

F#

Copy

```
int SetAutoSelectSteel(
    string Name,
    int NumberItems,
    ref string[] SectName,
    string AutoStartSection = "Median",
    string Notes = "",
    string GUID = ""
)

Function SetAutoSelectSteel (
    Name As String,
    NumberItems As Integer,
    ByRef SectName As String(),
    AutoStartSection As String = "Median",
    Notes As String = "",
    GUID As String = ""
) As Integer

Dim instance As cPropFrame
Dim Name As String
Dim NumberItems As Integer
Dim SectName As String()
Dim AutoStartSection As String
Dim Notes As String
Dim GUID As String
Dim returnValue As Integer

returnValue = instance.SetAutoSelectSteel(Name,
    NumberItems, SectName, AutoStartSection,
    Notes, GUID)

int SetAutoSelectSteel(
    String^ Name,
    int NumberItems,
    array<String^>^% SectName,
    String^ AutoStartSection = L"Median",
    String^ Notes = L"",
    String^ GUID = L""
)
```

cPropFrameAddLanguageSpecificTextSet("LST2B03D61B_0?cpp=3034");Set

```

abstract SetAutoSelectSteel :
    Name : string *
    NumberItems : int *
    SectName : string[] byref *
    ?AutoStartSection : string *
    ?Notes : string *
    ?GUID : string
(* Defaults:
    let _AutoStartSection = defaultArg AutoStartSection "Median"
    let _Notes = defaultArg Notes ""
    let _GUID = defaultArg GUID ""
*)
-> int

```

Parameters

Name

Type:Â [SystemString](#)

The name of an existing or new frame section property. If this is an existing property, that property is modified; otherwise, a new property is added.

NumberItems

Type:Â [SystemInt32](#)

The number of frame section properties included in the auto select list.

SectName

Type:Â [SystemString](#)

This is an array of the names of the frame section properties included in the auto select list.

Auto select lists and nonprismatic (variable) sections are not allowed in this array.

AutoStartSection (Optional)

Type:Â [SystemString](#)

This is either Median or the name of a frame section property in the SectName array. It is the starting section for the auto select list.

Notes (Optional)

Type:Â [SystemString](#)

The notes, if any, assigned to the section.

GUID (Optional)

Type:Â [SystemString](#)

The GUID (global unique identifier), if any, assigned to the section. If this item is input as Default, the program assigns a GUID to the section.

Return Value

Type:Â [Int32](#)

Returns zero if the auto select list is successfully filled; otherwise it returns a nonzero value.

▲ Remarks

▲ Examples

    ?Color : int *
    ?Notes : string *
    ?GUID : string
(* Defaults:
    let _Color = defaultArg Color -1
    let _Notes = defaultArg Notes ""
    let _GUID = defaultArg GUID ""
*)
-> int

```

Parameters

Name

Type: SystemString

The name of an existing or new frame section property. If this is an existing property, that property is modified; otherwise, a new property is added.

MatProp

Type: SystemString

The name of the material property for the section.

T3

Type: SystemDouble

Color (Optional)

Type: SystemInt32

Notes (Optional)

Type: SystemString

GUID (Optional)

Type: SystemString

The GUID (global unique identifier), if any, assigned to the section. If this item is input as Default, the program assigns a GUID to the section.

Return Value

Type: Int32

Returns zero if the section property is successfully initialized; otherwise it returns a nonzero value.

▲ Remarks

▲ Examples

VB

Copy

```

Public Sub Example()
    Dim SapModel As cSapModel
    Dim EtabsObject As cOAPI
    Dim ret As Integer = -1

    'create ETABS object
    Dim myHelper as cHelper = New Helper
    EtabsObject = myHelper.CreateObjectProgID("CSI.ETABS.API.ETABSObject")

    'start ETABS application
    ret = EtabsObject.ApplicationStart()

    'create SapModel object

```

Introduction

```
SapModel = EtabsObject.SapModel

'initialize model
ret = SapModel.InitializeNewModel()

'create steel deck template model
ret = SapModel.File.NewSteelDeck(4,12,12,4,4,24,24)

'set new frame section property
ret = SapModel.PropFrame.SetCircle("C1", "4000Psi", 20)

'close ETABS
EtabsObject.ApplicationExit(False)

'clean up variables
SapModel = Nothing
EtabsObject = Nothing
End Sub
```

CSI API ETABS v1

cPropFrameAddLanguageSpecificTextSet("LSTE85ECEA2_0?cpp3048u=.");Set

Method

Initializes a concrete L frame section property. If this function is called for an existing frame section property, all items for the section are reset to their default value.

Namespace: ETABSv1

Assembly: ETABSv1 (in ETABSv1.dll) Version: 1.0.0.0 (1.24.0.0)

Syntax

C#

VB

C++

F#

Copy

```
int SetConcreteL(
    string Name,
    string MatProp,
    double T3,
    double T2,
    double Tf,
    double TwC,
    double TwT,
    bool MirrorAbout2,
    bool MirrorAbout3,
    int Color = -1,
    string Notes = "",
    string GUID = ""
)
```

```

    ?GUID : string
(* Defaults:
    let _Color = defaultArg Color -1
    let _Notes = defaultArg Notes ""
    let _GUID = defaultArg GUID ""
*)
-> int
```

Parameters

Name

Type:Â SystemString

The name of an existing or new frame section property. If this is an existing property, that property is modified; otherwise, a new property is added.

MatProp

Type:Â SystemString

The name of the material property for the section.

T3

Type:Â SystemDouble

T2

Type:Â SystemDouble

Tf

Type:Â SystemDouble

TwC
Type:Â SystemDouble
The vertical leg thickness at the corner. [L]

TwT
Type:Â SystemDouble
The vertical leg thickness at the tip. [L]

MirrorAbout2
Type:Â SystemBoolean
Indicates whether the section is mirrored about the local 2-axis.

MirrorAbout3
Type:Â SystemBoolean
Indicates whether the section is mirrored about the local 3-axis.

Color (Optional)
Type:Â SystemInt32

Notes (Optional)
Type:Â SystemString

GUID (Optional)
Type:Â SystemString
The GUID (global unique identifier), if any, assigned to the section. If this item is input as Default, then the program assigns a GUID to the section.

Return Value

Type:Â Int32
returns zero if the section property is successfully initialized; otherwise it returns a nonzero value.

Remarks

This function supersedes SetAngle(String, String, Double, Double, Double, Double, Int32, String, String).

Examples

VB

Copy

```
Public Sub Example()
    Dim SapModel As cSapModel
    Dim EtabsObject As cOAPI
    Dim ret As Integer = -1

    'create ETABS object
    Dim myHelper as cHelper = New Helper
    EtabsObject = myHelper.CreateObjectProgID("CSI.ETABS.API.ETABSObject")

    'start ETABS application
    ret = EtabsObject.ApplicationStart()

    'create SapModel object
    SapModel = EtabsObject.SapModel

    'initialize model
    ret = SapModel.InitializeNewModel()

    'create steel deck template model
    ret = SapModel.File.NewSteelDeck(4,12,12,4,4,24,24)

    'set new frame section property
```

Introduction

```
ret = SapModel.PropFrame.SetConcreteL("ANGLE1", "4000Psi", 30, 36, 8, 7, 5, False, True)

'close ETABS
EtabsObject.ApplicationExit(False)

'clean up variables
SapModel = Nothing
EtabsObject = Nothing
End Sub
```

*)
-> int
```

Parameters

Name

Type:Â SystemString

Introduction

The name of an existing or new frame section property. If this is an existing property, that property is modified; otherwise, a new property is added.

SectName

Type:Â SystemString

FyTopFlange

Type:Â SystemDouble

The yield strength of the top flange of the I-section. [F/L2]

If this item is 0, the yield strength of the I-section specified by the SectName item is used.

FyWeb

Type:Â SystemDouble

The yield strength of the web of the I-section. [F/L2]

If this item is 0, the yield strength of the I-section specified by the SectName item is used.

FyBotFlange

Type:Â SystemDouble

The yield strength of the bottom flange of the I-section. [F/L2]

If this item is 0, the yield strength of the I-section specified by the SectName item is used.

Tc

Type:Â SystemDouble

Bc

Type:Â SystemDouble

MatPropTop

Type:Â SystemString

The name of the material property for the bottom cover plate.

This item applies only if both the tcb and the bcb items are greater than 0.

Tcb

Type:Â SystemDouble

Bcb

Type:Â SystemDouble

MatPropBot

Type:Â SystemString

The name of the material property for the bottom cover plate.

This item applies only if both the tcb and the bcb items are greater than 0.

Color (Optional)

Type:Â SystemInt32

Notes (Optional)

Type:Â SystemString

GUID (Optional)

Type:Â SystemString

The GUID (global unique identifier), if any, assigned to the section. If this item is input as Default, the program assigns a GUID to the section.

Return ValueType: Int32

Returns zero if the section property is successfully initialized; otherwise it returns a nonzero value.

▲ **Remarks**

▲ **Examples**

VB

Copy

```
Public Sub Example()
    Dim SapModel As cSapModel
    Dim EtabsObject As cOAPI
    Dim ret As Integer = -1

    'create ETABS object
    Dim myHelper as cHelper = New Helper
    EtabsObject = myHelper.CreateObjectProgID("CSI.ETABS.API.ETABSObject")

    'start ETABS application
    ret = EtabsObject.ApplicationStart()

    'create SapModel object
    SapModel = EtabsObject.SapModel

    'initialize model
    ret = SapModel.InitializeNewModel()

    'create steel deck template model
    ret = SapModel.File.NewSteelDeck(4,12,12,4,4,24,24)

    'set new I-type frame section property
    ret = SapModel.PropFrame.SetISection("ISEC", "A992Fy50", 24, 8, 0.5, 0.3, 8, 0.5)

    'set new cover plated I-type frame section property
    ret = SapModel.PropFrame.SetCoverPlatedI("CPI1", "ISEC", 0, 36, 0, 0.75, 14, "A992Fy50", 0)

    'close ETABS
    EtabsObject.ApplicationExit(False)

    'clean up variables
    SapModel = Nothing

int Color = -1,  
String^ Notes = L"",  
String^ GUID = L"  
)
```

```
abstract SetDblChannel :  
    Name : string *  
    MatProp : string *  
    T3 : float *  
    T2 : float *  
    Tf : float *  
    Tw : float *  
    Dis : float *  
    ?Color : int *  
    ?Notes : string *  
    ?GUID : string  
(* Defaults:  
    let _Color = defaultArg Color -1  
    let _Notes = defaultArg Notes ""  
    let _GUID = defaultArg GUID ""  
*)  
-> int
```

Parameters

Name

Type:Â SystemString

The name of an existing or new frame section property. If this is an existing property, that property is modified; otherwise, a new property is added.

MatProp

Type:Â SystemString

The name of the material property for the section.

T3

Type:Â SystemDouble

T2

Type:Â SystemDouble

Tf

Type:Â SystemDouble

Tw

Type:Â SystemDouble

Dis

Type:Â SystemDouble

Color (Optional)

Type:Â SystemInt32

Notes (Optional)

Parameters

Type: SystemString
 GUID (Optional)

Type: SystemString

The GUID (global unique identifier), if any, assigned to the section. If this item is input as Default, the program assigns a GUID to the section.

Return Value

Type: Int32

Returns zero if the section property is successfully initialized; otherwise it returns a nonzero value.

▀ Remarks

▀ Examples

VB

Copy

```
Public Sub Example()
    Dim SapModel As cSapModel
    Dim EtabsObject As cOAPI
    Dim ret As Integer = -1

    'create ETABS object
    Dim myHelper as cHelper = New Helper
    EtabsObject = myHelper.CreateObjectProgID("CSI.ETABS.API.ETABSObject")

    'start ETABS application
    ret = EtabsObject.ApplicationStart()

    'create SapModel object
    SapModel = EtabsObject.SapModel

    'initialize model
    ret = SapModel.InitializeNewModel()

    'create steel deck template model
    ret = SapModel.File.NewSteelDeck(4,12,12,4,4,24,24)

    'set new frame section property
    ret = SapModel.PropFrame.SetDblChannel("DBCHN1", "A992Fy50", 12, 6.5, 0.5, 0.3, 0.5)

    'close ETABS
    EtabsObject.ApplicationExit(False)

    'clean up variables
    SapModel = Nothing
    EtabsObject = Nothing
End Sub
```

CSI API ETABS v1

cPropFrameAddLanguageSpecificTextSet("LST9B7B0FD5_0?cpp=3060=.");Set

Method

Initializes a general frame section property. If this function is called for an existing frame section property, all items for the section are reset to their default value.

Namespace: $\hat{A}$ ETABSV1

Assembly: $\hat{A}$ ETABSV1 (in ETABSV1.dll) Version: 1.0.0.0 (1.24.0.0)

■ Syntax

C#

VB

```

Parameters

Name

Type: SystemString

The name of an existing or new frame section property. If this is an existing property, that property is modified; otherwise, a new property is added.

MatProp

Type: SystemString

The name of the material property for the section.

T3

Type: SystemDouble

T2

Type: SystemDouble

Area

Type: SystemDouble

The cross-sectional area. [L2]

As2

Type: SystemDouble

The shear area for forces in the section local 2-axis direction. [L2]

As3

Type: SystemDouble

The shear area for forces in the section local 3-axis direction. [L2]

Torsion

Type: SystemDouble

The torsional constant. [L4]

I22

Type: SystemDouble

The moment of inertia for bending about the local 2 axis. [L4]

I33

Type: SystemDouble

The moment of inertia for bending about the local 3 axis. [L4]

S22

Type: SystemDouble

The section modulus for bending about the local 2 axis. [L3]

S33

Type:Â SystemDouble
 The section modulus for bending about the local 3 axis. [L3]

Z22
 Type:Â SystemDouble
 The plastic modulus for bending about the local 2 axis. [L3]

Z33
 Type:Â SystemDouble
 The plastic modulus for bending about the local 3 axis. [L3]

R22
 Type:Â SystemDouble
 The radius of gyration about the local 2 axis. [L]

R33
 Type:Â SystemDouble
 The radius of gyration about the local 3 axis. [L]

Color (Optional)
 Type:Â SystemInt32

Notes (Optional)
 Type:Â SystemString

GUID (Optional)
 Type:Â SystemString
 The GUID (global unique identifier), if any, assigned to the section. If this item is input as Default, the program assigns a GUID to the section.

Return Value

Type:Â Int32
 Returns zero if the section property is successfully initialized; otherwise it returns a nonzero value.

▲Remarks

CSI API ETABS v1

cPropFrameAddLanguageSpecificTextSet("LSTB87C2D9D_0?cpp3072u=.");Se

Method

Sets the material property of a defined frame section

Namespace: [ETABSv1](#)

Assembly: [ETABSv1](#) (in ETABSv1.dll) Version: 1.0.0.0 (1.24.0.0)

Syntax

[C#](#)

[VB](#)

[C++](#)

[F#](#)

[Copy](#)

```
int SetMaterial(
    string Name,
    string MatProp
)
```

```
Function SetMaterial (
    Name As String,
    MatProp As String
) As Integer
```

```
Dim instance As cPropFrame
Dim Name As String
Dim MatProp As String
Dim returnValue As Integer
```

```
returnValue = instance.SetMaterial(Name,
    MatProp)
```

```
int SetMaterial(
    String^ Name,
    String^ MatProp
)
```

```
abstract SetMaterial :
    Name : string *
    MatProp : string -> int
```

Parameters

Name

Type: [SystemString](#)

The name of an existing frame section property.

MatProp

Type: [SystemString](#)

The name of the material property for the section.

Return Value

Type: Int32

Returns zero if the material property is successfully set; otherwise it returns a nonzero value.

▀ **Remarks**

▀ **Examples**

VB

Copy

```
Public Sub Example()
    Dim SapModel As cSapModel
    Dim EtabsObject As cOAPI
    Dim ret As Integer = -1
    Dim FileName As String

    'create ETABS object
    Dim myHelper as cHelper = New Helper
    EtabsObject = myHelper.CreateObjectProgID("CSI.ETABS.API.ETABSObject")

    'start ETABS application
    ret = EtabsObject.ApplicationStart()

    'create SapModel object
    SapModel = EtabsObject.SapModel

    'initialize model
    ret = SapModel.InitializeNewModel()

    'create steel deck template model
    ret = SapModel.File.NewSteelDeck(4,12,12,4,4,24,24)

    'set new frame section property
    ret = SapModel.PropFrame.SetTee("TEE1", "A992Fy50", 12, 10, 0.6, 0.3)

    'set frame section material property data
    ret = SapModel.PropFrame.SetMaterial("TEE1", "A992Fy50")

    'close ETABS
    EtabsObject.ApplicationExit(False)

    'clean up variables
    SapModel = Nothing
    EtabsObject = Nothing
End Sub
```

CSI API ETABS v1

cPropFrameAddLanguageSpecificTextSet("LSTD67065E7_0?cpp=3074.");SetM

Method

Assigns property modifiers to a frame section property. The default value for all modifiers is one.

Namespace: Â ETABSv1

Assembly: Â ETABSv1 (in ETABSv1.dll) Version: 1.0.0.0 (1.24.0.0)

▲ Syntax

C#

VB

C++

F#

Copy

```
int SetModifiers(
    string Name,
    ref double[] Value
)
```

```
Function SetModifiers (
    Name As String,
    ByRef Value As Double()
) As Integer
```

```
Dim instance As cPropFrame
Dim Name As String
Dim Value As Double()
Dim returnValue As Integer
```

```
returnValue = instance.SetModifiers(Name,
    Value)
```

```
int SetModifiers(
    String^ Name,
    array<double>^% Value
)
```

```
abstract SetModifiers :
    Name : string *
    Value : float[] byref -> int
```

Parameters

Name

Type:Â SystemString

The name of an existing frame section property.

Value

Type:Â SystemDouble

This is an array of eight unitless modifiers:

Value

Modifier

Value(0) Cross sectional area modifier

cPropFramespan id="LSTD67065E7_0"AddLanguageSpecificTextSet("LSTD67065E7_0?cpp=3074.");SetM

Introduction

Value(1) Shear area in local 2 direction modifier
Value(2) Shear area in local 3 direction modifier
Value(3) Torsional constant modifier
Value(4) Moment of inertia about local 2 axis modifier
Value(5) Moment of inertia about local 3 axis modifier
Value(6) Mass modifier
Value(7) Weight modifier

Return Value

Type: Int32

Returns zero if the modifiers are successfully assigned; otherwise it returns a nonzero value.

▲ Remarks

▲ Examples

VB

Copy

```
Public Sub Example()  
    Dim SapModel As cSapModel  
    Dim EtabsObject As cOAPI  
    Dim ret As Integer = -1  
    Dim i As Integer  
    Dim Value() As Double  
  
    'create ETABS object  
    Dim myHelper as cHelper = New Helper  
    EtabsObject = myHelper.CreateObjectProgID("CSI.ETABS.API.ETABSObject")  
  
    'start ETABS application  
    ret = EtabsObject.ApplicationStart()  
  
    'create SapModel object  
    SapModel = EtabsObject.SapModel  
  
    'initialize model  
    ret = SapModel.InitializeNewModel()

Dim instance As cPropFrame
Dim Name As String
Dim NumberItems As Integer
Dim StartSec As String()
Dim EndSec As String()
Dim MyLength As Double()
Dim MyType As Integer()
Dim EI33 As Integer()
Dim EI22 As Integer()
Dim Color As Integer
Dim Notes As String
Dim GUID As String
Dim returnValue As Integer
```

cPropFramespan id="LSTECB48E7D_0"AddLanguageSpecificTextSet("LSTECB48E7D_0?cpp3077u=.");SetNonPrismatic

```
returnValue = instance.SetNonPrismatic(Name,
NumberItems, StartSec, EndSec, MyLength,
MyType, EI33, EI22, Color, Notes, GUID)
```

```
int SetNonPrismatic(
String^ Name,
int NumberItems,
array<String^>^% StartSec,
array<String^>^% EndSec,
array<double>^% MyLength,
array<int>^% MyType,
array<int>^% EI33,
array<int>^% EI22,
int Color = -1,
String^ Notes = L"",
String^ GUID = L""
)
```

```
abstract SetNonPrismatic :
    Name : string *
    NumberItems : int *
    StartSec : string[] byref *
    EndSec : string[] byref *
    MyLength : float[] byref *
    MyType : int[] byref *
    EI33 : int[] byref *
    EI22 : int[] byref *
    ?Color : int *
    ?Notes : string *
    ?GUID : string
(* Defaults:
    let _Color = defaultArg Color -1
    let _Notes = defaultArg Notes ""
    let _GUID = defaultArg GUID ""
*)
-> int
```

Parameters

Name

Type: [SystemString](#)

The name of an existing or new frame section property. If this is an existing property, that property is modified; otherwise, a new property is added.

NumberItems

Type: [SystemInt32](#)

The number of segments assigned to the nonprismatic section.

StartSec

Type: [SystemString](#)

This is an array of the names of the frame section properties at the start of each segment.

Auto select lists and nonprismatic sections are not allowed in this array.

EndSec

Type: [SystemString](#)

This is an array of the names of the frame section properties at the end of each segment.

Auto select lists and nonprismatic sections are not allowed in this array.

MyLength

Type:Â SystemDouble

This is an array that includes the length of each segment. The length may be variable or absolute as indicated by the MyType item. [L] when length is absolute.

MyType

Type:Â SystemInt32

This is an array of either 1 or 2, indicating the length type for each segment:

Value	MyType
1	Variable (relative length)
2	Absolute

EI33

Type:Â SystemInt32

This is an array of 1, 2 or 3, indicating the variation type for EI33 in each segment:

Value	EI33
1	Linear
2	Parabolic
2	Cubic

EI22

Type:Â SystemInt32

This is an array of 1, 2 or 3, indicating the variation type for EI22 in each segment:

Value	EI22
1	Linear
2	Parabolic
2	Cubic

Color (Optional)

Type:Â SystemInt32

Notes (Optional)

Type:Â SystemString

GUID (Optional)

Type:Â SystemString

The GUID (global unique identifier), if any, assigned to the section. If this item is input as Default, the program assigns a GUID to the section.

Return Value

Type:Â Int32

Returns zero if the data is successfully filled; otherwise it returns a nonzero value.

▲Remarks

CSI API ETABS v1

cPropFrameAddLanguageSpecificTextSet("LST1A057E

Method

Initializes a pipe-type frame section property. If this function is called for an existing frame section property, all items for the section are reset to their default value.

Namespace: $\hat{A}$ ETABSV1

Assembly: $\hat{A}$ ETABSV1 (in ETABSV1.dll) Version: 1.0.0.0 (1.24.0.0)

▲ Syntax

C#

VB

C++

F#

Copy

```
int SetPipe(
    string Name,
    string MatProp,
    double T3,
    double TW,
    int Color = -1,
    string Notes = "",
    string GUID = ""
)
```

```
Function SetPipe (
    Name As String,
    MatProp As String,
    T3 As Double,
    TW As Double,
    Optional As Integer = -1,
    Optional As String = "",
    Optional As String = ""
) As Integer
```

```
Dim instance As cPropFrame
Dim Name As String
Dim MatProp As String
Dim T3 As Double
Dim TW As Double
Dim Color As Integer
Dim Notes As String
Dim GUID As String
Dim returnValue As Integer
```

```
returnValue = instance.SetPipe(Name, MatProp,
    T3, TW, Color, Notes, GUID)
```

```
int SetPipe(
    String^ Name,
    String^ MatProp,
    double T3,
    double TW,
    int Color = -1,
    String^ Notes = L"",
```

cPropFramespan id="LST1A057EF5_0"AddLanguageSpecificTextSet("LST1A057EF5_0?cpp=3082.");SetF

```

String^ GUID = L""
)

abstract SetPipe :
    Name : string *
    MatProp : string *
    T3 : float *
    TW : float *
    ?Color : int *
    ?Notes : string *
    ?GUID : string
(* Defaults:
    let _Color = defaultArg Color -1
    let _Notes = defaultArg Notes ""
    let _GUID = defaultArg GUID ""
*)
-> int

```

Parameters

Name

Type:Â SystemString

The name of an existing or new frame section property. If this is an existing property, that property is modified; otherwise, a new property is added.

MatProp

Type:Â SystemString

The name of the material property for the section.

T3

Type:Â SystemDouble

TW

Type:Â SystemDouble

The wall thickness. [L]

Color (Optional)

Type:Â SystemInt32

Notes (Optional)

Type:Â SystemString

GUID (Optional)

Type:Â SystemString

The GUID (global unique identifier), if any, assigned to the section. If this item is input as Default, the program assigns a GUID to the section.

Return Value

Type:Â Int32

Returns zero if the section property is successfully initialized; otherwise it returns a nonzero value.

▲ Remarks

▲ Examples

VB

Copy

```

Public Sub Example()
    Dim SapModel As cSapModel
    Dim EtabsObject As cOAPI

CSI API ETABS v1

cPropFrameAddLanguageSpecificTextSet("LSTCCF527FD_0?cpp308u=.");Se

Method

Assigns beam rebar data to frame sections.

Namespace: ETABSv1

Assembly: ETABSv1 (in ETABSv1.dll) Version: 1.0.0.0 (1.24.0.0)

■ Syntax

C#

VB

C++

F#

Copy

```
int SetRebarBeam(
    string Name,
    string MatPropLong,
    string MatPropConfine,
    double CoverTop,
    double CoverBot,
    double TopLeftArea,
    double TopRightArea,
    double BotLeftArea,
    double BotRightArea
)
```

```
Function SetRebarBeam (
    Name As String,
    MatPropLong As String,
    MatPropConfine As String,
    CoverTop As Double,
    CoverBot As Double,
    TopLeftArea As Double,
    TopRightArea As Double,
    BotLeftArea As Double,
    BotRightArea As Double
) As Integer
```

```
Dim instance As cPropFrame
Dim Name As String
Dim MatPropLong As String
Dim MatPropConfine As String
Dim CoverTop As Double
Dim CoverBot As Double
Dim TopLeftArea As Double
Dim TopRightArea As Double
Dim BotLeftArea As Double
Dim BotRightArea As Double
Dim returnValue As Integer
```

```
returnValue = instance.SetRebarBeam(Name,
    MatPropLong, MatPropConfine, CoverTop,
    CoverBot, TopLeftArea, TopRightArea,
    BotLeftArea, BotRightArea)
```

```

int SetRebarBeam(
String^ Name,
String^ MatPropLong,
String^ MatPropConfine,
double CoverTop,
double CoverBot,
double TopLeftArea,
double TopRightArea,
double BotLeftArea,
double BotRightArea
)

```

```

abstract SetRebarBeam :
    Name : string *
    MatPropLong : string *
    MatPropConfine : string *
    CoverTop : float *
    CoverBot : float *
    TopLeftArea : float *
    TopRightArea : float *
    BotLeftArea : float *
    BotRightArea : float -> int

```

Parameters

Name

Type:Â SystemString

The name of an existing frame section property.

MatPropLong

Type:Â SystemString

The name of the rebar material property for the longitudinal rebar.

MatPropConfine

Type:Â SystemString

The name of the rebar material property for the confinement rebar.

CoverTop

Type:Â SystemDouble

The distance from the top of the beam to the centroid of the top longitudinal reinforcement. [L]

CoverBot

Type:Â SystemDouble

The distance from the bottom of the beam to the centroid of the bottom longitudinal reinforcement. [L]

TopLeftArea

Type:Â SystemDouble

The total area of longitudinal reinforcement at the top left end of the beam. [L2]

TopRightArea

Type:Â SystemDouble

The total area of longitudinal reinforcement at the top right end of the beam. [L2]

BotLeftArea

Type:Â SystemDouble

The total area of longitudinal reinforcement at the bottom left end of the beam. [L2]

BotRightArea

Type: SystemDouble

The total area of longitudinal reinforcement at the bottom right end of the beam. [L2]

Return Value

Type: Int32

Returns zero if the rebar data is successfully assigned; otherwise it returns a nonzero value.

Remarks

This function applies only to the following section types. Calling this function for any other type of frame section property returns an error.

- I
- Angle
- Rectangular
- Circle

The material assigned to the specified frame section property must be concrete or this function returns an error.

Examples

VB

Copy

```
Public Sub Example()
    Dim SapModel As cSapModel
    Dim EtabsObject As cOAPI
    Dim ret As Integer = -1
    Dim RebarName As String

    'create ETABS object
    Dim myHelper as cHelper = New Helper
    EtabsObject = myHelper.CreateObjectProgID("CSI.ETABS.API.ETABSObject")

    'start ETABS application
    ret = EtabsObject.ApplicationStart()

    'create SapModel object
    SapModel = EtabsObject.SapModel

    'initialize model
    ret = SapModel.InitializeNewModel()

    'create steel deck template model
    ret = SapModel.File.NewSteelDeck(4,12,12,4,4,24,24)

    'set new frame section property
    ret = SapModel.PropFrame.SetRectangle("R1", "4000Psi", 20, 12)

    'add ASTM A706 rebar material
    ret = SapModel.PropMaterial.AddQuick(RebarName, eMatType.Rebar, , , , eMatTypeRebar.ASTM)

    'set beam rebar data
    ret = SapModel.PropFrame.SetRebarBeam("R1", RebarName, RebarName, 3.5, 3, 4.1, 4.2, 4.3, 4)

    'close ETABS
    EtabsObject.ApplicationExit(False)
```

```
'clean up variables
  SapModel = Nothing
  EtabsObject = Nothing
End Sub
```

    TieSize : string *
    TieSpacingLongit : float *
    Number2DirTieBars : int *
    Number3DirTieBars : int *
    ToBeDesigned : bool -> int
```

Parameters

Name

Type:Â SystemString

The name of an existing frame section property.

MatPropLongType:Â SystemString

The name of the rebar material property for the longitudinal rebar.

MatPropConfineType:Â SystemString

The name of the rebar material property for the confinement rebar.

PatternType:Â SystemInt32

This is either 1 or 2, indicating the rebar configuration.

Value Pattern

1 Rectangular

2 Circular

For circular frame section properties this item must be 2; otherwise an error is returned.

ConfineTypeType:Â SystemInt32

This is either 1 or 2, indicating the confinement bar type.

Value Type

1 Ties

2 Spiral

This item applies only when Pattern = 2. If Pattern = 1, the confinement bar type is assumed to be ties.

CoverType:Â SystemDouble

The clear cover for the confinement steel (ties). In the special case of circular reinforcement in a rectangular column, this is the minimum clear cover. [L]

NumberCBarsType:Â SystemInt32

This item applies to a circular rebar configuration, Pattern = 2. It is the total number of longitudinal reinforcing bars in the column.

NumberR3BarsType:Â SystemInt32

This item applies to a rectangular rebar configuration, Pattern = 1. It is the number of longitudinal bars (including the corner bar) on each face of the column that is parallel to the local 3-axis of the column.

NumberR2BarsType:Â SystemInt32

This item applies to a rectangular rebar configuration, Pattern = 1. It is the number of longitudinal bars (including the corner bar) on each face of the column that is parallel to the local 2-axis of the column.

RebarSizeType:Â SystemString

The rebar name for the longitudinal rebar in the column.

TieSizeType:Â SystemString

The rebar name for the confinement rebar in the column.

TieSpacingLongitType:Â SystemDouble

The longitudinal spacing of the confinement bars (ties). [L]

Number2DirTieBarsType: SystemInt32

This item applies to a rectangular reinforcing configuration, Pattern = 1. It is the number of confinement bars (tie legs) running in the local 2-axis direction of the column.

Number3DirTieBarsType: SystemInt32

This item applies to a rectangular reinforcing configuration, Pattern = 1. It is the number of confinement bars (tie legs) running in the local 3-axis direction of the column.

ToBeDesignedType: SystemBoolean

If this item is True, the column longitudinal rebar is to be designed; otherwise it is to be checked.

Return ValueType: Int32

Returns zero if the rebar data is successfully assigned; otherwise it returns a nonzero value.

Remarks

This function applies only to the following section types. Calling this function for any other type of frame section property returns an error.

- Rectangular
- Circle

The material assigned to the specified frame section property must be concrete or this function returns an error.

Examples

VB

Copy

```
Public Sub Example()
    Dim SapModel As cSapModel
    Dim EtabsObject As cOAPI
    Dim ret As Integer = -1
    Dim RebarName As String

    'create ETABS object
    Dim myHelper as cHelper = New Helper
    EtabsObject = myHelper.CreateObjectProgID("CSI.ETABS.API.ETABSObject")

    'start ETABS application
    ret = EtabsObject.ApplicationStart()

    'create SapModel object
    SapModel = EtabsObject.SapModel

    'initialize model
    ret = SapModel.InitializeNewModel()

    'create steel deck template model
    ret = SapModel.File.NewSteelDeck(4,12,12,4,4,24,24)
```

Introduction

```
'set new frame section property
    ret = SapModel.PropFrame.SetRectangle("R1", "4000Psi", 20, 12)

'add ASTM A706 rebar material
    ret = SapModel.PropMaterial.AddQuick(RebarName, eMatType.Rebar, , , , eMatTypeRebar.ASTM

'set column rebar data
    ret = SapModel.PropFrame.SetRebarColumn("R1", RebarName, RebarName, 2, 2, 2, 10, 0, 0, "#1

'close ETABS
    EtabsObject.ApplicationExit(False)

'clean up variables
    SapModel = Nothing
    EtabsObject = Nothing
End Sub
```

CSI API ETABS v1

cPropFrameAddLanguageSpecificTextSet("LST4209B9A5_0?cpp=3007.")

Method

Initializes a solid rectangular frame section property. If this function is called for an existing frame section property, all items for the section are reset to their default value.

Namespace: ETABSv1

Assembly: ETABSv1 (in ETABSv1.dll) Version: 1.0.0.0 (1.24.0.0)

Syntax

C#

VB

C++

F#

Copy

```
int SetRectangle(
    string Name,
    string MatProp,
    double T3,
    double T2,
    int Color = -1,
    string Notes = "",
    string GUID = ""
)
```

```
Function SetRectangle (
    Name As String,
    MatProp As String,
    T3 As Double,
    T2 As Double,
    Optional As Integer = -1,
    Optional Notes As String = "",
    Optional GUID As String = ""
) As Integer
```

```
Dim instance As cPropFrame
Dim Name As String
Dim MatProp As String
Dim T3 As Double
Dim T2 As Double
Dim Color As Integer
Dim Notes As String
Dim GUID As String
Dim returnValue As Integer
```

```
returnValue = instance.SetRectangle(Name,
    MatProp, T3, T2, Color, Notes, GUID)
```

```
int SetRectangle(
    String^ Name,
    String^ MatProp,
    double T3,
    double T2,
    int Color = -1,
```

cPropFramespan id="LST4209B9A5_0"AddLanguageSpecificTextSet("LST4209B9A5_0?cpp=3007.");SetF

```

String^ Notes = L"",
String^ GUID = L""
)

abstract SetRectangle :
    Name : string *
    MatProp : string *
    T3 : float *
    T2 : float *
    ?Color : int *
    ?Notes : string *
    ?GUID : string
(* Defaults:
    let _Color = defaultArg Color -1
    let _Notes = defaultArg Notes ""
    let _GUID = defaultArg GUID ""
*)
-> int

```

Parameters

Name

Type:Â SystemString

The name of an existing or new frame section property. If this is an existing property, that property is modified; otherwise, a new property is added.

MatProp

Type:Â SystemString

The name of the material property for the section.

T3

Type:Â SystemDouble

T2

Type:Â SystemDouble

Color (Optional)

Type:Â SystemInt32

Notes (Optional)

Type:Â SystemString

GUID (Optional)

Type:Â SystemString

The GUID (global unique identifier), if any, assigned to the section. If this item is input as Default, the program assigns a GUID to the section.

Return Value

Type:Â Int32

Returns zero if the section property is successfully initialized; otherwise it returns a nonzero value.

CSI API ETABS v1

cPropFrameAddLanguageSpecificTextSet("LST9E56D40_0") Method

initializes a solid rod frame section property. If this function is called for an existing frame section property, all items for the section are reset to their default value.

Namespace: ETABSV1

Assembly: ETABSV1 (in ETABSV1.dll) Version: 1.0.0.0 (1.24.0.0)

Syntax

C#

VB

C++

F#

Copy

```
int SetRod(
    string Name,
    string MatProp,
    double T3,
    int Color = -1,
    string Notes = "",
    string GUID = ""
)
```

```
Function SetRod (
    Name As String,
    MatProp As String,
    T3 As Double,
    Optional Color As Integer = -1,
    Optional Notes As String = "",
    Optional GUID As String = ""
) As Integer
```

```
Dim instance As cPropFrame
Dim Name As String
Dim MatProp As String
Dim T3 As Double
Dim Color As Integer
Dim Notes As String
Dim GUID As String
Dim returnValue As Integer
```

```
returnValue = instance.SetRod(Name, MatProp,
    T3, Color, Notes, GUID)
```

```
int SetRod(
    String^ Name,
    String^ MatProp,
    double T3,
    int Color = -1,
    String^ Notes = L"",
    String^ GUID = L""
)
```

abstract SetRod :

cPropFrameAddLanguageSpecificTextSet("LST9E56D40_0?cpp=::|n=100");SetRod

```

    Name : string *
    MatProp : string *
    T3 : float *
    ?Color : int *
    ?Notes : string *
    ?GUID : string
(* Defaults:
    let _Color = defaultArg Color -1
    let _Notes = defaultArg Notes ""
    let _GUID = defaultArg GUID ""
*)
-> int

```

Parameters

Name

Type:Â SystemString

The name of an existing or new frame section property. If this is an existing property, that property is modified; otherwise, a new property is added.

MatProp

Type:Â SystemString

The name of the material property for the section.

T3

Type:Â SystemDouble

Color (Optional)

Type:Â SystemInt32

Notes (Optional)

Type:Â SystemString

GUID (Optional)

Type:Â SystemString

The GUID (global unique identifier), if any, assigned to the section. If this item is input as Default, the program assigns a GUID to the section.

Return Value

Type:Â Int32

Returns zero if the section property is successfully initialized; otherwise it returns a nonzero value.

▲ Remarks

▲ Examples

VB

Copy

```

Public Sub Example()
    Dim SapModel As cSapModel
    Dim EtabsObject As cOAPI
    Dim ret As Integer = -1

    'create ETABS object
    Dim myHelper as cHelper = New Helper
    EtabsObject = myHelper.CreateObjectProgID("CSI.ETABS.API.ETABSObject")

    'start ETABS application
    ret = EtabsObject.ApplicationStart()

    'create SapModel object
    SapModel = EtabsObject.SapModel

```

Introduction

```
'initialize model
    ret = SapModel.InitializeNewModel()

'create steel deck template model
    ret = SapModel.File.NewSteelDeck(4,12,12,4,4,24,24)

'set new frame section property
    ret = SapModel.PropFrame.SetRod("R1", "A992Fy50", 20)

'close ETABS
    EtabsObject.ApplicationExit(False)

'clean up variables
    SapModel = Nothing
    EtabsObject = Nothing
End Sub
```

    ?GUID : string
(* Defaults:
    let _Color = defaultArg Color -1
    let _Notes = defaultArg Notes ""
    let _GUID = defaultArg GUID ""
*)
-> int
```

Parameters

Name

Type:Â SystemString

The name of an existing or new frame section property. If this is an existing property, that property is modified; otherwise, a new property is added.

MatProp

Type:Â SystemString

The name of the material property for the section.

T3

Type:Â SystemDouble

T2

Type:Â SystemDouble

Tf

Tw Type:Â SystemDouble

r Type:Â SystemDouble

Type:Â SystemDouble
The fillet radius. [L]

MirrorAbout2
Type:Â SystemBoolean
Indicates whether the section is mirrored about the local 2-axis.

MirrorAbout3
Type:Â SystemBoolean
Indicates whether the section is mirrored about the local 3-axis.

Color (Optional)
Type:Â SystemInt32

Notes (Optional)
Type:Â SystemString

GUID (Optional)
Type:Â SystemString
The GUID (global unique identifier), if any, assigned to the section. If this item is input as Default, then the program assigns a GUID to the section.

Return Value

Type:Â Int32
returns zero if the section property is successfully initialized; otherwise it returns a nonzero value.

Remarks

This function supersedes SetAngle(String, String, Double, Double, Double, Double, Int32, String, String).

Examples

VB

Copy

```
Public Sub Example()
    Dim SapModel As cSapModel
    Dim EtabsObject As cOAPI
    Dim ret As Integer = -1

    'create ETABS object
    Dim myHelper as cHelper = New Helper
    EtabsObject = myHelper.CreateObjectProgID("CSI.ETABS.API.ETABSObject")

    'start ETABS application
    ret = EtabsObject.ApplicationStart()

    'create SapModel object
    SapModel = EtabsObject.SapModel

    'initialize model
    ret = SapModel.InitializeNewModel()

    'create steel deck template model
    ret = SapModel.File.NewSteelDeck(4,12,12,4,4,24,24)

    'set new frame section property
    ret = SapModel.PropFrame.SetSteelAngle("ANGLE1", "A992Fy50", 6, 4, 0.5, 0.5, 0.5, False, F
```

```
'close ETABS
  EtabsObject.ApplicationExit(False)

'clean up variables
  SapModel = Nothing
  EtabsObject = Nothing
End Sub
```

    ?Color : int *
    ?Notes : string *
    ?GUID : string
(* Defaults:
    let _Color = defaultArg Color -1
    let _Notes = defaultArg Notes ""
    let _GUID = defaultArg GUID ""
*)
-> int

```

Parameters

Name

Type:Â SystemString

The name of an existing or new frame section property. If this is an existing property, that property is modified; otherwise, a new property is added.

MatProp

Type:Â SystemString

The name of the material property for the section.

T3

Type:Â SystemDouble

T2

Type:Â SystemDouble

Tf

Type:Â SystemDouble

Tw

Type:Â SystemDouble

Color (Optional)

Type:Â SystemInt32

Notes (Optional)

Type:Â SystemString

GUID (Optional)

Type:Â SystemString

The GUID (global unique identifier), if any, assigned to the section. If this item is input as Default, the program assigns a GUID to the section.

Return Value

Type: Int32

Returns zero if the section property is successfully initialized; otherwise it returns a nonzero value.

▲ **Remarks**

▲ **Examples**

VB

Copy

```
Public Sub Example()
    Dim SapModel As cSapModel
    Dim EtabsObject As cOAPI
    Dim ret As Integer = -1
    Dim FileName As String
    Dim MatProp As String
    Dim t3 As Double
    Dim t2 As Double
    Dim tf As Double
    Dim tw As Double
    Dim Color As Integer
    Dim Notes As String
    Dim GUID As String

    'create ETABS object
    Dim myHelper as cHelper = New Helper
    EtabsObject = myHelper.CreateObjectProgID("CSI.ETABS.API.ETABSObject")

    'start ETABS application
    ret = EtabsObject.ApplicationStart()

    'create SapModel object
    SapModel = EtabsObject.SapModel

    'initialize model
    ret = SapModel.InitializeNewModel()

    'create steel deck template model
    ret = SapModel.File.NewSteelDeck(4,12,12,4,4,24,24)

    'set new frame section property
    ret = SapModel.PropFrame.SetTube("TUBE1", "A992Fy50", 8, 6, 0.5, 0.5)

    'get frame section property data
    ret = SapModel.PropFrame.GetTube("TUBE1", FileName, MatProp, t3, t2, tf, tw, Color, Notes)

    'close ETABS
    EtabsObject.ApplicationExit(False)

    'clean up variables
    SapModel = Nothing
    EtabsObject = Nothing
End Sub
```

cPropFrameSDShape Interface

Namespace: $\hat{A}$ ETABSV1

Assembly: $\hat{A}$ ETABSV1 (in ETABSV1.dll) Version: 1.0.0.0 (1.24.0.0)

▲ Syntax

C#

VB

C++

F#

Copy

```
public interface cPropFrameSDShape
```

```
Public Interface cPropFrameSDShape
```

```
Dim instance As cPropFrameSDShape
```

```
public interface class cPropFrameSDShape
```

```
type cPropFrameSDShape = interface end
```

The cPropFrameSDShape type exposes the following members.

▲ Methods

$\hat{A}$	Name	Description
	<u>GetAngle</u>	Retrieves property data for an Angle shape in a section designer section
	<u>GetConcreteL</u>	Retrieves property data for a concrete L shape in a section designer section
	<u>GetConcreteTee</u>	Retrieves property data for a concrete tee shape in a section designer section
	<u>GetISection</u>	Retrieves property data for an I-section shape in a section designer section
	<u>GetReinfCircle</u>	Retrieves property data for a circular reinforcing shape in a section designer section
	<u>GetReinfCorner</u>	Retrieves corner point reinforcing data for solid rectangle, circle and polygon shapes in a section designer property
	<u>GetReinfEdge</u>	Retrieves edge reinforcing data for solid rectangle, circle, polygon, and rectangular reinforcing shapes in a section designer property
	<u>GetReinfLine</u>	Retrieves property data for a line reinforcing shape in a section designer section
	<u>GetReinfRectangular</u>	Retrieves property data for a rectangular reinforcing shape in a section designer section
	<u>GetReinfSingle</u>	Retrieves property data for a single bar reinforcing shape in a section designer section

- [GetSolidCircle](#) Retrieves property data for a solid circle shape in a section designer section
- [GetSolidRect](#) Retrieves property data for a solid rectangular shape in a section designer section
- [GetTee](#) Retrieves property data for a Tee shape in a section designer section

    H : float byref *
    Bf : float byref *
    Tf : float byref *
    Tw : float byref *
    Rotation : float byref -> int
```

Parameters

Name

Type:Â SystemString

The name of an existing frame section property that is a section designer section

ShapeName

Type:Â SystemString

The name of an existing Angle shape in the specified frame section property

MatProp

Type:Â SystemString

The name of the material property for the shape

PropName

Type:Â SystemString

This is a blank string or the name of a defined Angle property that has been imported from a section property file. If it is the name of a defined Angle property, the section dimensions are taken from that property

Color

Type:Â SystemInt32

The fill color assigned to the shape

XCenter

Type: SystemDouble

The X-coordinate of the center of the shape in the section designer coordinate system. [L]

YCenter

Type: SystemDouble

The Y-coordinate of the center of the shape in the section designer coordinate system. [L]

H

Type: SystemDouble

The section depth. [L]

Bf

Type: SystemDouble

The flange width. [L]

Tf

Type: SystemDouble

The flange thickness. [L]

Tw

Type: SystemDouble

The web thickness. [L]

Rotation

Type: SystemDouble

The counter clockwise rotation of the shape from its default orientation. [deg]

Return Value

Type: Int32

Returns zero if the property data is successfully retrieved; otherwise it returns a nonzero value

    Bf : float byref *
    Tf : float byref *
    Tw : float byref *
    Rotation : float byref *
    MirrorAbout3 : bool byref -> int
```

Parameters

Name

Type:Â SystemString

The name of an existing frame section property that is a section designer section

ShapeName

Type:Â SystemString

The name of an existing concrete tee shape in the specified frame section property

MatProp

Type:Â SystemString

The name of the material property for the shape

PropName

Type: SystemString

This is a blank string or the name of a defined concrete tee property that has been imported from a section property file. If it is the name of a defined concrete tee property, the section dimensions are taken from that property.

Color

Type: SystemInt32

The fill color assigned to the shape

XCenter

Type: SystemDouble

The X-coordinate of the center of the shape in the section designer coordinate system. [L]

YCenter

Type: SystemDouble

The Y-coordinate of the center of the shape in the section designer coordinate system. [L]

H

Type: SystemDouble

The section depth. [L]

Bf

Type: SystemDouble

The section width. [L]

Tf

Type: SystemDouble

The flange thickness. [L]

Tw

Type: SystemDouble

The web thickness. [L]

Rotation

Type: SystemDouble

The counter clockwise rotation of the shape from its default orientation. [deg]

MirrorAbout3

Type: SystemBoolean

Indicates whether the section is mirrored about the local 3-axis.

Return Value

Type: Int32

Returns zero if the property data is successfully retrieved; otherwise it returns a nonzero value

)

abstract GetReinfCircle :
    Name : string *
    ShapeName : string *
    XCenter : float byref *
    YCenter : float byref *
    Diameter : float byref *
    NumBars : int byref *
    Rotation : float byref *
    RebarSize : string byref *
    MatRebar : string byref -> int

```

Parameters

Name

Type:Â SystemString

The name of an existing frame section property that is a section designer section

ShapeName

Type:Â SystemString

The name of a circular reinforcing shape in the section designer section

XCenter

Type:Â SystemDouble

The X-coordinate of the center of the shape in the section designer coordinate system. [L]

YCenter

Type:Â SystemDouble

The Y-coordinate of the center of the shape in the section designer coordinate system. [L]

Diameter

Type:Â SystemDouble

The diameter of the circular shape. [L]

NumBars

Type:Â SystemInt32

The number of equally spaced bars for the circular reinforcing

Rotation

Type:Â SystemDouble

The counter clockwise rotation of the shape from its default orientation. [deg]

RebarSize

Type:Â SystemString

The size of the reinforcing bar

MatRebar

Type:Â SystemString

The material property for the reinforcing steel

Return Value

Type: Int32

Returns zero if the property data is successfully retrieved; otherwise it returns a nonzero value

```
PointNum : int[] byref *  
RebarSize : string[] byref -> int
```

Parameters

Name

Type: SystemString

The name of an existing frame section property that is a section designer section

ShapeName

Type: SystemString

The name of an existing solid rectangle shape in the specified frame section property

NumberItems

Type: SystemInt32

The number of edges in the shape

PointNum

Type: SystemInt32

This is an array that includes the corner point number in the shape

RebarSize

Type: SystemString

This is an array that includes None or the name of a defined rebar, indicating the rebar assignment to the considered corner point

Return Value

Type: Int32

Returns zero if the property data is successfully retrieved; otherwise it returns a nonzero value

    RebarSize : string[] byref *
    Spacing : float[] byref *
    Cover : float[] byref -> int
```

Parameters

Name

Type:Â SystemString

The name of an existing frame section property that is a section designer section

ShapeName

Type:Â SystemString

The name of an existing solid rectangle shape in the specified frame section property

NumberItems

Type:Â SystemInt32

The number of edges in the shape

EdgeNum

Type:Â SystemInt32

This is an array that includes the edge number in the shape

RebarSize

Type:Â SystemString

This is an array that includes None or the name of a defined rebar, indicating the rebar assignment to the considered edge

Spacing

Type:Â SystemDouble

This is an array that includes the rebar maximum center-to-center along the considered edge. [L]

Cover

Type:Â SystemDouble

This is an array that includes the rebar clear cover along the considered edge. [L]

Return Value

Type:Â Int32

Returns zero if the property data is successfully retrieved; otherwise it returns a nonzero value

    Y2 : float byref *
    Spacing : float byref *
    RebarSize : string byref *
    EndBars : bool byref *
    MatRebar : string byref -> int
```

Parameters

Name

Type:Â SystemString

The name of an existing frame section property that is a section designer section

ShapeName

Type:Â SystemString

The name of a line reinforcing shape in the section designer section

X1

Type:Â SystemDouble

The section designer X coordinate of the first drawn end point of the line reinforcing. [L]

Y1

Type:Â SystemDouble

The section designer Y coordinate of the first drawn end point of the line reinforcing. [L]

X2

Type:Â SystemDouble

The section designer X coordinate of the second drawn end point of the line reinforcing. [L]

Y2

Type:Â SystemDouble

The section designer Y coordinate of the second drawn end point of the line reinforcing. [L]

Spacing

Type:Â SystemDouble

The center-to-center spacing of the bars in the line pattern shape. [L]

RebarSize

Type: SystemString

The size of the reinforcing bars used in the line reinforcing shape

EndBars

Type: SystemBoolean

This item is True when there are bars at the end points of the line reinforcing

MatRebar

Type: SystemString

The material property for the reinforcing steel

Return Value

Type: Int32

Returns zero if the property data is successfully retrieved; otherwise it returns a nonzero value

    Rotation : float byref *
    MatRebar : string byref -> int
```

Parameters

Name

Type:Â SystemString

The name of an existing frame section property that is a section designer section

ShapeName

Type:Â SystemString

The name of a rectangular reinforcing shape in the section designer section

XCenter

Type:Â SystemDouble

The X-coordinate of the center of the shape in the section designer coordinate system. [L]

YCenter

Type:Â SystemDouble

The Y-coordinate of the center of the shape in the section designer coordinate system. [L]

H

Type:Â SystemDouble

The section depth. [L]

W

Type:Â SystemDouble

The top flange width. [L]

Rotation

Type:Â SystemDouble

The counter clockwise rotation of the shape from its default orientation. [deg

MatRebar

Type:Â SystemString

The material property for the reinforcing steel

Return Value

Type:Â Int32

Returns zero if the property data is successfully retrieved; otherwise it returns a nonzero value

bool% Reinf,
int% NumberBars,
double% Rotation,
double% Cover,
String^% RebarSize,
String^% MatRebar
)

```

```

abstract GetSolidCircle :
    Name : string *
    ShapeName : string *
    MatProp : string byref *
    SSOverwrite : string byref *
    Color : int byref *
    XCenter : float byref *
    YCenter : float byref *
    Diameter : float byref *
    Reinf : bool byref *
    NumberBars : int byref *
    Rotation : float byref *
    Cover : float byref *
    RebarSize : string byref *
    MatRebar : string byref -> int

```

Parameters

Name

Type:Â SystemString

The name of an existing frame section property that is a section designer section

ShapeName

Type:Â SystemString

The name of an existing solid circle shape in the specified frame section property

MatProp

Type:Â SystemString

The name of the material property for the shape

SSOverwrite

Type:Â SystemString

This is a blank string, Default, or the name of a defined stress-strain curve.

If this item is a blank string or Default, the shape stress-strain curve is based on the assigned material property.

Color

Type:Â SystemInt32

The fill color assigned to the shape

XCenter

Type:Â SystemDouble

The X-coordinate of the center of the shape in the section designer coordinate system. [L]

YCenter

Type:Â SystemDouble

The Y-coordinate of the center of the shape in the section designer coordinate system. [L]

Diameter

Type:Â SystemDouble

The diameter of the circle.[L]

Reinf

Type:Â SystemBoolean

This item is True when there is edge and corner reinforcing steel associated with the shape. The MatProp item must refer to a concrete material for this item to be True.

NumberBars

Type:Â SystemInt32

This item is visible only if the Reinf item is set to True. It is the number of equally spaced bars for the circular reinforcing.

Rotation

Type:Â SystemDouble

The counter clockwise rotation of the shape from its default orientation. [deg]

Cover

Type:Â SystemDouble

This item is visible only if the Reinf item is set to True. It is the clear cover for the specified rebar

RebarSize

Type:Â SystemString

This item is visible only if the Reinf item is set to True. It is the size of the reinforcing bar.

MatRebar

Type:Â SystemString

The material property for the edge and corner reinforcing steel associated with the shape. This item applies only when the MatProp item is a concrete material and the Reinf item is True.

Return Value

Type: Int32

Returns zero if the property data is successfully retrieved; otherwise it returns a nonzero value

The X-coordinate of the center of the shape in the section designer coordinate system. [L]

YCenter

Type: SystemDouble

The Y-coordinate of the center of the shape in the section designer coordinate system. [L]

H

Type: SystemDouble

The section depth. [L]

W

Type: SystemDouble

The section width. [L]

Rotation

Type: SystemDouble

The counter clockwise rotation of the shape from its default orientation. [deg]

Reinf

Type: SystemBoolean

This item is True when there is edge and corner reinforcing steel associated with the shape. The MatProp item must refer to a concrete material for this item to be True.

MatRebar

Type: SystemString

The material property for the edge and corner reinforcing steel associated with the shape. This item applies only when the MatProp item is a concrete material and the Reinf item is True.

Return Value

Type: Int32

Returns zero if the property data is successfully retrieved; otherwise it returns a nonzero value

CSI API ETABS v1

cPropFrameSDShapeAddLanguageSpecificTextSet("LSTCD87C83D_0") Method

Retrieves property data for a Tee shape in a section designer section

Namespace: ETABSv1

Assembly: ETABSv1 (in ETABSv1.dll) Version: 1.0.0.0 (1.24.0.0)

■ Syntax

C#

VB

C++

F#

Copy

```
int GetTee(
    string Name,
    string ShapeName,
    ref string MatProp,
    ref string PropName,
    ref int Color,
    ref double XCenter,
    ref double YCenter,
    ref double H,
    ref double Bf,
    ref double Tf,
    ref double Tw,
    ref double Rotation
)
```

```
Function GetTee (
    Name As String,
    ShapeName As String,
    ByRef MatProp As String,
    ByRef PropName As String,
    ByRef Color As Integer,
    ByRef XCenter As Double,
    ByRef YCenter As Double,
    ByRef H As Double,
    ByRef Bf As Double,
    ByRef Tf As Double,
    ByRef Tw As Double,
    ByRef Rotation As Double
) As Integer
```

```
Dim instance As cPropFrameSDShape
Dim Name As String
Dim ShapeName As String
Dim MatProp As String
Dim PropName As String
Dim Color As Integer
Dim XCenter As Double
Dim YCenter As Double
Dim H As Double
Dim Bf As Double
Dim Tf As Double
```

cPropFrameSDShapeAddLanguageSpecificTextSet("LSTCD87C83D_0")[?cpp=:::3D60](#)

Introduction

```
Dim Tw As Double
Dim Rotation As Double
Dim returnValue As Integer

returnValue = instance.GetTee(Name, ShapeName,
MatProp, PropName, Color, XCenter,
YCenter, H, Bf, Tf, Tw, Rotation)

int GetTee(
String^ Name,
String^ ShapeName,
String^% MatProp,
String^% PropName,
int% Color,
double% XCenter,
double% YCenter,
double% H,
double% Bf,
double% Tf,
double% Tw,
double% Rotation
)

abstract GetTee :
    Name : string *
    ShapeName : string *
    MatProp : string byref *
    PropName : string byref *
    Color : int byref *
    XCenter : float byref *
    YCenter : float byref *
    H : float byref *
    Bf : float byref *
    Tf : float byref *
    Tw : float byref *
    Rotation : float byref -> int
```

Parameters

Name

Type: SystemString

The name of an existing frame section property that is a section designer section

ShapeName

Type: SystemString

The name of an existing Tee shape in the specified frame section property

MatProp

Type: SystemString

The name of the material property for the shape

PropName

Type: SystemString

This is a blank string or the name of a defined Tee property that has been imported from a section property file. If it is the name of a defined Tee property, the section dimensions are taken from that property.

Color

Type: SystemInt32

The fill color assigned to the shape

XCenter

Type: SystemDouble

The X-coordinate of the center of the shape in the section designer coordinate system. [L]

YCenter

Type: SystemDouble

The Y-coordinate of the center of the shape in the section designer coordinate system. [L]

H

Type: SystemDouble

The section depth. [L]

Bf

Type: SystemDouble

The section width. [L]

Tf

Type: SystemDouble

The flange thickness. [L]

Tw

Type: SystemDouble

The web thickness. [L]

Rotation

Type: SystemDouble

The counter clockwise rotation of the shape from its default orientation. [deg]

Return Value

Type: Int32

Returns zero if the property data is successfully retrieved; otherwise it returns a nonzero value

CSI API ETABS v1

cPropLineSpringAddLanguageSpecificTextSet("LST3D Method

Changes the name of a defined line spring property

Namespace: ETABSV1

Assembly: ETABSV1 (in ETABSV1.dll) Version: 1.0.0.0 (1.24.0.0)

Syntax

C#

VB

C++

F#

Copy

```
int ChangeName(
    string Name,
    string NewName
)
```

```
Function ChangeName (
    Name As String,
    NewName As String
) As Integer
```

```
Dim instance As cPropLineSpring
Dim Name As String
Dim NewName As String
Dim returnValue As Integer
```

```
returnValue = instance.ChangeName(Name,
    NewName)
```

```
int ChangeName(
    String^ Name,
    String^ NewName
)
```

```
abstract ChangeName :
    Name : string *
    NewName : string -> int
```

Parameters

Name

Type: SystemString

The existing name of a defined line spring property

NewName

Type: SystemString

The new name for the line spring property

Return Value

Type: Int32

Returns zero if the new name is successfully applied, otherwise it returns a nonzero value.

▀ **Remarks**

▀ **Examples**

VB

Copy

```
Public Sub Example()
    Dim SapModel As cSapModel
    Dim EtabsObject As cOAPI
    Dim ret As Integer = -1

    'create ETABS object
    Dim myHelper as cHelper = New Helper
    EtabsObject = myHelper.CreateObjectProgID("CSI.ETABS.API.ETABSObject")

    'start ETABS application
    ret = EtabsObject.ApplicationStart()

    'create SapModel object
    SapModel = EtabsObject.SapModel

    'initialize model
    ret = SapModel.InitializeNewModel()

    'create steel deck template model
    ret = SapModel.File.NewSteelDeck(4, 12, 12, 4, 4, 24, 24)

    'define new spring property
    ret = SapModel.PropLineSpring.SetLineSpringProp("mySpringProp1", 0, 10, 20, 0, 0, 1)

    'change property name
    ret = SapModel.PropLineSpring.ChangeName("mySpringProp1", "prop1")

    'close ETABS
    EtabsObject.ApplicationExit(False)

    'clean up variables
    SapModel = Nothing
    EtabsObject = Nothing

End Sub
```

    U2 : float byref *
    U3 : float byref *
    R1 : float byref *
    NonlinearOption2 : int byref *
    NonlinearOption3 : int byref *
    color : int byref *
    notes : string byref *
    iGUID : string byref -> int
```

Parameters

Name

Type: SystemString

The name of the line spring property.

U1

Type: SystemDouble

The spring stiffness per unit length in the local 1 direction [F/L2]

U2

Type: SystemDouble

The spring stiffness per unit length in the local 2 direction [F/L2]

U3

Type: SystemDouble

The spring stiffness per unit length in the local 3 direction [F/L2]

R1

Type: SystemDouble

The rotational spring stiffness about local 1 [F/rad]

NonlinearOption2

Type: SystemInt32

The nonlinear option for the local 2 direction, this is one of the following values:

◊ 0 = (None) Linear - Resists Tension and Compression

◊ 1 = Resists Compression only

◊ 2 = Resists Tension only

NonlinearOption3

Type: SystemInt32

The nonlinear option for the local 3 direction, this is one of the following values:

◊ 0 = (None) Linear - Resists Tension and Compression

◊ 1 = Resists Compression only

◇ 2 = Resists Tension only

color

Type:Â SystemInt32

The display color for the property specified as an integer

notes

Type:Â SystemString

The notes, if any, assigned to the property

iGUID

Type:Â SystemString

The GUID (global unique identifier), if any, assigned to the property

Return Value

Type:Â Int32

Returns zero if the property is successfully set, otherwise returns nonzero

▲ Remarks

▲ Examples

VB

Copy

```

CSI API ETABS v1

cPropLineSpringAddLanguageSpecificTextSet("LST33 Method

Retrieves the names of all defined line spring property

Namespace: ETABSV1

Assembly: ETABSV1 (in ETABSV1.dll) Version: 1.0.0.0 (1.24.0.0)

Syntax

C#

VB

C++

F#

Copy

```
int GetNameList(
    ref int NumberNames,
    ref string[] MyName
)
```

```
Function GetNameList (
    ByRef NumberNames As Integer,
    ByRef MyName As String()
) As Integer
```

```
Dim instance As cPropLineSpring
Dim NumberNames As Integer
Dim MyName As String()
Dim returnValue As Integer
```

```
returnValue = instance.GetNameList(NumberNames,
    MyName)
```

```
int GetNameList(
    int% NumberNames,
    array<String^>^% MyName
)
```

```
abstract GetNameList :
    NumberNames : int byref *
    MyName : string[] byref -> int
```

Parameters

NumberNames

Type: System.Int32

The number of line spring property defined in the program

MyName

Type: System.String

This is a one-dimensional array of line spring property names. The MyName array is created as a dynamic, zero-based, array by the API user:

```
Dim MyName() as String
```

The array is dimensioned to (NumberNames + 1) inside the program, filled with the names, and returned to the API user.

Return Value

Type: Int32

Returns zero if the names are successfully retrieved, otherwise it returns nonzero.

▲ Remarks

▲ Examples

VB

Copy

```
Public Sub Example()
    Dim SapModel As cSapModel
    Dim EtabsObject As cOAPI
    Dim ret As Integer = -1

    'create ETABS object
    Dim myHelper as cHelper = New Helper
    EtabsObject = myHelper.CreateObjectProgID("CSI.ETABS.API.ETABSObject")

    'start ETABS application
    ret = EtabsObject.ApplicationStart()

    'create SapModel object
    SapModel = EtabsObject.SapModel

    'initialize model
    ret = SapModel.InitializeNewModel()

    'create steel deck template model
    ret = SapModel.File.NewSteelDeck(4, 12, 12, 4, 4, 24, 24)

    'define new spring property
    ret = SapModel.PropLineSpring.SetLineSpringProp("mySpringProp1", 0, 10, 20, 0, 0, 1)

    'get name list of properties
    Dim NumberNames as Integer
    Dim MyName() as String
    ret = SapModel.PropLineSpring.GetNameList(NumberNames, MyName)

    'close ETABS
    EtabsObject.ApplicationExit(False)

    'clean up variables
    SapModel = Nothing
    EtabsObject = Nothing

End Sub
```

    let _color = defaultArg color 0  
    let _notes = defaultArg notes ""  
    let _iGUID = defaultArg iGUID ""  
*)  
-> int
```

Parameters

Name

Type:Â SystemString

The name of the line spring property. If this is an existing property, that property is modified; otherwise, a new property is added.

U1

Type:Â SystemDouble

The spring stiffness per unit length in the local 1 direction [F/L2]

U2

Type:Â SystemDouble

The spring stiffness per unit length in the local 2 direction [F/L2]

U3

Type:Â SystemDouble

The spring stiffness per unit length in the local 3 direction [F/L2]

R1

Type:Â SystemDouble

The rotational spring stiffness about local 1 [F/rad]

NonlinearOption2

Type:Â SystemInt32

The nonlinear option for the local 2 direction, this is one of the following values:
◊ 0 = (None) Linear - Resists Tension and Compression

◇ 1 = Resists Compression only

◇ 2 = Resists Tension only

NonlinearOption3

Type:Â SystemInt32

The nonlinear option for the local 3 direction, this is one of the following values:

◇ 0 = (None) Linear - Resists Tension and Compression

◇ 1 = Resists Compression only

◇ 2 = Resists Tension only

color (Optional)

Type:Â SystemInt32

The display color for the property specified as an integer

notes (Optional)

Type:Â SystemString

The notes, if any, assigned to the property

iGUID (Optional)

Type:Â SystemString

The GUID (global unique identifier), if any, assigned to the property

Return Value

Type:Â Int32

Returns zero if the property is successfully set, otherwise returns nonzero

The cPropLink type exposes the following members.

▲ Methods

<u>Ä</u>	Name	Description
⇒	<u>ChangeName</u>	Changes the name of an existing link property.
⇒	<u>Count</u>	Returns the total number of defined link properties in the model. If desired, counts can be returned for all link properties of a specified type in the model.
⇒	<u>Delete</u>	Deletes a specified link property.
⇒	<u>GetAcceptanceCriteria</u>	Retrieves the acceptance criteria data for a link property
⇒	<u>GetDamper</u>	retrieves link property data for a damper-type link property.
⇒	<u>GetDamperBilinear</u>	
⇒	<u>GetDamperFrictionSpring</u>	
⇒	<u>GetFrictionIsolator</u>	Retrieves link property data for a friction isolator-type link property.
⇒	<u>GetGap</u>	Retrieves link property data for a gap-type link property.
⇒	<u>GetHook</u>	Retrieves link property data for a hook-type link property.
⇒	<u>GetLinear</u>	Retrieves link property data for a linear-type link property.
⇒	<u>GetMultiLinearElastic</u>	retrieves link property data for a multilinear elastic-type link property.

⇒ <u>GetMultiLinearPlastic</u>	retrieves link property data for a multilinear plastic-type link property.
⇒ <u>GetMultiLinearPoints</u>	Retrieves the force-deformation data for a specified degree of freedom in multilinear elastic and multilinear plastic link properties.
⇒ <u>GetNameList</u>	Retrieves the names of all defined link properties of the specified type.
⇒ <u>GetPDelta</u>	retrieves P-delta parameters for a link property.
⇒ <u>GetPlasticWen</u>	retrieves link property data for a plastic Wen-type link property.
⇒ <u>GetRubberIsolator</u>	retrieves link property data for a rubber isolator-type link property.
⇒ <u>GetSpringData</u>	retrieves length and area values for a link property that are used if the link property is specified in line and area spring assignments.
⇒ <u>GetTCFrictionIsolator</u>	Retrieves link property data for a T/C friction isolator-type link property.
⇒ <u>GetTypeOAPI</u>	Retrieves the property type for the specified link property.
⇒ <u>GetWeightAndMass</u>	Assigns weight and mass data to a link property.
⇒ <u>SetAcceptanceCriteria</u>	Assigns the acceptance criteria data for a link property
⇒ <u>SetDamper</u>	Initializes a damper-type link property. If this function is called for an existing link property, all items for the property are reset to their default values.
⇒ <u>SetDamperBilinear</u>	
⇒ <u>SetDamperFrictionSpring</u>	
⇒ <u>SetFrictionIsolator</u>	Initializes a friction isolator-type link property. If this function is called for an existing link property, all items for the property are reset to their default value.
⇒ <u>SetGap</u>	Initializes a gap-type link property. If this function is called for an existing link property, all items for the property are reset to their default value.
⇒ <u>SetHook</u>	Initializes a hook-type link property. If this function is called for an existing link property, all items for the property are reset to their default value.
⇒ <u>SetLinear</u>	Initializes a linear-type link property. If this function is called for an existing link property, all items for the property are reset to their default value.
⇒ <u>SetMultiLinearElastic</u>	Initializes a multilinear elastic-type link property. If this function is called for an existing link property, all items for the property are reset to their default values.
⇒ <u>SetMultiLinearPlastic</u>	Initializes a multilinear plastic-type link property. If this function is called for an existing link property, all items for the property are reset to their default values.
⇒ <u>SetMultiLinearPoints</u>	Sets the force-deformation data for a specified degree of freedom in multilinear elastic and multilinear plastic

link properties.

⇒ [SetPDelta](#)

Assigns P-delta parameters to a link property.

⇒ [SetPlasticWen](#)

Initializes a plastic Wen-type link property. If this function is called for an existing link property, all items for the property are reset to their default values.

⇒ [SetRubberIsolator](#)

Initializes a rubber isolator-type link property. If this function is called for an existing link property, all items for the property are reset to their default value.

⇒ [SetSpringData](#)

Assigns length and area values to a link property that are used if the link property is specified in line and area spring assignments.

⇒ [SetTCFrictionIsolator](#)

Initializes a T/C friction isolator-type link property. If this function is called for an existing link property, all items for the property are reset to their default value.

⇒ [SetWeightAndMass](#)

Retrieves weight and mass data for a link property.

cPropLink Methods

The cPropLink type exposes the following members.

Methods

Á	Name	Description
⇒	<u>ChangeName</u>	Changes the name of an existing link property.
⇒	<u>Count</u>	Returns the total number of defined link properties in the model. If desired, counts can be returned for all link properties of a specified type in the model.
⇒	<u>Delete</u>	Deletes a specified link property.
⇒	<u>GetAcceptanceCriteria</u>	Retrieves the acceptance criteria data for a link property
⇒	<u>GetDamper</u>	retrieves link property data for a damper-type link property.
⇒	<u>GetDamperBilinear</u>	
⇒	<u>GetDamperFrictionSpring</u>	
⇒	<u>GetFrictionIsolator</u>	Retrieves link property data for a friction isolator-type link property.
⇒	<u>GetGap</u>	Retrieves link property data for a gap-type link property.
⇒	<u>GetHook</u>	Retrieves link property data for a hook-type link property.
⇒	<u>GetLinear</u>	Retrieves link property data for a linear-type link property.
⇒	<u>GetMultiLinearElastic</u>	retrieves link property data for a multilinear elastic-type link property.
⇒	<u>GetMultiLinearPlastic</u>	retrieves link property data for a multilinear plastic-type link property.
⇒	<u>GetMultiLinearPoints</u>	Retrieves the force-deformation data for a specified degree of freedom in multilinear elastic and multilinear plastic link properties.
⇒	<u>GetNameList</u>	Retrieves the names of all defined link properties of the specified type.
⇒	<u>GetPDelta</u>	retrieves P-delta parameters for a link property.
⇒	<u>GetPlasticWen</u>	retrieves link property data for a plastic Wen-type link property.
⇒	<u>GetRubberIsolator</u>	retrieves link property data for a rubber isolator-type link property.
⇒	<u>GetSpringData</u>	retrieves length and area values for a link property that are used if the link property is specified in line and area spring assignments.
⇒	<u>GetTCFrictionIsolator</u>	Retrieves link property data for a T/C friction isolator-type link property.

⇒ <u>GetTypeOAPI</u>	Retrieves the property type for the specified link property.
⇒ <u>GetWeightAndMass</u>	Assigns weight and mass data to a link property.
⇒ <u>SetAcceptanceCriteria</u>	Assigns the acceptance criteria data for a link property
⇒ <u>SetDamper</u>	Initializes a damper-type link property. If this function is called for an existing link property, all items for the property are reset to their default values.
⇒ <u>SetDamperBilinear</u>	
⇒ <u>SetDamperFrictionSpring</u>	
⇒ <u>SetFrictionIsolator</u>	Initializes a friction isolator-type link property. If this function is called for an existing link property, all items for the property are reset to their default value.
⇒ <u>SetGap</u>	Initializes a gap-type link property. If this function is called for an existing link property, all items for the property are reset to their default value.
⇒ <u>SetHook</u>	Initializes a hook-type link property. If this function is called for an existing link property, all items for the property are reset to their default value.
⇒ <u>SetLinear</u>	Initializes a linear-type link property. If this function is called for an existing link property, all items for the property are reset to their default value.
⇒ <u>SetMultiLinearElastic</u>	Initializes a multilinear elastic-type link property. If this function is called for an existing link property, all items for the property are reset to their default values.
⇒ <u>SetMultiLinearPlastic</u>	Initializes a multilinear plastic-type link property. If this function is called for an existing link property, all items for the property are reset to their default values.
⇒ <u>SetMultiLinearPoints</u>	Sets the force-deformation data for a specified degree of freedom in multilinear elastic and multilinear plastic link properties.
⇒ <u>SetPDelta</u>	Assigns P-delta parameters to a link property.
⇒ <u>SetPlasticWen</u>	Initializes a plastic Wen-type link property. If this function is called for an existing link property, all items for the property are reset to their default values.
⇒ <u>SetRubberIsolator</u>	Initializes a rubber isolator-type link property. If this function is called for an existing link property, all items for the property are reset to their default value.
⇒ <u>SetSpringData</u>	Assigns length and area values to a link property that are used if the link property is specified in line and area spring assignments.
⇒ <u>SetTCFrictionIsolator</u>	Initializes a T/C friction isolator-type link property. If this function is called for an existing link property, all items for the property are reset to their default value.
⇒ <u>SetWeightAndMass</u>	Retrieves weight and mass data for a link property.

CSI API ETABS v1

cPropLinkAddLanguageSpecificTextSet("LSTE01B4387_0") Method

Changes the name of an existing link property.

Namespace: ETABSv1

Assembly: ETABSv1 (in ETABSv1.dll) Version: 1.0.0.0 (1.24.0.0)

■ Syntax

C#

VB

C++

F#

Copy

```
int ChangeName(
    string Name,
    string NewName
)
```

```
Function ChangeName (
    Name As String,
    NewName As String
) As Integer
```

```
Dim instance As cPropLink
Dim Name As String
Dim NewName As String
Dim returnValue As Integer
```

```
returnValue = instance.ChangeName(Name,
    NewName)
```

```
int ChangeName(
    String^ Name,
    String^ NewName
)
```

```
abstract ChangeName :
    Name : string *
    NewName : string -> int
```

Parameters

Name

Type: SystemString

The existing name of a defined link property.

NewName

Type: SystemString

The new name for the link property.

Return ValueType: $\hat{A}$ Int32

Returns zero if the new name is successfully applied; otherwise it returns a nonzero value.

▲ **Remarks**

▲ **Examples**

VB

Copy

```
Public Sub Example()
    Dim SapModel As cSapModel
    Dim EtabsObject As cOAPI
    Dim ret As Integer = -1
    Dim DOF() As Boolean
    Dim Fixed() As Boolean
    Dim Ke() As Double
    Dim Ce() As Double

    'create ETABS object
    Dim myHelper as cHelper = New Helper
    EtabsObject = myHelper.CreateObjectProgID("CSI.ETABS.API.ETABSObject")

    'start ETABS application
    ret = EtabsObject.ApplicationStart()

    'create SapModel object
    SapModel = EtabsObject.SapModel

    'initialize model
    ret = SapModel.InitializeNewModel()

    'create steel deck template model
    ret = SapModel.File.NewSteelDeck(4,12,12,4,4,24,24)

    'add link property
    ReDim DOF(5)
    ReDim Fixed(5)
    ReDim Ke(5)
    ReDim Ce(5)
    DOF(0) = True
    Ke(0) = 12
    ret = SapModel.PropLink.SetLinear("L1", DOF, Fixed, Ke, Ce, 0, 0)

    'change name of link property
    ret = SapModel.PropLink.ChangeName("L1", "MyLink")

    'close ETABS
    EtabsObject.ApplicationExit(False)

    'clean up variables
    SapModel = Nothing
    EtabsObject = Nothing
End Sub
```

CSI API ETABS v1

cPropLinkAddLanguageSpecificTextSet("LST6FE95469_0")

Method

Returns the total number of defined link properties in the model. If desired, counts can be returned for all link properties of a specified type in the model.

Namespace: ETABSv1

Assembly: ETABSv1 (in ETABSv1.dll) Version: 1.0.0.0 (1.24.0.0)

Syntax

C#

VB

C++

F#

Copy

```
int Count(
    eLinkPropType PropType =
)
```

```
Function Count (
    Optional PropType As eLinkPropType =
) As Integer
```

```
Dim instance As cPropLink
Dim PropType As eLinkPropType
Dim returnValue As Integer
```

```
returnValue = instance.Count(PropType)
```

```
int Count(
    eLinkPropType PropType =
)
```

```
abstract Count :
    ?PropType : eLinkPropType
(* Defaults:
    let _PropType = defaultArg PropType
*)
-> int
```

Parameters

PropType (Optional)

Type: ETABSv1eLinkPropType

This optional value is one of the items in the eLinkPropType enumeration. If no value is input for PropType, a count is returned for all link properties in the model regardless of type.

Return Value

Type: Int32

Returns the total number of defined link properties in the model.

cPropLinkspan id="LST6FE95469_0"AddLanguageSpecificTextSet("LST6FE95469_0?cpp=::|n8493;Count I

Remarks

Examples

VB

Copy

```
Public Sub Example()
    Dim SapModel As cSapModel
    Dim EtabsObject As cOAPI
    Dim ret As Integer = -1
    Dim DOF() As Boolean
    Dim Fixed() As Boolean
    Dim Ke() As Double
    Dim Ce() As Double
    Dim Count As Integer

    'create ETABS object
    Dim myHelper as cHelper = New Helper

CSI API ETABS v1

cPropLinkAddLanguageSpecificTextSet("LST4C322B9_0") Delete Method

Deletes a specified link property.

Namespace: [ETABSv1](#)

Assembly: [ETABSv1](#) (in ETABSv1.dll) Version: 1.0.0.0 (1.24.0.0)

▲ Syntax

[C#](#)

[VB](#)

[C++](#)

[F#](#)

[Copy](#)

```
int Delete(
    string Name
)
```

```
Function Delete (
    Name As String
) As Integer
```

```
Dim instance As cPropLink
Dim Name As String
Dim returnValue As Integer
```

```
returnValue = instance.Delete(Name)
```

```
int Delete(
    String^ Name
)
```

```
abstract Delete :
    Name : string -> int
```

Parameters

Name

Type: [SystemString](#)

The name of an existing link property.

Return Value

Type: [Int32](#)

Returns zero if the link property is successfully deleted; otherwise it returns a nonzero value. It returns an error if the specified link property can not be deleted, for example, if it is being used by an existing link object.

▲ Remarks

array<double>^% LSNeg,
array<double>^% CPNeg
)
```

```
abstract GetAcceptanceCriteria :
    Name : string *
    AcceptanceType : int byref *
    Symmetric : bool byref *
    Active : bool[] byref *
    IOPos : float[] byref *
    LSPos : float[] byref *
    CPPos : float[] byref *
    IONeg : float[] byref *
    LSNeg : float[] byref *
    CPNeg : float[] byref -> int
```

Parameters

Name

Type: [SystemString](#)

The name of an existing link property

AcceptanceType

Type: [SystemInt32](#)

This item is either 1 or 2. 1 means Force and 2 means Displacement.

Symmetric

Type: [SystemBoolean](#)

Indicates if the acceptance criteria is symmetric, that is, the negative values are the same as the positive values.

Active

Type: [SystemBoolean](#)

This is an array dimensioned to 5 indicating if the acceptance criteria is active for each. Items 0 thru 5 in the array refer to F1, F2, F3, M1, M2, M3 or U1, U2, U3, R1, R2, R3, respectively.

IOPos

Type: [SystemDouble](#)

This is an array dimensioned to 5 indicating the positive immediate occupancy acceptance criteria values for each DOF. Items 0 thru 5 in the array refer to F1, F2, F3, M1, M2, M3 or U1, U2, U3, R1, R2, R3, respectively.

LSPos

Type: [SystemDouble](#)

This is an array dimensioned to 5 indicating the positive life safety acceptance criteria values for each DOF. Items 0 thru 5 in the array refer to F1, F2, F3, M1, M2, M3 or U1, U2, U3, R1, R2, R3, respectively.

CPPosType: SystemDouble

This is an array dimensioned to 5 indicating the positive collapse prevention acceptance criteria values for each DOF. Items 0 thru 5 in the array refer to F1, F2, F3, M1, M2, M3 or U1, U2, U3, R1, R2, R3, respectively.

IONegType: SystemDouble

This is an array dimensioned to 5 indicating the negative immediate occupancy acceptance criteria values for each DOF. Items 0 thru 5 in the array refer to F1, F2, F3, M1, M2, M3 or U1, U2, U3, R1, R2, R3, respectively.

LSNegType: SystemDouble

This is an array dimensioned to 5 indicating the negative life safety acceptance criteria values for each DOF. Items 0 thru 5 in the array refer to F1, F2, F3, M1, M2, M3 or U1, U2, U3, R1, R2, R3, respectively.

CPNegType: SystemDouble

This is an array dimensioned to 5 indicating the negative collapse prevention acceptance criteria values for each DOF. Items 0 thru 5 in the array refer to F1, F2, F3, M1, M2, M3 or U1, U2, U3, R1, R2, R3, respectively.

Return ValueType: Int32

returns zero if the data is successfully retrieved; otherwise it returns a nonzero value.

    GUID : string byref -> int

```

Parameters

Name

Type: SystemString

The name of an existing damper-type link property.

DOF

Type: SystemBoolean

This is a boolean array, dimensioned to 5, indicating if properties exist for a specified degree of freedom.

Value DOF

DOF(0) U1

DOF(1) U2

DOF(2) U3

DOF(3) R1

DOF(4) R2

DOF(5) R3

Fixed

Type: SystemBoolean

This is a boolean array, dimensioned to 5, indicating if the specified degree of freedom is fixed (restrained).

Value	Fixity
--------------	---------------

Fixed(0) U1 fixity if DOF(0) = True

Fixed(1) U2 fixity if DOF(1) = True

Fixed(2) U3 fixity if DOF(2) = True

Fixed(3) R1 fixity if DOF(3) = True

Fixed(4) R2 fixity if DOF(4) = True

Fixed(5) R3 fixity if DOF(5) = True

The term Fixed(n) applies only when DOF(n) = True.

Nonlinear

Type: SystemBoolean

This is a boolean array, dimensioned to 5, indicating if nonlinear properties exist for a specified degree of freedom.

Value	Nonlinear
--------------	------------------

Nonlinear(0) U1 has nonlinear properties

Nonlinear(1) U2 has nonlinear properties

Nonlinear(2) U3 has nonlinear properties

Nonlinear(3) R1 has nonlinear properties

Nonlinear(4) R2 has nonlinear properties

Nonlinear(5) R3 has nonlinear properties

The term Nonlinear(n) applies only when DOF(n) = True and Fixed(n) = False.

Ke

Type: SystemDouble

This is an array of effective stiffness terms for the link property. The effective stiffness applies for linear analyses.

Value Stiffness

Ke(0) U1 [F/L]

Ke(1) U2 [F/L]

Ke(2) U3 [F/L]

Ke(3) R1 [FL]

Ke(4) R2 [FL]

Ke(5) R3 [FL]

The term ke(n) applies only when DOF(n) = True and Fixed(n) = False.

Ce

Type: SystemDouble

This is an array of effective damping terms for the link property. The effective stiffness applies for linear analyses.

Value Damping

Ce(0) U1 [F/L]

Ce(1) U2 [F/L]

Ce(2) U3 [F/L]

Ce(3) R1 [FL]

Ce(4) R2 [FL]

Ce(5) R3 [FL]

The term ce(n) applies only when DOF(n) = True and Fixed(n) = False.

K

Type: SystemDouble

This is an array of initial stiffness terms for the link property. The initial stiffness applies for nonlinear analyses.

Value Stiffness

K(0) U1 [F/L]

K(1) U2 [F/L]

K(2) U3 [F/L]

K(3) R1 [FL]

K(4) R2 [FL]

K(5) R3 [FL]

The term k(n) applies only when DOF(n) = True, Fixed(n) = False, and Nonlinear(n) = True.

C

Type: SystemDouble

This is an array of nonlinear damping coefficient terms for the link property. The nonlinear damping coefficient applies for nonlinear analyses.

Value Damping

C(0) U1 [F/(L^{cexp})]

C(1) U2 [F/(L^{cexp})]

C(2) U3 [F/(L^{cexp})]

C(3) R1 [FL]

C(4) R2 [FL]

C(5) R3 [FL]

The term c(n) applies only when DOF(n) = True, Fixed(n) = False, and Nonlinear(n) = True.

CExp

Type: SystemDouble

This is an array of the nonlinear damping exponent terms. The nonlinear damping exponent applies for nonlinear analyses. It is applied to the velocity across the damper in the equation of motion.

Value cexp

cexp(0) U1

cexp(1) U2

cexp(2) U3

cexp(3) R1

cexp(4) R2

cexp(5) R3

The term cexp(n) applies only when DOF(n) = True, Fixed(n) = False, and Nonlinear(n) = True.

DJ2

Type:Â SystemDouble

The distance from the J-End of the link to the U2 shear spring. This item applies only when DOF(1) = True. [L]

DJ3

Type:Â SystemDouble

The distance from the J-End of the link to the U3 shear spring. This item applies only when DOF(2) = True. [L]

Notes

Type:Â SystemString

The notes, if any, assigned to the property.

GUID

Type:Â SystemString

The GUID (global unique identifier), if any, assigned to the property.

Return Value

Type:Â Int32

Returns zero if the property is successfully retrieved; otherwise it returns a nonzero value.

```

Parameters

Name

Type:Â SystemString

The name of an existing friction isolator-type link property.

DOF

Type:Â SystemBoolean

This is a boolean array, dimensioned to 5, indicating if properties exist for a specified degree of freedom.

Value DOF

DOF(0) U1

DOF(1) U2

DOF(2) U3

DOF(3) R1

DOF(4) R2

DOF(5) R3

Fixed

Type:Â SystemBoolean

This is a boolean array, dimensioned to 5, indicating if the specified degree of freedom is fixed (restrained).

Value Fixity

Fixed(0) U1 fixity if DOF(0) = True

Fixed(1) U2 fixity if DOF(1) = True

Fixed(2) U3 fixity if DOF(2) = True

Fixed(3) R1 fixity if DOF(3) = True

Fixed(4) R2 fixity if DOF(4) = True

Fixed(5) R3 fixity if DOF(5) = True

Nonlinear

Type:Â SystemBoolean

This is a boolean array, dimensioned to 5, indicating if nonlinear properties exist for a specified degree of freedom.

Value Nonlinear

Nonlinear(0) U1 has nonlinear properties

Nonlinear(1) U2 has nonlinear properties

Nonlinear(2) U3 has nonlinear properties

Nonlinear(3) R1, not used

Nonlinear(4) R2, not used

Nonlinear(5) R3, not used

Note that this item is applicable only for degrees of freedom U1, U2 and U3. For those degrees of freedom, the term Nonlinear(n) applies only when DOF(n) = True and Fixed(n) = False.

Ke

Type:Â SystemDouble

This is an array of effective stiffness terms for the link property. The effective stiffness applies for linear analyses.

Value Stiffness

Ke(0) U1 [F/L]

Ke(1) U2 [F/L]

Ke(2) U3 [F/L]

Ke(3) R1 [FL]

Ke(4) R2 [FL]

Ke(5) R3 [FL]

The term ke(n) applies only when DOF(n) = True and Fixed(n) = False.

Ce

Type: SystemDouble

This is an array of effective damping terms for the link property. The effective stiffness applies for linear analyses.

Value Damping

Ce(0) U1 [F/L]

Ce(1) U2 [F/L]

Ce(2) U3 [F/L]

Ce(3) R1 [FL]

Ce(4) R2 [FL]

Ce(5) R3 [FL]

The term ce(n) applies only when DOF(n) = True and Fixed(n) = False.

K

Type: SystemDouble

This is an array of initial stiffness terms for the link property. The initial stiffness applies for nonlinear analyses.

Value Stiffness

K(0) U1 [F/L]

K(1) U2 [F/L]

K(2) U3 [F/L]

K(3) R1, not used

K(4) R2, not used

K(5) R3, not used

Note that this item is applicable only for degrees of freedom U1, U2 and U3. For those degrees of freedom, the term k(n) applies only when DOF(n) = True, Fixed(n) = False, and Nonlinear(n) = True.

Slow

Type: SystemDouble

This is an array of the friction coefficient at zero velocity terms for the link property. This coefficient applies for nonlinear analyses.

Value Slow

Slow(0) U1, not used

Slow(1) U2

Slow(2) U3

Slow(3) R1, not used

Slow(4) R2, not used

Slow(5) R3, not used

Note that this item is applicable only for degrees of freedom U2 and U3. For those degrees of freedom, the term Slow(n) applies only when DOF(n) = True, Fixed(n) = False, and Nonlinear(n) = True.

Fast

Type: SystemDouble

This is an array of the friction coefficient at fast velocity terms for the link property. This coefficient applies for nonlinear analyses.

Value	Fast
--------------	-------------

Fast(0) U1, not used

Fast(1) U2

Fast(2) U3

Fast(3) R1, not used

Fast(4) R2, not used

Fast(5) R3, not used

Note that this item is applicable only for degrees of freedom U2 and U3. For those degrees of freedom, the term Fast(n) applies only when DOF(n) = True, Fixed(n) = False, and Nonlinear(n) = True.

Rate

Type: SystemDouble

This is an array of the inverse of the characteristic sliding velocity terms for the link property. This item applies for nonlinear analyses.

Value	Rate
--------------	-------------

Rate(0) U1, not used

Rate(1) U2 [s/L]

Rate(2) U3 [s/L]

Rate(3) R1, not used

Rate(4) R2, not used

Rate(5) R3, not used

Note that this item is applicable only for degrees of freedom U2 and U3. For those degrees of freedom, the term Rate(n) applies only when DOF(n) = True, Fixed(n) = False, and Nonlinear(n) = True.

Radius

Type: SystemDouble

This is an array of the radius of the sliding contact surface terms for the link property. Inputting 0 means there is an infinite radius, that is, the slider is flat. This item applies for nonlinear analyses.

Value	Radius
--------------	---------------

Radius(0) U1, not used

Radius(1) U2 [L]

Radius(2) U3 [L]

Radius(3) R1, not used

Radius(4) R2, not used

Radius(5) R3, not used

Note that this item is applicable only for degrees of freedom U2 and U3. For those degrees of freedom, the term Radius(n) applies only when DOF(n) = True, Fixed(n) = False, and Nonlinear(n) = True.

DampingType: SystemDouble

This is the nonlinear damping coefficient used for the axial translational degree of freedom, U1. This item applies for nonlinear analyses. [F/L]

DJ2Type: SystemDouble

The distance from the J-End of the link to the U2 shear spring. This item applies only when DOF(1) = True. [L]

DJ3Type: SystemDouble

The distance from the J-End of the link to the U3 shear spring. This item applies only when DOF(2) = True. [L]

NotesType: SystemString

The notes, if any, assigned to the property.

GUIDType: SystemString

The GUID (global unique identifier), if any, assigned to the property.

Return ValueType: Int32

Returns zero if the property is successfully retrieved; otherwise it returns a nonzero value.

```

Parameters

Name

Type:Â SystemString

The name of an existing gap-type link property.

DOF

Type:Â SystemBoolean

This is a boolean array, dimensioned to 5, indicating if properties exist for a specified degree of freedom.

Value DOF

DOF(0) U1

DOF(1) U2

DOF(2) U3

DOF(3) R1

DOF(4) R2

DOF(5) R3

Fixed

Type:Â SystemBoolean

This is a boolean array, dimensioned to 5, indicating if the specified degree of freedom is fixed (restrained).

Value Fixity

Fixed(0) U1 fixity if DOF(0) = True
 Fixed(1) U2 fixity if DOF(1) = True
 Fixed(2) U3 fixity if DOF(2) = True
 Fixed(3) R1 fixity if DOF(3) = True
 Fixed(4) R2 fixity if DOF(4) = True
 Fixed(5) R3 fixity if DOF(5) = True

Nonlinear

Type: SystemBoolean

This is a boolean array, dimensioned to 5, indicating if nonlinear properties exist for a specified degree of freedom.

Value Nonlinear

Nonlinear(0) U1 has nonlinear properties
 Nonlinear(1) U2 has nonlinear properties
 Nonlinear(2) U3 has nonlinear properties
 Nonlinear(3) R1 has nonlinear properties
 Nonlinear(4) R2 has nonlinear properties
 Nonlinear(5) R3 has nonlinear properties

The term Nonlinear(n) applies only when DOF(n) = True and Fixed(n) = False.

Ke

Type: SystemDouble

This is an array of effective stiffness terms for the link property. The effective stiffness applies for linear analyses.

Value Stiffness

Ke(0) U1 [F/L]
 Ke(1) U2 [F/L]
 Ke(2) U3 [F/L]
 Ke(3) R1 [FL]
 Ke(4) R2 [FL]
 Ke(5) R3 [FL]

The term ke(n) applies only when DOF(n) = True and Fixed(n) = False.

Ce

Type: SystemDouble

This is an array of effective damping terms for the link property. The effective stiffness applies for linear analyses.

Value Damping

Ce(0) U1 [F/L]
 Ce(1) U2 [F/L]
 Ce(2) U3 [F/L]
 Ce(3) R1 [FL]
 Ce(4) R2 [FL]
 Ce(5) R3 [FL]

The term ce(n) applies only when DOF(n) = True and Fixed(n) = False.

K

Type: SystemDouble

This is an array of initial stiffness terms for the link property. The initial stiffness applies for nonlinear analyses.

Value Stiffness

K(0) U1 [F/L]

K(1) U2 [F/L]

K(2) U3 [F/L]

K(3) R1 [FL]

K(4) R2 [FL]

K(5) R3 [FL]

The term k(n) applies only when DOF(n) = True, Fixed(n) = False, and Nonlinear(n) = True.

Dis

Type: SystemDouble

This is an array of initial gap opening terms for the link property. The initial gap opening applies for nonlinear analyses.

Value Dis

dis(0) U1 [L]

dis(1) U2 [L]

dis(2) U3 [L]

dis(3) R1 [rad]

dis(4) R2 [rad]

dis(5) R3 [rad]

The term dis(n) applies only when DOF(n) = True, Fixed(n) = False, and Nonlinear(n) = True.

DJ2

Type: SystemDouble

The distance from the J-End of the link to the U2 shear spring. This item applies only when DOF(1) = True. [L]

DJ3

Type: SystemDouble

The distance from the J-End of the link to the U3 shear spring. This item applies only when DOF(2) = True. [L]

Notes

Type: SystemString

The notes, if any, assigned to the property.

GUID

Type: SystemString

The GUID (global unique identifier), if any, assigned to the property. If this item is input as Default, the program assigns a GUID to the property.

Return ValueType: Int32

Returns zero if the property is successfully retrieved; otherwise it returns a nonzero value

    Dis : float[] byref *
    DJ2 : float byref *
    DJ3 : float byref *
    Notes : string byref *
    GUID : string byref -> int
```

Parameters

Name

Type:Â SystemString

The name of an existing hook-type link property.

DOF

Type:Â SystemBoolean

This is a boolean array, dimensioned to 5, indicating if properties exist for a specified degree of freedom.

Value DOF

DOF(0) U1

DOF(1) U2

DOF(2) U3

DOF(3) R1

DOF(4) R2

DOF(5) R3

Fixed

Type:Â SystemBoolean

This is a boolean array, dimensioned to 5, indicating if the specified degree of freedom is fixed (restrained).

Value Fixity

Fixed(0) U1 fixity if DOF(0) = True

Fixed(1) U2 fixity if DOF(1) = True

Fixed(2) U3 fixity if DOF(2) = True

Fixed(3) R1 fixity if DOF(3) = True

Fixed(4) R2 fixity if DOF(4) = True

Fixed(5) R3 fixity if DOF(5) = True

Nonlinear

Type: SystemBoolean

This is a boolean array, dimensioned to 5, indicating if nonlinear properties exist for a specified degree of freedom.

Value Nonlinear

Nonlinear(0) U1 has nonlinear properties

Nonlinear(1) U2 has nonlinear properties

Nonlinear(2) U3 has nonlinear properties

Nonlinear(3) R1 has nonlinear properties

Nonlinear(4) R2 has nonlinear properties

Nonlinear(5) R3 has nonlinear properties

The term Nonlinear(n) applies only when DOF(n) = True and Fixed(n) = False.

Ke

Type: SystemDouble

This is an array of effective stiffness terms for the link property. The effective stiffness applies for linear analyses.

Value Stiffness

Ke(0) U1 [F/L]

Ke(1) U2 [F/L]

Ke(2) U3 [F/L]

Ke(3) R1 [FL]

Ke(4) R2 [FL]

Ke(5) R3 [FL]

The term ke(n) applies only when DOF(n) = True and Fixed(n) = False.

Ce

Type: SystemDouble

This is an array of effective damping terms for the link property. The effective stiffness applies for linear analyses.

Value Damping

Ce(0) U1 [F/L]

Ce(1) U2 [F/L]

Ce(2) U3 [F/L]

Ce(3) R1 [FL]

Ce(4) R2 [FL]

Ce(5) R3 [FL]

The term ce(n) applies only when DOF(n) = True and Fixed(n) = False.

K

Type: SystemDouble

This is an array of initial stiffness terms for the link property. The initial stiffness applies for nonlinear analyses.

Value Stiffness

K(0) U1 [F/L]

K(1) U2 [F/L]

K(2) U3 [F/L]

K(3) R1 [FL]

K(4) R2 [FL]

K(5) R3 [FL]

The term k(n) applies only when DOF(n) = True, Fixed(n) = False, and Nonlinear(n) = True.

Dis

Type: SystemDouble

This is an array of initial hook opening terms for the link property. The initial hook opening applies for nonlinear analyses.

Value Dis

dis(0) U1 [L]

dis(1) U2 [L]

dis(2) U3 [L]

dis(3) R1 [rad]

dis(4) R2 [rad]

dis(5) R3 [rad]

The term dis(n) applies only when DOF(n) = True, Fixed(n) = False, and Nonlinear(n) = True.

DJ2

Type: SystemDouble

The distance from the J-End of the link to the U2 shear spring. This item applies only when DOF(1) = True. [L]

DJ3

Type: SystemDouble

The distance from the J-End of the link to the U3 shear spring. This item applies only when DOF(2) = True. [L]

Notes

Type: SystemString

The notes, if any, assigned to the property.

GUID

Type: SystemString

The GUID (global unique identifier), if any, assigned to the property. If this item is input as Default, the program assigns a GUID to the property.

Return ValueType: Int32

Returns zero if the property is successfully retrieved; otherwise it returns a nonzero value

▲ Remarks

bool% KeCoupled,
bool% CeCoupled,
String^% Notes,
String^% GUID
)
```

```
abstract GetLinear :
    Name : string *
    DOF : bool[] byref *
    Fixed : bool[] byref *
    Ke : float[] byref *
    Ce : float[] byref *
    DJ2 : float byref *
    DJ3 : float byref *
    KeCoupled : bool byref *
    CeCoupled : bool byref *
    Notes : string byref *
    GUID : string byref -> int
```

Parameters

Name

Type:Â SystemString

The name of an existing linear-type link property.

DOF

Type:Â SystemBoolean

This is a boolean array, dimensioned to 5, indicating if properties exist for a specified degree of freedom.

Value DOF

DOF(0) U1

DOF(1) U2

DOF(2) U3

DOF(3) R1

DOF(4) R2

DOF(5) R3

Fixed

Type:Â SystemBoolean

This is a boolean array, dimensioned to 5, indicating if the specified degree of freedom is fixed (restrained).

Value

Fixity

Fixed(0) U1 fixity if DOF(0) = True

Fixed(1) U2 fixity if DOF(1) = True
 Fixed(2) U3 fixity if DOF(2) = True
 Fixed(3) R1 fixity if DOF(3) = True
 Fixed(4) R2 fixity if DOF(4) = True
 Fixed(5) R3 fixity if DOF(5) = True

Ke

Type: SystemDouble

This is an array of stiffness terms for the link property. There are 6 terms in the array if the stiffness is uncoupled and 21 if it is coupled. The KeCoupled item indicates if the stiffness is coupled.

If the stiffness is uncoupled:

Value Stiffness

Ke(0) U1 [F/L]
 Ke(1) U2 [F/L]
 Ke(2) U3 [F/L]
 Ke(3) R1 [FL]
 Ke(4) R2 [FL]
 Ke(5) R3 [FL]

If the stiffness is coupled:

Value Stiffness

Ke(0) U1U1 [F/L]
 Ke(1) U1U2 [F/L]
 Ke(2) U2U2 [F/L]
 Ke(3) U1U3 [F/L]
 Ke(4) U2U3 [F/L]
 Ke(5) U3U3 [F/L]
 Ke(6) U1R1 [F]
 Ke(7) U2R1 [F]
 Ke(8) U3R1 [F]
 Ke(9) R1R1 [FL]
 Ke(10) U1R2 [F]
 Ke(11) U2R2 [F]
 Ke(12) U3R2 [F]
 Ke(14) R2R2 [FL]
 Ke(15) U1R3 [F]
 Ke(16) U2R3 [F]
 Ke(17) U3R3 [F]
 Ke(18) R1R3 [FL]
 Ke(19) R2R3 [FL]
 Ke(20) R3R3 [FL]

Ce

Type: SystemDouble

This is an array of damping terms for the link property. There are 6 terms in the array if the damping is uncoupled and 21 if it is coupled. The CeCoupled item indicates if the damping is coupled.

If the damping is uncoupled:

Value Damping

Ce(0) U1 [F/L]

Ce(1) U2 [F/L]

Ce(2) U3 [F/L]

Ce(3) R1 [FL]

Ce(4) R2 [FL]

Ce(5) R3 [FL]

If the damping is coupled:

Value Damping

Ce(0) U1U1 [F/L]

Ce(1) U1U2 [F/L]

Ce(2) U2U2 [F/L]

Ce(3) U1U3 [F/L]

Ce(4) U2U3 [F/L]

Ce(5) U3U3 [F/L]

Ce(6) U1R1 [F]

Ce(7) U2R1 [F]

Ce(8) U3R1 [F]

Ce(9) R1R1 [FL]

Ce(10) U1R2 [F]

Ce(11) U2R2 [F]

Ce(12) U3R2 [F]

Ce(14) R2R2 [FL]

Ce(15) U1R3 [F]

Ce(16) U2R3 [F]

Ce(17) U3R3 [F]

Ce(18) R1R3 [FL]

Ce(19) R2R3 [FL]

Ce(20) R3R3 [FL]

DJ2

Type: SystemDouble

The distance from the J-End of the link to the U2 shear spring. This item applies only when DOF(1) = True. [L]

DJ3

Type: SystemDouble

The distance from the J-End of the link to the U3 shear spring. This item applies only when DOF(2) = True. [L]

KeCoupledType: SystemBoolean

This item is True if the link stiffness, Ke, is coupled. There are 21 terms in the Ke array if Ke is coupled; otherwise there are 6 terms

CeCoupledType: SystemBoolean

This item is True if the link damping, Ce, is coupled. There are 21 terms in the Ce array if Ce is coupled; otherwise there are 6 terms

NotesType: SystemString

The notes, if any, assigned to the property.

GUIDType: SystemString

The GUID (global unique identifier), if any, assigned to the property.

Return ValueType: Int32

Returns zero if the property data is successfully retrieved; otherwise it returns a nonzero value.

```

Parameters

Name

Type: SystemString

The name of an existing damper-type link property.

DOF

Type: SystemBoolean

This is a boolean array, dimensioned to 5, indicating if properties exist for a specified degree of freedom.

Value DOF

DOF(0) U1

DOF(1) U2

DOF(2) U3

DOF(3) R1

DOF(4) R2

DOF(5) R3

Fixed

Type: SystemBoolean

This is a boolean array, dimensioned to 5, indicating if the specified degree of freedom is fixed (restrained).

Value Fixity

Fixed(0) U1 fixity if DOF(0) = True

Fixed(1) U2 fixity if DOF(1) = True

Fixed(2) U3 fixity if DOF(2) = True

Fixed(3) R1 fixity if DOF(3) = True

Fixed(4) R2 fixity if DOF(4) = True

Fixed(5) R3 fixity if DOF(5) = True

The term Fixed(n) applies only when DOF(n) = True.

Nonlinear

Type: SystemBoolean

This is a boolean array, dimensioned to 5, indicating if nonlinear properties exist for a specified degree of freedom.

Value

Nonlinear

Nonlinear(0) U1 has nonlinear properties

Nonlinear(1) U2 has nonlinear properties

Nonlinear(2) U3 has nonlinear properties

Nonlinear(3) R1 has nonlinear properties

Nonlinear(4) R2 has nonlinear properties

Nonlinear(5) R3 has nonlinear properties

The term Nonlinear(n) applies only when DOF(n) = True and Fixed(n) = False.

Ke

Type: SystemDouble

This is an array of effective stiffness terms for the link property. The effective stiffness applies for linear analyses.

Value Stiffness

Ke(0) U1 [F/L]

Ke(1) U2 [F/L]

Ke(2) U3 [F/L]

Ke(3) R1 [FL]

Ke(4) R2 [FL]

Ke(5) R3 [FL]

The term ke(n) applies only when DOF(n) = True and Fixed(n) = False.

Ce

Type: SystemDouble

This is an array of effective damping terms for the link property. The effective stiffness applies for linear analyses.

Value Damping

Ce(0) U1 [F/L]

Ce(1) U2 [F/L]

Ce(2) U3 [F/L]

Ce(3) R1 [FL]

Ce(4) R2 [FL]

Ce(5) R3 [FL]

The term ce(n) applies only when DOF(n) = True and Fixed(n) = False.

DJ2

Type: SystemDouble

The distance from the J-End of the link to the U2 shear spring. This item applies only when DOF(1) = True. [L]

DJ3

Type: SystemDouble

The distance from the J-End of the link to the U3 shear spring. This item applies

only when DOF(2) = True. [L]

Notes

Type: SystemString

The notes, if any, assigned to the property.

GUID

Type: SystemString

The GUID (global unique identifier), if any, assigned to the property.

Return Value

Type: Int32

Returns zero if the property is successfully retrieved; otherwise it returns a nonzero value.

Remarks

    DJ2 : float byref *
    DJ3 : float byref *
    Notes : string byref *
    GUID : string byref -> int
```

Parameters

Name

Type: SystemString

The name of an existing damper-type link property.

DOF

Type: SystemBoolean

This is a boolean array, dimensioned to 5, indicating if properties exist for a specified degree of freedom.

Value DOF

DOF(0) U1

DOF(1) U2

DOF(2) U3

DOF(3) R1

DOF(4) R2

DOF(5) R3

Fixed

Type: SystemBoolean

This is a boolean array, dimensioned to 5, indicating if the specified degree of freedom is fixed (restrained).

Value Fixity

Fixed(0) U1 fixity if DOF(0) = True

Fixed(1) U2 fixity if DOF(1) = True

Fixed(2) U3 fixity if DOF(2) = True

Fixed(3) R1 fixity if DOF(3) = True

Fixed(4) R2 fixity if DOF(4) = True

Fixed(5) R3 fixity if DOF(5) = True

The term Fixed(n) applies only when DOF(n) = True.

Nonlinear

Type: SystemBoolean

This is a boolean array, dimensioned to 5, indicating if nonlinear properties exist for a specified degree of freedom.

Value

Nonlinear

Nonlinear(0) U1 has nonlinear properties

Nonlinear(1) U2 has nonlinear properties

Nonlinear(2) U3 has nonlinear properties

Nonlinear(3) R1 has nonlinear properties

Nonlinear(4) R2 has nonlinear properties

Nonlinear(5) R3 has nonlinear properties

The term Nonlinear(n) applies only when DOF(n) = True and Fixed(n) = False.

Ke

Type: SystemDouble

This is an array of effective stiffness terms for the link property. The effective stiffness applies for linear analyses.

Value Stiffness

Ke(0) U1 [F/L]

Ke(1) U2 [F/L]

Ke(2) U3 [F/L]

Ke(3) R1 [FL]

Ke(4) R2 [FL]

Ke(5) R3 [FL]

The term ke(n) applies only when DOF(n) = True and Fixed(n) = False.

Ce

Type: SystemDouble

This is an array of effective damping terms for the link property. The effective stiffness applies for linear analyses.

Value Damping

Ce(0) U1 [F/L]

Ce(1) U2 [F/L]

Ce(2) U3 [F/L]

Ce(3) R1 [FL]

Ce(4) R2 [FL]

Ce(5) R3 [FL]

The term ce(n) applies only when DOF(n) = True and Fixed(n) = False.

DJ2

Type: SystemDouble

The distance from the J-End of the link to the U2 shear spring. This item applies only when DOF(1) = True. [L]

DJ3

Type: SystemDouble

The distance from the J-End of the link to the U3 shear spring. This item applies

only when DOF(2) = True. [L]

Notes

Type: SystemString

The notes, if any, assigned to the property.

GUID

Type: SystemString

The GUID (global unique identifier), if any, assigned to the property.

Return Value

Type: Int32

Returns zero if the property is successfully retrieved; otherwise it returns a nonzero value.

double% Eta
)

abstract GetMultiLinearPoints :
    Name : string *
    DOF : int *
    NumberPoints : int byref *
    F : float[] byref *
    D : float[] byref *
    MyType : int byref *
    A1 : float byref *
    A2 : float byref *
    B1 : float byref *
    B2 : float byref *
    Eta : float byref -> int

```

Parameters

Name

Type: SystemString

The name of an existing multilinear elastic or multilinear plastic link property.

DOF

Type: SystemInt32

This is 1, 2, 3, 4, 5 or 6, indicating the degree of freedom to which the multilinear points apply.

Value DOF

1	U1
2	U2
3	U3
4	R1
5	R2
6	R3

NumberPoints

Type: SystemInt32

The number of force-deformation points for the specified degree of freedom.

F

Type: SystemDouble

This is an array, dimensioned to NumberPoints - 1, that includes the force at

each point. When DOF is U1, U2 or U3, this is a force. When DOF is R1, R2 or R3, this is a moment. [F] if DOF is less than or equal to 3, and [FL] if DOF is greater than 3.

D

Type: SystemDouble

This is an array, dimensioned to NumberPoints - 1, that includes the displacement at each point. When DOF is U1, U2 or U3, this is a translation. When DOF is R1, R2 or R3, this is a rotation. [L] if DOF is less than or equal to 3, and [rad] if DOF is greater than 3.

MyType

Type: SystemInt32

This item applies only to multilinear plastic link properties. It is 1, 2 or 3, indicating the hysteresis type.

MyType Hysteresis Type

- | | |
|---|-----------|
| 1 | Kinematic |
| 2 | Takeda |
| 3 | Pivot |

A1

Type: SystemDouble

This item applies only to multilinear plastic link properties that have a pivot hysteresis type (MyType = 3). It is the Alpha1 hysteresis parameter.

A2

Type: SystemDouble

This item applies only to multilinear plastic link properties that have a pivot hysteresis type (MyType = 3). It is the Alpha2 hysteresis parameter.

B1

Type: SystemDouble

This item applies only to multilinear plastic link properties that have a pivot hysteresis type (MyType = 3). It is the Beta1 hysteresis parameter.

B2

Type: SystemDouble

This item applies only to multilinear plastic link properties that have a pivot hysteresis type (MyType = 3). It is the Beta2 hysteresis parameter.

Eta

Type: SystemDouble

This item applies only to multilinear plastic link properties that have a pivot hysteresis type (MyType = 3). It is the Eta hysteresis parameter.

Return Value

Type: Int32

Returns zero if the data is successfully assigned; otherwise it returns a nonzero value.

Remarks

To successfully retrieve this data from the indicated link property, the following conditions must be met:

1. The link property must be multilinear elastic or multilinear plastic.
2. The specified DOF must be active.
3. The specified DOF must not be fixed.
4. The specified DOF must be nonlinear.

Examples

VB

Copy

```
Public Sub Example()
    Dim SapModel As cSapModel
    Dim EtabsObject As cOAPI
    Dim ret As Integer = -1
    Dim MyDOF() As Boolean
    Dim MyFixed() As Boolean
    Dim MyNonLinear() As Boolean
    Dim MyKe() As Double
    Dim MyCe() As Double
    Dim MyF() As Double

CSI API ETABS v1

cPropLinkAddLanguageSpecificTextSet("LST86F940BC0") Method

Retrieves the names of all defined link properties of the specified type.

Namespace: [ETABSv1](#)

Assembly: [ETABSv1](#) (in ETABSv1.dll) Version: 1.0.0.0 (1.24.0.0)

Syntax

[C#](#)

[VB](#)

[C++](#)

[F#](#)

[Copy](#)

```
int GetNameList(
    ref int NumberNames,
    ref string[] MyName,
    eLinkPropType PropType =
)
```

```
Function GetNameList (
    ByRef NumberNames As Integer,
    ByRef MyName As String(),
    Optional PropType As eLinkPropType =
) As Integer
```

```
Dim instance As cPropLink
Dim NumberNames As Integer
Dim MyName As String()
Dim PropType As eLinkPropType
Dim returnValue As Integer
```

```
returnValue = instance.GetNameList(NumberNames,
MyName, PropType)
```

```
int GetNameList(
    int% NumberNames,
    array<String^>^% MyName,
    eLinkPropType PropType =
)
```

```
abstract GetNameList :
    NumberNames : int byref *
    MyName : string[] byref *
    ?PropType : eLinkPropType
(* Defaults:
    let _PropType = defaultArg PropType
*)
-> int
```

Parameters

NumberNames

Type: SystemInt32

The number of link property names retrieved by the program.

MyName

Type: SystemString

This is a one-dimensional array of link property names. The MyName array is created as a dynamic, zero-based, array by the API user: Dim MyName() as String

The array is dimensioned to (NumberNames - 1) inside the program, filled with the names, and returned to the API user.

PropType (Optional)

Type: ETABSv1eLinkPropType

This optional value is one of the items in the eLinkPropType enumeration.

If no value is input for PropType, names are returned for all link properties in the model regardless of type.

Return Value

Type: Int32

Returns zero if the names are successfully retrieved; otherwise it returns nonzero.

▲ Remarks

▲ Examples

VB

Copy

```
Public Sub Example()
    Dim SapModel As cSapModel
    Dim EtabsObject As cOAPI
    Dim ret As Integer = -1
    Dim DOF() As Boolean
    Dim Fixed() As Boolean
    Dim Ke() As Double
    Dim Ce() As Double
    Dim NumberNames As Integer
    Dim MyName() As String

    'create ETABS object
    Dim myHelper as cHelper = New Helper
    EtabsObject = myHelper.CreateObjectProgID("CSI.ETABS.API.ETABSObject")

    'start ETABS application
    ret = EtabsObject.ApplicationStart()

    'create SapModel object
    SapModel = EtabsObject.SapModel

    'initialize model
    ret = SapModel.InitializeNewModel()

    'create steel deck template model
    ret = SapModel.File.NewSteelDeck(4,12,12,4,4,24,24)

    'add link property
    ReDim DOF(5)
    ReDim Fixed(5)
    ReDim Ke(5)
    ReDim Ce(5)
```

Introduction

```
D0F(0) = True
Ke(0) = 12
ret = SapModel.PropLink.SetLinear("L1", D0F, Fixed, Ke, Ce, 0, 0)

'get link property names
ret = SapModel.PropLink.GetNameList(NumberNames, MyName)

'close ETABS
EtabsObject.ApplicationExit(False)

'clean up variables
SapModel = Nothing
EtabsObject = Nothing
End Sub

CSI API ETABS v1

cPropLinkAddLanguageSpecificTextSet("LST62CA0E7C_0?cpp=::3259");GetP Method

retrieves P-delta parameters for a link property.

Namespace: ETABSv1

Assembly: ETABSv1 (in ETABSv1.dll) Version: 1.0.0.0 (1.24.0.0)

Syntax

C#

VB

C++

F#

Copy

```
int GetPDelta(
    string Name,
    ref double[] Value
)
```

```
Function GetPDelta (
    Name As String,
    ByRef Value As Double()
) As Integer
```

```
Dim instance As cPropLink
Dim Name As String
Dim Value As Double()
Dim returnValue As Integer
```

```
returnValue = instance.GetPDelta(Name,
    Value)
```

```
int GetPDelta(
    String^ Name,
    array<double>^% Value
)
```

```
abstract GetPDelta :
    Name : string *
    Value : float[] byref -> int
```

Parameters

Name

Type: SystemString

The name of an existing link property.

Value

Type: SystemDouble

This is an array of P-delta parameters

Value

PDelta Parameter

Value(0) M2 P-delta to I-end of link as moment, M2I

Introduction

Value(1) M2 P-delta to J-end of link as moment, M2J

Value(2) M3 P-delta to I-end of link as moment, M3I

Value(3) M3 P-delta to J-end of link as moment, M3J

Return Value

Type: Int32

Returns zero if the values are successfully retrieved; otherwise it returns a nonzero value.

    DJ2 : float byref *
    DJ3 : float byref *
    Notes : string byref *
    GUID : string byref -> int
```

Parameters

Name

Type: SystemString

The name of an existing plastic Wen-type link property.

DOF

Type: SystemBoolean

This is a boolean array, dimensioned to 5, indicating if properties exist for a specified degree of freedom.

Value DOF

DOF(0) U1

DOF(1) U2
 DOF(2) U3
 DOF(3) R1
 DOF(4) R2
 DOF(5) R3

Fixed

Type: SystemBoolean

This is a boolean array, dimensioned to 5, indicating if the specified degree of freedom is fixed (restrained).

Value Fixity

Fixed(0) U1 fixity if DOF(0) = True
 Fixed(1) U2 fixity if DOF(1) = True
 Fixed(2) U3 fixity if DOF(2) = True
 Fixed(3) R1 fixity if DOF(3) = True
 Fixed(4) R2 fixity if DOF(4) = True
 Fixed(5) R3 fixity if DOF(5) = True

Nonlinear

Type: SystemBoolean

This is a boolean array, dimensioned to 5, indicating if nonlinear properties exist for a specified degree of freedom.

Value Nonlinear

Nonlinear(0) U1 has nonlinear properties
 Nonlinear(1) U2 has nonlinear properties
 Nonlinear(2) U3 has nonlinear properties
 Nonlinear(3) R1 has nonlinear properties
 Nonlinear(4) R2 has nonlinear properties
 Nonlinear(5) R3 has nonlinear properties

The term Nonlinear(n) applies only when DOF(n) = True and Fixed(n) == False.

Ke

Type: SystemDouble

This is an array of effective stiffness terms for the link property. The effective stiffness applies for linear analyses.

Value Stiffness

Ke(0) U1 [F/L]
 Ke(1) U2 [F/L]
 Ke(2) U3 [F/L]
 Ke(3) R1 [FL]
 Ke(4) R2 [FL]
 Ke(5) R3 [FL]

The term ke(n) applies only when DOF(n) = True and Fixed(n) = False.

Ce

Type: SystemDouble

This is an array of effective damping terms for the link property. The effective stiffness applies for linear analyses.

Value Damping

Ce(0) U1 [F/L]

Ce(1) U2 [F/L]

Ce(2) U3 [F/L]

Ce(3) R1 [FL]

Ce(4) R2 [FL]

Ce(5) R3 [FL]

The term ce(n) applies only when DOF(n) = True and Fixed(n) = False.

K

Type: SystemDouble

This is an array of initial stiffness terms for the link property. The initial stiffness applies for nonlinear analyses.

Value Stiffness

K(0) U1 [F/L]

K(1) U2 [F/L]

K(2) U3 [F/L]

K(3) R1 [F]

K(4) R2 [F]

K(5) R3 [F]

The term k(n) applies only when DOF(n) = True, Fixed(n) = False, and Nonlinear(n) = True.

Yield

Type: SystemDouble

This is an array of yield force terms for the link property. The yield force applies for nonlinear analyses.

Value Yield

yield(0) U1 [F]

yield(1) U2 [F]

yield(2) U3 [F]

yield(3) R1 [F/L]

yield(4) R2 [F/L]

yield(5) R3 [F/L]

The term Yield(n) applies only when DOF(n) = True, Fixed(n) = False, and Nonlinear(n) = True.

Ratio

Type: SystemDouble

This is an array of post-yield stiffness ratio terms for the link property. The post-yield stiffness ratio applies for nonlinear analyses. It is the post-yield stiffness divided by the initial stiffness.

Value Ratio

Ratio(0) U1

Ratio(1) U2

Ratio(2) U3

Ratio(3) R1

Ratio(4) R2

Ratio(5) R3

The term Ratio(n) applies only when DOF(n) = True, Fixed(n) = False, and Nonlinear(n) = True.

Exp

Type:Â SystemDouble

This is an array of yield exponent terms for the link property. The yield exponent applies for nonlinear analyses. The yielding exponent that controls the sharpness of the transition from the initial stiffness to the yielded stiffness.

Value Exp

Exp(0) U1

Exp(1) U2

Exp(2) U3

Exp(3) R1

Exp(4) R2

Exp(5) R3

The term Exp(n) applies only when DOF(n) = True, Fixed(n) = False, and Nonlinear(n) = True.

DJ2

Type:Â SystemDouble

The distance from the J-End of the link to the U2 shear spring. This item applies only when DOF(1) = True. [L]

DJ3

Type:Â SystemDouble

The distance from the J-End of the link to the U3 shear spring. This item applies only when DOF(2) = True. [L]

Notes

Type:Â SystemString

The notes, if any, assigned to the property.

GUID

Type:Â SystemString

The GUID (global unique identifier), if any, assigned to the property. If this item is input as Default, the program assigns a GUID to the property.

Return Value

Type:Â Int32

Returns zero if the property is successfully initialized; otherwise it returns a nonzero value.

)

abstract GetRubberIsolator :
    Name : string *
    DOF : bool[] byref *
    Fixed : bool[] byref *
    Nonlinear : bool[] byref *
    Ke : float[] byref *
    Ce : float[] byref *
    K : float[] byref *
    Yield : float[] byref *
    Ratio : float[] byref *
    DJ2 : float byref *
    DJ3 : float byref *
    Notes : string byref *
    GUID : string byref -> int
```

Parameters

Name

Type:Â SystemString

The name of an existing rubber isolator-type link property.

DOF

Type:Â SystemBoolean

This is a boolean array, dimensioned to 5, indicating if properties exist for a specified degree of freedom.

Value DOF

DOF(0) U1

DOF(1) U2

DOF(2) U3

DOF(3) R1

DOF(4) R2

DOF(5) R3

FixedType: SystemBoolean

This is a boolean array, dimensioned to 5, indicating if the specified degree of freedom is fixed (restrained).

Value	Fixity
--------------	---------------

Fixed(0) U1 fixity if DOF(0) = True

Fixed(1) U2 fixity if DOF(1) = True

Fixed(2) U3 fixity if DOF(2) = True

Fixed(3) R1 fixity if DOF(3) = True

Fixed(4) R2 fixity if DOF(4) = True

Fixed(5) R3 fixity if DOF(5) = True

NonlinearType: SystemBoolean

This is a boolean array, dimensioned to 5, indicating if nonlinear properties exist for a specified degree of freedom.

Value	Nonlinear
--------------	------------------

Nonlinear(0) U1 has nonlinear properties

Nonlinear(1) U2 has nonlinear properties

Nonlinear(2) U3 has nonlinear properties

Nonlinear(3) R1, not used

Nonlinear(4) R2, not used

Nonlinear(5) R3, not used

Note that this item is applicable only for degrees of freedom U1, U2 and U3. For those degrees of freedom, the term Nonlinear(n) applies only when DOF(n) = True and Fixed(n) = False.

KeType: SystemDouble

This is an array of effective stiffness terms for the link property. The effective stiffness applies for linear analyses.

Value Stiffness

Ke(0) U1 [F/L]

Ke(1) U2 [F/L]

Ke(2) U3 [F/L]

Ke(3) R1 [FL]

Ke(4) R2 [FL]

Ke(5) R3 [FL]

The term ke(n) applies only when DOF(n) = True and Fixed(n) = False.

CeType: SystemDouble

This is an array of effective damping terms for the link property. The effective stiffness applies for linear analyses.

Value Damping

Ce(0) U1 [F/L]

Ce(1) U2 [F/L]

Ce(2) U3 [F/L]

Ce(3) R1 [FL]

Ce(4) R2 [FL]

Ce(5) R3 [FL]

The term ce(n) applies only when DOF(n) = True and Fixed(n) = False.

K

Type: SystemDouble

This is an array of initial stiffness terms for the link property. The initial stiffness applies for nonlinear analyses.

Value Stiffness

K(0) U1, not used

K(1) U2 [F/L]

K(2) U3 [F/L]

K(3) R1, not used

K(4) R2, not used

K(5) R3, not used

Note that this item is applicable only for degrees of freedom U2 and U3. For those degrees of freedom, the term k(n) applies only when DOF(n) = True, Fixed(n) = False, and Nonlinear(n) = True.

Yield

Type: SystemDouble

This is an array of yield force terms for the link property. The yield force applies for nonlinear analyses.

Value Yield

yield(0) U1, not used

yield(1) U2 [F]

yield(2) U3 [F]

yield(3) R1, not used

yield(4) R2, not used

yield(5) R3, not used

Note that this item is applicable only for degrees of freedom U2 and U3. For those degrees of freedom, the term Yield(n) applies only when DOF(n) = True, Fixed(n) = False, and Nonlinear(n) = True.

Ratio

Type: SystemDouble

This is an array of post-yield stiffness ratio terms for the link property. The post-yield stiffness ratio applies for nonlinear analyses. It is the post-yield stiffness divided by the initial stiffness.

Value Ratio

Ratio(0) U1, not used

Ratio(1) U2

Ratio(2) U3

Ratio(3) R1, not used

Ratio(4) R2, not used

Ratio(5) R3, not used

Introduction

Note that this item is applicable only for degrees of freedom U2 and U3. For those degrees of freedom, the term Ratio(n) applies only when DOF(n) = True, Fixed(n) = False, and Nonlinear(n) = True.

DJ2

Type:Â SystemDouble

The distance from the J-End of the link to the U2 shear spring. This item applies only when DOF(1) = True. [L]

DJ3

Type:Â SystemDouble

The distance from the J-End of the link to the U3 shear spring. This item applies only when DOF(2) = True. [L]

Notes

Type:Â SystemString

The notes, if any, assigned to the property.

GUID

Type:Â SystemString

The GUID (global unique identifier), if any, assigned to the property.

Return Value

Type:Â Int32

Returns zero if the property is successfully retrieved; otherwise it returns a nonzero value.

CSI API ETABS v1

cPropLinkAddLanguageSpecificTextSet("LSTB434E2FF_0") Method

retrieves length and area values for a link property that are used if the link property is specified in line and area spring assignments.

Namespace: [ETABSv1](#)

Assembly: [ETABSv1](#) (in ETABSv1.dll) Version: 1.0.0.0 (1.24.0.0)

Syntax

[C#](#)

[VB](#)

[C++](#)

[F#](#)

[Copy](#)

```
int GetSpringData(
    string Name,
    ref double DefinedForThisLength,
    ref double DefinedForThisArea
)
```

```
Function GetSpringData (
    Name As String,
    ByRef DefinedForThisLength As Double,
    ByRef DefinedForThisArea As Double
) As Integer
```

```
Dim instance As cPropLink
Dim Name As String
Dim DefinedForThisLength As Double
Dim DefinedForThisArea As Double
Dim returnValue As Integer
```

```
returnValue = instance.GetSpringData(Name,
    DefinedForThisLength, DefinedForThisArea)
```

```
int GetSpringData(
    String^ Name,
    double% DefinedForThisLength,
    double% DefinedForThisArea
)
```

```
abstract GetSpringData :
    Name : string *
    DefinedForThisLength : float byref *
    DefinedForThisArea : float byref -> int
```

Parameters

Name

Type: [SystemString](#)

The name of an existing link property.

DefinedForThisLength

cPropLinkspan id="LSTB434E2FF_0"AddLanguageSpecificTextSet("LSTB434E2FF_0?cpp=::|0276);GetSp

Type: SystemDouble

The link property is defined for this length in a line (frame) spring. [L]
DefinedForThisArea

Type: SystemDouble

The link property is defined for this area in an area spring. [L2]

Return Value

Type: Int32

Returns zero if the values are successfully retrieved; otherwise it returns a nonzero value.

```

Parameters

Name

Type:Â SystemString

The name of an existing T/C friction isolator-type link property.

DOF

Type:Â SystemBoolean

This is a boolean array, dimensioned to 5, indicating if properties exist for a specified degree of freedom.

Value DOF

DOF(0) U1

DOF(1) U2

DOF(2) U3

DOF(3) R1

DOF(4) R2

DOF(5) R3

Fixed

Type:Â SystemBoolean

This is a boolean array, dimensioned to 5, indicating if the specified degree of freedom is fixed (restrained).

Value Fixity

Fixed(0) U1 fixity if DOF(0) = True

Fixed(1) U2 fixity if DOF(1) = True

Fixed(2) U3 fixity if DOF(2) = True

Fixed(3) R1 fixity if DOF(3) = True

Fixed(4) R2 fixity if DOF(4) = True

Fixed(5) R3 fixity if DOF(5) = True

Nonlinear

Type: SystemBoolean

This is a boolean array, dimensioned to 5, indicating if nonlinear properties exist for a specified degree of freedom.

Value

Nonlinear

Nonlinear(0) U1 has nonlinear properties

Nonlinear(1) U2 has nonlinear properties

Nonlinear(2) U3 has nonlinear properties

Nonlinear(3) R1, not used

Nonlinear(4) R2, not used

Nonlinear(5) R3, not used

Note that this item is applicable only for degrees of freedom U1, U2 and U3. For those degrees of freedom, the term Nonlinear(n) applies only when DOF(n) = True and Fixed(n) = False.

Ke

Type: SystemDouble

This is an array of effective stiffness terms for the link property. The effective stiffness applies for linear analyses.

Value Stiffness

Ke(0) U1 [F/L]

Ke(1) U2 [F/L]

Ke(2) U3 [F/L]

Ke(3) R1 [FL]

Ke(4) R2 [FL]

Ke(5) R3 [FL]

The term ke(n) applies only when DOF(n) = True and Fixed(n) = False.

Ce

Type: SystemDouble

This is an array of effective damping terms for the link property. The effective stiffness applies for linear analyses.

Value Damping

Ce(0) U1 [F/L]

Ce(1) U2 [F/L]

Ce(2) U3 [F/L]

Ce(3) R1 [FL]

Ce(4) R2 [FL]

Ce(5) R3 [FL]

The term ce(n) applies only when DOF(n) = True and Fixed(n) = False.

K

Type: SystemDouble

This is an array of initial stiffness terms for the link property. The initial stiffness applies for nonlinear analyses.

Value Stiffness

K(0) U1 [F/L]
 K(1) U2 [F/L]
 K(2) U3 [F/L]
 K(3) R1, not used
 K(4) R2, not used
 K(5) R3, not used

Note that this item is applicable only for degrees of freedom U1, U2 and U3. For those degrees of freedom, the term k(n) applies only when DOF(n) = True, Fixed(n) = False, and Nonlinear(n) = True.

Slow

Type: SystemDouble

This is an array of the friction coefficient at zero velocity terms when U1 is in compression for the link property. This coefficient applies for nonlinear analyses.

Value Slow

Slow(0) U1, not used
 Slow(1) U2
 Slow(2) U3
 Slow(3) R1, not used
 Slow(4) R2, not used
 Slow(5) R3, not used

Note that this item is applicable only for degrees of freedom U2 and U3. For those degrees of freedom, the term Slow(n) applies only when DOF(n) = True, Fixed(n) = False, and Nonlinear(n) = True.

Fast

Type: SystemDouble

This is an array of the friction coefficient at fast velocity terms when U1 is in compression for the link property. This coefficient applies for nonlinear analyses.

Value Fast

Fast(0) U1, not used
 Fast(1) U2
 Fast(2) U3
 Fast(3) R1, not used
 Fast(4) R2, not used
 Fast(5) R3, not used

Note that this item is applicable only for degrees of freedom U2 and U3. For those degrees of freedom, the term Fast(n) applies only when DOF(n) = True, Fixed(n) = False, and Nonlinear(n) = True.

Rate

Type: SystemDouble

This is an array of the inverse of the characteristic sliding velocity terms when U1 is in compression for the link property. This item applies for nonlinear analyses.

Value Rate

Rate(0) U1, not used

Rate(1) U2 [s/L]

Rate(2) U3 [s/L]

Rate(3) R1, not used

Rate(4) R2, not used

Rate(5) R3, not used

Note that this item is applicable only for degrees of freedom U2 and U3. For those degrees of freedom, the term Fast(n) applies only when DOF(n) = True, Fixed(n) = False, and Nonlinear(n) = True.

Radius

Type: SystemDouble

This is an array of the radius of the sliding contact surface terms for the link property. Inputting 0 means there is an infinite radius, that is, the slider is flat. This item applies for nonlinear analyses.

Value Radius

Radius(0) U1, not used

Radius(1) U2 [L]

Radius(2) U3 [L]

Radius(3) R1, not used

Radius(4) R2, not used

Radius(5) R3, not used

Note that this item is applicable only for degrees of freedom U2 and U3. For those degrees of freedom, the term Fast(n) applies only when DOF(n) = True, Fixed(n) = False, and Nonlinear(n) = True.

SlowT

Type: SystemDouble

This is an array of the friction coefficient at zero velocity terms when U1 is in tension for the link property. This coefficient applies for nonlinear analyses.

Value Slow

SlowT(0) U1, not used

SlowT(1) U2

SlowT(2) U3

SlowT(3) R1, not used

SlowT(4) R2, not used

SlowT(5) R3, not used

Note that this item is applicable only for degrees of freedom U2 and U3. For those degrees of freedom, the term SlowT(n) applies only when DOF(n) = True, Fixed(n) = False, and Nonlinear(n) = True.

FastT

Type: SystemDouble

This is an array of the friction coefficient at fast velocity terms when U1 is in tension for the link property. This coefficient applies for nonlinear analyses.

Value Fast

FastT(0) U1, not used

FastT(1) U2

FastT(2) U3

FastT(3) R1, not used

FastT(4) R2, not used

FastT(5) R3, not used

Note that this item is applicable only for degrees of freedom U2 and U3. For those degrees of freedom, the term FastT(n) applies only when DOF(n) = True, Fixed(n) = False, and Nonlinear(n) = True.

RateT

Type: SystemDouble

This is an array of the inverse of the characteristic sliding velocity terms when U1 is in tension for the link property. This item applies for nonlinear analyses.

Value Rate

RateT(0) U1, not used

RateT(1) U2 [s/L]

RateT(2) U3 [s/L]

RateT(3) R1, not used

RateT(4) R2, not used

RateT(5) R3, not used

Note that this item is applicable only for degrees of freedom U2 and U3. For those degrees of freedom, the term RateT(n) applies only when DOF(n) = True, Fixed(n) = False, and Nonlinear(n) = True.

Kt

Type: SystemDouble

The axial translational tension stiffness for the U1 degree of freedom. This item applies for nonlinear analyses. [F/L]

Dis

Type: SystemDouble

The U1 degree of freedom gap opening for compression. This item applies for nonlinear analyses. [L]

Dist

Type: SystemDouble

The U1 degree of freedom gap opening for tension. This item applies for nonlinear analyses. [L]

Damping

Type: SystemDouble

This is the nonlinear damping coefficient used for the axial translational degree of freedom, U1. This item applies for nonlinear analyses. [F/L]

DJ2

Type: SystemDouble

The distance from the J-End of the link to the U2 shear spring. This item applies only when DOF(1) = True. [L]

DJ3

Type: SystemDouble

The distance from the J-End of the link to the U3 shear spring. This item applies only when DOF(2) = True. [L]

Notes

Type: SystemString

The notes, if any, assigned to the property.

GUID

Type: SystemString

The GUID (global unique identifier), if any, assigned to the property.

Return ValueType: Int32

Returns zero if the property is successfully retrieved; otherwise it returns a nonzero value.

CSI API ETABS v1

cPropLinkAddLanguageSpecificTextSet("LST6F93598D_0") Method

Retrieves the property type for the specified link property.

Namespace: ETABSv1

Assembly: ETABSv1 (in ETABSv1.dll) Version: 1.0.0.0 (1.24.0.0)

Syntax

C#

VB

C++

F#

Copy

```
int GetType0API(
    string Name,
    ref eLinkPropType PropType
)
```

```
Function GetType0API (
    Name As String,
    ByRef PropType As eLinkPropType
) As Integer
```

```
Dim instance As cPropLink
Dim Name As String
Dim PropType As eLinkPropType
Dim returnValue As Integer
```

```
returnValue = instance.GetType0API(Name,
    PropType)
```

```
int GetType0API(
    String^ Name,
    eLinkPropType% PropType
)
```

```
abstract GetType0API :
    Name : string *
    PropType : eLinkPropType byref -> int
```

Parameters

Name

Type: SystemString

The name of an existing link property.

PropType

Type: ETABSv1eLinkPropType

This is one of the items in the eLinkPropType enumeration.

Return ValueType: $\hat{A}$ Int32

Returns zero if the type is successfully retrieved; otherwise it returns nonzero.

▲ Remarks

▲ Examples

VB

Copy

```
Public Sub Example()
    Dim SapModel As cSapModel
    Dim EtabsObject As cOAPI
    Dim ret As Integer = -1
    Dim DOF() As Boolean
    Dim Fixed() As Boolean
    Dim Ke() As Double
    Dim Ce() As Double
    Dim PropType As eLinkPropType

    'create ETABS object
    Dim myHelper as cHelper = New Helper
    EtabsObject = myHelper.CreateObjectProgID("CSI.ETABS.API.ETABSObject")

    'start ETABS application
    ret = EtabsObject.ApplicationStart()

CSI API ETABS v1

cPropLinkAddLanguageSpecificTextSet("LSTB86F4B20_0") Method

Assigns weight and mass data to a link property.

Namespace: [ETABSV1](#)

Assembly: [ETABSV1](#) (in ETABSV1.dll) Version: 1.0.0.0 (1.24.0.0)

■ Syntax

[C#](#)

[VB](#)

[C++](#)

[F#](#)

[Copy](#)

```
int GetWeightAndMass(
    string Name,
    ref double W,
    ref double M,
    ref double R1,
    ref double R2,
    ref double R3
)
```

```
Function GetWeightAndMass (
    Name As String,
    ByRef W As Double,
    ByRef M As Double,
    ByRef R1 As Double,
    ByRef R2 As Double,
    ByRef R3 As Double
) As Integer
```

```
Dim instance As cPropLink
Dim Name As String
Dim W As Double
Dim M As Double
Dim R1 As Double
Dim R2 As Double
Dim R3 As Double
Dim returnValue As Integer
```

```
returnValue = instance.GetWeightAndMass(Name,
    W, M, R1, R2, R3)
```

```
int GetWeightAndMass(
    String^ Name,
    double% W,
    double% M,
    double% R1,
    double% R2,
    double% R3
)
```

```
abstract GetWeightAndMass :
    Name : string *
```

cPropLinkspan id="LSTB86F4B20_0"AddLanguageSpecificTextSet("LSTB86F4B20_0?cpp=::|rsid=3292;GetWe

```

W : float byref *
M : float byref *
R1 : float byref *
R2 : float byref *
R3 : float byref -> int

```

Parameters

Name

Type:Â SystemString
The name of an existing link property.

W

Type:Â SystemDouble
The weight of the link. [F]

M

Type:Â SystemDouble
The translational mass of the link. [M]

R1

Type:Â SystemDouble
The rotational inertia of the link about its local 1 axis. [ML2]

R2

Type:Â SystemDouble
The rotational inertia of the link about its local 2 axis. [ML2]

R3

Type:Â SystemDouble
The rotational inertia of the link about its local 3 axis. [ML2]

Return Value

Type:Â Int32

returns zero if the data is successfully assigned; otherwise it returns a nonzero value.

▲Remarks

Dim returnValue As Integer
```

```
returnValue = instance.SetAcceptanceCriteria(Name,
    AcceptanceType, Symmetric, Active,
```

IOPos, LSPos, CPPos, IONeg, LSNeg, CPNeg)

```
int SetAcceptanceCriteria(
String^ Name,
int AcceptanceType,
bool Symmetric,
array<bool>^% Active,
array<double>^% IOPos,
array<double>^% LSPos,
array<double>^% CPPos,
array<double>^% IONeg,
array<double>^% LSNeg,
array<double>^% CPNeg
)
```

```
abstract SetAcceptanceCriteria :
    Name : string *
    AcceptanceType : int *
    Symmetric : bool *
    Active : bool[] byref *
    IOPos : float[] byref *
    LSPos : float[] byref *
    CPPos : float[] byref *
    IONeg : float[] byref *
    LSNeg : float[] byref *
    CPNeg : float[] byref -> int
```

Parameters

Name

Type:Â SystemString

The name of an existing link property

AcceptanceType

Type:Â SystemInt32

This item is either 1 or 2. 1 means Force and 2 means Displacement.

Symmetric

Type:Â SystemBoolean

Indicates if the acceptance criteria is symmetric, that is, the negative values are the same as the positive values.

Active

Type:Â SystemBoolean

This is an array dimensioned to 5 indicating if the acceptance criteria is active for each. Items 0 thru 5 in the array refer to F1, F2, F3, M1, M2, M3 or U1, U2, U3, R1, R2, R3, respectively.

IOPos

Type:Â SystemDouble

This is an array dimensioned to 5 indicating the positive immediate occupancy acceptance criteria values for each DOF. Items 0 thru 5 in the array refer to F1, F2, F3, M1, M2, M3 or U1, U2, U3, R1, R2, R3, respectively.

LSPos

Type:Â SystemDouble

This is an array dimensioned to 5 indicating the positive life safety acceptance criteria values for each DOF. Items 0 thru 5 in the array refer to F1, F2, F3, M1, M2, M3 or U1, U2, U3, R1, R2, R3, respectively.

CPPosType: SystemDouble

This is an array dimensioned to 5 indicating the positive collapse prevention acceptance criteria values for each DOF. Items 0 thru 5 in the array refer to F1, F2, F3, M1, M2, M3 or U1, U2, U3, R1, R2, R3, respectively.

IONegType: SystemDouble

This is an array dimensioned to 5 indicating the negative immediate occupancy acceptance criteria values for each DOF. Items 0 thru 5 in the array refer to F1, F2, F3, M1, M2, M3 or U1, U2, U3, R1, R2, R3, respectively.

LSNegType: SystemDouble

This is an array dimensioned to 5 indicating the negative life safety acceptance criteria values for each DOF. Items 0 thru 5 in the array refer to F1, F2, F3, M1, M2, M3 or U1, U2, U3, R1, R2, R3, respectively.

CPNegType: SystemDouble

This is an array dimensioned to 5 indicating the negative collapse prevention acceptance criteria values for each DOF. Items 0 thru 5 in the array refer to F1, F2, F3, M1, M2, M3 or U1, U2, U3, R1, R2, R3, respectively.

Return ValueType: Int32

returns zero if the data is successfully retrieved; otherwise it returns a nonzero value.

    let _GUID = defaultArg GUID ""
*)
-> int

```

Parameters

Name

Type: SystemString

The name of an existing or new link property. If this is an existing property, that property is modified; otherwise, a new property is added

DOF

Type: SystemBoolean

This is a boolean array, dimensioned to 5, indicating if properties exist for a specified degree of freedom.

Value DOF

DOF(0) U1
 DOF(1) U2
 DOF(2) U3
 DOF(3) R1
 DOF(4) R2
 DOF(5) R3

Fixed

Type: SystemBoolean

This is a boolean array, dimensioned to 5, indicating if the specified degree of freedom is fixed (restrained).

Value	Fixity
--------------	---------------

Fixed(0) U1	fixity if DOF(0) = True
-------------	-------------------------

Fixed(1) U2	fixity if DOF(1) = True
-------------	-------------------------

Fixed(2) U3	fixity if DOF(2) = True
-------------	-------------------------

Fixed(3) R1	fixity if DOF(3) = True
-------------	-------------------------

Fixed(4) R2	fixity if DOF(4) = True
-------------	-------------------------

Fixed(5) R3	fixity if DOF(5) = True
-------------	-------------------------

The term Fixed(n) applies only when DOF(n) = True.

Nonlinear

Type: SystemBoolean

This is a boolean array, dimensioned to 5, indicating if nonlinear properties exist for a specified degree of freedom.

Value	Nonlinear
--------------	------------------

Nonlinear(0) U1	has nonlinear properties
-----------------	--------------------------

Nonlinear(1) U2	has nonlinear properties
-----------------	--------------------------

Nonlinear(2) U3	has nonlinear properties
-----------------	--------------------------

Nonlinear(3) R1	has nonlinear properties
-----------------	--------------------------

Nonlinear(4) R2	has nonlinear properties
-----------------	--------------------------

Nonlinear(5) R3	has nonlinear properties
-----------------	--------------------------

The term Nonlinear(n) applies only when DOF(n) = True and Fixed(n) = False.

Ke

Type: SystemDouble

This is an array of effective stiffness terms for the link property. The effective stiffness applies for linear analyses.

Value Stiffness

Ke(0) U1	[F/L]
----------	-------

Ke(1) U2	[F/L]
----------	-------

Ke(2) U3	[F/L]
----------	-------

Ke(3) R1	[FL]
----------	------

Ke(4) R2	[FL]
----------	------

Ke(5) R3	[FL]
----------	------

The term ke(n) applies only when DOF(n) = True and Fixed(n) = False.

Ce

Type: SystemDouble

This is an array of effective damping terms for the link property. The effective

stiffness applies for linear analyses.

Value Damping

Ce(0) U1 [F/L]

Ce(1) U2 [F/L]

Ce(2) U3 [F/L]

Ce(3) R1 [FL]

Ce(4) R2 [FL]

Ce(5) R3 [FL]

The term ce(n) applies only when DOF(n) = True and Fixed(n) = False.

K

Type: SystemDouble

This is an array of initial stiffness terms for the link property. The initial stiffness applies for nonlinear analyses.

Value Stiffness

K(0) U1 [F/L]

K(1) U2 [F/L]

K(2) U3 [F/L]

K(3) R1 [FL]

K(4) R2 [FL]

K(5) R3 [FL]

The term k(n) applies only when DOF(n) = True, Fixed(n) = False, and Nonlinear(n) = True.

C

Type: SystemDouble

This is an array of nonlinear damping coefficient terms for the link property. The nonlinear damping coefficient applies for nonlinear analyses.

Value Damping

C(0) U1 [F/(L^{cexp})]

C(1) U2 [F/(L^{cexp})]

C(2) U3 [F/(L^{cexp})]

C(3) R1 [FL]

C(4) R2 [FL]

C(5) R3 [FL]

The term c(n) applies only when DOF(n) = True, Fixed(n) = False, and Nonlinear(n) = True.

CExp

Type: SystemDouble

This is an array of the nonlinear damping exponent terms. The nonlinear damping exponent applies for nonlinear analyses. It is applied to the velocity across the damper in the equation of motion.

Value CExp

cexp(0) U1

cexp(1) U2

cexp(2) U3

cexp(3) R1

cexp(4) R2

cexp(5) R3

The term cexp(n) applies only when DOF(n) = True, Fixed(n) = False, and Nonlinear(n) = True.

DJ2

Type:Â SystemDouble

The distance from the J-End of the link to the U2 shear spring. This item applies only when DOF(1) = True. [L]

DJ3

Type:Â SystemDouble

The distance from the J-End of the link to the U3 shear spring. This item applies only when DOF(2) = True. [L]

Notes (Optional)

Type:Â SystemString

The notes, if any, assigned to the property.

GUID (Optional)

Type:Â SystemString

The GUID (global unique identifier), if any, assigned to the property. If this item is input as Default, the program assigns a GUID to the property.

Return Value

Type:Â Int32

Returns zero if the property is successfully initialized; otherwise it returns a nonzero value.

CSI API ETABS v1

cPropLinkAddLanguageSpecificTextSet("LSTF362BD1E_0?cpp=::|00#2");SetFrictionIsolator

Method

Initializes a friction isolator-type link property. If this function is called for an existing link property, all items for the property are reset to their default value.

Namespace: [ETABSv1](#)

Assembly: [ETABSv1](#) (in ETABSv1.dll) Version: 1.0.0.0 (1.24.0.0)

Syntax

[C#](#)

[VB](#)

[C++](#)

[F#](#)

[Copy](#)

```
int SetFrictionIsolator(
    string Name,
    ref bool[] DOF,

```

cPropLinkspan id="LSTF362BD1E_0"AddLanguageSpecificTextSet("LSTF362BD1E_0?cpp=::|0013");SetFr

-> int

Parameters

Name

Type:Â SystemString

The name of an existing or new link property. If this is an existing property, that property is modified; otherwise, a new property is added

DOF

Type:Â SystemBoolean

This is a boolean array, dimensioned to 5, indicating if properties exist for a specified degree of freedom.

Value DOF

DOF(0) U1

DOF(1) U2

DOF(2) U3

DOF(3) R1

DOF(4) R2

DOF(5) R3

Fixed

Type:Â SystemBoolean

This is a boolean array, dimensioned to 5, indicating if the specified degree of freedom is fixed (restrained).

Value Fixity

Fixed(0) U1 fixity if DOF(0) = True

Fixed(1) U2 fixity if DOF(1) = True

Fixed(2) U3 fixity if DOF(2) = True

Fixed(3) R1 fixity if DOF(3) = True

Fixed(4) R2 fixity if DOF(4) = True

Fixed(5) R3 fixity if DOF(5) = True

Nonlinear

Type:Â SystemBoolean

This is a boolean array, dimensioned to 5, indicating if nonlinear properties exist for a specified degree of freedom.

Value Nonlinear

Nonlinear(0) U1 has nonlinear properties

Nonlinear(1) U2 has nonlinear properties

Nonlinear(2) U3 has nonlinear properties

Nonlinear(3) R1, not used

Nonlinear(4) R2, not used

Nonlinear(5) R3, not used

Note that this item is applicable only for degrees of freedom U1, U2 and U3. For those degrees of freedom, the term Nonlinear(n) applies only when DOF(n) = True and Fixed(n) = False.

Ke

Type:Â SystemDouble

This is an array of effective stiffness terms for the link property. The effective stiffness applies for linear analyses.

Value Stiffness

Ke(0) U1 [F/L]

Ke(1) U2 [F/L]

Ke(2) U3 [F/L]

Ke(3) R1 [FL]

Ke(4) R2 [FL]

Ke(5) R3 [FL]

The term ke(n) applies only when DOF(n) = True and Fixed(n) = False.

Ce

Type: SystemDouble

This is an array of effective damping terms for the link property. The effective stiffness applies for linear analyses.

Value Damping

Ce(0) U1 [F/L]

Ce(1) U2 [F/L]

Ce(2) U3 [F/L]

Ce(3) R1 [FL]

Ce(4) R2 [FL]

Ce(5) R3 [FL]

The term ce(n) applies only when DOF(n) = True and Fixed(n) = False.

K

Type: SystemDouble

This is an array of initial stiffness terms for the link property. The initial stiffness applies for nonlinear analyses.

Value Stiffness

K(0) U1 [F/L]

K(1) U2 [F/L]

K(2) U3 [F/L]

K(3) R1, not used

K(4) R2, not used

K(5) R3, not used

Note that this item is applicable only for degrees of freedom U1, U2 and U3. For those degrees of freedom, the term k(n) applies only when DOF(n) = True, Fixed(n) = False, and Nonlinear(n) = True.

Slow

Type: SystemDouble

This is an array of the friction coefficient at zero velocity terms for the link property. This coefficient applies for nonlinear analyses.

Value Slow

Slow(0) U1, not used

Slow(1) U2

Slow(2) U3

Slow(3) R1, not used

Slow(4) R2, not used

Slow(5) R3, not used

Note that this item is applicable only for degrees of freedom U2 and U3. For those degrees of freedom, the term Slow(n) applies only when DOF(n) = True, Fixed(n) = False, and Nonlinear(n) = True.

Fast

Type: SystemDouble

This is an array of the friction coefficient at fast velocity terms for the link property. This coefficient applies for nonlinear analyses.

Value Fast

Fast(0) U1, not used

Fast(1) U2

Fast(2) U3

Fast(3) R1, not used

Fast(4) R2, not used

Fast(5) R3, not used

Note that this item is applicable only for degrees of freedom U2 and U3. For those degrees of freedom, the term Fast(n) applies only when DOF(n) = True, Fixed(n) = False, and Nonlinear(n) = True.

Rate

Type: SystemDouble

This is an array of the inverse of the characteristic sliding velocity terms for the link property. This item applies for nonlinear analyses.

Value Rate

Rate(0) U1, not used

Rate(1) U2 [s/L]

Rate(2) U3 [s/L]

Rate(3) R1, not used

Rate(4) R2, not used

Rate(5) R3, not used

Note that this item is applicable only for degrees of freedom U2 and U3. For those degrees of freedom, the term Rate(n) applies only when DOF(n) = True, Fixed(n) = False, and Nonlinear(n) = True.

Radius

Type: SystemDouble

This is an array of the radius of the sliding contact surface terms for the link property. Inputting 0 means there is an infinite radius, that is, the slider is flat. This item applies for nonlinear analyses.

Value Radius

Radius(0) U1, not used

Radius(1) U2 [L]

Radius(2) U3 [L]

Radius(3) R1, not used

Radius(4) R2, not used

Radius(5) R3, not used

Introduction

Note that this item is applicable only for degrees of freedom U2 and U3. For those degrees of freedom, the term Fast(n) applies only when DOF(n) = True, Fixed(n) = False, and Nonlinear(n) = True.

Damping

Type: SystemDouble

This is the nonlinear damping coefficient used for the axial translational degree of freedom, U1. This item applies for nonlinear analyses. [F/L]

DJ2

Type: SystemDouble

The distance from the J-End of the link to the U2 shear spring. This item applies only when DOF(1) = True. [L]

DJ3

Type: SystemDouble

The distance from the J-End of the link to the U3 shear spring. This item applies only when DOF(2) = True. [L]

Notes (Optional)

Type: SystemString

The notes, if any, assigned to the property.

GUID (Optional)

Type: SystemString

The GUID (global unique identifier), if any, assigned to the property. If this item is input as Default, the program assigns a GUID to the property.

Return Value

Type: Int32

Returns zero if the property is successfully initialized; otherwise it returns a nonzero value.

Remarks

Examples

VB

Copy

```
Public Sub Example()  
    Dim SapModel As cSapModel

-> int

```

Parameters

Name

Type: SystemString

The name of an existing or new link property. If this is an existing property, that property is modified; otherwise, a new property is added

DOF

Type: SystemBoolean

This is a boolean array, dimensioned to 5, indicating if properties exist for a specified degree of freedom.

Value DOF

DOF(0) U1

DOF(1) U2

DOF(2) U3

DOF(3) R1

DOF(4) R2

DOF(5) R3

FixedType: SystemBoolean

This is a boolean array, dimensioned to 5, indicating if the specified degree of freedom is fixed (restrained).

Value	Fixity
--------------	---------------

Fixed(0) U1 fixity if DOF(0) = True

Fixed(1) U2 fixity if DOF(1) = True

Fixed(2) U3 fixity if DOF(2) = True

Fixed(3) R1 fixity if DOF(3) = True

Fixed(4) R2 fixity if DOF(4) = True

Fixed(5) R3 fixity if DOF(5) = True

NonlinearType: SystemBoolean

This is a boolean array, dimensioned to 5, indicating if nonlinear properties exist for a specified degree of freedom.

Value	Nonlinear
--------------	------------------

Nonlinear(0) U1 has nonlinear properties

Nonlinear(1) U2 has nonlinear properties

Nonlinear(2) U3 has nonlinear properties

Nonlinear(3) R1 has nonlinear properties

Nonlinear(4) R2 has nonlinear properties

Nonlinear(5) R3 has nonlinear properties

The term Nonlinear(n) applies only when DOF(n) = True and Fixed(n) = False.

KeType: SystemDouble

This is an array of effective stiffness terms for the link property. The effective stiffness applies for linear analyses.

Value Stiffness

Ke(0) U1 [F/L]

Ke(1) U2 [F/L]

Ke(2) U3 [F/L]

Ke(3) R1 [FL]

Ke(4) R2 [FL]

Ke(5) R3 [FL]

The term ke(n) applies only when DOF(n) = True and Fixed(n) = False.

CeType: SystemDouble

This is an array of effective damping terms for the link property. The effective stiffness applies for linear analyses.

Value Damping

Ce(0) U1 [F/L]

Ce(1) U2 [F/L]

Ce(2) U3 [F/L]

Ce(3) R1 [FL]

Ce(4) R2 [FL]

Ce(5) R3 [FL]

The term ce(n) applies only when DOF(n) = True and Fixed(n) = False.

K

Type: SystemDouble

This is an array of initial stiffness terms for the link property. The initial stiffness applies for nonlinear analyses.

Value Stiffness

K(0) U1 [F/L]

K(1) U2 [F/L]

K(2) U3 [F/L]

K(3) R1 [FL]

K(4) R2 [FL]

K(5) R3 [FL]

The term k(n) applies only when DOF(n) = True, Fixed(n) = False, and Nonlinear(n) = True.

Dis

Type: SystemDouble

This is an array of initial gap opening terms for the link property. The initial gap opening applies for nonlinear analyses.

Value Dis

dis(0) U1 [L]

dis(1) U2 [L]

dis(2) U3 [L]

dis(3) R1 [rad]

dis(4) R2 [rad]

dis(5) R3 [rad]

The term dis(n) applies only when DOF(n) = True, Fixed(n) = False, and Nonlinear(n) = True.

DJ2

Type: SystemDouble

The distance from the J-End of the link to the U2 shear spring. This item applies only when DOF(1) = True. [L]

DJ3

Type: SystemDouble

The distance from the J-End of the link to the U3 shear spring. This item applies only when DOF(2) = True. [L]

Notes (Optional)

Type: SystemString

The notes, if any, assigned to the property.

GUID (Optional)

Type: SystemString

The GUID (global unique identifier), if any, assigned to the property. If this item is input as Default, the program assigns a GUID to the property.

Return ValueType: Int32

Returns zero if the property is successfully initialized; otherwise it returns a nonzero value

▲ Remarks

▲ Examples

VB

Copy

```
Public Sub Example()
    Dim SapModel As cSapModel
    Dim EtabsObject As cOAPI
    Dim ret As Integer = -1
    Dim MyDOF() As Boolean
    Dim MyFixed() As Boolean
    Dim MyNonLinear() As Boolean
    Dim MyKe() As Double
    Dim MyCe() As Double
    Dim MyK() As Double
    Dim MyDis() As Double

    'create ETABS object
    Dim myHelper as cHelper = New Helper
    EtabsObject = myHelper.CreateObjectProgID("CSI.ETABS.API.ETABSObject")

    'start ETABS application
    ret = EtabsObject.ApplicationStart()

    'create SapModel object
    SapModel = EtabsObject.SapModel

    'initialize model
    ret = SapModel.InitializeNewModel()

    'create steel deck template model
    ret = SapModel.File.NewSteelDeck(4,12,12,4,4,24,24)

    'add link property
    ReDim MyDOF(5)
    ReDim MyFixed(5)
    ReDim MyNonLinear(5)

-> int
```

Parameters

Name

Type:Â SystemString

The name of an existing or new link property. If this is an existing property, that property is modified; otherwise, a new property is added

DOF

Type:Â SystemBoolean

This is a boolean array, dimensioned to 5, indicating if properties exist for a specified degree of freedom.

Value DOF

DOF(0) U1

DOF(1) U2

DOF(2) U3

DOF(3) R1

DOF(4) R2

DOF(5) R3

FixedType: SystemBoolean

This is a boolean array, dimensioned to 5, indicating if the specified degree of freedom is fixed (restrained).

Value	Fixity
--------------	---------------

Fixed(0) U1 fixity if DOF(0) = True

Fixed(1) U2 fixity if DOF(1) = True

Fixed(2) U3 fixity if DOF(2) = True

Fixed(3) R1 fixity if DOF(3) = True

Fixed(4) R2 fixity if DOF(4) = True

Fixed(5) R3 fixity if DOF(5) = True

NonlinearType: SystemBoolean

This is a boolean array, dimensioned to 5, indicating if nonlinear properties exist for a specified degree of freedom.

Value	Nonlinear
--------------	------------------

Nonlinear(0) U1 has nonlinear properties

Nonlinear(1) U2 has nonlinear properties

Nonlinear(2) U3 has nonlinear properties

Nonlinear(3) R1 has nonlinear properties

Nonlinear(4) R2 has nonlinear properties

Nonlinear(5) R3 has nonlinear properties

The term Nonlinear(n) applies only when DOF(n) = True and Fixed(n) = False.

KeType: SystemDouble

This is an array of effective stiffness terms for the link property. The effective stiffness applies for linear analyses.

Value Stiffness

Ke(0) U1 [F/L]

Ke(1) U2 [F/L]

Ke(2) U3 [F/L]

Ke(3) R1 [FL]

Ke(4) R2 [FL]

Ke(5) R3 [FL]

The term ke(n) applies only when DOF(n) = True and Fixed(n) = False.

CeType: SystemDouble

This is an array of effective damping terms for the link property. The effective stiffness applies for linear analyses.

Value Damping

Ce(0) U1 [F/L]

Ce(1) U2 [F/L]

Ce(2) U3 [F/L]

Ce(3) R1 [FL]

Ce(4) R2 [FL]

Ce(5) R3 [FL]

The term ce(n) applies only when DOF(n) = True and Fixed(n) = False.

K

Type: SystemDouble

This is an array of initial stiffness terms for the link property. The initial stiffness applies for nonlinear analyses.

Value Stiffness

K(0) U1 [F/L]

K(1) U2 [F/L]

K(2) U3 [F/L]

K(3) R1 [FL]

K(4) R2 [FL]

K(5) R3 [FL]

The term k(n) applies only when DOF(n) = True, Fixed(n) = False, and Nonlinear(n) = True.

Dis

Type: SystemDouble

This is an array of initial hook opening terms for the link property. The initial hook opening applies for nonlinear analyses.

Value Dis

dis(0) U1 [L]

dis(1) U2 [L]

dis(2) U3 [L]

dis(3) R1 [rad]

dis(4) R2 [rad]

dis(5) R3 [rad]

The term dis(n) applies only when DOF(n) = True, Fixed(n) = False, and Nonlinear(n) = True.

DJ2

Type: SystemDouble

The distance from the J-End of the link to the U2 shear spring. This item applies only when DOF(1) = True. [L]

DJ3

Type: SystemDouble

The distance from the J-End of the link to the U3 shear spring. This item applies only when DOF(2) = True. [L]

Notes (Optional)

Type: SystemString

The notes, if any, assigned to the property.

GUID (Optional)

Type: SystemString

The GUID (global unique identifier), if any, assigned to the property. If this item is input as Default, the program assigns a GUID to the property.

Return ValueType: Int32

Returns zero if the property is successfully initialized; otherwise it returns a nonzero value

)  
-> int
```

Parameters

Name

Type:Â SystemString

The name of an existing or new link property. If this is an existing property, that property is modified; otherwise, a new property is added.

DOF

Type:Â SystemBoolean

This is a boolean array, dimensioned to 5, indicating if properties exist for a specified degree of freedom.

Value DOF

DOF(0) U1

DOF(1) U2

DOF(2) U3

DOF(3) R1

DOF(4) R2

DOF(5) R3

Fixed

Type: SystemBoolean

This is a boolean array, dimensioned to 5, indicating if the specified degree of freedom is fixed (restrained).

Value	Fixity
--------------	---------------

Fixed(0) U1 fixity if DOF(0) = True

Fixed(1) U2 fixity if DOF(1) = True

Fixed(2) U3 fixity if DOF(2) = True

Fixed(3) R1 fixity if DOF(3) = True

Fixed(4) R2 fixity if DOF(4) = True

Fixed(5) R3 fixity if DOF(5) = True

The term Fixed(n) applies only when DOF(n) = True

Ke

Type: SystemDouble

This is an array of stiffness terms for the link property. There are 6 terms in the array if the stiffness is uncoupled and 21 if it is coupled. The KeCoupled item indicates if the stiffness is coupled.

If the stiffness is uncoupled:

Value	Stiffness
--------------	------------------

Ke(0) U1 [F/L]

Ke(1) U2 [F/L]

Ke(2) U3 [F/L]

Ke(3) R1 [FL]

Ke(4) R2 [FL]

Ke(5) R3 [FL]

If the stiffness is coupled:

Value	Stiffness
--------------	------------------

Ke(0) U1U1 [F/L]

Ke(1) U1U2 [F/L]

Ke(2) U2U2 [F/L]

Ke(3) U1U3 [F/L]

Ke(4) U2U3 [F/L]

Ke(5) U3U3 [F/L]

Ke(6) U1R1 [F]

Ke(7) U2R1 [F]

Ke(8) U3R1 [F]

Ke(9) R1R1 [FL]

Ke(10) U1R2 [F]

Ke(11) U2R2 [F]

Ke(12) U3R2 [F]

Ke(14) R2R2 [FL]
 Ke(15) U1R3 [F]
 Ke(16) U2R3 [F]
 Ke(17) U3R3 [F]
 Ke(18) R1R3 [FL]
 Ke(19) R2R3 [FL]
 Ke(20) R3R3 [FL]

Ce

Type: SystemDouble

This is an array of damping terms for the link property. There are 6 terms in the array if the damping is uncoupled and 21 if it is coupled. The CeCoupled item indicates if the damping is coupled.

If the damping is uncoupled:

Value Damping

Ce(0) U1 [F/L]
 Ce(1) U2 [F/L]
 Ce(2) U3 [F/L]
 Ce(3) R1 [FL]
 Ce(4) R2 [FL]
 Ce(5) R3 [FL]

If the damping is coupled:

Value Damping

Ce(0) U1U1 [F/L]
 Ce(1) U1U2 [F/L]
 Ce(2) U2U2 [F/L]
 Ce(3) U1U3 [F/L]
 Ce(4) U2U3 [F/L]
 Ce(5) U3U3 [F/L]
 Ce(6) U1R1 [F]
 Ce(7) U2R1 [F]
 Ce(8) U3R1 [F]
 Ce(9) R1R1 [FL]
 Ce(10) U1R2 [F]
 Ce(11) U2R2 [F]
 Ce(12) U3R2 [F]
 Ce(14) R2R2 [FL]
 Ce(15) U1R3 [F]
 Ce(16) U2R3 [F]
 Ce(17) U3R3 [F]
 Ce(18) R1R3 [FL]

Ce(19) R2R3 [FL]

Ce(20) R3R3 [FL]

DJ2

Type:Â SystemDouble

The distance from the J-End of the link to the U2 shear spring. This item applies only when DOF(1) = True. [L]

DJ3

Type:Â SystemDouble

The distance from the J-End of the link to the U3 shear spring. This item applies only when DOF(2) = True. [L]

KeCoupled (Optional)

Type:Â SystemBoolean

This item is True if the link stiffness, Ke, is coupled. There are 21 terms in the Ke array if Ke is coupled; otherwise there are 6 terms

CeCoupled (Optional)

Type:Â SystemBoolean

This item is True if the link damping, Ce, is coupled. There are 21 terms in the Ce array if Ce is coupled; otherwise there are 6 terms

Notes (Optional)

Type:Â SystemString

The notes, if any, assigned to the property.

GUID (Optional)

Type:Â SystemString

The GUID (global unique identifier), if any, assigned to the property. If this item is input as Default, the program assigns a GUID to the property.

Return Value

Type:Â Int32

returns zero if the property is successfully initialized; otherwise it returns a nonzero value.

The name of an existing or new link property. If this is an existing property, that property is modified; otherwise, a new property is added

DOF

Type: SystemBoolean

This is a boolean array, dimensioned to 5, indicating if properties exist for a specified degree of freedom.

Value DOF

DOF(0) U1

DOF(1) U2

DOF(2) U3

DOF(3) R1

DOF(4) R2

DOF(5) R3

Fixed

Type: SystemBoolean

This is a boolean array, dimensioned to 5, indicating if the specified degree of freedom is fixed (restrained).

Value	Fixity
--------------	---------------

Fixed(0) U1 fixity if DOF(0) = True

Fixed(1) U2 fixity if DOF(1) = True

Fixed(2) U3 fixity if DOF(2) = True

Fixed(3) R1 fixity if DOF(3) = True

Fixed(4) R2 fixity if DOF(4) = True

Fixed(5) R3 fixity if DOF(5) = True

The term Fixed(n) applies only when DOF(n) = True.

NonlinearType: SystemBoolean

This is a boolean array, dimensioned to 5, indicating if nonlinear properties exist for a specified degree of freedom.

Value	Nonlinear
--------------	------------------

Nonlinear(0) U1 has nonlinear properties

Nonlinear(1) U2 has nonlinear properties

Nonlinear(2) U3 has nonlinear properties

Nonlinear(3) R1 has nonlinear properties

Nonlinear(4) R2 has nonlinear properties

Nonlinear(5) R3 has nonlinear properties

The term Nonlinear(n) applies only when DOF(n) = True and Fixed(n) = False.

KeType: SystemDouble

This is an array of effective stiffness terms for the link property. The effective stiffness applies for linear analyses.

Value Stiffness

Ke(0) U1 [F/L]

Ke(1) U2 [F/L]

Ke(2) U3 [F/L]

Ke(3) R1 [FL]

Ke(4) R2 [FL]

Ke(5) R3 [FL]

The term ke(n) applies only when DOF(n) = True and Fixed(n) = False.

CeType: SystemDouble

This is an array of effective damping terms for the link property. The effective stiffness applies for linear analyses.

Value Damping

Ce(0) U1 [F/L]

Ce(1) U2 [F/L]

Ce(2) U3 [F/L]

Ce(3) R1 [FL]

Ce(4) R2 [FL]

Ce(5) R3 [FL]

The term ce(n) applies only when DOF(n) = True and Fixed(n) = False.

DJ2

Type: SystemDouble

The distance from the J-End of the link to the U2 shear spring. This item applies only when DOF(1) = True. [L]

DJ3

Type: SystemDouble

The distance from the J-End of the link to the U3 shear spring. This item applies only when DOF(2) = True. [L]

Notes (Optional)

Type: SystemString

The notes, if any, assigned to the property.

GUID (Optional)

Type: SystemString

The GUID (global unique identifier), if any, assigned to the property. If this item is input as Default, the program assigns a GUID to the property.

Return Value

Type: Int32

Returns zero if the property is successfully initialized; otherwise it returns a nonzero value.

▲ Remarks

▲ Examples

VB

Copy

```
Public Sub Example()
    Dim SapModel As cSapModel
    Dim EtabsObject As cOAPI
    Dim ret As Integer = -1
    Dim MyDOF() As Boolean
    Dim MyFixed() As Boolean
    Dim MyNonLinear() As Boolean
    Dim MyKe() As Double
    Dim MyCe() As Double

    'create ETABS object
    Dim myHelper as cHelper = New Helper
    EtabsObject = myHelper.CreateObjectProgID("CSI.ETABS.API.ETABSObject")

    'start ETABS application
    ret = EtabsObject.ApplicationStart()

    'create SapModel object
    SapModel = EtabsObject.SapModel

    'initialize model
    ret = SapModel.InitializeNewModel()

    'create steel deck template model
    ret = SapModel.File.NewSteelDeck(4,12,12,4,4,24,24)

    'add link property
    ReDim MyDOF(5)
    ReDim MyFixed(5)
    ReDim MyNonLinear(5)
    ReDim MyKe(5)
    ReDim MyCe(5)
```

Introduction

```
MyDOF(0) = True
MyKe(0) = 12
MyCe(0) = 0.01

MyDOF(1) = True
MyNonLinear(1) = True
MyKe(1) = 12
MyCe(1) = 0.01

MyDOF(2) = True
MyFixed(2) = True

ret = SapModel.PropLink.SetMultiLinearElastic("MLE1", MyDOF, MyFixed, MyNonLinear, MyKe, M

'close ETABS
  EtabsObject.ApplicationExit(False)

'clean up variables
  SapModel = Nothing
  EtabsObject = Nothing
End Sub
```

    ?Notes : string *
    ?GUID : string
(* Defaults:
    let _Notes = defaultArg Notes ""
    let _GUID = defaultArg GUID ""
*)
-> int
```

Parameters

Name

Type: SystemString

The name of an existing or new link property. If this is an existing property, that property is modified; otherwise, a new property is added

DOF

Type: SystemBoolean

This is a boolean array, dimensioned to 5, indicating if properties exist for a specified degree of freedom.

Value DOF

DOF(0) U1

DOF(1) U2

DOF(2) U3

DOF(3) R1

DOF(4) R2

DOF(5) R3

Fixed

Type: SystemBoolean

This is a boolean array, dimensioned to 5, indicating if the specified degree of freedom is fixed (restrained).

Value	Fixity
--------------	---------------

Fixed(0) U1 fixity if DOF(0) = True

Fixed(1) U2 fixity if DOF(1) = True

Fixed(2) U3 fixity if DOF(2) = True

Fixed(3) R1 fixity if DOF(3) = True

Fixed(4) R2 fixity if DOF(4) = True

Fixed(5) R3 fixity if DOF(5) = True

The term Fixed(n) applies only when DOF(n) = True.

NonlinearType: SystemBoolean

This is a boolean array, dimensioned to 5, indicating if nonlinear properties exist for a specified degree of freedom.

Value	Nonlinear
--------------	------------------

Nonlinear(0) U1 has nonlinear properties

Nonlinear(1) U2 has nonlinear properties

Nonlinear(2) U3 has nonlinear properties

Nonlinear(3) R1 has nonlinear properties

Nonlinear(4) R2 has nonlinear properties

Nonlinear(5) R3 has nonlinear properties

The term Nonlinear(n) applies only when DOF(n) = True and Fixed(n) = False.

KeType: SystemDouble

This is an array of effective stiffness terms for the link property. The effective stiffness applies for linear analyses.

Value Stiffness

Ke(0) U1 [F/L]

Ke(1) U2 [F/L]

Ke(2) U3 [F/L]

Ke(3) R1 [FL]

Ke(4) R2 [FL]

Ke(5) R3 [FL]

The term ke(n) applies only when DOF(n) = True and Fixed(n) = False.

CeType: SystemDouble

This is an array of effective damping terms for the link property. The effective stiffness applies for linear analyses.

Value Damping

Ce(0) U1 [F/L]

Ce(1) U2 [F/L]

Ce(2) U3 [F/L]

Ce(3) R1 [FL]

Ce(4) R2 [FL]

Ce(5) R3 [FL]

The term ce(n) applies only when DOF(n) = True and Fixed(n) = False.

DJ2

Type:Â SystemDouble

The distance from the J-End of the link to the U2 shear spring. This item applies only when DOF(1) = True. [L]

DJ3

Type:Â SystemDouble

The distance from the J-End of the link to the U3 shear spring. This item applies only when DOF(2) = True. [L]

Notes (Optional)

Type:Â SystemString

The notes, if any, assigned to the property.

GUID (Optional)

Type:Â SystemString

The GUID (global unique identifier), if any, assigned to the property. If this item is input as Default, the program assigns a GUID to the property.

Return Value

Type:Â Int32

Returns zero if the property is successfully initialized; otherwise it returns a nonzero value.

▲Remarks

▲Examples

VB

    let _B1 = defaultArg B1 0
    let _B2 = defaultArg B2 0
    let _Eta = defaultArg Eta 0
*)
-> int

```

Parameters

Name

Type: SystemString

The name of an existing multilinear elastic or multilinear plastic link property.

DOF

Type: SystemInt32

This is 1, 2, 3, 4, 5 or 6, indicating the degree of freedom to which the multilinear points apply.

Value DOF

1	U1
2	U2
3	U3
4	R1
5	R2

6 R3

NumberPointsType: SystemInt32

The number of force-deformation points for the specified degree of freedom.

FType: SystemDouble

This is an array, dimensioned to NumberPoints - 1, that includes the force at each point. When DOF is U1, U2 or U3, this is a force. When DOF is R1, R2 or R3, this is a moment. [F] if DOF is less than or equal to 3, and [FL] if DOF is greater than 3.

DType: SystemDouble

This is an array, dimensioned to NumberPoints - 1, that includes the displacement at each point. When DOF is U1, U2 or U3, this is a translation. When DOF is R1, R2 or R3, this is a rotation. [L] if DOF is less than or equal to 3, and [rad] if DOF is greater than 3.

MyType (Optional)Type: SystemInt32

This item applies only to multilinear plastic link properties. It is 1, 2 or 3, indicating the hysteresis type.

MyType Hysteresis Type

- 1 Kinematic
- 2 Takeda
- 3 Pivot

A1 (Optional)Type: SystemDouble

This item applies only to multilinear plastic link properties that have a pivot hysteresis type (MyType = 3). It is the Alpha1 hysteresis parameter.

A2 (Optional)Type: SystemDouble

This item applies only to multilinear plastic link properties that have a pivot hysteresis type (MyType = 3). It is the Alpha2 hysteresis parameter.

B1 (Optional)Type: SystemDouble

This item applies only to multilinear plastic link properties that have a pivot hysteresis type (MyType = 3). It is the Beta1 hysteresis parameter.

B2 (Optional)Type: SystemDouble

This item applies only to multilinear plastic link properties that have a pivot hysteresis type (MyType = 3). It is the Beta2 hysteresis parameter.

Eta (Optional)Type: SystemDouble

This item applies only to multilinear plastic link properties that have a pivot hysteresis type (MyType = 3). It is the Eta hysteresis parameter.

Return ValueType: Int32

Returns zero if the data is successfully assigned; otherwise it returns a nonzero value.

Remarks

Return Value

3350

To successfully apply this data to the indicated link property, the following conditions must be met:

1. The link property must be multilinear elastic or multilinear plastic.
2. The specified DOF must be active.
3. The specified DOF must not be fixed.
4. The specified DOF must be nonlinear.

Examples

VB

Copy

```
Public Sub Example()
    Dim SapModel As cSapModel
    Dim EtabsObject As cOAPI
    Dim ret As Integer = -1
    Dim MyDOF() As Boolean

CSI API ETABS v1

cPropLinkAddLanguageSpecificTextSet("LST9F8101300") Method

Assigns P-delta parameters to a link property.

Namespace: ETABSv1

Assembly: ETABSv1 (in ETABSv1.dll) Version: 1.0.0.0 (1.24.0.0)

Syntax

C#

VB

C++

F#

Copy

```
int SetPDelta(
    string Name,
    ref double[] Value
)
```

```
Function SetPDelta (
    Name As String,
    ByRef Value As Double()
) As Integer
```

```
Dim instance As cPropLink
Dim Name As String
Dim Value As Double()
Dim returnValue As Integer
```

```
returnValue = instance.SetPDelta(Name,
    Value)
```

```
int SetPDelta(
    String^ Name,
    array<double>^% Value
)
```

```
abstract SetPDelta :
    Name : string *
    Value : float[] byref -> int
```

Parameters

Name

Type: SystemString

The name of an existing link property.

Value

Type: SystemDouble

This is an array of P-delta parameters

Value

PDelta Parameter

Value(0) M2 P-delta to I-end of link as moment, M2I

Value(1) M2 P-delta to J-end of link as moment, M2J

Value(2) M3 P-delta to I-end of link as moment, M3I

Value(3) M3 P-delta to J-end of link as moment, M3J

Return Value

Type: Int32

Returns zero if the values are successfully assigned; otherwise it returns a nonzero value.

-> int

```

Parameters

Name

Type: SystemString

The name of an existing or new link property. If this is an existing property, that property is modified; otherwise, a new property is added.

DOF

Type: SystemBoolean

This is a boolean array, dimensioned to 5, indicating if properties exist for a specified degree of freedom.

Value DOF

DOF(0) U1

DOF(1) U2

DOF(2) U3

DOF(3) R1

DOF(4) R2

DOF(5) R3

Fixed

Type: SystemBoolean

This is a boolean array, dimensioned to 5, indicating if the specified degree of freedom is fixed (restrained).

Value Fixity

Fixed(0) U1 fixity if DOF(0) = True

Fixed(1) U2 fixity if DOF(1) = True

Fixed(2) U3 fixity if DOF(2) = True

Fixed(3) R1 fixity if DOF(3) = True

Fixed(4) R2 fixity if DOF(4) = True

Fixed(5) R3 fixity if DOF(5) = True

Nonlinear

Type: SystemBoolean

This is a boolean array, dimensioned to 5, indicating if nonlinear properties exist for a specified degree of freedom.

Value Nonlinear

Nonlinear(0) U1 has nonlinear properties

Nonlinear(1) U2 has nonlinear properties

Nonlinear(2) U3 has nonlinear properties

Nonlinear(3) R1 has nonlinear properties

Nonlinear(4) R2 has nonlinear properties

Nonlinear(5) R3 has nonlinear properties

The term Nonlinear(n) applies only when DOF(n) = True and Fixed(n) = False.

Ke

Type: SystemDouble

This is an array of effective stiffness terms for the link property. The effective stiffness applies for linear analyses.

Value Stiffness

Ke(0) U1 [F/L]

Ke(1) U2 [F/L]

Ke(2) U3 [F/L]

Ke(3) R1 [FL]

Ke(4) R2 [FL]

Ke(5) R3 [FL]

The term ke(n) applies only when DOF(n) = True and Fixed(n) = False.

Ce

Type: SystemDouble

This is an array of effective damping terms for the link property. The effective stiffness applies for linear analyses.

Value Damping

Ce(0) U1 [F/L]

Ce(1) U2 [F/L]

Ce(2) U3 [F/L]

Ce(3) R1 [FL]

Ce(4) R2 [FL]

Ce(5) R3 [FL]

The term ce(n) applies only when DOF(n) = True and Fixed(n) = False.

K

Type: SystemDouble

This is an array of initial stiffness terms for the link property. The initial stiffness applies for nonlinear analyses.

Value Stiffness

K(0) U1 [F/L]

K(1) U2 [F/L]

K(2) U3 [F/L]

K(3) R1 [F]

K(4) R2 [F]

K(5) R3 [F]

The term k(n) applies only when DOF(n) = True, Fixed(n) = False, and Nonlinear(n) = True.

Yield

Type: SystemDouble

This is an array of yield force terms for the link property. The yield force applies for nonlinear analyses.

Value Yield

yield(0) U1 [F]

yield(1) U2 [F]

yield(2) U3 [F]

yield(3) R1 [F/L]

yield(4) R2 [F/L]

yield(5) R3 [F/L]

The term Yield(n) applies only when DOF(n) = True, Fixed(n) = False, and Nonlinear(n) = True.

Ratio

Type: SystemDouble

This is an array of post-yield stiffness ratio terms for the link property. The post-yield stiffness ratio applies for nonlinear analyses. It is the post-yield stiffness divided by the initial stiffness.

Value Ratio

Ratio(0) U1

Ratio(1) U2

Ratio(2) U3

Ratio(3) R1

Ratio(4) R2

Ratio(5) R3

The term Ratio(n) applies only when DOF(n) = True, Fixed(n) = False, and Nonlinear(n) = True.

Exp

Type: SystemDouble

This is an array of yield exponent terms for the link property. The yield exponent applies for nonlinear analyses. The yielding exponent that controls the sharpness of the transition from the initial stiffness to the yielded stiffness.

Value Exp

Exp(0) U1

Exp(1) U2

Exp(2) U3

Exp(3) R1

Exp(4) R2

Exp(5) R3

The term Exp(n) applies only when DOF(n) = True, Fixed(n) = False, and Nonlinear(n) = True.

DJ2

Type: SystemDouble

The distance from the J-End of the link to the U2 shear spring. This item applies only when DOF(1) = True. [L]

DJ3

Type: SystemDouble

The distance from the J-End of the link to the U3 shear spring. This item applies only when DOF(2) = True. [L]

Notes (Optional)

Type: SystemString

The notes, if any, assigned to the property.

GUID (Optional)

Type: SystemString

The GUID (global unique identifier), if any, assigned to the property. If this item is input as Default, the program assigns a GUID to the property.

Return Value

Type: Int32

Returns zero if the property is successfully initialized; otherwise it returns a nonzero value.

-> int
```

Parameters

Name

Type:Â SystemString

The name of an existing or new link property. If this is an existing property, that property is modified; otherwise, a new property is added.

DOF

Type:Â SystemBoolean

This is a boolean array, dimensioned to 5, indicating if properties exist for a specified degree of freedom.

Value DOF

DOF(0) U1
 DOF(1) U2
 DOF(2) U3
 DOF(3) R1
 DOF(4) R2
 DOF(5) R3

Fixed

Type: SystemBoolean

This is a boolean array, dimensioned to 5, indicating if the specified degree of freedom is fixed (restrained).

Value	Fixity
--------------	---------------

Fixed(0) U1	fixity if DOF(0) = True
Fixed(1) U2	fixity if DOF(1) = True
Fixed(2) U3	fixity if DOF(2) = True
Fixed(3) R1	fixity if DOF(3) = True
Fixed(4) R2	fixity if DOF(4) = True
Fixed(5) R3	fixity if DOF(5) = True

Nonlinear

Type: SystemBoolean

This is a boolean array, dimensioned to 5, indicating if nonlinear properties exist for a specified degree of freedom.

Value	Nonlinear
--------------	------------------

Nonlinear(0) U1	has nonlinear properties
Nonlinear(1) U2	has nonlinear properties
Nonlinear(2) U3	has nonlinear properties
Nonlinear(3) R1	not used
Nonlinear(4) R2	not used
Nonlinear(5) R3	not used

Note that this item is applicable only for degrees of freedom U1, U2 and U3. For those degrees of freedom, the term Nonlinear(n) applies only when DOF(n) = True and Fixed(n) = False.

Ke

Type: SystemDouble

This is an array of effective stiffness terms for the link property. The effective stiffness applies for linear analyses.

Value Stiffness

Ke(0) U1	[F/L]
Ke(1) U2	[F/L]
Ke(2) U3	[F/L]
Ke(3) R1	[FL]
Ke(4) R2	[FL]
Ke(5) R3	[FL]

The term ke(n) applies only when DOF(n) = True and Fixed(n) = False.

Ce

Type: SystemDouble

This is an array of effective damping terms for the link property. The effective stiffness applies for linear analyses.

Value Damping

Ce(0) U1 [F/L]

Ce(1) U2 [F/L]

Ce(2) U3 [F/L]

Ce(3) R1 [FL]

Ce(4) R2 [FL]

Ce(5) R3 [FL]

The term ce(n) applies only when DOF(n) = True and Fixed(n) = False.

K

Type: SystemDouble

This is an array of initial stiffness terms for the link property. The initial stiffness applies for nonlinear analyses.

Value Stiffness

K(0) U1, not used

K(1) U2 [F/L]

K(2) U3 [F/L]

K(3) R1, not used

K(4) R2, not used

K(5) R3, not used

Note that this item is applicable only for degrees of freedom U2 and U3. For those degrees of freedom, the term k(n) applies only when DOF(n) = True, Fixed(n) = False, and Nonlinear(n) = True.

Yield

Type: SystemDouble

This is an array of yield force terms for the link property. The yield force applies for nonlinear analyses.

Value Yield

yield(0) U1, not used

yield(1) U2 [F]

yield(2) U3 [F]

yield(3) R1, not used

yield(4) R2, not used

yield(5) R3, not used

Note that this item is applicable only for degrees of freedom U2 and U3. For those degrees of freedom, the term Yield(n) applies only when DOF(n) = True, Fixed(n) = False, and Nonlinear(n) = True.

Ratio

Type: SystemDouble

This is an array of post-yield stiffness ratio terms for the link property. The post-yield stiffness ratio applies for nonlinear analyses. It is the post-yield stiffness divided by the initial stiffness.

Value Ratio

Ratio(0) U1, not used

Ratio(1) U2

Ratio(2) U3

Ratio(3) R1, not used

Ratio(4) R2, not used

Ratio(5) R3, not used

Note that this item is applicable only for degrees of freedom U2 and U3. For those degrees of freedom, the term Ratio(n) applies only when DOF(n) = True, Fixed(n) = False, and Nonlinear(n) = True.

DJ2

Type:Â SystemDouble

The distance from the J-End of the link to the U2 shear spring. This item applies only when DOF(1) = True. [L]

DJ3

Type:Â SystemDouble

The distance from the J-End of the link to the U3 shear spring. This item applies only when DOF(2) = True. [L]

Notes (Optional)

Type:Â SystemString

The notes, if any, assigned to the property.

GUID (Optional)

Type:Â SystemString

The GUID (global unique identifier), if any, assigned to the property. If this item is input as Default, the program assigns a GUID to the property.

Return Value

Type:Â Int32

Returns zero if the property is successfully initialized; otherwise it returns a nonzero value.

CSI API ETABS v1

cPropLinkAddLanguageSpecificTextSet("LSTBA583B1") Method

Assigns length and area values to a link property that are used if the link property is specified in line and area spring assignments.

Namespace: ETABSv1

Assembly: ETABSv1 (in ETABSv1.dll) Version: 1.0.0.0 (1.24.0.0)

Syntax

C#

VB

C++

F#

Copy

```
int SetSpringData(
    string Name,
    double DefinedForThisLength,
    double DefinedForThisArea
)
```

```
Function SetSpringData (
    Name As String,
    DefinedForThisLength As Double,
    DefinedForThisArea As Double
) As Integer
```

```
Dim instance As cPropLink
Dim Name As String
Dim DefinedForThisLength As Double
Dim DefinedForThisArea As Double
Dim returnValue As Integer
```

```
returnValue = instance.SetSpringData(Name,
    DefinedForThisLength, DefinedForThisArea)
```

```
int SetSpringData(
    String^ Name,
    double DefinedForThisLength,
    double DefinedForThisArea
)
```

```
abstract SetSpringData :
    Name : string *
    DefinedForThisLength : float *
    DefinedForThisArea : float -> int
```

Parameters

Name

Type: SystemString

The name of an existing link property.

DefinedForThisLength

cPropLinkspan id="LSTBA583B1_0"AddLanguageSpecificTextSet("LSTBA583B1_0?cpp=::|nu=3376SetSpring

Type: SystemDouble

The link property is defined for this length in a line (frame) spring. [L]
DefinedForThisArea

Type: SystemDouble

The link property is defined for this area in an area spring. [L2]

Return Value

Type: Int32

Returns zero if the values are successfully assigned; otherwise it returns a nonzero value.

▀ Remarks

▀ Examples

VB

Copy

```
Public Sub Example()
    Dim SapModel As cSapModel

```

Parameters

Name

Type:Â SystemString

The name of an existing or new link property. If this is an existing property, that property is modified; otherwise, a new property is added.

DOF

Type:Â SystemBoolean

This is a boolean array, dimensioned to 5, indicating if properties exist for a specified degree of freedom.

Value DOF

DOF(0) U1

DOF(1) U2

DOF(2) U3

DOF(3) R1

DOF(4) R2

DOF(5) R3

Fixed

Type:Â SystemBoolean

This is a boolean array, dimensioned to 5, indicating if the specified degree of freedom is fixed (restrained).

Value

Fixity

Fixed(0) U1 fixity if DOF(0) = True
 Fixed(1) U2 fixity if DOF(1) = True
 Fixed(2) U3 fixity if DOF(2) = True
 Fixed(3) R1 fixity if DOF(3) = True
 Fixed(4) R2 fixity if DOF(4) = True
 Fixed(5) R3 fixity if DOF(5) = True

Nonlinear

Type: SystemBoolean

This is a boolean array, dimensioned to 5, indicating if nonlinear properties exist for a specified degree of freedom.

Value	Nonlinear
--------------	------------------

Nonlinear(0) U1 has nonlinear properties
 Nonlinear(1) U2 has nonlinear properties
 Nonlinear(2) U3 has nonlinear properties
 Nonlinear(3) R1, not used
 Nonlinear(4) R2, not used
 Nonlinear(5) R3, not used

Note that this item is applicable only for degrees of freedom U1, U2 and U3. For those degrees of freedom, the term Nonlinear(n) applies only when DOF(n) = True and Fixed(n) = False.

Ke

Type: SystemDouble

This is an array of effective stiffness terms for the link property. The effective stiffness applies for linear analyses.

Value Stiffness

Ke(0) U1 [F/L]
 Ke(1) U2 [F/L]
 Ke(2) U3 [F/L]
 Ke(3) R1 [FL]
 Ke(4) R2 [FL]
 Ke(5) R3 [FL]

The term ke(n) applies only when DOF(n) = True and Fixed(n) = False.

Ce

Type: SystemDouble

This is an array of effective damping terms for the link property. The effective stiffness applies for linear analyses.

Value Damping

Ce(0) U1 [F/L]
 Ce(1) U2 [F/L]
 Ce(2) U3 [F/L]
 Ce(3) R1 [FL]
 Ce(4) R2 [FL]
 Ce(5) R3 [FL]

The term ce(n) applies only when DOF(n) = True and Fixed(n) = False.

K

Type: SystemDouble

This is an array of initial stiffness terms for the link property. The initial stiffness applies for nonlinear analyses.

Value Stiffness

K(0) U1 [F/L]

K(1) U2 [F/L]

K(2) U3 [F/L]

K(3) R1, not used

K(4) R2, not used

K(5) R3, not used

Note that this item is applicable only for degrees of freedom U1, U2 and U3. For those degrees of freedom, the term k(n) applies only when DOF(n) = True, Fixed(n) = False, and Nonlinear(n) = True.

Slow

Type: SystemDouble

This is an array of the friction coefficient at zero velocity terms when U1 is in compression for the link property. This coefficient applies for nonlinear analyses.

Value Slow

Slow(0) U1, not used

Slow(1) U2

Slow(2) U3

Slow(3) R1, not used

Slow(4) R2, not used

Slow(5) R3, not used

Note that this item is applicable only for degrees of freedom U2 and U3. For those degrees of freedom, the term Slow(n) applies only when DOF(n) = True, Fixed(n) = False, and Nonlinear(n) = True.

Fast

Type: SystemDouble

This is an array of the friction coefficient at fast velocity terms when U1 is in compression for the link property. This coefficient applies for nonlinear analyses.

Value Fast

Fast(0) U1, not used

Fast(1) U2

Fast(2) U3

Fast(3) R1, not used

Fast(4) R2, not used

Fast(5) R3, not used

Note that this item is applicable only for degrees of freedom U2 and U3. For those degrees of freedom, the term Fast(n) applies only when DOF(n) = True, Fixed(n) = False, and Nonlinear(n) = True.

Rate

Type: SystemDouble

This is an array of the inverse of the characteristic sliding velocity terms when

U1 is in compression for the link property. This item applies for nonlinear analyses.

Value Rate

Rate(0) U1, not used

Rate(1) U2 [s/L]

Rate(2) U3 [s/L]

Rate(3) R1, not used

Rate(4) R2, not used

Rate(5) R3, not used

Note that this item is applicable only for degrees of freedom U2 and U3. For those degrees of freedom, the term Fast(n) applies only when DOF(n) = True, Fixed(n) = False, and Nonlinear(n) = True.

Radius

Type: SystemDouble

This is an array of the radius of the sliding contact surface terms for the link property. Inputting 0 means there is an infinite radius, that is, the slider is flat. This item applies for nonlinear analyses.

Value Radius

Radius(0) U1, not used

Radius(1) U2 [L]

Radius(2) U3 [L]

Radius(3) R1, not used

Radius(4) R2, not used

Radius(5) R3, not used

Note that this item is applicable only for degrees of freedom U2 and U3. For those degrees of freedom, the term Fast(n) applies only when DOF(n) = True, Fixed(n) = False, and Nonlinear(n) = True.

SlowT

Type: SystemDouble

This is an array of the friction coefficient at zero velocity terms when U1 is in tension for the link property. This coefficient applies for nonlinear analyses.

Value Slow

SlowT(0) U1, not used

SlowT(1) U2

SlowT(2) U3

SlowT(3) R1, not used

SlowT(4) R2, not used

SlowT(5) R3, not used

Note that this item is applicable only for degrees of freedom U2 and U3. For those degrees of freedom, the term SlowT(n) applies only when DOF(n) = True, Fixed(n) = False, and Nonlinear(n) = True.

FastT

Type: SystemDouble

This is an array of the friction coefficient at fast velocity terms when U1 is in tension for the link property. This coefficient applies for nonlinear analyses.

Value Fast

FastT(0) U1, not used

FastT(1) U2

FastT(2) U3

FastT(3) R1, not used

FastT(4) R2, not used

FastT(5) R3, not used

Note that this item is applicable only for degrees of freedom U2 and U3. For those degrees of freedom, the term FastT(n) applies only when DOF(n) = True, Fixed(n) = False, and Nonlinear(n) = True.

RateT

Type: SystemDouble

This is an array of the inverse of the characteristic sliding velocity terms when U1 is in tension for the link property. This item applies for nonlinear analyses.

Value Rate

RateT(0) U1, not used

RateT(1) U2 [s/L]

RateT(2) U3 [s/L]

RateT(3) R1, not used

RateT(4) R2, not used

RateT(5) R3, not used

Note that this item is applicable only for degrees of freedom U2 and U3. For those degrees of freedom, the term RateT(n) applies only when DOF(n) = True, Fixed(n) = False, and Nonlinear(n) = True.

Kt

Type: SystemDouble

The axial translational tension stiffness for the U1 degree of freedom. This item applies for nonlinear analyses. [F/L]

Dis

Type: SystemDouble

The U1 degree of freedom gap opening for compression. This item applies for nonlinear analyses. [L]

Dist

Type: SystemDouble

The U1 degree of freedom gap opening for tension. This item applies for nonlinear analyses. [L]

Damping

Type: SystemDouble

This is the nonlinear damping coefficient used for the axial translational degree of freedom, U1. This item applies for nonlinear analyses. [F/L]

DJ2

Type: SystemDouble

The distance from the J-End of the link to the U2 shear spring. This item applies only when DOF(1) = True. [L]

DJ3

Type: SystemDouble

The distance from the J-End of the link to the U3 shear spring. This item applies only when DOF(2) = True. [L]

Notes (Optional)

Type:Â SystemString

The notes, if any, assigned to the property.

GUID (Optional)

Type:Â SystemString

The GUID (global unique identifier), if any, assigned to the property. If this item is input as Default, the program assigns a GUID to the property.

Return Value

Type:Â Int32

Returns zero if the property is successfully initialized; otherwise it returns a nonzero value.

```

W : float *
M : float *
R1 : float *
R2 : float *
R3 : float -> int

```

Parameters

Name

Type:Â SystemString
The name of an existing link property.

W

Type:Â SystemDouble
The weight of the link. [F]

M

Type:Â SystemDouble
The translational mass of the link. [M]

R1

Type:Â SystemDouble
The rotational inertia of the link about its local 1 axis. [ML2]

R2

Type:Â SystemDouble
The rotational inertia of the link about its local 2 axis. [ML2]

R3

Type:Â SystemDouble
The rotational inertia of the link about its local 3 axis. [ML2]

Return Value

Type:Â Int32

returns zero if the data is successfully retrieved; otherwise it returns a nonzero value.

CSI API ETABS v1

cPropMaterial Interface

Namespace: $\hat{A}$ ETABSv1

Assembly: $\hat{A}$ ETABSv1 (in ETABSv1.dll) Version: 1.0.0.0 (1.24.0.0)

▲ Syntax

C#

VB

C++

F#

Copy

```
public interface cPropMaterial
```

```
Public Interface cPropMaterial
```

```
Dim instance As cPropMaterial
```

```
public interface class cPropMaterial
```

```
type cPropMaterial = interface end
```

The cPropMaterial type exposes the following members.

▲ Properties

$\hat{A}$ Name	Description
----------------	-------------

 <u>TimeDep</u>	API calls for time dependent material properties.
--	---

Top

▲ Methods

$\hat{A}$ Name	Description
----------------	-------------

 <u>AddMaterial</u>	Adds a new material property to the model.
 <u>ChangeName</u>	Changes the name of an existing material property.
 <u>Count</u>	Gets the total number of defined material properties in the model. If desired, counts can be returned for all material properties of a specified type in the model.
 <u>Delete</u>	Deletes a specified material property.
 <u>GetDamping</u>	Retrieves the additional material damping data for the material.
 <u>GetMassSource</u>	DEPRECATED Retrieves the mass source for the model.
 <u>GetMassSource_1</u>	Retrieves the mass source for the model.
 <u>GetMaterial</u>	Retrieves some basic material property data.
 <u>GetMPAnisotropic</u>	Retrieves the mechanical properties for a material with an anisotropic directional symmetry type.
 <u>GetMPIsotropic</u>	Retrieves the mechanical properties for a material with an isotropic directional symmetry type.
 <u>GetMPOrthotropic</u>	Retrieves the mechanical properties for a material with an orthotropic directional symmetry type.

Introduction

⇒ <u>GetMPUniaxial</u>	Retrieves the mechanical properties for a material with an uniaxial directional symmetry type.
⇒ <u>GetNameList</u>	Retrieves the names of all defined material properties of the specified type.
⇒ <u>GetOConcrete</u>	(NEWER FUNCTION AVAILABLE) Retrieves the other material property data for concrete materials.
⇒ <u>GetOConcrete_1</u>	Retrieves the other material property data for concrete materials.
⇒ <u>GetONoDesign</u>	Retrieves the other material property data for no design type materials.
⇒ <u>GetORebar</u>	(NEWER FUNCTION AVAILABLE) Retrieves the other material property data for rebar materials.
⇒ <u>GetORebar_1</u>	Retrieves the other material property data for rebar materials.
⇒ <u>GetOSteel</u>	(NEWER FUNCTION AVAILABLE) Retrieves the other material property data for steel materials.
⇒ <u>GetOSteel_1</u>	Retrieves the other material property data for steel materials.
⇒ <u>GetOTendon</u>	(NEWER FUNCTION AVAILABLE) Retrieves the other material property data for tendon materials.
⇒ <u>GetOTendon_1</u>	Retrieves the other material property data for tendon materials.
⇒ <u>GetSSCurve</u>	Retrieves the material stress-strain curve.
⇒ <u>GetTemp</u>	Retrieves the temperatures at which properties are specified for a material.
⇒ <u>GetTypeOAPI</u>	
⇒ <u>GetWeightAndMass</u>	Retrieves the weight per unit volume and mass per unit volume of the material.
⇒ <u>SetDamping</u>	Sets the additional material damping data for the material.
⇒ <u>SetMassSource</u>	DEPRECATED Sets the mass source for the model.
⇒ <u>SetMassSource_1</u>	Sets the mass source for the model.
⇒ <u>SetMaterial</u>	DEPRECATED. Initializes a material property. If this function is called for an existing material property, all items for the material are reset to their default value.
⇒ <u>SetMPAnisotropic</u>	Sets the material directional symmetry type to anisotropic, and assigns the anisotropic mechanical properties.
⇒ <u>SetMPIsotropic</u>	Sets the material directional symmetry type to isotropic, and assigns the isotropic mechanical properties.
⇒ <u>SetMPOrthotropic</u>	Sets the material directional symmetry type to orthotropic, and assigns the orthotropic mechanical properties.
⇒ <u>SetMPUniaxial</u>	Sets the material directional symmetry type to uniaxial, and assigns the uniaxial mechanical properties.
⇒ <u>SetOConcrete</u>	(NEWER FUNCTION AVAILABLE) Sets the other material property data for concrete materials.
⇒ <u>SetOConcrete_1</u>	Sets the other material property data for concrete materials.
⇒ <u>SetONoDesign</u>	

Introduction

Sets the other material property data for no design type materials.

- ⇒ [SetORebar](#) (NEWER FUNCTION AVAILABLE) Sets the other material property data for rebar materials.
- ⇒ [SetORebar_1](#) Sets the other material property data for rebar materials.
- ⇒ [SetOSteel](#) (NEWER FUNCTION AVAILABLE) Sets the other material property data for steel materials.
- ⇒ [SetOSteel_1](#) Sets the other material property data for steel materials.
- ⇒ [SetOTendon](#) (NEWER FUNCTION AVAILABLE) Sets the other material property data for tendon materials.
- ⇒ [SetOTendon_1](#) Sets the other material property data for tendon materials.
- ⇒ [SetSSCurve](#) Sets the material stress-strain curve for materials that are specified to have user-defined stress-strain curves.
- ⇒ [SetTemp](#) assigns the temperatures at which properties are specified for a material. This data is required only for materials whose properties are temperature dependent.
- ⇒ [SetWeightAndMass](#) Assigns weight per unit volume or mass per unit volume to a material property.

⇒ <u>SetMPIsotropic</u>	Sets the material directional symmetry type to isotropic, and assigns the isotropic mechanical properties.
⇒ <u>SetMPOrthotropic</u>	Sets the material directional symmetry type to orthotropic, and assigns the orthotropic mechanical properties.
⇒ <u>SetMPUniaxial</u>	Sets the material directional symmetry type to uniaxial, and assigns the uniaxial mechanical properties.
⇒ <u>SetOConcrete</u>	(NEWER FUNCTION AVAILABLE) Sets the other material property data for concrete materials.
⇒ <u>SetOConcrete_1</u>	Sets the other material property data for concrete materials.
⇒ <u>SetONoDesign</u>	Sets the other material property data for no design type materials.
⇒ <u>SetORebar</u>	(NEWER FUNCTION AVAILABLE) Sets the other material property data for rebar materials.
⇒ <u>SetORebar_1</u>	Sets the other material property data for rebar materials.
⇒ <u>SetOSteel</u>	(NEWER FUNCTION AVAILABLE) Sets the other material property data for steel materials.
⇒ <u>SetOSteel_1</u>	Sets the other material property data for steel materials.
⇒ <u>SetOTendon</u>	(NEWER FUNCTION AVAILABLE) Sets the other material property data for tendon materials.
⇒ <u>SetOTendon_1</u>	Sets the other material property data for tendon materials.
⇒ <u>SetSSCurve</u>	Sets the material stress-strain curve for materials that are specified to have user-defined stress-strain curves.
⇒ <u>SetTemp</u>	assigns the temperatures at which properties are specified for a material. This data is required only for materials whose properties are temperature dependent.
⇒ <u>SetWeightAndMass</u>	Assigns weight per unit volume or mass per unit volume to a material property.

Namespace: ETABSV1

▲ Syntax

C#

VBC++

F#

Copy

```
Function AddMaterial (
ByRef Name As String,
MatType As eMatType,
Region As String,
Standard As String,
Grade As String,
Optional Name As String = ""
) As Integer
```

```
Dim instance As cPropMaterial
Dim Name As String
Dim MatType As eMatType
Dim Region As String
Dim Standard As String
Dim Grade As String
Dim UserName As String
Dim returnValue As Integer
```

```
returnValue = instance.AddMaterial(Name,
MatType, Region, Standard, Grade,
UserName)
```

```
int AddMaterial(
String^% Name,
eMatType MatType,
String^ Region,
String^ Standard,
String^ Grade,
String^ UserName = L""
)
```

cPropMaterialsAddLanguageSpecificTextSet("LST7113B64A_0?cpp=3394=.");Ad

```

    Name : string byref *
    MatType : eMatType *
    Region : string *
    Standard : string *
    Grade : string *
    ?UserName : string
(* Defaults:
    let _UserName = defaultArg UserName ""
*)
-> int

```

Parameters

Name

Type:Â SystemString

This item is returned by the program. It is the name that the program ultimately assigns for the material property. If no UserName is specified, the program assigns a default name to the material property. If a UserName is specified and that name is not used for another material property, the UserName is assigned to the material property.

MatType

Type:Â ETABSV1eMatType

This is one of the items in the eMatType enumeration.

Region

Type:Â SystemString

The region name of the material property that is user-predefined in the file "CSiMaterialLibrary*.xml" located in subfolder "Property Libraries" under the program installation.

Standard

Type:Â SystemString

The Standard name of the material property with the specified MatType within the specified region.

Grade

Type:Â SystemString

UserName (Optional)

Type:Â SystemString

Return Value

Type:Â Int32

Returns zero if the material property is successfully added, otherwise it returns a nonzero value.

Remarks

This function adds a new material property to the model based on the Code-specified and other pre-defined material properties defined in the installed file "CSiMaterialLibrary*.xml" located in subfolder "Property Libraries" under the program installation folder.

Examples

VB

Copy

```

Public Sub Example()
    Dim SapModel As cSapModel
    Dim EtabsObject As cOAPI

```

Introduction

```
Dim ret As Integer = -1

'create ETABS object
Dim myHelper as cHelper = New Helper
EtabsObject = myHelper.CreateObjectProgID("CSI.ETABS.API.ETABSObject")

'start ETABS application
ret = EtabsObject.ApplicationStart()

'create SapModel object
SapModel = EtabsObject.SapModel

'initialize model
ret = SapModel.InitializeNewModel()

'create steel deck template model
ret = SapModel.File.NewSteelDeck(4,12,12,4,4,24,24)

'add ASTM A706 rebar material property in United states Region
ret = SapModel.PropMaterial.AddMaterial(Name, eMatType.Rebar, "United States", "ASTM A706")

'close ETABS
EtabsObject.ApplicationExit(False)

'clean up variables
SapModel = Nothing
EtabsObject = Nothing
End Sub
```

CSI API ETABS v1

cPropMaterialAddLanguageSpecificTextSet("LST977B32A8_0?cpp3397=.");Ch

Method

Changes the name of an existing material property.

Namespace: ETABSV1

Assembly: ETABSV1 (in ETABSV1.dll) Version: 1.0.0.0 (1.24.0.0)

Syntax

C#

VB

C++

F#

Copy

```
int ChangeName(
    string Name,
    string NewName
)
```

```
Function ChangeName (
    Name As String,
    NewName As String
) As Integer
```

```
Dim instance As cPropMaterial
Dim Name As String
Dim NewName As String
Dim returnValue As Integer
```

```
returnValue = instance.ChangeName(Name,
    NewName)
```

```
int ChangeName(
    String^ Name,
    String^ NewName
)
```

```
abstract ChangeName :
    Name : string *
    NewName : string -> int
```

Parameters

Name

Type: SystemString

The existing name of a defined material property.

NewName

Type: SystemString

The new name for the material property.

Return ValueType: Int32

Returns zero if the new name is successfully applied; otherwise it returns a nonzero value.

▲ **Remarks**

▲ **Examples**

VB

Copy

```
Public Sub Example()
    Dim SapModel As cSapModel
    Dim EtabsObject As cOAPI
    Dim ret As Integer = -1

    'create ETABS object
    Dim myHelper as cHelper = New Helper
    EtabsObject = myHelper.CreateObjectProgID("CSI.ETABS.API.ETABSObject")

    'start ETABS application
    ret = EtabsObject.ApplicationStart()

    'create SapModel object
    SapModel = EtabsObject.SapModel

    'initialize model
    ret = SapModel.InitializeNewModel()

    'create steel deck template model
    ret = SapModel.File.NewSteelDeck(4,12,12,4,4,24,24)

    'change name of material property
    ret = SapModel.PropMaterial.ChangeName("4000Psi", "MatConc")

    'close ETABS
    EtabsObject.ApplicationExit(False)

    'clean up variables
    SapModel = Nothing
    EtabsObject = Nothing
End Sub
```

CSI API ETABS v1

cPropMaterialAddLanguageSpecificTextSet("LST479E5573_0?cpp=3300=.");Count

Method

Gets the total number of defined material properties in the model. If desired, counts can be returned for all material properties of a specified type in the model.

Namespace: ETABSv1

Assembly: ETABSv1 (in ETABSv1.dll) Version: 1.0.0.0 (1.24.0.0)

Syntax

C#

VB

C++

F#

Copy

```
int Count(
    eMatType MatType =
)
```

```
Function Count (
    Optional MatType As eMatType =
) As Integer
```

```
Dim instance As cPropMaterial
Dim MatType As eMatType
Dim returnValue As Integer
```

```
returnValue = instance.Count(MatType)
```

```
int Count(
    eMatType MatType =
)
```

```
abstract Count :
    ?MatType : eMatType
(* Defaults:
    let _MatType = defaultArg MatType
*)
-> int
```

Parameters

MatType (Optional)

Type: ETABSv1eMatType

This optional value is one of the items in the eMatType enumeration.

Return Value

Type: Int32

Returns the total number of defined material properties in the model. If desired, counts can be returned for all material properties of a specified type in the model.

Remarks

cPropMaterialsid="LST479E5573_0"AddLanguageSpecificTextSet("LST479E5573_0?cpp=3300=.");Count

Examples

VB

Copy

```
Public Sub Example()
    Dim SapModel As cSapModel
    Dim EtabsObject As cOAPI
    Dim ret As Integer = -1
    Dim Count as Integer

    'create ETABS object
    Dim myHelper as cHelper = New Helper
    EtabsObject = myHelper.CreateObjectProgID("CSI.ETABS.API.ETABSObject")

    'start ETABS application
    ret = EtabsObject.ApplicationStart()

    'create SapModel object
    SapModel = EtabsObject.SapModel

    'initialize model
    ret = SapModel.InitializeNewModel()

    'create steel deck template model
    ret = SapModel.File.NewSteelDeck(4,12,12,4,4,24,24)

    'return number of defined material properties of all types
    Count = SapModel.PropMaterial.Count

    'close ETABS
    EtabsObject.ApplicationExit(False)

    'clean up variables
    SapModel = Nothing
    EtabsObject = Nothing
End Sub
```

CSI API ETABS v1

cPropMaterialAddLanguageSpecificTextSet("LST62E55B45_0?cpp3401u=.");Delete Method

Deletes a specified material property.

Namespace: ETABSv1

Assembly: ETABSv1 (in ETABSv1.dll) Version: 1.0.0.0 (1.24.0.0)

▲ Syntax

C#

VB

C++

F#

Copy

```
int Delete(
    string Name
)
```

```
Function Delete (
    Name As String
) As Integer
```

```
Dim instance As cPropMaterial
Dim Name As String
Dim returnValue As Integer
```

```
returnValue = instance.Delete(Name)
```

```
int Delete(
    String^ Name
)
```

```
abstract Delete :
    Name : string -> int
```

Parameters

Name

Type: SystemString

The name of an existing material property.

Return Value

Type: Int32

returns zero if the material property is successfully deleted; otherwise it returns a nonzero value. It returns an error if the specified material property can not be deleted, for example, if it is being used in a section property.

▲ Remarks

▲ Examples

VB

Copy

cPropMaterialsspan id="LST62E55B45_0"AddLanguageSpecificTextSet("LST62E55B45_0?cpp3401u=.");Delete

Introduction

```
Public Sub Example()  
    Dim SapModel As cSapModel  
    Dim EtabsObject As cOAPI  
    Dim ret As Integer = -1  
  
    'create ETABS object  
    Dim myHelper as cHelper = New Helper  
    EtabsObject = myHelper.CreateObjectProgID("CSI.ETABS.API.ETABSObject")  
  
    'start ETABS application

CSI API ETABS v1

cPropMaterialAddLanguageSpecificTextSet("LST180D5C27_0?cpp3400=");GetDamping

Method

Retrieves the additional material damping data for the material.

Namespace: [ETABSv1](#)

Assembly: [ETABSv1](#) (in ETABSv1.dll) Version: 1.0.0.0 (1.24.0.0)

Syntax

C#

VB

C++

F#

Copy

```
int GetDamping(
    string Name,
    ref double ModalRatio,
    ref double ViscousMassCoeff,
    ref double ViscousStiffCoeff,
    ref double HystereticMassCoeff,
    ref double HystereticStiffCoeff,
    double Temp = 0
)
```

```
Function GetDamping (
    Name As String,
    ByRef ModalRatio As Double,
    ByRef ViscousMassCoeff As Double,
    ByRef ViscousStiffCoeff As Double,
    ByRef HystereticMassCoeff As Double,
    ByRef HystereticStiffCoeff As Double,
    Temp As Double = 0
) As Integer
```

```
Dim instance As cPropMaterial
Dim Name As String
Dim ModalRatio As Double
Dim ViscousMassCoeff As Double
Dim ViscousStiffCoeff As Double
Dim HystereticMassCoeff As Double
Dim HystereticStiffCoeff As Double
Dim Temp As Double
Dim returnValue As Integer
```

```
returnValue = instance.GetDamping(Name,
    ModalRatio, ViscousMassCoeff, ViscousStiffCoeff,
    HystereticMassCoeff, HystereticStiffCoeff,
    Temp)
```

```
int GetDamping(
    String^ Name,
    double% ModalRatio,
    double% ViscousMassCoeff,
    double% ViscousStiffCoeff,
    double% HystereticMassCoeff,
```

cPropMaterialspan id="LST180D5C27_0"AddLanguageSpecificTextSet("LST180D5C27_0?cpp3400=");GetDamping

Introduction

```
double% HystereticStiffCoeff,  
double Temp = 0  
)  
  
abstract GetDamping :  
    Name : string *  
    ModalRatio : float byref *  
    ViscousMassCoeff : float byref *  
    ViscousStiffCoeff : float byref *  
    HystereticMassCoeff : float byref *  
    HystereticStiffCoeff : float byref *  
    ?Temp : float  
(* Defaults:  
    let _Temp = defaultArg Temp 0  
*)  
-> int
```

Parameters

Name

Type:Â SystemString

The name of an existing material property.

ModalRatio

Type:Â SystemDouble

The modal damping ratio.

ViscousMassCoeff

Type:Â SystemDouble

The mass coefficient for viscous proportional damping.

ViscousStiffCoeff

Type:Â SystemDouble

The stiffness coefficient for viscous proportional damping.

HystereticMassCoeff

Type:Â SystemDouble

The mass coefficient for hysteretic proportional damping.

HystereticStiffCoeff

Type:Â SystemDouble

The stiffness coefficient for hysteretic proportional damping.

Temp (Optional)

Type:Â SystemDouble

The temperature at which the specified data is to be retrieved. The temperature must have been previously defined for the material

This item applies only if the specified material has properties that are temperature dependent. That is, it applies only if properties are specified for the material at more than one temperature

Return Value

Type:Â Int32

Returns zero if the data is successfully retrieved; otherwise it returns a nonzero value.

▲ Remarks

CSI API ETABS v1

cPropMaterialAddLanguageSpecificTextSet("LSTA86B Method

DEPRECATED Retrieves the mass source for the model.

Namespace: ETABSv1

Assembly: ETABSv1 (in ETABSv1.dll) Version: 1.0.0.0 (1.24.0.0)

Syntax

C#

VB

C++

F#

Copy

```
int GetMassSource(
    ref int MyOption,
    ref int NumberLoads,
    ref string[] LoadPat,
    ref double[] SF
)
```

```
Function GetMassSource (
    ByRef MyOption As Integer,
    ByRef NumberLoads As Integer,
    ByRef LoadPat As String(),
    ByRef SF As Double()
) As Integer
```

```
Dim instance As cPropMaterial
Dim MyOption As Integer
Dim NumberLoads As Integer
Dim LoadPat As String()
Dim SF As Double()
Dim returnValue As Integer
```

```
returnValue = instance.GetMassSource(MyOption,
    NumberLoads, LoadPat, SF)
```

```
int GetMassSource(
    int% MyOption,
    int% NumberLoads,
    array<String^>^% LoadPat,
    array<double>^% SF
)
```

```
abstract GetMassSource :
    MyOption : int byref *
    NumberLoads : int byref *
    LoadPat : string[] byref *
    SF : float[] byref -> int
```

Parameters**MyOption**Type: SystemInt32

This is 1, 2 or 3, indicating the mass source option.

Value**Option**

- | | |
|---|--|
| 1 | From element self mass and additional masses |
| 2 | From loads |
| 3 | From element self mass and additional masses and loads |

NumberLoadsType: SystemInt32

The number of load patterns from which mass is obtained. This item applies only when MyOption is 2 or 3.

LoadPatType: SystemString

This is an array of the names of the load patterns from which mass is obtained. This item applies only when MyOption is 2 or 3.

SFType: SystemDouble

This is an array of load patterns multipliers used to calculate the mass. This item applies only when MyOption is 2 or 3

Return ValueType: Int32

Returns zero if the mass source is successfully retrieved; otherwise it returns a nonzero value.

▲ **Remarks**This function is DEPRECATED. Please use GetMassSource_1(Boolean, Boolean, Boolean, Int32, String, Double)▲ **Examples**

VB

Copy

```

returnValue = instance.GetMaterial(Name,
    MatType, Color, Notes, GUID)
```

```
int GetMaterial(
    String^ Name,
    eMatType% MatType,
    int% Color,
    String^% Notes,
    String^% GUID
)
```

```
abstract GetMaterial :
    Name : string *
    MatType : eMatType byref *
    Color : int byref *
    Notes : string byref *
    GUID : string byref -> int
```

cPropMaterialspan id="LSTD35A4C12_0"AddLanguageSpecificTextSet("LSTD35A4C12_0?cpp3412u=.");G

Parameters

Name

Type:Â SystemString

The name of an existing material property.

MatType

Type:Â ETABSv1eMatTypeThis is one of the items in the eMatType enumeration.

Color

Type:Â SystemInt32

Notes

Type:Â SystemString

GUID

Type:Â SystemString

The GUID (global unique identifier), if any, assigned to the material.

Return ValueType:Â Int32

Returns zero if the material is successfully retrieved; otherwise it returns a nonzero value.

▲Remarks

▲Examples

VB

Copy

```
Public Sub Example()
    Dim SapModel As cSapModel
    Dim EtabsObject As cOAPI
    Dim ret As Integer = -1
    Dim MatType As eMatType
    Dim Color As Integer
    Dim Notes As String
    Dim GUID As String

    'create ETABS object
    Dim myHelper as cHelper = New Helper
    EtabsObject = myHelper.CreateObjectProgID("CSI.ETABS.API.ETABSObject")

    'start ETABS application
    ret = EtabsObject.ApplicationStart()

    'create SapModel object
    SapModel = EtabsObject.SapModel

    'initialize model
    ret = SapModel.InitializeNewModel()

    'create steel deck template model
    ret = SapModel.File.NewSteelDeck(4,12,12,4,4,24,24)

    'initialize new material property
    ret = SapModel.PropMaterial.SetMaterial("Steel", eMatType.Steel, -1, "API example test", '

    'get basic material property data
    ret = SapModel.PropMaterial.GetMaterial("Steel", MatType, Color, Notes, GUID)

    'close ETABS
```

Introduction

```
EtabsObject.ApplicationExit(False)

'clean up variables
  SapModel = Nothing
  EtabsObject = Nothing
End Sub
```

    E, U, A, G, Temp)
```

```
int GetMPAnisotropic(
    String^ Name,
    array<double>^% E,
    array<double>^% U,
    array<double>^% A,
    array<double>^% G,
    double Temp = 0
)
```

abstract GetMPAnisotropic :

cPropMaterialsid="LST699F1505_0"AddLanguageSpecificTextSet("LST699F1505_0?cpp=3415.");Get

```

    Name : string *
    E : float[] byref *
    U : float[] byref *
    A : float[] byref *
    G : float[] byref *
    ?Temp : float
(* Defaults:
    let _Temp = defaultArg Temp 0
*)
-> int

```

Parameters

Name

Type: SystemString

The name of an existing material property.

E

Type: SystemDouble

This is an array that includes the modulus of elasticity.

Value Term

e(0) E1 [F/L2]

e(1) E2 [F/L2]

e(2) E3 [F/L2]

U

Type: SystemDouble

This is an array that includes poisson's ratio.

Value Term

u(0) U12

u(1) U13

u(2) U23

u(3) U14

u(4) U24

u(5) U34

u(6) U15

u(7) U25

u(8) U35

u(9) U45

u(10) U16

u(11) U26

u(12) U36

u(13) U46

u(14) U56

A

Type: SystemDouble

This is an array that includes the thermal coefficient.

Value Term

a(0) A1 [1/T]

a(1) A2 [1/T]

a(2) A3 [1/T]
 a(3) A12 [1/T]
 a(4) A13 [1/T]
 a(5) A23 [1/T]

G

Type: SystemDouble

This is an array that includes the shear modulus.

Value Term

g(0) G12 [F/L2]
 g(1) G13 [F/L2]
 g(2) G23 [F/L2]

Temp (Optional)

Type: SystemDouble

The temperature at which the specified data is to be retrieved. The temperature must have been previously defined for the material.

This item applies only if the specified material has properties that are temperature dependent. That is, it applies only if properties are specified for the material at more than one temperature.

Return Value

Type: Int32

Returns zero if the data is successfully retrieved; otherwise it returns a nonzero value. The function returns an error if the symmetry type of the specified material is not anisotropic.

    double% G,
    double% Temp = 0
)
```

abstract GetMPIsotropic :

cPropMaterialspan id="LST20773246_0"AddLanguageSpecificTextSet("LST20773246_0?cpp=3420-");Get

```

    Name : string *
    E : float byref *
    U : float byref *
    A : float byref *
    G : float byref *
    ?Temp : float
(* Defaults:
    let _Temp = defaultArg Temp 0
*)
-> int

```

Parameters

Name

Type:Â SystemString
The name of an existing material property.

E

Type:Â SystemDouble
The modulus of elasticity. [F/L2]

U

Type:Â SystemDouble
Poissonâs ratio.

A

Type:Â SystemDouble
The thermal coefficient. [1/T]

G

Type:Â SystemDouble
The shear modulus. For isotropic materials this value is program calculated from the modulus of elasticity and poissonâs ratio. [F/L2]

Temp (Optional)

Type:Â SystemDouble
the temperature at which the specified data is to be retrieved. The temperature must have been defined previously for the material.

This item applies only if the specified material has properties that are temperature dependent. That is, it applies only if properties are specified for the material at more than one temperature.

Return Value

Type:Â Int32

Returns zero if the data is successfully retrieved; otherwise it returns a nonzero value. The function returns an error if the symmetry type of the specified material is not isotropic.

(* Defaults:
    let _Temp = defaultArg Temp 0
*)
-> int

```

Parameters

Name

Type: SystemString

The name of an existing material property.

E

Type: SystemDouble

This is an array that includes the modulus of elasticity.

Value Term

e(0) E1 [F/L2]

e(1) E2 [F/L2]

e(2) E3 [F/L2]

U

Type: SystemDouble

This is an array that includes poisson's ratio.

Value Term

u(0) U12

u(1) U13

u(2) U23

A

Type: SystemDouble

This is an array that includes the thermal coefficient.

Value Term

a(0) A1 [1/T]

a(1) A2 [1/T]

a(2) A3 [1/T]

G

Type: SystemDouble

This is an array that includes the shear modulus.

Value Term

g(0) G12 [F/L2]

g(1) G13 [F/L2]

g(2) G23 [F/L2]

Temp (Optional)

Type: SystemDouble

The temperature at which the specified data is to be retrieved. The temperature must have been previously defined for the material.

Introduction

This item applies only if the specified material has properties that are temperature dependent. That is, it applies only if properties are specified for the material at more than one temperature.

Return Value

Type: $\hat{A}$ Int32

Returns zero if the data is successfully retrieved; otherwise it returns a nonzero value. The function returns an error if the symmetry type of the specified material is not orthotropic.

CSI API ETABS v1

cPropMaterialAddLanguageSpecificTextSet("LSTB0368426_0") Method

Retrieves the names of all defined material properties of the specified type.

Namespace: [ETABSv1](#)

Assembly: [ETABSv1](#) (in ETABSv1.dll) Version: 1.0.0.0 (1.24.0.0)

Syntax

[C#](#)

[VB](#)

[C++](#)

[F#](#)

[Copy](#)

```
int GetNameList(
    ref int NumberNames,
    ref string[] MyName,
    eMatType MatType =
)
```

```
Function GetNameList (
    ByRef NumberNames As Integer,
    ByRef MyName As String(),
    Optional MatType As eMatType =
) As Integer
```

```
Dim instance As cPropMaterial
Dim NumberNames As Integer
Dim MyName As String()
Dim MatType As eMatType
Dim returnValue As Integer
```

```
returnValue = instance.GetNameList(NumberNames,
MyName, MatType)
```

```
int GetNameList(
    int% NumberNames,
    array<String^>^% MyName,
    eMatType MatType =
)
```

```
abstract GetNameList :
    NumberNames : int byref *
    MyName : string[] byref *
    ?MatType : eMatType
(* Defaults:
    let _MatType = defaultArg MatType
*)
-> int
```

Parameters

NumberNames

Type: SystemInt32

The number of material property names retrieved by the program.

MyName

Type: SystemString

One-dimensional array of material property names. The MyName array is created as a dynamic, zero-based, array by the API user:

```
Dim MyName() as String
```

The array is dimensioned to (NumberNames - 1) inside the program, filled with the names, and returned to the API user.

MatType (Optional)

Type: ETABSv1eMatType

This optional value is one of the items in the eMatType enumeration.

If no value is input for MatType, names are returned for all material properties in the model regardless of type.

Return Value

Type: Int32

Returns zero if the names are successfully retrieved; otherwise it returns nonzero.

▲ Remarks

▲ Examples

VB

Copy

```
Public Sub Example()
    Dim SapModel As cSapModel

    ?Temp : float  
(* Defaults:  
    let _Temp = defaultArg Temp 0  
*)  
-> int
```

Parameters

Name

Type:Â SystemString

The name of an existing concrete material property.

Fc

Type:Â SystemDouble

IsLightweight

Type:Â SystemBoolean

If this item is True, the concrete is assumed to be lightweight concrete.

FcsFactor

Type:Â SystemDouble

SSType

Type:Â SystemInt32

This is 0, 1 or 2, indicating the stress-strain hysteresis type.

Value **SSType**

0 User defined

1 Parametric - Simple

2 Parametric - Mander

SSHysType

Type:Â SystemInt32

This is 0 through 7, indicating the stress-strain curve type.

Value SSHysType

- 0 Elastic
- 1 Kinematic
- 2 Takeda
- 3 Pivot
- 4 Concrete
- 5 BRB Hardening
- 6 Degrading
- 7 Isotropic

StrainAtFc

Type:Â SystemDouble

StrainUltimate

Type:Â SystemDouble

This item applies only to parametric stress-strain curves. It is the ultimate unconfined strain capacity. This item must be larger than the StrainAtfc item

FrictionAngle

Type:Â SystemDouble

The Drucker-Prager friction angle. This item must be smaller or equal to 0 and less than 90. [deg]

DilatationalAngle

Type:Â SystemDouble

The Drucker-Prager dilatational angle. This item must be smaller or equal to 0 and less than 90. [deg]

Temp (Optional)

Type:Â SystemDouble

The temperature at which the specified data is to be retrieved. The temperature must have been defined previously for the material.

This item applies only if the specified material has properties that are temperature dependent. That is, it applies only if properties are specified for the material at more than one temperature.

Return ValueType:Â Int32

Returns zero if the data is successfully retrieved; otherwise it returns a nonzero value.

▲Remarks

▲Examples

VB

Copy

```
Public Sub Example()
    Dim SapModel As cSapModel
    Dim EtabsObject As cOAPI
    Dim ret As Integer = -1
    Dim fc As Double
    Dim IsLightweight As Boolean
```

Introduction

```
Dim fcsfactor As Double
Dim SStype As Integer
Dim SSHystype As Integer
Dim StrainAtfc As Double
Dim StrainUltimate As Double
Dim FrictionAngle As Double
Dim DilatationalAngle As Double

'create ETABS object
Dim myHelper as cHelper = New Helper
EtabsObject = myHelper.CreateObjectProgID("CSI.ETABS.API.ETABSObject")

'start ETABS application
ret = EtabsObject.ApplicationStart()

'create SapModel object
SapModel = EtabsObject.SapModel

'initialize model
ret = SapModel.InitializeNewModel()

'create steel deck template model
ret = SapModel.File.NewSteelDeck(4,12,12,4,4,24,24)

'initialize new material property
ret = SapModel.PropMaterial.SetMaterial("Concrete", eMatType.Concrete)

'assign other properties
ret = SapModel.PropMaterial.Set0Concrete("Concrete", 5, False, 0, 1, 2, 0.0022, 0.0052)

'get other properties
ret = SapModel.PropMaterial.Get0Concrete("Concrete", fc, IsLightweight, fcsfactor, SStype,

'close ETABS
EtabsObject.ApplicationExit(False)

'clean up variables
SapModel = Nothing
EtabsObject = Nothing
End Sub
```

    DilatationalAngle : float byref *
    ?Temp : float
(* Defaults:
    let _Temp = defaultArg Temp 0
*)
-> int
```

Parameters

Name

Type:Â SystemString

The name of an existing concrete material property.

Fc

Type:Â SystemDouble

IsLightweight

Type:Â SystemBoolean

If this item is True, the concrete is assumed to be lightweight concrete.

FcsFactor

Type:Â SystemDouble

SSType

Type:Â SystemInt32

This is 0, 1 or 2, indicating the stress-strain curve type.

Value	SSType
0	User defined
1	Parametric - Simple
2	Parametric - Mander

SSHysTypeType:Â SystemInt32

This is 0 through 7, indicating the stress-strain curve type.

Value	SSHysType
--------------	------------------

0	Elastic
1	Kinematic
2	Takeda
3	Pivot
4	Concrete
5	BRB Hardening
6	Degrading
7	Isotropic

StrainAtFcType:Â SystemDouble**StrainUltimate**Type:Â SystemDouble

This item applies only to parametric stress-strain curves. It is the ultimate unconfined strain capacity. This item must be larger than the StrainAtfc item

FinalSlopeType:Â SystemDouble

This item applies only to parametric stress-strain curves. It is a multiplier on the material modulus of elasticity, E. This value multiplied times E gives the final slope on the compression side of the curve.

FrictionAngleType:Â SystemDouble

The Drucker-Prager friction angle. This item must be smaller or equal to 0 and less than 90. [deg]

DilatationalAngleType:Â SystemDouble

The Drucker-Prager dilatational angle. This item must be smaller or equal to 0 and less than 90. [deg]

Temp (Optional)Type:Â SystemDouble

The temperature at which the specified data is to be retrieved. The temperature must have been defined previously for the material.

This item applies only if the specified material has properties that are temperature dependent. That is, it applies only if properties are specified for the material at more than one temperature.

Return ValueType:Â Int32

Returns zero if the data is successfully retrieved; otherwise it returns a nonzero value.

    bool% UseCaltransSSDefaults,
    double Temp = 0
)

abstract Get0Rebar :
    Name : string *
    Fy : float byref *
    Fu : float byref *
    EFy : float byref *
    EFu : float byref *
    SStype : int byref *
    SSHysType : int byref *
    StrainAtHardening : float byref *
    StrainUltimate : float byref *
    UseCaltransSSDefaults : bool byref *
    ?Temp : float
(* Defaults:
    let _Temp = defaultArg Temp 0
*)
-> int

```

Parameters

Name

Type:Â [SystemString](#)

The name of an existing rebar material property.

Fy

Type:Â [SystemDouble](#)

Fu

Type:Â [SystemDouble](#)

The minimum tensile stress. [F/L2]

EFy

Type:Â [SystemDouble](#)

EFu

Type:Â [SystemDouble](#)

SStype

Type:Â [SystemInt32](#)

This is 0, 1 or 2, indicating the stress-strain curve type.

Value **SStype**

0 User defined

- 1 Parametric - Simple
- 2 Parametric - Park

SSHysTypeType:Â SystemInt32

This is 0 through 7, indicating the stress-strain curve type.

Value SSHysType

- 0 Elastic
- 1 Kinematic
- 2 Takeda
- 3 Pivot
- 4 Concrete
- 5 BRB Hardening
- 6 Degradation
- 7 Isotropic

StrainAtHardeningType:Â SystemDouble

This item applies only when parametric stress-strain curves are used and when UseCaltransSSDefaults is False. It is the strain at the onset of strain hardening.

StrainUltimateType:Â SystemDouble

This item applies only when parametric stress-strain curves are used and when UseCaltransSSDefaults is False. It is the ultimate strain capacity. This item must be larger than the StrainAtHardening item.

UseCaltransSSDefaultsType:Â SystemBoolean

If this item is True, the program uses Caltrans default controlling strain values, which are bar size dependent.

Temp (Optional)Type:Â SystemDouble

The temperature at which the specified data is to be retrieved. The temperature must have been defined previously for the material.

This item applies only if the specified material has properties that are temperature dependent. That is, it applies only if properties are specified for the material at more than one temperature.

Return ValueType:Â Int32

Returns zero if the data is successfully retrieved; otherwise it returns a nonzero value.

    Name : string *
    Fy : float byref *
    Fu : float byref *
    EFy : float byref *
    EFu : float byref *
    SStype : int byref *
    SSHysType : int byref *
    StrainAtHardening : float byref *
    StrainUltimate : float byref *
    FinalSlope : float byref *
    UseCaltransSSDefaults : bool byref *
    ?Temp : float
(* Defaults:
    let _Temp = defaultArg Temp 0
*)
-> int
```

Parameters

Name	Type:Â <u>SystemString</u> The name of an existing rebar material property.
Fy	Type:Â <u>SystemDouble</u>
Fu	Type:Â <u>SystemDouble</u> The minimum tensile stress. [F/L2]
EFy	Type:Â <u>SystemDouble</u>
EFu	Type:Â <u>SystemDouble</u>
SStype	

Type: SystemInt32

This is 0, 1 or 2, indicating the stress-strain curve type.

Value SSType

- 0 User defined
- 1 Parametric - Simple
- 2 Parametric - Park

SSHysType

Type: SystemInt32

This is 0 through 7, indicating the stress-strain curve type.

Value SSHysType

- 0 Elastic
- 1 Kinematic
- 2 Takeda
- 3 Pivot
- 4 Concrete
- 5 BRB Hardening
- 6 Degrading
- 7 Isotropic

StrainAtHardening

Type: SystemDouble

This item applies only when parametric stress-strain curves are used and when UseCaltransSSDefaults is False. It is the strain at the onset of strain hardening.

StrainUltimate

Type: SystemDouble

This item applies only when parametric stress-strain curves are used and when UseCaltransSSDefaults is False. It is the ultimate strain capacity. This item must be larger than the StrainAtHardening item.

FinalSlope

Type: SystemDouble

This item applies only to parametric stress-strain curves. It is a multiplier on the material modulus of elasticity, E. This value multiplied times E gives the final slope of the curve.

UseCaltransSSDefaults

Type: SystemBoolean

If this item is True, the program uses Caltrans default controlling strain values, which are bar size dependent.

Temp (Optional)

Type: SystemDouble

The temperature at which the specified data is to be retrieved. The temperature must have been defined previously for the material.

This item applies only if the specified material has properties that are temperature dependent. That is, it applies only if properties are specified for the material at more than one temperature.

Return ValueType: $\hat{A}$ Int32

Returns zero if the data is successfully retrieved; otherwise it returns a nonzero value.

▲ Remarks

▲ Examples

VB

Copy

```
Public Sub Example()
    Dim SapModel As cSapModel

Parameters

Name

Type:Â SystemString

The name of an existing steel material property.

Fy

Type:Â SystemDouble

Fu

Type:Â SystemDouble

The minimum tensile stress. [F/L2]

EFy

Type:Â SystemDouble

EFu

Type:Â SystemDouble

SStype

Type:Â SystemInt32

This is 0 or 1, indicating the stress-strain curve type.

Value **SStype**

0 User defined

1 Parametric - Simple

SSHysType
 Type:Â SystemInt32
 This is 0 through 7, indicating the stress-strain curve type.
Value SSHysType

0	Elastic
1	Kinematic
2	Takeda
3	Pivot
4	Concrete
5	BRB Hardening
6	Degrading
7	Isotropic

StrainAtHardening
 Type:Â SystemDouble
 This item applies only when parametric stress-strain curves are used. It is the strain at the onset of strain hardening.

StrainAtMaxStress
 Type:Â SystemDouble
 This item applies only when parametric stress-strain curves are used. It is the strain at the maximum stress. This item must be larger than the StrainAtHardening item.

StrainAtRupture
 Type:Â SystemDouble
 This item applies only when parametric stress-strain curves are used. It is the strain at rupture. This item must be larger than the StrainAtMaxStress item.

Temp (Optional)
 Type:Â SystemDouble
 The temperature at which the specified data is to be retrieved. The temperature must have been defined previously for the material.

This item applies only if the specified material has properties that are temperature dependent. That is, it applies only if properties are specified for the material at more than one temperature.

Return Value

Type:Â Int32
 Returns zero if the data is successfully retrieved; otherwise it returns a nonzero value.

    SSHysType : int byref *
    FinalSlope : float byref *
    ?Temp : float
(* Defaults:
    let _Temp = defaultArg Temp 0
*)
-> int

```

Parameters

Name

Type:Â SystemString

The name of an existing tendon material property.

Fy

Type:Â SystemDouble

Fu

Type:Â SystemDouble

The minimum tensile stress. [F/L2]

SSType

Type:Â SystemInt32

This is 0, 1 or 2, indicating the stress-strain curve type.

Value	SSType
0	User defined
1	Parametric - 250 ksi strand
1	Parametric - 270 ksi strand

SSHysType

Type:Â SystemInt32

This is 0 through 7, indicating the stress-strain curve type.

Value	SSHysType
0	Elastic
1	Kinematic
2	Takeda
3	Pivot
4	Concrete
5	BRB Hardening
6	Degrading
7	Isotropic

FinalSlope

Type:Â SystemDouble

This item applies only to parametric stress-strain curves. It is a multiplier on the material modulus of elasticity, E. This value multiplied times E gives the final slope of the curve.

Temp (Optional)Type: SystemDouble

The temperature at which the specified data to be retrieved. The temperature must have been defined previously for the material.

This item applies only if the specified material has properties that are temperature dependent. That is, it applies only if properties are specified for the material at more than one temperature.

Return ValueType: Int32

Returns zero if the data is successfully retrieved; otherwise it returns a nonzero value. The function returns an error if the specified material is not tendon.

)

abstract GetSSCurve :
    Name : string *
    NumberPoints : int byref *
    PointID : int[] byref *
    Strain : float[] byref *
    Stress : float[] byref *
    ?SectName : string *
    ?RebarArea : float *
    ?Temp : float
(* Defaults:
    let _SectName = defaultArg SectName ""
    let _RebarArea = defaultArg RebarArea 0
    let _Temp = defaultArg Temp 0
*)
-> int

```

Parameters

Name

Type:Â SystemString

The name of an existing material property.

NumberPoints

Type:Â SystemInt32

The number of points in the stress-strain curve.

PointID

Type:Â SystemInt32

This is one of the following integers which sets the point ID. The point ID controls the color that will be displayed for hinges in a deformed shape plot.

Value Point ID

-5	-E
-4	-D
-3	-C
-2	-B
-1	-A
0	None
1	A
2	B
3	C
4	D
5	E

Strain

Type:Â SystemDouble

This is an array that includes the strain at each point on the stress strain curve.

Stress

Type: SystemDouble

This is an array that includes the stress at each point on the stress strain curve.
[F/L2]

SectName (Optional)

Type: SystemString

This item applies only if the specified material is concrete with a Mander concrete type.

This is the frame section property for which the Mander stress-strain curve is retrieved.

The section must be round or rectangular

RebarArea (Optional)

Type: SystemDouble

This is the area of the rebar for which the stress-strain curve is retrieved.

This item applies only if the specified material is rebar, which does not have a user-defined stress-strain curve and is specified to use Caltrans default controlling strain values, which are bar size dependent.

Temp (Optional)

Type: SystemDouble

The temperature at which the specified data is to be retrieved. The temperature must have been defined previously for the material.

This item applies only if the specified material has properties that are temperature dependent. That is, it applies only if properties are specified for the material at more than one temperature.

Return Value

Type: Int32

Returns zero if the data is successfully retrieved; otherwise it returns a nonzero value.

▲ Remarks

▲ Examples

VB

Copy

```
Public Sub Example()
    Dim SapModel As cSapModel
    Dim EtabsObject As cOAPI
    Dim ret As Integer = -1
    Dim NumberPoints As Integer
    Dim PointID() As Integer
    Dim Strain() As Double
    Dim Stress() As Double

    'create ETABS object
    Dim myHelper as cHelper = New Helper
    EtabsObject = myHelper.CreateObjectProgID("CSI.ETABS.API.ETABSObject")

    'start ETABS application
    ret = EtabsObject.ApplicationStart()

    'create SapModel object
    SapModel = EtabsObject.SapModel
```

Introduction

```
'initialize model
    ret = SapModel.InitializeNewModel()

'create steel deck template model
    ret = SapModel.File.NewSteelDeck(4,12,12,4,4,24,24)

'get stress strain curve
    ret = SapModel.PropMaterial.GetSSCurve("A992Fy50", NumberPoints, PointID, Strain, Stress)

'close ETABS
    EtabsObject.ApplicationExit(False)

'clean up variables
    SapModel = Nothing
    EtabsObject = Nothing
End Sub
```

    ?Temp : float
(* Defaults:
    let _Temp = defaultArg Temp 0
*)
-> int

```

Parameters

Name

Type:Â SystemString

The name of an existing material property.

ModalRatio

Type:Â SystemDouble

The modal damping ratio.

ViscousMassCoeff

Type:Â SystemDouble

The mass coefficient for viscous proportional damping.

ViscousStiffCoeff

Type:Â SystemDouble

The stiffness coefficient for viscous proportional damping.

HystereticMassCoeff

Type:Â SystemDouble

The mass coefficient for hysteretic proportional damping.

HystereticStiffCoeff

Type:Â SystemDouble

The stiffness coefficient for hysteretic proportional damping.

Temp (Optional)

Type:Â SystemDouble

The temperature at which the specified data applies. The temperature must have been previously defined for the material.

This item applies only if the specified material has properties that are temperature dependent. That is, it applies only if properties are specified for the material at more than one temperature.

Return Value

Type:Â Int32

Returns zero if the data is successfully assigned; otherwise it returns a nonzero value.

NumberLoads : int *
LoadPat : string[] byref *
sf : float[] byref -> int

```

Parameters

IncludeElements

Type:Â SystemBoolean
Include element self mass

IncludeAddedMass

Type:Â SystemBoolean
Include additional masses

IncludeLoads

Type:Â SystemBoolean
Include specified loads

NumberLoads

Type:Â SystemInt32
The number of load patterns from which mass is obtained. This item applies only when IncludeLoads is True.

LoadPat

Type:Â SystemString
This is an array of the names of the load patterns from which mass is obtained. This item applies only when IncludeLoads is True.

sf

Type:Â SystemDouble
This is an array of load patterns multipliers used to calculate the mass. This item applies only when IncludeLoads is True.

Return Value

Type:Â Int32

Returns zero if the mass source is successfully set; otherwise it returns a nonzero value.

CSI API ETABS v1

cPropMaterialAddLanguageSpecificTextSet("LSTA5E5EC2D_0?cpnu=")

Method

DEPRECATED. Initializes a material property. If this function is called for an existing material property, all items for the material are reset to their default value.

Namespace: ETABSv1

Assembly: ETABSv1 (in ETABSv1.dll) Version: 1.0.0.0 (1.24.0.0)

Syntax

C#

VB

C++

F#

Copy

```
int SetMaterial(
    string Name,
    eMatType MatType,
    int Color = -1,
    string Notes = "",
    string GUID = ""
)
```

```
Function SetMaterial (
    Name As String,
    MatType As eMatType,
    Optional As Integer = -1,
    Optional As String = "",
    Optional As String = ""
) As Integer
```

```
Dim instance As cPropMaterial
Dim Name As String
Dim MatType As eMatType
Dim Color As Integer
Dim Notes As String
Dim GUID As String
Dim returnValue As Integer
```

```
returnValue = instance.SetMaterial(Name,
    MatType, Color, Notes, GUID)
```

```
int SetMaterial(
    String^ Name,
    eMatType MatType,
    int Color = -1,
    String^ Notes = L"",
    String^ GUID = L""
)
```

```
abstract SetMaterial :
    Name : string *
    MatType : eMatType *
    ?Color : int *
    ?Notes : string *
```

cPropMaterialspan id="LSTA5E5EC2D_0"AddLanguageSpecificTextSet("LSTA5E5EC2D_0?cpnu=");S

```

        ?GUID : string
(* Defaults:
    let _Color = defaultArg Color -1
    let _Notes = defaultArg Notes ""
    let _GUID = defaultArg GUID ""
*)
-> int

```

Parameters

Name

Type:Â SystemString

The name of an existing or new material property. If this is an existing property, that property is modified; otherwise, a new property is added.

MatType

Type:Â ETABSV1eMatType

This is one of the items in the eMatType enumeration.

Color (Optional)

Type:Â SystemInt32

Notes (Optional)

Type:Â SystemString

GUID (Optional)

Type:Â SystemString

The GUID (global unique identifier), if any, assigned to the material. If this item is input as Default, the program assigns a GUID to the material.

Return Value

Type:Â Int32

Returns zero if the material is successfully initialized; otherwise it returns a nonzero value.

Remarks

This function is DEPRECATED. Please use AddMaterial(String, eMatType, String, String, String, String) instead.

Examples

VB

Copy

```

Public Sub Example()
    Dim SapModel As cSapModel
    Dim EtabsObject As cOAPI
    Dim ret As Integer = -1

    'create ETABS object
    Dim myHelper as cHelper = New Helper
    EtabsObject = myHelper.CreateObjectProgID("CSI.ETABS.API.ETABSObject")

    'start ETABS application
    ret = EtabsObject.ApplicationStart()

    'create SapModel object
    SapModel = EtabsObject.SapModel

    'initialize model
    ret = SapModel.InitializeNewModel()

    'create steel deck template model

```

Introduction

```
ret = SapModel.File.NewSteelDeck(4,12,12,4,4,24,24)

'initialize new material property
ret = SapModel.PropMaterial.SetMaterial("Steel", eMatType.Steel)

'close ETABS
EtabsObject.ApplicationExit(False)

'clean up variables
SapModel = Nothing
EtabsObject = Nothing
End Sub
```

```

```
int SetMPAnisotropic(
    String^ Name,
    array<double>^% E,
    array<double>^% U,
    array<double>^% A,
    array<double>^% G,
    double Temp = 0
)
```

```
abstract SetMPAnisotropic :
```

cPropMaterialspan id="LST5662BE34_0"AddLanguageSpecificTextSet("LST5662BE34_0?cpp3495=.");Se

```

    Name : string *
    E : float[] byref *
    U : float[] byref *
    A : float[] byref *
    G : float[] byref *
    ?Temp : float
(* Defaults:
    let _Temp = defaultArg Temp 0
*)
-> int

```

Parameters

Name

Type: SystemString

The name of an existing material property.

E

Type: SystemDouble

This is an array that includes the modulus of elasticity.

Value Term

e(0) E1 [F/L2]

e(1) E2 [F/L2]

e(2) E3 [F/L2]

U

Type: SystemDouble

This is an array that includes poisson's ratio.

Value Term

u(0) U12

u(1) U13

u(2) U23

u(3) U14

u(4) U24

u(5) U34

u(6) U15

u(7) U25

u(8) U35

u(9) U45

u(10) U16

u(11) U26

u(12) U36

u(13) U46

u(14) U56

A

Type: SystemDouble

This is an array that includes the thermal coefficient.

Value Term

a(0) A1 [1/T]

a(1) A2 [1/T]

a(2) A3 [1/T]
 a(3) A12 [1/T]
 a(4) A13 [1/T]
 a(5) A23 [1/T]

G

Type: SystemDouble

This is an array that includes the shear modulus.

Value Term

g(0) G12 [F/L2]
 g(1) G13 [F/L2]
 g(2) G23 [F/L2]

Temp (Optional)

Type: SystemDouble

The temperature at which the specified data applies. The temperature must have been defined previously for the material.

This item applies only if the specified material has properties that are temperature dependent. That is, it applies only if properties are specified for the material at more than one temperature.

Return Value

Type: Int32

Returns zero if the data is successfully assigned; otherwise it returns a nonzero value.

▲Remarks

(* Defaults:  
    let _FrictionAngle = defaultArg FrictionAngle 0  
    let _DilatationalAngle = defaultArg DilatationalAngle 0  
    let _Temp = defaultArg Temp 0  
)  
-> int
```

Parameters

Name

Type:Â SystemString

The name of an existing concrete material property.

Fc

Type:Â SystemDouble

IsLightweight

Type:Â SystemBoolean

If this item is True, the concrete is assumed to be lightweight concrete.

FcsFactor

Type:Â SystemDouble

SSType

Type:Â SystemInt32

This is 0, 1 or 2, indicating the stress-strain curve type.

Value **SSType**

- 0 User defined
- 1 Parametric - Simple
- 2 Parametric - Mander

SSHysTypeType: SystemInt32

This is 0 through 7, indicating the stress-strain curve type.

Value SSHysType

- 0 Elastic
- 1 Kinematic
- 2 Takeda
- 3 Pivot
- 4 Concrete
- 5 BRB Hardening
- 6 Degradation
- 7 Isotropic

StrainAtFcType: SystemDouble**StrainUltimate**Type: SystemDouble

This item applies only to parametric stress-strain curves. It is the ultimate unconfined strain capacity. This item must be larger than the StrainAtfc item

FrictionAngle (Optional)Type: SystemDouble

The Drucker-Prager friction angle. This item must be smaller or equal to 0 and less than 90. [deg]

DilatationalAngle (Optional)Type: SystemDouble

The Drucker-Prager dilatational angle. This item must be smaller or equal to 0 and less than 90. [deg]

Temp (Optional)Type: SystemDouble

The temperature at which the specified data applies. The temperature must have been defined previously for the material.

This item applies only if the specified material has properties that are temperature dependent. That is, it applies only if properties are specified for the material at more than one temperature.

Return ValueType: Int32

Returns zero if the data is successfully assigned; otherwise it returns a nonzero value.

▲ **Remarks**▲ **Examples**

VB

Copy

```
Public Sub Example()  
    Dim SapModel As cSapModel  
    Dim EtabsObject As cOAPI
```

Introduction

```
Dim ret As Integer = -1

'create ETABS object
Dim myHelper as cHelper = New Helper
EtabsObject = myHelper.CreateObjectProgID("CSI.ETABS.API.ETABSObject")

'start ETABS application
ret = EtabsObject.ApplicationStart()

'create SapModel object
SapModel = EtabsObject.SapModel

'initialize model
ret = SapModel.InitializeNewModel()

'create steel deck template model
ret = SapModel.File.NewSteelDeck(4,12,12,4,4,24,24)

'initialize new material property
ret = SapModel.PropMaterial.SetMaterial("Concrete", eMatType.Concrete)

'assign other properties
ret = SapModel.PropMaterial.Set0Concrete("Concrete", 5, False, 0, 1, 2, 0.0022, 0.0052)

'close ETABS
EtabsObject.ApplicationExit(False)

'clean up variables
SapModel = Nothing
EtabsObject = Nothing
End Sub
```

-> int
```

Parameters

Name

Type:Â SystemString

The name of an existing concrete material property.

Fc

Type:Â SystemDouble

IsLightweight

Type:Â SystemBoolean

If this item is True, the concrete is assumed to be lightweight concrete.

FcsFactor

Type:Â SystemDouble

SSType

Type: SystemInt32

This is 0, 1 or 2, indicating the stress-strain curve type.

Value SSType

- 0 User defined
- 1 Parametric - Simple
- 2 Parametric - Mander

SSHysType

Type: SystemInt32

This is 0 through 7, indicating the stress-strain curve type.

Value SSHysType

- 0 Elastic
- 1 Kinematic
- 2 Takeda
- 3 Pivot
- 4 Concrete
- 5 BRB Hardening
- 6 Degradation
- 7 Isotropic

StrainAtFc

Type: SystemDouble

StrainUltimate

Type: SystemDouble

This item applies only to parametric stress-strain curves. It is the ultimate unconfined strain capacity. This item must be larger than the StrainAtfc item

FinalSlope

Type: SystemDouble

This item applies only to parametric stress-strain curves. It is a multiplier on the material modulus of elasticity, E. This value multiplied times E gives the final slope on the compression side of the curve.

FrictionAngle (Optional)

Type: SystemDouble

The Drucker-Prager friction angle. This item must be smaller or equal to 0 and less than 90. [deg]

DilatationalAngle (Optional)

Type: SystemDouble

The Drucker-Prager dilatational angle. This item must be smaller or equal to 0 and less than 90. [deg]

Temp (Optional)

Type: SystemDouble

The temperature at which the specified data applies. The temperature must have been defined previously for the material.

This item applies only if the specified material has properties that are temperature dependent. That is, it applies only if properties are specified for the material at more than one temperature.

Return Value

Type: Int32

Returns zero if the data is successfully assigned; otherwise it returns a nonzero value.

    ?Temp : float
(* Defaults:
    let _Temp = defaultArg Temp 0
*)
-> int

```

Parameters

Name

Type: SystemString

The name of an existing rebar material property.

Fy

Type: SystemDouble

Fu

Type: SystemDouble

The minimum tensile stress. [F/L2]

EFy

Type: SystemDouble

EFu

Type: SystemDouble

SStype

Type: SystemInt32

This is 0, 1 or 2, indicating the stress-strain curve type.

Value **SStype**

0 User defined

- 1 Parametric - Simple
- 2 Parametric - Park

SSHysType

Type: SystemInt32

This is 0 through 7, indicating the stress-strain curve type.

Value SSHysType

- 0 Elastic
- 1 Kinematic
- 2 Takeda
- 3 Pivot
- 4 Concrete
- 5 BRB Hardening
- 6 Degrading
- 7 Isotropic

StrainAtHardening

Type: SystemDouble

This item applies only when parametric stress-strain curves are used and when UseCaltransSSDefaults is False. It is the strain at the onset of strain hardening.

StrainUltimate

Type: SystemDouble

This item applies only when parametric stress-strain curves are used and when UseCaltransSSDefaults is False. It is the ultimate strain capacity. This item must be larger than the StrainAtHardening item.

UseCaltransSSDefaults

Type: SystemBoolean

If this item is True, the program uses Caltrans default controlling strain values, which are bar size dependent.

Temp (Optional)

Type: SystemDouble

The temperature at which the specified data applies. The temperature must have been defined previously for the material.

This item applies only if the specified material has properties that are temperature dependent. That is, it applies only if properties are specified for the material at more than one temperature.

Return Value

Type: Int32

Returns zero if the data is successfully assigned; otherwise it returns a nonzero value.

    double EFu,
    int SStype,
    int SSHysType,
    double StrainAtHardening,
    double StrainAtMaxStress,
    double StrainAtRupture,
    double Temp = 0
)

abstract Set0Steel :
    Name : string *
    Fy : float *
    Fu : float *
    EFy : float *
    EFu : float *
    SStype : int *
    SSHysType : int *
    StrainAtHardening : float *
    StrainAtMaxStress : float *
    StrainAtRupture : float *
    ?Temp : float
(* Defaults:
    let _Temp = defaultArg Temp 0
*)
-> int

```

Parameters

Name

Type:Â SystemString

The name of an existing steel material property.

Fy

Type:Â SystemDouble

Fu

Type:Â SystemDouble

The minimum tensile stress. [F/L2]

EFy

Type:Â SystemDouble

EFu

Type:Â SystemDouble

SStype

Type:Â SystemInt32

This is 0 or 1, indicating the stress-strain curve type.

Value **SStype**

0 User defined

1 Parametric - Simple

SSHysType

Type:Â SystemInt32

This is 0 through 7, indicating the stress-strain curve type.

Value SSHysType

- 0 Elastic
- 1 Kinematic
- 2 Takeda
- 3 Pivot
- 4 Concrete
- 5 BRB Hardening
- 6 Degrading
- 7 Isotropic

StrainAtHardening

Type:Â SystemDouble

This item applies only when parametric stress-strain curves are used. It is the strain at the onset of strain hardening.

StrainAtMaxStress

Type:Â SystemDouble

This item applies only when parametric stress-strain curves are used. It is the strain at maximum stress. This item must be larger than the StrainAtHardening item.

StrainAtRupture

Type:Â SystemDouble

This item applies only when parametric stress-strain curves are used. It is the strain at rupture. This item must be larger than the StrainAtMaxStress item.

Temp (Optional)

Type:Â SystemDouble

The temperature at which the specified data applies. The temperature must have been defined previously for the material.

This item applies only if the specified material has properties that are temperature dependent. That is, it applies only if properties are specified for the material at more than one temperature.

Return ValueType:Â Int32

Returns zero if the data is successfully assigned; otherwise it returns a nonzero value.

▲Remarks

▲Examples

VB

Copy

```
Public Sub Example()
    Dim SapModel As cSapModel
    Dim EtabsObject As cOAPI
    Dim ret As Integer = -1

    'create ETABS object
    Dim myHelper as cHelper = New Helper
```

Introduction

```
EtabsObject = myHelper.CreateObjectProgID("CSI.ETABS.API.ETABSObject")

'start ETABS application
ret = EtabsObject.ApplicationStart()

'create SapModel object
SapModel = EtabsObject.SapModel

'initialize model
ret = SapModel.InitializeNewModel()

'create steel deck template model
ret = SapModel.File.NewSteelDeck(4,12,12,4,4,24,24)

'initialize new material property
ret = SapModel.PropMaterial.SetMaterial("Steel", eMatType.Steel)

'assign other properties
ret = SapModel.PropMaterial.Set0Steel("Steel", 55, 68, 60, 70, 1, 2, 0.02, 0.1, 0.2)

'close ETABS
EtabsObject.ApplicationExit(False)

'clean up variables
SapModel = Nothing
EtabsObject = Nothing
End Sub
```

*)
-> int
```

Parameters

Name	Type:Â <u>SystemString</u> The name of an existing steel material property.
Fy	Type:Â <u>SystemDouble</u>
Fu	Type:Â <u>SystemDouble</u> The minimum tensile stress. [F/L2]
EFy	Type:Â <u>SystemDouble</u>
EFu	Type:Â <u>SystemDouble</u>
SStype	

Type: SystemInt32

This is 0 or 1, indicating the stress-strain curve type.

Value SSType

- 0 User defined
- 1 Parametric - Simple

SSHysType

Type: SystemInt32

This is 0 through 7, indicating the stress-strain curve type.

Value SSHysType

- 0 Elastic
- 1 Kinematic
- 2 Takeda
- 3 Pivot
- 4 Concrete
- 5 BRB Hardening
- 6 Degradation
- 7 Isotropic

StrainAtHardening

Type: SystemDouble

This item applies only when parametric stress-strain curves are used. It is the strain at the onset of strain hardening.

StrainAtMaxStress

Type: SystemDouble

This item applies only when parametric stress-strain curves are used. It is the strain at maximum stress. This item must be larger than the StrainAtHardening item.

StrainAtRupture

Type: SystemDouble

This item applies only when parametric stress-strain curves are used. It is the strain at rupture. This item must be larger than the StrainAtMaxStress item.

FinalSlope

Type: SystemDouble

This item applies only to parametric stress-strain curves. It is a multiplier on the material modulus of elasticity, E. This value multiplied times E gives the final slope of the curve.

Temp (Optional)

Type: SystemDouble

The temperature at which the specified data applies. The temperature must have been defined previously for the material.

This item applies only if the specified material has properties that are temperature dependent. That is, it applies only if properties are specified for the material at more than one temperature.

Return Value

Type: Int32

Returns zero if the data is successfully assigned; otherwise it returns a nonzero value.

*)
-> int

```

Parameters

Name

Type:Â SystemString

The name of an existing tendon material property.

Fy

Type:Â SystemDouble

Fu

Type:Â SystemDouble

The minimum tensile stress. [F/L2]

SStype

Type:Â SystemInt32

This is 0, 1 or 2, indicating the stress-strain curve type.

Value	SStype
0	User defined
1	Parametric - 250 ksi strand
1	Parametric - 270 ksi strand

SSHysType

Type:Â SystemInt32

This is 0 through 7, indicating the stress-strain curve type.

Value	SSHysType
0	Elastic
1	Kinematic
2	Takeda
3	Pivot
4	Concrete
5	BRB Hardening
6	Degrading
7	Isotropic

Temp (Optional)

Type:Â SystemDouble

The temperature at which the specified data applies. The temperature must have been defined previously for the material.

This item applies only if the specified material has properties that are temperature dependent. That is, it applies only if properties are specified for the material at more than one temperature.

Return Value

Type: Int32

Returns zero if the data is successfully assigned; otherwise it returns a nonzero value.

CSI API ETABS v1

cPropMaterialAddLanguageSpecificTextSet("LST8E4EAB9D_0?cpu=.") Method

Sets the material stress-strain curve for materials that are specified to have user-defined stress-strain curves.

Namespace: [ETABSv1](#)

Assembly: [ETABSv1](#) (in ETABSv1.dll) Version: 1.0.0.0 (1.24.0.0)

Syntax

[C#](#)

[VB](#)

[C++](#)

[F#](#)

[Copy](#)

```
int SetSSCurve(
    string Name,
    int NumberPoints,
    ref int[] PointID,
    ref double[] Strain,
    ref double[] Stress,
    double Temp = 0
)
```

```
Function SetSSCurve (
    Name As String,
    NumberPoints As Integer,
    ByRef PointID As Integer(),
    ByRef Strain As Double(),
    ByRef Stress As Double(),
    Temp As Double = 0
) As Integer
```

```
Dim instance As cPropMaterial
Dim Name As String
Dim NumberPoints As Integer
Dim PointID As Integer()
Dim Strain As Double()
Dim Stress As Double()
Dim Temp As Double
Dim returnValue As Integer
```

```
returnValue = instance.SetSSCurve(Name,
    NumberPoints, PointID, Strain, Stress,
    Temp)
```

```
int SetSSCurve(
    String^ Name,
    int NumberPoints,
    array<int>^% PointID,
    array<double>^% Strain,
    array<double>^% Stress,
    double Temp = 0
)
```

```

abstract SetSSCurve :
    Name : string *
    NumberPoints : int *
    PointID : int[] byref *
    Strain : float[] byref *
    Stress : float[] byref *
    ?Temp : float
(* Defaults:
    let _Temp = defaultArg Temp 0
*)
-> int

```

Parameters

Name

Type: SystemString

The name of an existing material property.

NumberPoints

Type: SystemInt32

The number of points in the stress-strain curve. This item must be at least 3.

PointID

Type: SystemInt32

This is one of the following integers which sets the point ID. The point ID controls the color that will be displayed for hinges in a deformed shape plot.

Value Point ID

-5	-E
-4	-D
-3	-C
-2	-B
-1	-A
0	None
1	A
2	B
3	C
4	D
5	E

The point IDs must be input in numerically increasing order, except that 0 (None) values are allowed anywhere. No duplicate values are allowed except for 0 (None).

Strain

Type: SystemDouble

This is an array that includes the strain at each point on the stress strain curve. The strains must increase monotonically.

Stress

Type: SystemDouble

This is an array that includes the stress at each point on the stress strain curve. [F/L2]

Points that have a negative strain must have a zero or negative stress. Similarly, points that have a positive strain must have a zero or positive stress.

There must be one point defined that has zero strain and zero stress.

Temp (Optional)

Type: SystemDouble

The temperature at which the specified data applies. The temperature must have been defined previously for the material.

This item applies only if the specified material has properties that are temperature dependent. That is, it applies only if properties are specified for the material at more than one temperature.

Return Value

Type: Int32

Returns zero if the data is successfully assigned; otherwise it returns a nonzero value.

▲ Remarks

▲ Examples

CSI API ETABS v1

cPropMaterialAddLanguageSpecificTextSet("LST3625F9C9_0?cpp3547=.");SetTemp

Method

assigns the temperatures at which properties are specified for a material. This data is required only for materials whose properties are temperature dependent.

Namespace: ETABSv1

Assembly: ETABSv1 (in ETABSv1.dll) Version: 1.0.0.0 (1.24.0.0)

Syntax

C#

VB

C++

F#

Copy

```
int SetTemp(
    string Name,
    int NumberItems,
    ref double[] Temp
)
```

```
Function SetTemp (
    Name As String,
    NumberItems As Integer,
    ByRef Temp As Double()
) As Integer
```

```
Dim instance As cPropMaterial
Dim Name As String
Dim NumberItems As Integer
Dim Temp As Double()
Dim returnValue As Integer
```

```
returnValue = instance.SetTemp(Name, NumberItems,
    Temp)
```

```
int SetTemp(
    String^ Name,
    int NumberItems,
    array<double>^% Temp
)
```

```
abstract SetTemp :
    Name : string *
    NumberItems : int *
    Temp : float[] byref -> int
```

Parameters

Name

Type: SystemString

The name of an existing material property.

NumberItems

cPropMaterialspan id="LST3625F9C9_0"AddLanguageSpecificTextSet("LST3625F9C9_0?cpp3547=.");SetTemp

Type:Â SystemInt32

The number of different temperatures at which properties are specified for the material.

Temp

Type:Â SystemDouble

This is an array that includes the different temperatures at which properties are specified for the material.

Return Value

Type:Â Int32

Returns zero if the temperatures are successfully set; otherwise it returns a nonzero value

▲ Remarks

▲ Examples

VB

Copy

```
Public Sub Example()
    Dim SapModel As cSapModel

CSI API ETABS v1

cPropMaterialAddLanguageSpecificTextSet("LST36C6A362_0?cpp3550u=.");Set

Method

Assigns weight per unit volume or mass per unit volume to a material property.

Namespace: [ETABSv1](#)

Assembly: [ETABSv1](#) (in ETABSv1.dll) Version: 1.0.0.0 (1.24.0.0)

Syntax

[C#](#)

[VB](#)

[C++](#)

[F#](#)

[Copy](#)

```
int SetWeightAndMass(
    string Name,
    int MyOption,
    double Value,
    double Temp = 0
)
```

```
Function SetWeightAndMass (
    Name As String,
    MyOption As Integer,
    Value As Double,
    Temp As Double = 0
) As Integer
```

```
Dim instance As cPropMaterial
Dim Name As String
Dim MyOption As Integer
Dim Value As Double
Dim Temp As Double
Dim returnValue As Integer
```

```
returnValue = instance.SetWeightAndMass(Name,
    MyOption, Value, Temp)
```

```
int SetWeightAndMass(
    String^ Name,
    int MyOption,
    double Value,
    double Temp = 0
)
```

```
abstract SetWeightAndMass :
    Name : string *
    MyOption : int *
    Value : float *
    ?Temp : float
(* Defaults:
    let _Temp = defaultArg Temp 0
*)
-> int
```

cPropMaterialspan id="LST36C6A362_0"AddLanguageSpecificTextSet("LST36C6A362_0?cpp3550u=.");Set

Parameters

Name

Type:Â SystemString

The name of an existing material property.

MyOption

Type:Â SystemInt32

This is either 1 or 2, indicating what is specified by the Value item.

Value**Option**

1 Weight per unit volume is specified

2 Mass per unit volume is specified

Value

Type:Â SystemDouble

This is either the weight per unit volume or the mass per unit volume, depending on the value of the MyOption item. [F/L3] for MyOption = 1 (weight), and [M/L3] for MyOption = 2 (mass)

Temp (Optional)

Type:Â SystemDouble**Return Value**Type:Â Int32

Returns zero if the data is successfully assigned; otherwise it returns a nonzero value.

▲Remarks

▲Examples

VB

Copy

```
Public Sub Example()
    Dim SapModel As cSapModel
    Dim EtabsObject As cOAPI
    Dim ret As Integer = -1

    'create ETABS object
    Dim myHelper as cHelper = New Helper
    EtabsObject = myHelper.CreateObjectProgID("CSI.ETABS.API.ETABSObject")

    'start ETABS application
    ret = EtabsObject.ApplicationStart()

    'create SapModel object
    SapModel = EtabsObject.SapModel

    'initialize model
    ret = SapModel.InitializeNewModel()

    'create steel deck template model
    ret = SapModel.File.NewSteelDeck(4,12,12,4,4,24,24)

    'initialize new material property
    ret = SapModel.PropMaterial.SetMaterial("Steel", eMatType.Steel)

    'assign material property weight per unit volume
    ret = SapModel.PropMaterial.SetWeightAndMass("Steel", 1, 0.00029)

    'close ETABS
```

Introduction

```
EtabsObject.ApplicationExit(False)

'clean up variables
SapModel = Nothing
EtabsObject = Nothing
End Sub
```

```

The cPropPointSpring type exposes the following members.

▲ Methods

▲	Name	Description
⇒	ChangeName	Changes the name of a defined point spring property
⇒	Delete	Deletes the specified point spring property
⇒	GetLinks	Retrieves the single joint links for a named point spring property
⇒	GetNameList	Retrieves the names of all defined point spring property
⇒	GetPointSpringProp	Retrieves an existing named point spring property
⇒	SetLinks	Sets single joint links for a named point spring property
⇒	SetPointSpringProp	Creates a new named point spring property, or modifies an existing named point spring property

CSI API ETABS v1

cPropPointSpringAddLanguageSpecificTextSet("LST5D274749_0") Method

Changes the name of a defined point spring property

Namespace: ETABSv1

Assembly: ETABSv1 (in ETABSv1.dll) Version: 1.0.0.0 (1.24.0.0)

Syntax

C#

VB

C++

F#

Copy

```
int ChangeName(
    string Name,
    string NewName
)
```

```
Function ChangeName (
    Name As String,
    NewName As String
) As Integer
```

```
Dim instance As cPropPointSpring
Dim Name As String
Dim NewName As String
Dim returnValue As Integer
```

```
returnValue = instance.ChangeName(Name,
    NewName)
```

```
int ChangeName(
    String^ Name,
    String^ NewName
)
```

```
abstract ChangeName :
    Name : string *
    NewName : string -> int
```

Parameters

Name

Type: SystemString

The existing name of a defined point spring property

NewName

Type: SystemString

The new name for the point spring property

Return Value

Type: Int32

Returns zero if the new name is successfully applied, otherwise it returns a nonzero value.

▀ Remarks

▀ Examples

VB

Copy

```
Public Sub Example()
    Dim SapModel As cSapModel
    Dim EtabsObject As cOAPI
    Dim ret As Integer = -1

    'create ETABS object
    Dim myHelper as cHelper = New Helper
    EtabsObject = myHelper.CreateObjectProgID("CSI.ETABS.API.ETABSObject")

    'start ETABS application
    ret = EtabsObject.ApplicationStart()

    'create SapModel object
    SapModel = EtabsObject.SapModel

    'initialize model
    ret = SapModel.InitializeNewModel()

    'create steel deck template model
    ret = SapModel.File.NewSteelDeck(4, 12, 12, 4, 4, 24, 24)

    'define new spring property
    Dim k() as Double
    ReDim k(5)
    k(2) = 1
    ret = SapModel.PropPointSpring.SetPointSpringProp("mySpringProp1", 1, k)

    'change property name
    ret = SapModel.PropPointSpring.ChangeName("mySpringProp1", "prop1")

    'close ETABS
    EtabsObject.ApplicationExit(False)

    'clean up variables
    SapModel = Nothing
    EtabsObject = Nothing
End Sub
```

CSI API ETABS v1

cPropPointSpringAddLanguageSpecificTextSet("LST6297AEB2_0") Method

Deletes the specified point spring property

Namespace: ETABSv1

Assembly: ETABSv1 (in ETABSv1.dll) Version: 1.0.0.0 (1.24.0.0)

▲ Syntax

C#

VB

C++

F#

Copy

```
int Delete(
    string Name
)
```

```
Function Delete (
    Name As String
) As Integer
```

```
Dim instance As cPropPointSpring
Dim Name As String
Dim returnValue As Integer
```

```
returnValue = instance.Delete(Name)
```

```
int Delete(
    String^ Name
)
```

```
abstract Delete :
    Name : string -> int
```

Parameters

Name

Type: SystemString

The name of an existing point spring property

Return Value

Type: Int32

Returns zero if the point spring property is successfully deleted, otherwise it returns a nonzero value.

▲ Remarks

▲ Examples

VB

Copy

```

    NumberLinks, LinkNames, LinkAxialDirs,
    LinkAngles)
```

```
int GetLinks(
    String^ Name,
    int% NumberLinks,
    array<String^>^% LinkNames,
    array<int>^% LinkAxialDirs,
    array<double>^% LinkAngles
)
```

```
abstract GetLinks :
    Name : string *
    NumberLinks : int byref *
    LinkNames : string[] byref *
    LinkAxialDirs : int[] byref *
```

cPropPointSpringspan id="LST317A7AA4_0"AddLanguageSpecificTextSet("LST317A7AA4_0?3560::|nu="

LinkAngles : float[] byref -> int

Parameters

Name

Type:Â SystemString

The name of an existing point spring property. This spring property must be of type option 1

NumberLinks

Type:Â SystemInt32

The number of links

LinkNames

Type:Â SystemString

This array contains the names of existing link properties

LinkAxialDirs

Type:Â SystemInt32

This array contains integers representing the axial direction of their respective link properties and can take one of six values:

◇ -1 : -X

◇ -2 : -Y

◇ -3 : -Z

◇ 1 : +X

◇ 2 : +Y

◇ 3 : +Z

LinkAngles

Type:Â SystemDouble

This array contains the axis 2 angles of their respective link properties [deg]

Return Value

Type:Â Int32

Returns zero if the links are successfully retrieved, otherwise returns nonzero

Send comments on this topic to support@csiamerica.com

Namespace: ETABSv1

▲ Syntax

VB

F#

Copy

```
Function GetNameList (
ByRef NumberNames As Integer,
ByRef MyName As String()
) As Integer
```

```
int GetNameList(
int% NumberNames,
array<String^>^% MyName
)
```

Parameters

Type: SystemInt32

MyName

Type: SystemString

```
Dim MyName() as String
```

Introduction

The array is dimensioned to (NumberNames + 1) inside the program, filled with the names, and returned to the API user.

Return Value

Type: Int32

Returns zero if the names are successfully retrieved, otherwise it returns nonzero.

▲ Remarks

▲ Examples

VB

Copy

    Footing : string byref *
    Period : float byref *
    color : int byref *
    notes : string byref *
    iGUID : string byref -> int
```

Parameters

Name

Type:Â SystemString

The name of the point spring property

SpringOption

Type:Â SystemInt32

The spring stiffness option, either 1 or 2:

1. User Specified / Link Properties
2. Based on Soil Profile and Footing Dimensions

k

Type:Â SystemDouble

This is an array of six spring stiffness values:

- ◊ Value(0) = U1 [F/L]
- ◊ Value(1) = U2 [F/L]
- ◊ Value(2) = U3 [F/L]
- ◊ Value(3) = R1 [FL/rad]
- ◊ Value(4) = R2 [FL/rad]
- ◊ Value(5) = R3 [FL/rad]

This argument only applies when SpringOption = 1

CSys

Type:Â SystemString

The name of the coordinate system in which the property is defined.

This argument only applies when SpringOption = 1

SoilProfile

Type:Â SystemString

The name of an existing Soil Profile

This argument only applies when SpringOption = 2

Footring

Type:Â SystemString

The name of an existing Isolated Column Footring

This argument only applies when SpringOption = 2

Period

Type:Â SystemDouble

The first-mode time period [sec]

This argument only applies when SpringOption = 2

color

Type:Â SystemInt32

The display color for the property specified as an integer

notes

Type:Â SystemString

The notes, if any, assigned to the property

iGUID

Type:Â SystemString

The GUID (global unique identifier), if any, assigned to the property

Return Value

Type:Â Int32

Returns zero if the property is retrieved successfully, otherwise returns nonzero

▲ Remarks

▲ Examples

VB

Copy

Dim LinkAngles As Double()
Dim returnValue As Integer
```

```
returnValue = instance.SetLinks(Name,
    NumberLinks, LinkNames, LinkAxialDirs,
    LinkAngles)
```

```
int SetLinks(
    String^ Name,
    int NumberLinks,
    array<String^>^% LinkNames,
    array<int>^% LinkAxialDirs,
    array<double>^% LinkAngles
)
```

```
abstract SetLinks :
    Name : string *
    NumberLinks : int *
    LinkNames : string[] byref *
    LinkAxialDirs : int[] byref *
```

LinkAngles : float[] byref -> int

Parameters

Name

Type:Â SystemString

The name of an existing point spring property. This spring property must be of type option 1

NumberLinks

Type:Â SystemInt32

The number of links

LinkNames

Type:Â SystemString

This array contains the names of existing link properties

LinkAxialDirs

Type:Â SystemInt32

This array contains integers representing the axial direction of their respective link properties and can take one of six values:

◇ -1 : -X

◇ -2 : -Y

◇ -3 : -Z

◇ 1 : +X

◇ 2 : +Y

◇ 3 : +Z

LinkAngles

Type:Â SystemDouble

This array contains the axis 2 angles of their respective link properties [deg]

Return Value

Type:Â Int32

Returns zero if the links are successfully set, otherwise returns nonzero

▲ Remarks

▲ Examples

VB

Copy

```
Public Sub Example()
    Dim SapModel As cSapModel
    Dim EtabsObject As cOAPI
    Dim ret As Integer = -1

    'create ETABS object
    Dim myHelper as cHelper = New Helper
    EtabsObject = myHelper.CreateObjectProgID("CSI.ETABS.API.ETABSObject")

    'start ETABS application
    ret = EtabsObject.ApplicationStart()

    'create SapModel object
    SapModel = EtabsObject.SapModel

    'initialize model
    ret = SapModel.InitializeNewModel()
```

Introduction

```
'create steel deck template model
ret = SapModel.File.NewSteelDeck(4, 12, 12, 4, 4, 24, 24)

'define new link property
Dim DOF() As Boolean
Dim Fixed() As Boolean
Dim Ke() As Double
Dim Ce() As Double
ReDim DOF(5)
ReDim Fixed(5)
ReDim Ke(5)
ReDim Ce(5)
DOF(0) = True
Ke(0) = 12
ret = SapModel.PropLink.SetLinear("myLink1", DOF, Fixed, Ke, Ce, 0, 0)

'define new spring property
Dim k() as Double
ReDim k(5)
k(2) = 1
ret = SapModel.PropPointSpring.SetPointSpringProp("myPtSpringProp", 1, k)

'set links in spring property
Dim NumberLinks As Integer
Dim LinkNames() As String
Dim LinkAxialDirs() As Integer
Dim LinkAngles() As Double

NumberLinks = 1
ReDim LinkNames(NumberLinks - 1)
ReDim LinkAxialDirs(NumberLinks - 1)
ReDim LinkAngles(NumberLinks - 1)
LinkNames(0) = "myLink1"
LinkAxialDirs(0) = -2
LinkAngles(0) = 45

ret = SapModel.PropPointSpring.SetLinks("myPtSpringProp", NumberLinks, LinkNames, LinkAxialDirs)

'close ETABS
EtabsObject.ApplicationExit(False)

'clean up variables
SapModel = Nothing
EtabsObject = Nothing

End Sub
```

CSI API ETABS v1

cPropPointSpringAddLanguageSpecificTextSet("LST4

Method

Creates a new named point spring property, or modifies an existing named point spring property

Namespace: Â ETABSV1

Assembly: Â ETABSV1 (in ETABSV1.dll) Version: 1.0.0.0 (1.24.0.0)

▲ Syntax

C#

VB

C++

F#

Copy

```
int SetPointSpringProp(
    string Name,
    int SpringOption,
    ref double[] k,
    string CSys = "",
    string SoilProfile = "",
    string Footing = "",
    double Period = 0,
    int color = 0,
    string notes = "",
    string iGUID = ""
)
```

```
Function SetPointSpringProp (
    Name As String,
    SpringOption As Integer,
    ByRef k As Double(),
    CSys As String = "",
    SoilProfile As String = "",
    Footing As String = "",
    Period As Double = 0,
    color As Integer = 0,
    notes As String = "",
    iGUID As String = ""
) As Integer
```

```
Dim instance As cPropPointSpring
Dim Name As String
Dim SpringOption As Integer
Dim k As Double()
Dim CSys As String
Dim SoilProfile As String
Dim Footing As String
Dim Period As Double
Dim color As Integer
Dim notes As String
Dim iGUID As String
Dim returnValue As Integer
```

```
returnValue = instance.SetPointSpringProp(Name,
```

cPropPointSpringspan id="LST4D95EDF0_0"AddLanguageSpecificTextSet("LST4D95EDF0_03574=::|nu=.

```
SpringOption, k, CSys, SoilProfile,
Footing, Period, color, notes, iGUID)
```

```
int SetPointSpringProp(
String^ Name,
int SpringOption,
array<double>^% k,
String^ CSys = L"",
String^ SoilProfile = L"",
String^ Footing = L"",
double Period = 0,
int color = 0,
String^ notes = L"",
String^ iGUID = L""
)
```

```
abstract SetPointSpringProp :
    Name : string *
    SpringOption : int *
    k : float[] byref *
    ?CSys : string *
    ?SoilProfile : string *
    ?Footing : string *
    ?Period : float *
    ?color : int *
    ?notes : string *
    ?iGUID : string
(* Defaults:
    let _CSys = defaultArg CSys ""
    let _SoilProfile = defaultArg SoilProfile ""
    let _Footing = defaultArg Footing ""
    let _Period = defaultArg Period 0
    let _color = defaultArg color 0
    let _notes = defaultArg notes ""
    let _iGUID = defaultArg iGUID ""
*)
-> int
```

Parameters

Name

Type: [SystemString](#)

The name of the point spring property. If this is an existing property, that property is modified; otherwise, a new property is added.

SpringOption

Type: [SystemInt32](#)

The spring stiffness option, either 1 or 2:

1. User Specified / Link Properties
2. Based on Soil Profile and Footing Dimensions

k

Type: [SystemDouble](#)

This is an array of six spring stiffness values:

- ◊ Value(0) = U1 [F/L]
- ◊ Value(1) = U2 [F/L]
- ◊ Value(2) = U3 [F/L]
- ◊ Value(3) = R1 [FL/rad]
- ◊ Value(4) = R2 [FL/rad]

◇ Value(5) = R3 [FL/rad]

This argument only applies when SpringOption = 1

CSys (Optional)

Type:Â SystemString

The name of the coordinate system in which the property is defined. If this item not defined or left blank, the Global coordinate system is assumed.

This argument only applies when SpringOption = 1

SoilProfile (Optional)

Type:Â SystemString

The name of an existing Soil Profile

This argument only applies when SpringOption = 2

Footing (Optional)

Type:Â SystemString

The name of an existing Isolated Column Footing

This argument only applies when SpringOption = 2

Period (Optional)

Type:Â SystemDouble

The first-mode time period [sec]

This argument only applies when SpringOption = 2

color (Optional)

Type:Â SystemInt32

The display color for the property specified as an integer

notes (Optional)

Type:Â SystemString

The notes, if any, assigned to the property

iGUID (Optional)

Type:Â SystemString

The GUID (global unique identifier), if any, assigned to the property

Return Value

Type:Â Int32

Returns zero if the property is successfully set, otherwise returns nonzero

▲ Remarks

▲ Examples

VB

Copy

```
Public Sub Example()  
    Dim SapModel As cSapModel  
    Dim EtabsObject As cOAPI  
    Dim ret As Integer = -1
```

'create ETABS object

```
    Dim myHelper as cHelper = New Helper  
    EtabsObject = myHelper.CreateObjectProgID("CSI.ETABS.API.ETABSObject")
```

'start ETABS application

```
    ret = EtabsObject.ApplicationStart()
```

Introduction

```
'create SapModel object
  SapModel = EtabsObject.SapModel

'initialize model
  ret = SapModel.InitializeNewModel()

'create steel deck template model
  ret = SapModel.File.NewSteelDeck(4, 12, 12, 4, 4, 24, 24)

'define new spring property
  Dim k() as Double
  ReDim k(5)
  k(2) = 1
  ret = SapModel.PropPointSpring.SetPointSpringProp("mySpringProp1", 1, k)

'close ETABS
  EtabsObject.ApplicationExit(False)

'clean up variables
  SapModel = Nothing
  EtabsObject = Nothing

End Sub
```

CSI API ETABS v1

cPropRebarAddLanguageSpecificTextSet("LST4762D4 Method

Retrieves the names of all defined rebar properties

Namespace: ETABSv1

Assembly: ETABSv1 (in ETABSv1.dll) Version: 1.0.0.0 (1.24.0.0)

Syntax

C#

VB

C++

F#

Copy

```
int GetNameList(
    ref int NumberNames,
    ref string[] MyName
)
```

```
Function GetNameList (
    ByRef NumberNames As Integer,
    ByRef MyName As String()
) As Integer
```

```
Dim instance As cPropRebar
Dim NumberNames As Integer
Dim MyName As String()
Dim returnValue As Integer
```

```
returnValue = instance.GetNameList(NumberNames,
    MyName)
```

```
int GetNameList(
    int% NumberNames,
    array<String^>^% MyName
)
```

```
abstract GetNameList :
    NumberNames : int byref *
    MyName : string[] byref -> int
```

Parameters

NumberNames

Type: System.Int32

The number of rebar properties

MyName

Type: System.String

This is a one-dimensional array of rebar property names. The MyName array is created as a dynamic, zero-based, array by the API user:

```
Dim MyName() as String
```

cPropRebarspan id="LST4762D4D3_0"AddLanguageSpecificTextSet("LST4762D4D3_0?cpp=3580.");Getf

Introduction

The array is dimensioned to (NumberNames + 1) inside the ETABS program, filled with the names, and returned to the API user.

Return Value

Type: Int32

Returns zero if the data is successfully retrieved, otherwise it returns nonzero

CSI API ETABS v1

cPropTendonAddLanguageSpecificTextSet("LST27762C55_0") Method

Changes the name of an existing tendon property.

Namespace: ETABSv1

Assembly: ETABSv1 (in ETABSv1.dll) Version: 1.0.0.0 (1.24.0.0)

Syntax

C#

VB

C++

F#

Copy

```
int ChangeName(
    string Name,
    string NewName
)
```

```
Function ChangeName (
    Name As String,
    NewName As String
) As Integer
```

```
Dim instance As cPropTendon
Dim Name As String
Dim NewName As String
Dim returnValue As Integer
```

```
returnValue = instance.ChangeName(Name,
    NewName)
```

```
int ChangeName(
    String^ Name,
    String^ NewName
)
```

```
abstract ChangeName :
    Name : string *
    NewName : string -> int
```

Parameters

Name

Type: SystemString

The existing name of a defined tendon property.

NewName

Type: SystemString

The new name for the tendon property.

Return Value

Type: Int32

Returns zero if the new name is successfully applied; otherwise it returns a nonzero value.

▀ Remarks

▀ Examples

VB

Copy

```
Public Sub Example()
    Dim SapModel As cSapModel
    Dim EtabsObject As cOAPI
    Dim ret As Integer = -1
    Dim Name As String

    'create ETABS object
    Dim myHelper as cHelper = New Helper
    EtabsObject = myHelper.CreateObjectProgID("CSI.ETABS.API.ETABSObject")

    'start ETABS application
    ret = EtabsObject.ApplicationStart()

    'create SapModel object
    SapModel = EtabsObject.SapModel

    'initialize model
    ret = SapModel.InitializeNewModel()

    'create steel deck template model
    ret = SapModel.File.NewSteelDeck(4,12,12,4,4,24,24)

    'add tendon material
    ret = SapModel.PropMaterial.AddQuick(Name, eMatType.Tendon, , , , , eMatTypeTendon.ASTM_)

    'set new tendon property
    ret = SapModel.PropTendon.SetProp("T1", Name, 1, 2.25)

    'change name of tendon property
    ret = SapModel.PropTendon.ChangeName("T1", "MyTendon")

    'close ETABS
    EtabsObject.ApplicationExit(False)

    'clean up variables
    SapModel = Nothing
    EtabsObject = Nothing
End Sub
```

CSI API ETABS v1

cPropTendonAddLanguageSpecificTextSet("LSTA520F9AF_0?cpp3595") Method

Deletes a specified tendon property.

Namespace: ETABSv1

Assembly: ETABSv1 (in ETABSv1.dll) Version: 1.0.0.0 (1.24.0.0)

▲ Syntax

C#

VB

C++

F#

Copy

```
int Delete(
    string Name
)
```

```
Function Delete (
    Name As String
) As Integer
```

```
Dim instance As cPropTendon
Dim Name As String
Dim returnValue As Integer
```

```
returnValue = instance.Delete(Name)
```

```
int Delete(
    String^ Name
)
```

```
abstract Delete :
    Name : string -> int
```

Parameters

Name

Type: SystemString

The name of an existing tendon property.

Return Value

Type: Int32

Returns zero if the property is successfully deleted; otherwise it returns a nonzero value. It returns an error if the specified property can not be deleted, for example, if it is assigned to an existing object.

▲ Remarks

▲ Examples

VB

Copy

cPropTendonspan id="LSTA520F9AF_0"AddLanguageSpecificTextSet("LSTA520F9AF_0?cpp3595");De

Introduction

```
Public Sub Example()  
    Dim SapModel As cSapModel  
    Dim EtabsObject As cOAPI  
    Dim ret As Integer = -1  
    Dim Name As String  
  
    'create ETABS object  
    Dim myHelper as cHelper = New Helper  
    EtabsObject = myHelper.CreateObjectProgID("CSI.ETABS.API.ETABSObject")  
  
    'start ETABS application  
    ret = EtabsObject.ApplicationStart()  
  
    'create SapModel object  
    SapModel = EtabsObject.SapModel  
  
    'initialize model  
    ret = SapModel.InitializeNewModel()

CSI API ETABS v1

cPropTendonAddLanguageSpecificTextSet("LST1B4BB78F_0?cpp3597u=.");Get

Method

Retrieves the names of all defined tendon properties in the model.

Namespace: [ETABSV1](#)

Assembly: [ETABSV1](#) (in ETABSV1.dll) Version: 1.0.0.0 (1.24.0.0)

Syntax

[C#](#)

[VB](#)

[C++](#)

[F#](#)

[Copy](#)

```
int GetNameList(
    ref int NumberNames,
    ref string[] MyName
)
```

```
Function GetNameList (
    ByRef NumberNames As Integer,
    ByRef MyName As String()
) As Integer
```

```
Dim instance As cPropTendon
Dim NumberNames As Integer
Dim MyName As String()
Dim returnValue As Integer
```

```
returnValue = instance.GetNameList(NumberNames,
    MyName)
```

```
int GetNameList(
    int% NumberNames,
    array<String^>^% MyName
)
```

```
abstract GetNameList :
    NumberNames : int byref *
    MyName : string[] byref -> int
```

Parameters

NumberNames

Type: [System.Int32](#)

The number of tendon property names retrieved by the program.

MyName

Type: [System.String](#)

This is a one-dimensional array of tendon property names. The MyName array is created as a dynamic, zero-based, array by the API user: Dim MyName() as String

The array is dimensioned to (NumberNames - 1) inside the program, filled with the names, and returned to the API user.

Return Value

Type: Int32

Returns zero if the names are successfully retrieved; otherwise it returns nonzero.

▲ Remarks

▲ Examples

VB

Copy

```
Public Sub Example()
    Dim SapModel As cSapModel
    Dim EtabsObject As cOAPI
    Dim ret As Integer = -1
    Dim Name As String
    Dim NumberNames As Integer
    Dim MyName() As String

    'create ETABS object
    Dim myHelper as cHelper = New Helper
    EtabsObject = myHelper.CreateObjectProgID("CSI.ETABS.API.ETABSObject")

    'start ETABS application
    ret = EtabsObject.ApplicationStart()

    'create SapModel object
    SapModel = EtabsObject.SapModel

    'initialize model
    ret = SapModel.InitializeNewModel()

    'create steel deck template model
    ret = SapModel.File.NewSteelDeck(4,12,12,4,4,24,24)

    'add tendon material
    ret = SapModel.PropMaterial.AddQuick(Name, eMatType.Tendon, , , , , eMatTypeTendon.ASTM_

    'set new tendon property
    ret = SapModel.PropTendon.SetProp("T1", Name, 1, 2.25)

    'get tendon property names
    ret = SapModel.PropTendon.GetNameList(NumberNames, MyName)

    'close ETABS
    EtabsObject.ApplicationExit(False)

    'clean up variables
    SapModel = Nothing
    EtabsObject = Nothing
End Sub
```

)
```

```
abstract GetProp :
    Name : string *
    MatProp : string byref *
    ModelingOption : int byref *
    Area : float byref *
    Color : int byref *
    Notes : string byref *
    GUID : string byref -> int
```

Parameters

Name

Type:Â SystemString

The name of an existing tendon property.

MatProp

Type:Â SystemString

The name of the material property assigned to the tendon property.

ModelingOption

Type:Â SystemInt32

This is either 1 or 2, indicating the tendon modeling option.

Value	Modeling Option
1	Model tendon as loads
2	Model tendon as elements

Area

Type:Â SystemDouble

The cross-sectional area of the tendon. [L2]

Color

Type:Â SystemInt32

Notes

Type:Â SystemString

GUID

Type:Â SystemString

The GUID (global unique identifier), if any, assigned to the property.

Return Value

Type:Â Int32

Returns zero if the property is successfully retrieved; otherwise it returns a nonzero value.

Remarks

Modeling tendons as elements (ModelingOption = 2) is not supported in ETABS.

Examples

VB

Copy

```
Public Sub Example()
    Dim SapModel As cSapModel
    Dim EtabsObject As cOAPI
    Dim ret As Integer = -1
    Dim Name As String
    Dim MatProp As String
```

Introduction

```
Dim ModelingOption As Integer
Dim Area As Double
Dim Color As Integer
Dim Notes As String
Dim GUID As String

'create ETABS object
Dim myHelper as cHelper = New Helper
EtabsObject = myHelper.CreateObjectProgID("CSI.ETABS.API.ETABSObject")

'start ETABS application
ret = EtabsObject.ApplicationStart()

'create SapModel object
SapModel = EtabsObject.SapModel

'initialize model
ret = SapModel.InitializeNewModel()

'create steel deck template model
ret = SapModel.File.NewSteelDeck(4,12,12,4,4,24,24)

'add tendon material
ret = SapModel.PropMaterial.AddQuick(Name, eMatType.Tendon, , , , , eMatTypeTendon.ASTM_)

'set new tendon property
ret = SapModel.PropTendon.SetProp("T1", Name, 1, 2.25)

'get tendon property data
ret = SapModel.PropTendon.GetProp("T1", MatProp, ModelingOption, Area, Color, Notes, GUID)

'close ETABS
EtabsObject.ApplicationExit(False)

'clean up variables
SapModel = Nothing
EtabsObject = Nothing
End Sub
```

CSI API ETABS v1

cPropTendonAddLanguageSpecificTextSet("LST69569 Method

Defines a tendon property

Namespace: ETABSv1

Assembly: ETABSv1 (in ETABSv1.dll) Version: 1.0.0.0 (1.24.0.0)

Syntax

C#

VB

C++

F#

Copy

```
int SetProp(
    string Name,
    string MatProp,
    int ModelingOption,
    double Area,
    int Color = -1,
    string Notes = "",
    string GUID = ""
)
```

```
Function SetProp (
    Name As String,
    MatProp As String,
    ModelingOption As Integer,
    Area As Double,
    Optional As Integer = -1,
    Optional As String = "",
    Optional As String = ""
) As Integer
```

```
Dim instance As cPropTendon
Dim Name As String
Dim MatProp As String
Dim ModelingOption As Integer
Dim Area As Double
Dim Color As Integer
Dim Notes As String
Dim GUID As String
Dim returnValue As Integer
```

```
returnValue = instance.SetProp(Name, MatProp,
    ModelingOption, Area, Color, Notes,
    GUID)
```

```
int SetProp(
    String^ Name,
    String^ MatProp,
    int ModelingOption,
    double Area,
    int Color = -1,
    String^ Notes = L"",
```

cPropTendonspan id="LST6956910D_0"AddLanguageSpecificTextSet("LST6956910D_0?cpp=3606.");Set

```
String^ GUID = L""
)

abstract SetProp :
    Name : string *
    MatProp : string *
    ModelingOption : int *
    Area : float *
    ?Color : int *
    ?Notes : string *
    ?GUID : string
(* Defaults:
    let _Color = defaultArg Color -1
    let _Notes = defaultArg Notes ""
    let _GUID = defaultArg GUID ""
*)
-> int
```

Parameters

Name

Type:Â SystemString

The name of an existing or new tendon property. If this is an existing property, that property is modified; otherwise, a new property is added.

MatProp

Type:Â SystemString

The name of the material property assigned to the tendon property.

ModelingOption

Type:Â SystemInt32

This is either 1 or 2, indicating the tendon modeling option.

Value Modeling Option

1 Model tendon as loads

2 Model tendon as elements

Area

Type:Â SystemDouble

The cross-sectional area of the tendon. [L2]

Color (Optional)

Type:Â SystemInt32

Notes (Optional)

Type:Â SystemString

GUID (Optional)

Type:Â SystemString

The GUID (global unique identifier), if any, assigned to the property. If this item is input as Default, the program assigns a GUID to the property

Return Value

Type:Â Int32

Returns zero if the property is successfully defined; otherwise it returns a nonzero value.

Remarks

Modeling tendons as elements (ModelingOption = 2) is not supported in ETABS.

Examples

VB

Copy

```
Public Sub Example()
    Dim SapModel As cSapModel
    Dim EtabsObject As cOAPI
    Dim ret As Integer = -1
    Dim Name As String

    'create ETABS object
    Dim myHelper as cHelper = New Helper
    EtabsObject = myHelper.CreateObjectProgID("CSI.ETABS.API.ETABSObject")

    'start ETABS application
    ret = EtabsObject.ApplicationStart()

    'create SapModel object
    SapModel = EtabsObject.SapModel

    'initialize model
    ret = SapModel.InitializeNewModel()

    'create steel deck template model
    ret = SapModel.File.NewSteelDeck(4,12,12,4,4,24,24)

    'add tendon material
    ret = SapModel.PropMaterial.AddQuick(Name, eMatType.Tendon, , , , , eMatTypeTendon.ASTM_

    'set new tendon property
    ret = SapModel.PropTendon.SetProp("T1", Name, 1, 2.25)

    'close ETABS
    EtabsObject.ApplicationExit(False)

    'clean up variables
    SapModel = Nothing
    EtabsObject = Nothing
End Sub
```

[Top](#)

📁 Methods

⌂

Name

Description

💡

[GetDatabaseUnits](#)

Returns a value from the [eUnits](#) enumeration indicating the database units for the model. All data is internally stored in the model in these units and converted to the present units as needed.

💡

[GetDatabaseUnits_2](#)

Retrieves the database units for the model. All data is internally stored in the model in these units and converted to the present units as needed.

💡

[GetMergeTol](#)

💡

[GetModelFilename](#)

Introduction

Returns a string that represents the filename of the current model, with or without the full path.

⇒ [GetModelFilepath](#)

Returns the filepath of the current model

⇒ [GetModelIsLocked](#)

⇒ [GetPresentCoordSystem](#)

⇒ [GetPresentUnits](#)

Returns a value from the [eUnits](#) enumeration indicating the units presently specified for the model.

⇒ [GetPresentUnits_2](#)

Retrieves the units presently specified for the model

⇒ [GetProgramInfo](#)

Retrieve information about the program

⇒ [GetProjectInfo](#)

Retrieves the project information data.

⇒ [GetVersion](#)

Returns the program version.

⇒ [InitializeNewModel](#)

This function clears the previous model and initializes the program for a new model. If it is later needed, you should save your previous model prior to calling this function.

⇒ [SetMergeTol](#)

⇒ [SetModelIsLocked](#)

Locks or unlocks the model.

⇒ [SetPresentUnits](#)

Sets the display (present) units.

⇒ [SetPresentUnits_2](#)

Specifies the units for the model

⇒ [SetProjectInfo](#)

Sets the data for an item in the project information.

⇒ [TreeIsUpdateSuspended](#)

⇒ [TreeResumeUpdateData](#)

⇒ [TreeSuspendUpdateData](#)

[Top](#)

CSI API ETABS v1

cSapModelAddLanguageSpecificTextSet("LSTC6FB2B Property

Gives access to API calls related to analysis results.

Namespace: [ETABSv1](#)

Assembly: [ETABSv1](#) (in ETABSv1.dll) Version: 1.0.0.0 (1.24.0.0)

▲ Syntax

[C#](#)

[VB](#)

[C++](#)

[F#](#)

[Copy](#)

```
cAnalysisResults Results { get; }
```

```
ReadOnly Property Results As cAnalysisResults
Get
```

```
Dim instance As cSapModel
Dim value As cAnalysisResults
```

```
value = instance.Results
```

```
property cAnalysisResults^ Results {
cAnalysisResults^ get ();
}
```

```
abstract Results : cAnalysisResults with get
```

Property Value

Type: [cAnalysisResults](#)

Return Value

Type: [cAnalysisResults](#)

▲ Remarks

The analysis results are returned in a collection of one-dimensional result arrays. Each result array is created as a dynamic array by the API user. As an example, in VB .NET a dynamic string array is defined by:

VB

[Copy](#)

```
Dim MyArray() as String
```

The array is dimensioned to (NumberResults + 1) inside the program, filled with the result values, and returned to the API user.

The arrays are zero-based. Thus the first result is at array index 0, and the last result is at array index (NumberResults- 1). For example, the StepType() array is filled as:

cSapModelspan id="LSTC6FB2BE3_0"AddLanguageSpecificTextSet("LSTC6FB2BE3_0?cpp=354.");Res

VB

Copy

StepType(0) = Step type for first result returned

VB

Copy

StepType(1) = Step type for second result

VB

Copy

StepType(NumberResults- 1) = Step type for last result

Immediately before requesting results data, it is a good idea to clear the SelectedForOutput flag for all load cases and response combinations and then to set the flag True for those cases and combos for which output is to be generated. This avoids confusion as to which cases and combos are currently selected for output.

CSI API ETABS v1

cSapModel Methods

The cSapModel type exposes the following members.

Methods

Á	Name	Description
⇒	<u>GetDatabaseUnits</u>	Returns a value from the <u>eUnits</u> enumeration indicating the database units for the model. All data is internally stored in the model in these units and converted to the present units as needed.
⇒	<u>GetDatabaseUnits_2</u>	Retrieves the database units for the model. All data is internally stored in the model in these units and converted to the present units as needed.
⇒	<u>GetMergeTol</u>	
⇒	<u>GetModelFilename</u>	Returns a string that represents the filename of the current model, with or without the full path.
⇒	<u>GetModelFilepath</u>	Returns the filepath of the current model
⇒	<u>GetModelIsLocked</u>	
⇒	<u>GetPresentCoordSystem</u>	
⇒	<u>GetPresentUnits</u>	Returns a value from the <u>eUnits</u> enumeration indicating the units presently specified for the model.
⇒	<u>GetPresentUnits_2</u>	Retrieves the units presently specified for the model
⇒	<u>GetProgramInfo</u>	Retrieve information about the program
⇒	<u>GetProjectInfo</u>	Retrieves the project information data.
⇒	<u>GetVersion</u>	Returns the program version.
⇒	<u>InitializeNewModel</u>	This function clears the previous model and initializes the program for a new model. If it is later needed, you should save your previous model prior to calling this function.
⇒	<u>SetMergeTol</u>	
⇒	<u>SetModelIsLocked</u>	Locks or unlocks the model.
⇒	<u>SetPresentUnits</u>	Sets the display (present) units.
⇒	<u>SetPresentUnits_2</u>	Specifies the units for the model
⇒	<u>SetProjectInfo</u>	Sets the data for an item in the project information.
⇒	<u>TreeIsUpdateSuspended</u>	
⇒	<u>TreeResumeUpdateData</u>	
⇒	<u>TreeSuspendUpdateData</u>

CSI API ETABS v1

cSapModelAddLanguageSpecificTextSet("LST2F5F3A17_0?cpp=::3664");GetDatabaseUnits() Method

Returns a value from the [eUnits](#) enumeration indicating the database units for the model. All data is internally stored in the model in these units and converted to the present units as needed.

Namespace: [ETABSv1](#)

Assembly: [ETABSv1](#) (in ETABSv1.dll) Version: 1.0.0.0 (1.24.0.0)

Syntax

[C#](#)

[VB](#)

[C++](#)

[F#](#)

[Copy](#)

```
eUnits GetDatabaseUnits()
```

```
Function GetDatabaseUnits As eUnits
```

```
Dim instance As cSapModel
```

```
Dim returnValue As eUnits
```

```
returnValue = instance.GetDatabaseUnits()
```

```
eUnits GetDatabaseUnits()
```

```
abstract GetDatabaseUnits : unit -> eUnits
```

Return Value

Type: [eUnits](#)

Returns a value from the [eUnits](#) enumeration if successful, otherwise returns zero.

Remarks

Examples

[VB](#)

[Copy](#)

```
Public Sub Example()
    Dim SapModel As cSapModel
    Dim EtabsObject As cOAPI
    Dim ret As Integer = -1

    'create ETABS object
    Dim myHelper as cHelper = New Helper
    EtabsObject = myHelper.CreateObjectProgID("CSI.ETABS.API.ETABSObject")

    'start ETABS application
    ret = EtabsObject.ApplicationStart()

    'create SapModel object
    SapModel = EtabsObject.SapModel

    'initialize model
```

cSapModelspan id="LST2F5F3A17_0"AddLanguageSpecificTextSet("LST2F5F3A17_0?cpp=::3664");GetDatabaseUnits()

Introduction

```
ret = SapModel.InitializeNewModel()  
  
'create steel deck template model  
ret = SapModel.File.NewSteelDeck(4,12,12,4,4,24,24)  
  
'get database units  
Dim dbUnits as eUnits  
dbUnits = SapModel.GetDatabaseUnits()  
  
'run model (this will create the analysis model)  
ret = SapModel.Analyze.RunAnalysis  
  
'close ETABS  
EtabsObject.ApplicationExit(False)  
  
'clean up variables  
SapModel = Nothing  
EtabsObject = Nothing  
End Sub
```

CSI API ETABS v1

cSapModelAddLanguageSpecificTextSet("LSTFD197EB8_0")

Method

Retrieves the database units for the model. All data is internally stored in the model in these units and converted to the present units as needed.

Namespace: [ETABSv1](#)

Assembly: [ETABSv1](#) (in ETABSv1.dll) Version: 1.0.0.0 (1.24.0.0)

Syntax

[C#](#)

[VB](#)

[C++](#)

[F#](#)

[Copy](#)

```
int GetDatabaseUnits_2(
    ref eForce forceUnits,
    ref eLength lengthUnits,
    ref eTemperature temperatureUnits
)
```

```
Function GetDatabaseUnits_2 (
    ByRef forceUnits As eForce,
    ByRef lengthUnits As eLength,
    ByRef temperatureUnits As eTemperature
) As Integer
```

```
Dim instance As cSapModel
Dim forceUnits As eForce
Dim lengthUnits As eLength
Dim temperatureUnits As eTemperature
Dim returnValue As Integer
```

```
returnValue = instance.GetDatabaseUnits_2(forceUnits,
    lengthUnits, temperatureUnits)
```

```
int GetDatabaseUnits_2(
    eForce% forceUnits,
    eLength% lengthUnits,
    eTemperature% temperatureUnits
)
```

```
abstract GetDatabaseUnits_2 :
    forceUnits : eForce byref *
    lengthUnits : eLength byref *
    temperatureUnits : eTemperature byref -> int
```

Parameters

forceUnits

Type: [ETABSv1eForce](#)

A value from the [eForce](#) enumeration

lengthUnits

cSapModelspan id="LSTFD197EB8_0"AddLanguageSpecificTextSet("LSTFD197EB8_0?cpp=:3666.");GetD

Type: ETABSv1eLength

A value from the eLength enumeration

temperatureUnits

Type: ETABSv1eTemperature

A value from the eTemperature enumeration

Return Value

Type: Int32

Returns zero if the units are successfully retrieved, otherwise returns nonzero

▲ Remarks

▲ Examples

VB

Copy

```
Public Sub Example()

CSI API ETABS v1

cSapModelAddLanguageSpecificTextSet("LST1C30AEFA_0?cpp=3p71=");GetModelFilename

Method

Returns a string that represents the filename of the current model, with or without the full path.

Namespace: ETABSV1

Assembly: ETABSV1 (in ETABSV1.dll) Version: 1.0.0.0 (1.24.0.0)

Syntax

C#

VB

C++

F#

Copy

```
string GetModelFilename(
    bool IncludePath = true
)
```

```
Function GetModelFilename (
    Optional IncludePath As Boolean = true
) As String
```

```
Dim instance As cSapModel
Dim IncludePath As Boolean
Dim returnValue As String
```

```
returnValue = instance.GetModelFilename(IncludePath)
```

```
String^ GetModelFilename(
    bool IncludePath = true
)
```

```
abstract GetModelFilename :
    ?IncludePath : bool
(* Defaults:
    let _IncludePath = defaultArg IncludePath true
*)
-> string
```

Parameters

IncludePath (Optional)

Type: System.Boolean

A boolean (True or False) value. When this item is True, the returned filename includes the full path where the file is located.

Return Value

Type: String

Returns a string that represents the filename of the current model, with or without the full path.

cSapModelspan id="LST1C30AEFA_0"AddLanguageSpecificTextSet("LST1C30AEFA_0?cpp=3p71=");GetModelFilename

Remarks

    ByRef ProgramVersion As String,
    ByRef ProgramLevel As String
) As Integer
```

```
Dim instance As cSapModel
Dim ProgramName As String
Dim ProgramVersion As String
Dim ProgramLevel As String
Dim returnValue As Integer
```

```
returnValue = instance.GetProgramInfo(ProgramName,
    ProgramVersion, ProgramLevel)
```

```
int GetProgramInfo(
    String^% ProgramName,
    String^% ProgramVersion,
    String^% ProgramLevel
)
```

```
abstract GetProgramInfo :
    ProgramName : string byref *
    ProgramVersion : string byref *
    ProgramLevel : string byref -> int
```

Parameters

ProgramName

Type: [SystemString](#)

The program name

ProgramVersion

Type:Â SystemString
The program version
ProgramLevel
Type:Â SystemString
The program level

Return Value

Type:Â Int32
Returns zero if the data is successfully retrieved; otherwise it returns a nonzero value.

    array<String^>^% Data
)
```

```
abstract GetProjectInfo :
    NumberItems : int byref *
    Item : string[] byref *
    Data : string[] byref -> int
```

Parameters

NumberItems

Type: [System.Int32](#)

The number of project info items returned.

Item

Type: SystemString

This is an array that includes the name of the project information item.

Data

Type: SystemString

Return Value

Type: Int32

Returns zero if the data is successfully retrieved; otherwise it returns a nonzero value.

CSI API ETABS v1

cSapModelAddLanguageSpecificTextSet("LST148C3CA Method

Returns the program version.

Namespace: ETABSv1

Assembly: ETABSv1 (in ETABSv1.dll) Version: 1.0.0.0 (1.24.0.0)

Syntax

C#

VB

C++

F#

Copy

```
int GetVersion(
    ref string Version,
    ref double MyVersionNumber
)
```

```
Function GetVersion (
    ByRef Version As String,
    ByRef MyVersionNumber As Double
) As Integer
```

```
Dim instance As cSapModel
Dim Version As String
Dim MyVersionNumber As Double
Dim returnValue As Integer
```

```
returnValue = instance.GetVersion(Version,
MyVersionNumber)
```

```
int GetVersion(
    String^% Version,
    double% MyVersionNumber
)
```

```
abstract GetVersion :
    Version : string byref *
    MyVersionNumber : float byref -> int
```

Parameters

Version

Type: SystemString

MyVersionNumber

Type: SystemDouble

The program version number that is used internally by the program and not displayed to the user.

Return Value

Type: Int32

Returns zero if the information is successfully retrieved; otherwise it returns a nonzero value.

▲ **Remarks**

▲ **Examples**

VB

Copy

```
Public Sub Example()
    Dim SapModel As cSapModel
    Dim EtabsObject As cOAPI
    Dim ret As Integer = -1

CSI API ETABS v1

cSapModelAddLanguageSpecificTextSet("LSTB8665F52_0")

Method

This function clears the previous model and initializes the program for a new model. If it is later needed, you should save your previous model prior to calling this function.

Namespace: ETABSv1

Assembly: ETABSv1 (in ETABSv1.dll) Version: 1.0.0.0 (1.24.0.0)

Syntax

C#

VB

C++

F#

Copy

```
int InitializeNewModel(
    eUnits Units = eUnits.kip_in_F
)
```

```
Function InitializeNewModel (
    Optional As eUnits = eUnits.kip_in_F
) As Integer
```

```
Dim instance As cSapModel
Dim Units As eUnits
Dim returnValue As Integer
```

```
returnValue = instance.InitializeNewModel(Units)
```

```
int InitializeNewModel(
    eUnits Units = eUnits::kip_in_F
)
```

```
abstract InitializeNewModel :
    ?Units : eUnits
(* Defaults:
    let _Units = defaultArg Units eUnits.kip_in_F
*)
-> int
```

Parameters

Units (Optional)

Type: ETABSv1eUnits

This is the display (present) units for the new model. Possible items in the eUnits enumeration.

All numerical items are shown in the GUI in display units. All API calls use display units.

All data stored internally in the model is in database units. If the length unit in the display units is inch or feet, the database units will be set to lb_in_F.

cSapModelspan id="LSTB8665F52_0"AddLanguageSpecificTextSet("LSTB8665F52_0?cpp=::|0007");Initiali

Otherwise, the database units are set to N_mm_C.

Return Value

Type: Int32

The function returns zero if a new model is successfully initialized, otherwise it returns a nonzero value.

Remarks

After calling the InitializeNewModel function, it is not necessary to also call the ApplicationStart function because the functionality of the ApplicationStart function is included in the InitializeNewModel function.

Examples

VB

Copy

```
Public Sub Example()
    Dim SapModel As cSapModel
    Dim EtabsObject As cOAPI
    Dim ret As Integer = -1

    'create ETABS object
    Dim myHelper as cHelper = New Helper
    EtabsObject = myHelper.CreateObjectProgID("CSI.ETABS.API.ETABSObject")

    'start ETABS application
    ret = EtabsObject.ApplicationStart()

    'create SapModel object
    SapModel = EtabsObject.SapModel

    'initialize model
    ret = SapModel.InitializeNewModel()

    'create steel deck template model
    ret = SapModel.File.NewSteelDeck(4,12,12,4,4,24,24)

    'run model (this will create the analysis model)
    ret = SapModel.Analyze.RunAnalysis

    'close ETABS
    EtabsObject.ApplicationExit(False)

    'clean up variables
    SapModel = Nothing
    EtabsObject = Nothing
End Sub
```

CSI API ETABS v1

cSapModelAddLanguageSpecificTextSet("LSTF76E04B6_0?cpp=::3692");SetM

Method

Locks or unlocks the model.

Namespace: ETABSV1

Assembly: ETABSV1 (in ETABSV1.dll) Version: 1.0.0.0 (1.24.0.0)

▲ Syntax

C#

VB

C++

F#

Copy

```
int SetModelIsLocked(
    bool Lockit
)
```

```
Function SetModelIsLocked (
    Lockit As Boolean
) As Integer
```

```
Dim instance As cSapModel
Dim Lockit As Boolean
Dim returnValue As Integer
```

```
returnValue = instance.SetModelIsLocked(Lockit)
```

```
int SetModelIsLocked(
    bool Lockit
)
```

```
abstract SetModelIsLocked :
    Lockit : bool -> int
```

Parameters

Lockit

Type: SystemBoolean

The item is True if the model is to be locked and False if it is to be unlocked.

Return Value

Type: Int32

Returns zero if the locked status of the model is successfully set. Otherwise it returns a nonzero value.

▲ Remarks

With some exceptions, definitions and assignments can not be changed in a model while the model is locked. If an attempt is made to change a definition or assignment while the model is locked and that change is not allowed in a locked model, an error will be returned.

cSapModelspan id="LSTF76E04B6_0"AddLanguageSpecificTextSet("LSTF76E04B6_0?cpp=::3692");SetM

Examples

VB

Copy

```
Public Sub Example()
    Dim SapModel As cSapModel
    Dim EtabsObject As cOAPI
    Dim ret As Integer = -1

    'create ETABS object
    Dim myHelper as cHelper = New Helper
    EtabsObject = myHelper.CreateObjectProgID("CSI.ETABS.API.ETABSObject")

    'start ETABS application
    ret = EtabsObject.ApplicationStart()

    'create SapModel object
    SapModel = EtabsObject.SapModel

    'initialize model
    ret = SapModel.InitializeNewModel()

    'create steel deck template model
    ret = SapModel.File.NewSteelDeck(4,12,12,4,4,24,24)

    'Lock model
    ret = SapModel.SetModelIsLocked(True)

    'close ETABS
    EtabsObject.ApplicationExit(False)

    'clean up variables
    SapModel = Nothing
    EtabsObject = Nothing
End Sub
```

CSI API ETABS v1

cSapModelAddLanguageSpecificTextSet("LST4C893D5D_0")

Method

Sets the data for an item in the project information.

Namespace: ETABSv1

Assembly: ETABSv1 (in ETABSv1.dll) Version: 1.0.0.0 (1.24.0.0)

Syntax

C#

VB

C++

F#

Copy

```
int SetProjectInfo(
    string Item,
    string Data
)
```

```
Function SetProjectInfo (
    Item As String,
    Data As String
) As Integer
```

```
Dim instance As cSapModel
Dim Item As String
Dim Data As String
Dim returnValue As Integer
```

```
returnValue = instance.SetProjectInfo(Item,
    Data)
```

```
int SetProjectInfo(
    String^ Item,
    String^ Data
)
```

```
abstract SetProjectInfo :
    Item : string *
    Data : string -> int
```

Parameters

Item

Type: SystemString

The name of the project information item to be set.

Data

Type: SystemString

Return ValueType: Int32

Returns zero if the data is successfully set; otherwise it returns a nonzero value.

▲ **Remarks**▲ **Examples**

VB

Copy

```
Public Sub Example()
    Dim SapModel As cSapModel

```
public interface cSelect
```

```
Public Interface cSelect
```

```
Dim instance As cSelect
```

```
public interface class cSelect
```

```
type cSelect = interface end
```

The cSelect type exposes the following members.

▲ Methods

▲	Name	Description
◆	All	Selects or deselects all objects in the model.
◆	ClearSelection	Deselects all objects in the model.
◆	GetSelected	Retrieves a list of selected objects
◆	Group	Selects or deselects all objects in the specified group.
◆	InvertSelection	Deselects all selected objects and selects all unselected objects; that is, it inverts the selection
◆	PreviousSelection	Restores the previous selection

CSI API ETABS v1

cSelectAddLanguageSpecificTextSet("LSTC26FCA50_0") Method

Selects or deselects all objects in the model.

Namespace: [ETABSv1](#)

Assembly: [ETABSv1](#) (in ETABSv1.dll) Version: 1.0.0.0 (1.24.0.0)

▲ Syntax

[C#](#)

[VB](#)

[C++](#)

[F#](#)

[Copy](#)

```
int All(
    bool Deselect = false
)
```

```
Function All (
    Optional Deselect As Boolean = false
) As Integer
```

```
Dim instance As cSelect
Dim Deselect As Boolean
Dim returnValue As Integer
```

```
returnValue = instance.All(Deselect)
```

```
int All(
    bool Deselect = false
)
```

```
abstract All :
    ?Deselect : bool
(* Defaults:
    let _Deselect = defaultArg Deselect false
*)
-> int
```

Parameters

Deselect (Optional)

Type: [System.Boolean](#)

The item is False if objects are to be selected and True if they are to be deselected.

Return Value

Type: [Int32](#)

Returns zero if the selection is successfully completed, otherwise it returns nonzero.

```

```
returnValue = instance.GetSelected(NumberItems,
    ObjectType, ObjectName)
```

```
int GetSelected(
    int% NumberItems,
    array<int>^% ObjectType,
    array<String>^% ObjectName
)
```

```
abstract GetSelected :
    NumberItems : int byref *
    ObjectType : int[] byref *
    ObjectName : string[] byref -> int
```

Parameters

NumberItems

Type: System.Int32

The number of selected objects

ObjectType

Type: SystemInt32

This is an array that includes the object type of each selected object.

1. Point object
2. Frame object
3. Cable object
4. Tendon object
5. Area object
6. Solid object
7. Link object

ObjectName

Type: SystemString

This is an array that includes the name of each selected object

Return Value

Type: Int32

Returns zero if the selection list is successfully retrieved, otherwise it returns a nonzero value

CSI API ETABS v1

cSelectAddLanguageSpecificTextSet("LST7509C626_0 Method

Selects or deselects all objects in the specified group.

Namespace: ETABSv1

Assembly: ETABSv1 (in ETABSv1.dll) Version: 1.0.0.0 (1.24.0.0)

Syntax

C#

VB

C++

F#

Copy

```
int Group(
    string Name,
    bool Deselect = false
)
```

```
Function Group (
    Name As String,
    Deselect As Boolean = false
) As Integer
```

```
Dim instance As cSelect
Dim Name As String
Dim Deselect As Boolean
Dim returnValue As Integer
```

```
returnValue = instance.Group(Name, Deselect)
```

```
int Group(
    String^ Name,
    bool Deselect = false
)
```

```
abstract Group :
    Name : string *
    ?Deselect : bool
(* Defaults:
    let _Deselect = defaultArg Deselect false
*)
-> int
```

Parameters

Name

Type: SystemString

The name of an existing group.

Deselect (Optional)

Type: SystemBoolean

Return Value

Type: Int32

Returns zero if the selection is successfully completed, otherwise it returns nonzero.

▲ **Remarks**

▲ **Examples**

VB

Copy

```
Public Sub Example()
    Dim SapModel As cSapModel
    Dim EtabsObject As cOAPI
    Dim ret As Integer = -1

    'create ETABS object
    Dim myHelper as cHelper = New Helper
    EtabsObject = myHelper.CreateObjectProgID("CSI.ETABS.API.ETABSObject")

    'start ETABS application
    ret = EtabsObject.ApplicationStart()

    'create SapModel object
    SapModel = EtabsObject.SapModel

    'initialize model
    ret = SapModel.InitializeNewModel()

    'create steel deck template model
    ret = SapModel.File.NewSteelDeck(4,12,12,4,4,24,24)

    'select group
    ret = SapModel.SelectObj.Group("ALL")

    'close ETABS
    EtabsObject.ApplicationExit(False)

    'clean up variables
    SapModel = Nothing
    EtabsObject = Nothing
End Sub
```

CSI API ETABS v1

cSelectAddLanguageSpecificTextSet("LSTE1F6273C_0") Method

Deselects all selected objects and selects all unselected objects; that is, it inverts the selection

Namespace: [ETABSv1](#)

Assembly: [ETABSv1](#) (in ETABSv1.dll) Version: 1.0.0.0 (1.24.0.0)

▲ Syntax

[C#](#)

[VB](#)

[C++](#)

[F#](#)

[Copy](#)

```
int InvertSelection()
```

```
Function InvertSelection As Integer
```

```
Dim instance As cSelect
```

```
Dim returnValue As Integer
```

```
returnValue = instance.InvertSelection()
```

```
int InvertSelection()
```

```
abstract InvertSelection : unit -> int
```

Return Value

Type: [Int32](#)

Returns zero if the selection is successfully inverted, otherwise it returns nonzero

CSI API ETABS v1

cSpandrelLabelAddLanguageSpecificTextSet("LST11B Method

Changes the name of a defined Spandrel Label

Namespace: ETABSv1

Assembly: ETABSv1 (in ETABSv1.dll) Version: 1.0.0.0 (1.24.0.0)

▲ Syntax

C#

VB

C++

F#

Copy

```
int ChangeName(
    string Name,
    string NewName
)
```

```
Function ChangeName (
    Name As String,
    NewName As String
) As Integer
```

```
Dim instance As cSpandrelLabel
Dim Name As String
Dim NewName As String
Dim returnValue As Integer
```

```
returnValue = instance.ChangeName(Name,
    NewName)
```

```
int ChangeName(
    String^ Name,
    String^ NewName
)
```

```
abstract ChangeName :
    Name : string *
    NewName : string -> int
```

Parameters

Name

Type: SystemString

The existing name of a defined Spandrel Label

NewName

Type: SystemString

The new name for the Spandrel Label

Return Value

Type: Int32

Returns zero if the new name is successfully applied, otherwise it returns a nonzero value.

▀ **Remarks**

▀ **Examples**

VB

Copy

```
Public Sub Example()
    Dim SapModel As cSapModel
    Dim EtabsObject As cOAPI
    Dim ret As Integer = -1

    'create ETABS object
    Dim myHelper as cHelper = New Helper
    EtabsObject = myHelper.CreateObjectProgID("CSI.ETABS.API.ETABSObject")

    'start ETABS application
    ret = EtabsObject.ApplicationStart()

CSI API ETABS v1

cSpandrelLabelAddLanguageSpecificTextSet("LSTE1D Method

Retrieves the names of all defined Spandrel Labels

Namespace: ETABSv1

Assembly: ETABSv1 (in ETABSv1.dll) Version: 1.0.0.0 (1.24.0.0)

Syntax

C#

VB

C++

F#

Copy

```
int GetNameList(
    ref int NumberNames,
    ref string[] MyName,
    ref bool[] IsMultiStory
)
```

```
Function GetNameList (
    ByRef NumberNames As Integer,
    ByRef MyName As String(),
    ByRef IsMultiStory As Boolean()
) As Integer
```

```
Dim instance As cSpandrelLabel
Dim NumberNames As Integer
Dim MyName As String()
Dim IsMultiStory As Boolean()
Dim returnValue As Integer
```

```
returnValue = instance.GetNameList(NumberNames,
    MyName, IsMultiStory)
```

```
int GetNameList(
    int% NumberNames,
    array<String^>^% MyName,
    array<bool>^% IsMultiStory
)
```

```
abstract GetNameList :
    NumberNames : int byref *
    MyName : string[] byref *
    IsMultiStory : bool[] byref -> int
```

Parameters

NumberNames

Type: SystemInt32

The number of Spandrel Labels defined in the program

MyName

Type: SystemString

This is a one-dimensional array of coordinate system names. The MyName array is created as a dynamic, zero-based, array by the API user:

```
Dim MyName() as String
```

The array is dimensioned to (NumberNames + 1) inside the ETABS program, filled with the names, and returned to the API user.

IsMultiStory

Type: SystemBoolean

This values of this array are True or False, indicating whether the associated Spandrel Label spans multiple story levels

Return Value

Type: Int32

Returns zero if the names are successfully retrieved, otherwise it returns nonzero.

▲ Remarks

▲ Examples

VB

Copy

```
Public Sub Example()
    Dim SapModel As cSapModel
    Dim EtabsObject As cOAPI
    Dim ret As Integer = -1

```

```
CGRightY : float[] byref *
CGRightZ : float[] byref -> int
```

Parameters

Name

Type:Â SystemString

The name of an existing spandrel

NumberStories

Type:Â SystemInt32

The number of stories that the spandrel exists on and for which section properties are provided

StoryName

Type:Â SystemString

This is an array that includes the story names at which the spandrel exists

NumAreaObj

Type:Â SystemInt32

This is an array that includes the number of area objects in the spandrel at each story

NumLineObj

Type:Â SystemInt32

This is an array that includes the number of line objects in the spandrel at each story

Length

Type:Â SystemDouble

This is an array that includes the spandrel length

DepthLeft

Type:Â SystemDouble

This is an array that includes the spandrel depth at the left end

ThickLeft

Type:Â SystemDouble

This is an array that includes the spandrel thickness at the left end

DepthRight

Type:Â SystemDouble

This is an array that includes the spandrel depth at the right end

ThickRight

Type:Â SystemDouble

This is an array that includes the spandrel thickness at the right end

MatProp

Type:Â SystemString

This is an array that includes the pier material property

CGLeftX

Type:Â SystemDouble

This is an array that includes the x-coordinate of the center of gravity at the left end of the spandrel

CGLeftY

Type:Â SystemDouble

This is an array that includes the y-coordinate of the center of gravity at the left end of the spandrel

CGLeftZ

Type: SystemDouble

This is an array that includes the z-coordinate of the center of gravity at the left end of the spandrel

CGRightX

Type: SystemDouble

This is an array that includes the x-coordinate of the center of gravity at the right end of the spandrel

CGRightY

Type: SystemDouble

This is an array that includes the y-coordinate of the center of gravity at the right end of the spandrel

CGRightZ

Type: SystemDouble

This is an array that includes the z-coordinate of the center of gravity at the right end of the spandrel

Return Value

Type: Int32

Returns zero if the data is successfully retrieved; otherwise it returns a nonzero value

returnValue = instance.SetSpandrel(Name,
    IsMultiStory)
```

```
int SetSpandrel(
    String^ Name,
    bool IsMultiStory
)
```

```
abstract SetSpandrel :
    Name : string *
    IsMultiStory : bool -> int
```

Parameters

Name

Type: SystemString

The name of a Spandrel Label. If this is the name of an existing spandrel label, that spandrel label is modified, otherwise a new spandrel label is added.

IsMultiStory

Type: SystemBoolean

Whether the Spandrel Label spans multiple story levels

Return Value

Type: Int32

Returns zero if the Spandrel Label is successfully added or modified, otherwise it returns a nonzero value.

▲ **Remarks**

▲ **Examples**

VB

Copy

```
Public Sub Example()
    Dim SapModel As cSapModel
    Dim EtabsObject As cOAPI
    Dim ret As Integer = -1
    Dim NumberNames As Integer
    Dim MyName As String()

    'create ETABS object
    Dim myHelper as cHelper = New Helper
    EtabsObject = myHelper.CreateObjectProgID("CSI.ETABS.API.ETABSObject")

    'start ETABS application
    ret = EtabsObject.ApplicationStart()

    'create SapModel object
    SapModel = EtabsObject.SapModel

    'initialize model
    ret = SapModel.InitializeNewModel()

    'create steel deck template model
    ret = SapModel.File.NewSteelDeck(4, 12, 12, 4, 4, 24, 24)

    'define new Spandrel label
    ret = SapModel.SpandrelLabel.SetSpandrel("MySpandrel", False)

    'modify Spandrel label
    ret = SapModel.SpandrelLabel.SetSpandrel("MySpandrel", True)

    'close ETABS
    EtabsObject.ApplicationExit(False)

    'clean up variables
    SapModel = Nothing
    EtabsObject = Nothing

End Sub
```

CSI API ETABS v1

cStoryAddLanguageSpecificTextSet("LSTC8216A13_0?Method

Retrieves the elevation of a defined story

Namespace: ETABSv1

Assembly: ETABSv1 (in ETABSv1.dll) Version: 1.0.0.0 (1.24.0.0)

Syntax

C#

VB

C++

F#

Copy

```
int GetElevation(
    string Name,
    ref double Elevation
)
```

```
Function GetElevation (
    Name As String,
    ByRef Elevation As Double
) As Integer
```

```
Dim instance As cStory
Dim Name As String
Dim Elevation As Double
Dim returnValue As Integer
```

```
returnValue = instance.GetElevation(Name,
    Elevation)
```

```
int GetElevation(
    String^ Name,
    double% Elevation
)
```

```
abstract GetElevation :
    Name : string *
    Elevation : float byref -> int
```

Parameters

Name

Type: SystemString

The name of a defined story

Elevation

Type: SystemDouble

The elevation of the story

Return ValueType: Int32

Returns zero if the value is successfully retrieved, otherwise returns nonzero.

▲ **Remarks**▲ **Examples**

VB

Copy

```
Public Sub Example()
    Dim SapModel As cSapModel
    Dim EtabsObject As cOAPI

Namespace: ETABSv1

▲ Syntax

C#

VBC++

F#

Copy

```
Function GetNameList (
ByRef NumberNames As Integer,
ByRef MyName As String()
) As Integer
```

```
returnValue = instance.GetNameList(NumberNames,
MyName)
```

```
int GetNameList(
int% NumberNames,
array<String^>% MyName
)
```

Parameters

Type: SystemInt32

MyName

Type: SystemString

```
Dim MyName() as String
```

Introduction

The array is dimensioned to (NumberNames + 1) inside the program, filled with the names, and returned to the API user.

Return Value

Type: Int32

Returns zero if the names are successfully retrieved, otherwise returns nonzero.

Remarks

Examples

VB

Copy

```
Public Sub Example()  
    Dim SapModel As cSapModel  
    Dim EtabsObject As cOAPI

    StoryHeights : float[] byref *
    IsMasterStory : bool[] byref *
    SimilarToStory : string[] byref *
    SpliceAbove : bool[] byref *
    SpliceHeight : float[] byref -> int

```

Parameters

NumberStories

Type:Â SystemInt32

The number of stories. All output arrays have length (NumberStories + 1), because they include values for "Base" , which is not a story.

StoryNames

Type:Â SystemString

The names of the stories. This array will include "Base" .

StoryElevations

Type:Â SystemDouble

The story elevations. The first value is the "Base" elevation.

StoryHeights

Type:Â SystemDouble

The story heights. The first value is the "Base" height.

IsMasterStory

Type:Â SystemBoolean

Whether the story is a master story

SimilarToStory

Type:Â SystemString

If the story is not a master story, which master story the story is similar to

SpliceAbove

Type:Â SystemBoolean

This is True if the story has a splice height, and False otherwise

SpliceHeight

Type:Â SystemDouble

The story splice height

Return Value

Type:Â Int32

Returns zero if the story data is successfully retrieved, otherwise returns nonzero.

▲ Remarks

To change the current tower, use [SetActiveTower\(String\)](#)

Examples

VB

Copy

```
Public Sub Example()
    Dim SapModel As cSapModel
    Dim EtabsObject As cOAPI
    Dim ret As Integer = -1
    Dim NumberStories As Integer
    Dim StoryNames() As String
    Dim StoryHeights() As Double
    Dim StoryElevations() As Double
    Dim IsMasterStory() As Boolean
    Dim SimilarToStory() As String
    Dim SpliceAbove() As Boolean
    Dim SpliceHeight() As Double

    'create ETABS object
    Dim myHelper as cHelper = New Helper
    EtabsObject = myHelper.CreateObjectProgID("CSI.ETABS.API.ETABSObject")

    'start ETABS application
    ret = EtabsObject.ApplicationStart()

    'create SapModel object
    SapModel = EtabsObject.SapModel

    'initialize model
    ret = SapModel.InitializeNewModel()

    'create steel deck template model
    ret = SapModel.File.NewSteelDeck(4,12,12,4,4,24,24)

    'get stories
    ret = SapModel.Story.GetStories(NumberStories, StoryNames, StoryHeights, StoryElevations, _
                                    IsMasterStory, SimilarToStory, SpliceAbove, SpliceHeight)

    'close ETABS
    EtabsObject.ApplicationExit(False)

    'clean up variables
    SapModel = Nothing
    EtabsObject = Nothing
End Sub
```

    SimilarToStory : string[] byref *  
    SpliceAbove : bool[] byref *  
    SpliceHeight : float[] byref *  
    color : int[] byref -> int
```

Parameters

BaseElevation

Type:Â SystemDouble

The elevation of the base [L]

NumberStories

Type:Â SystemInt32

The number of stories

StoryNames

Type:Â SystemString

The names of the stories

StoryElevations

Type:Â SystemDouble

The story elevations [L]

StoryHeights

Type:Â SystemDouble

The story heights [L]

IsMasterStory

Type:Â SystemBoolean

Whether the story is a master story

SimilarToStory

Type:Â SystemString

If the story is not a master story, which master story the story is similar to

SpliceAbove

Type:Â SystemBoolean

This is True if the story has a splice height, and False otherwise

SpliceHeight

Type: SystemDouble

The story splice height [L]

color

Type: SystemInt32

The display color for the story specified as an Integer

Return Value

Type: Int32

Returns zero if the story data is successfully retrieved, otherwise returns nonzero.

    array<double>^ StoryElevations,
    array<double>^ StoryHeights,
```

cStoryspan id="LST7DD6422E_0"AddLanguageSpecificTextSet("LST7DD6422E_0?cpp=::|nu=377;SetStorie

```

array<bool>^ IsMasterStory,
array<String>^ SimilarToStory,
array<bool>^ SpliceAbove,
array<double>^ SpliceHeight
)

abstract SetStories :
    StoryNames : string[] *
    StoryElevations : float[] *
    StoryHeights : float[] *
    IsMasterStory : bool[] *
    SimilarToStory : string[] *
    SpliceAbove : bool[] *
    SpliceHeight : float[] -> int

```

Parameters

StoryNames

Type:Â SystemString

The names of the stories

StoryElevations

Type:Â SystemDouble

The story elevations. This array has length (Number of stories + 1). The first value in the array is the "Base" elevation, commonly 0.

StoryHeights

Type:Â SystemDouble

The story heights. Although this argument is not optional, an empty array may be used, and the heights will be inferred from the StoryElevations array. This array has length (Number of stories), with no value for "Base"

IsMasterStory

Type:Â SystemBoolean

Whether the story is a master story. This array has length (Number of stories), with no value for "Base"

SimilarToStory

Type:Â SystemString

If the story is not a master story, which master story the story is similar to. This array has length (Number of stories), with no value for "Base"

SpliceAbove

Type:Â SystemBoolean

This is True if the story has a splice height, and False otherwise. This array has length (Number of stories), with no value for "Base"

SpliceHeight

Type:Â SystemDouble

The story splice heights, if applicable. This array has length (Number of stories), with no value for "Base"

Return Value

Type:Â Int32

Returns zero if the story data is successfully set, otherwise returns nonzero.

▲ Remarks

To change the current tower, use SetActiveTower(String)

▲ Examples

VB

Copy

```

Public Sub Example()
    Dim SapModel As cSapModel
    Dim EtabsObject As cOAPI
    Dim ret As Integer = -1
    Dim NumberStories As Integer
    Dim StoryNames() As String
    Dim StoryHeights() As Double
    Dim StoryElevations() As Double
    Dim IsMasterStory() As Boolean
    Dim SimilarToStory() As String
    Dim SpliceAbove() As Boolean
    Dim SpliceHeight() As Double

    'create ETABS object
    Dim myHelper as cHelper = New Helper

CSI API ETABS v1

cStoryAddLanguageSpecificTextSet("LST23D9E85D_0") Method

Sets the stories for the current tower.

This function supersedes SetStories. Note: this function can only be used when no objects exist in the model.

Namespace: [ETABSV1](#)

Assembly: [ETABSV1](#) (in ETABSV1.dll) Version: 1.0.0.0 (1.24.0.0)

Syntax

[C#](#)

[VB](#)

[C++](#)

[F#](#)

[Copy](#)

```
int SetStories_2(
double BaseElevation,
int NumberStories,
ref string[] StoryNames,
ref double[] StoryHeights,
ref bool[] IsMasterStory,
ref string[] SimilarToStory,
ref bool[] SpliceAbove,
ref double[] SpliceHeight,
ref int[] color
)
```

```
Function SetStories_2 (
BaseElevation As Double,
NumberStories As Integer,
ByRef StoryNames As String(),
ByRef StoryHeights As Double(),
ByRef IsMasterStory As Boolean(),
ByRef SimilarToStory As String(),
ByRef SpliceAbove As Boolean(),
ByRef SpliceHeight As Double(),
ByRef color As Integer()
) As Integer
```

```
Dim instance As cStory
Dim BaseElevation As Double
Dim NumberStories As Integer
Dim StoryNames As String()
Dim StoryHeights As Double()
Dim IsMasterStory As Boolean()
Dim SimilarToStory As String()
Dim SpliceAbove As Boolean()
Dim SpliceHeight As Double()
Dim color As Integer()
Dim returnValue As Integer
```

```
returnValue = instance.SetStories_2(BaseElevation,

array<double>^% SpliceHeight,  
array<int>^% color  
)
```

```
abstract SetStories_2 :  
    BaseElevation : float *  
    NumberStories : int *  
    StoryNames : string[] byref *  
    StoryHeights : float[] byref *  
    IsMasterStory : bool[] byref *  
    SimilarToStory : string[] byref *  
    SpliceAbove : bool[] byref *  
    SpliceHeight : float[] byref *  
    color : int[] byref -> int
```

Parameters

BaseElevation

Type:Â SystemDouble

The elevation of the base [L]

NumberStories

Type:Â SystemInt32

The number of stories

StoryNames

Type:Â SystemString

The names of the stories

StoryHeights

Type:Â SystemDouble

The story heights [L]

IsMasterStory

Type:Â SystemBoolean

Whether the story is a master story

SimilarToStory

Type:Â SystemString

If the story is not a master story, which master story the story is similar to

SpliceAbove

Type:Â SystemBoolean

This is True if the story has a splice height, and False otherwise

SpliceHeight

Type:Â SystemDouble

The story splice height [L]

color

Type:Â SystemInt32

The display color for the story specified as an Integer

Return ValueType: Int32

Returns zero if the story data is successfully set, otherwise returns nonzero.

NumberItems, TendonName, DatumOffset,
ItemType)
```

```
int GetDatumOffset(  
String^ Name,  
int% NumberItems,  
array<String^>% TendonName,  
array<double>% DatumOffset,  
eItemType ItemType = eItemType::Objects  
)
```

cTendonObjspan id="LST23791B1_0"AddLanguageSpecificTextSet("LST23791B1_0?cpp=::|nu3791tGetData

```

        ?ItemType : eItemType
(* Defaults:
    let _ItemType = defaultArg ItemType eItemType.Objects
*)
-> int

```

Parameters

Name

Type:Â SystemString

The name of an existing tendon object or group, depending on the value of the ItemType item.

NumberItems

Type:Â SystemInt32

The total number of items retrieved for the specified tendon objects, all the retrieved data arrays are dimensioned to this length

TendonName

Type:Â SystemString

The name of the tendon object associated with each value.

DatumOffset

Type:Â SystemDouble

Global Z dist from model datum to tendon layout datum, positive in positive global Z direction [L]

ItemType (Optional)

Type:Â ETABSv1eItemType

This is one of the following items in the eItemType enumeration:

◊ Object = 0

◊ Group = 1

◊ SelectedObjects = 2

If this item is Objects, data is retrieved for the tendon object specified by the Name item.

If this item is Group, data is retrieved for all tendon objects in the group specified by the Name item.

If this item is SelectedObjects, data is retrieved for all selected tendon objects, and the Name item is ignored.

Return Value

Type:Â Int32

Returns zero if the data is successfully retrieved; otherwise it returns a nonzero value.

▲ Remarks

This function is intended for internal use

eItemType ItemType = eItemType::Objects
)

abstract GetDrawingPoint :
    Name : string *
    NumberItems : int byref *
    TendonName : string[] byref *
    DrawingPointID : string[] byref *
    gx : float[] byref *
    gy : float[] byref *
    gz : float[] byref *
    ?ItemType : eItemType
(* Defaults:
    let _ItemType = defaultArg ItemType eItemType.Objects
*)
-> int

```

Parameters

Name

Type: SystemString

The name of an existing tendon object or group, depending on the value of the ItemType item.

NumberItems

Type: SystemInt32

The total number of items retrieved for the specified tendon objects, all the retrieved data arrays are dimensioned to this length

TendonName

Type: SystemString

The name of the tendon object associated with each value.

DrawingPointID

Type: SystemString

The drawing point ID associated with each value

gx

Type: SystemDouble

Global x value [L]

gy

Type: SystemDouble

Global y value [L]

gz

Type: SystemDouble

Global z value [L]

ItemType (Optional)

Type: ETABSv1eItemType

This is one of the following items in the eItemType enumeration:

◊ Object = 0

◊ Group = 1

◊ SelectedObjects = 2

If this item is Objects, data is retrieved for the tendon object specified by the Name item.

Introduction

If this item is Group, data is retrieved for all tendon objects in the group specified by the Name item.

If this item is SelectedObjects, data is retrieved for all selected tendon objects, and the Name item is ignored.

Return Value

Type: Int32

Returns zero if the data is successfully retrieved; otherwise it returns a nonzero value.

Remarks

Drawing point data may include points from the meshed model not available through GetTendonGeometry(String, Int32, Double, Double, Double, String)

)
```

```
abstract GetGroupAssign :
    Name : string *
    NumberGroups : int byref *
    Groups : string[] byref -> int
```

Parameters

Name

Type: [SystemString](#)

The name of an existing tendon object.

NumberGroups

Type:Â SystemInt32

The number of group names retrieved.

Groups

Type:Â SystemString

This is an array of the names of the groups to which the tendon object is assigned.

Return Value

Type:Â Int32

Returns zero if the group assignments are successfully retrieved, otherwise it returns a nonzero value.

▲ Remarks

▲ Examples

VB

Copy

```
Public Sub Example()
    Dim SapModel As cSapModel
    Dim EtabsObject As cOAPI
    Dim ret As Integer = -1
    Dim Name As String
    Dim NumberGroups As Integer
    Dim Groups() as String

Introduction

LoadPatTransfer, JackFrom, LoadType,
LoadValue, LossSpecification, ItemType)

```
int GetLoadForceStress_1(  
String^ Name,  
int% NumberItems,  
array<String^>^% TendonName,  
array<String^>^% LoadPatFinal,  
array<String^>^% LoadPatTransfer,  
array<int>^% JackFrom,  
array<int>^% LoadType,  
array<double>^% LoadValue,  
array<int>^% LossSpecification,  
eItemType ItemType = eItemType::Objects  
)
```

```
abstract GetLoadForceStress_1 :  
    Name : string *  
    NumberItems : int byref *  
    TendonName : string[] byref *  
    LoadPatFinal : string[] byref *  
    LoadPatTransfer : string[] byref *  
    JackFrom : int[] byref *  
    LoadType : int[] byref *  
    LoadValue : float[] byref *  
    LossSpecification : int[] byref *  
    ?ItemType : eItemType  
(* Defaults:  
    let _ItemType = defaultArg ItemType eItemType.Objects  
*)  
-> int
```

Parameters

Name

Type:Â [SystemString](#)

The name of an existing tendon object or group, depending on the value of the ItemType item.

NumberItems

Type:Â [SystemInt32](#)

The total number of items retrieved for the specified tendon objects

TendonName

Type:Â [SystemString](#)

This is an array that includes the name of the tendon object associated with each value.

LoadPatFinal

Type:Â [SystemString](#)

This is an array that includes the final load pattern name

LoadPatTransfer

Type:Â [SystemString](#)

This is an array that includes the transfer load pattern name

JackFrom

Type:Â [SystemInt32](#)

The jacking location, an item from the following list

1. Start Of Tendon
2. End Of Tendon

3. Both Ends

LoadType

Type: $\hat{A}$ SystemInt32

This is an array that includes either 0 or 1, indicating the type of load

◊ 0 = Force

◊ 1 = Stress

LoadValue

Type: $\hat{A}$ SystemDouble

This is an array that includes the load value. [F] when LoadType is 0, and [F/L2] when LoadType is 1

LossSpecification

Type: $\hat{A}$ SystemInt32

The tendon loss type, an item from the following list

1. Percent

2. Fixed

3. Detailed

Once the loss type is known, the functions GetLossesDetailed(String, Int32, String, Double, Double, Double, Double, Double, Double, eItemType) , GetLossesFixed(String, Int32, String, Double, Double, eItemType), and GetLossesPercent(String, Int32, String, Double, Double, eItemType) can be called to retrieve additional data

ItemType (Optional)

Type: $\hat{A}$ ETABSv1eItemTypeThis is one of the following items in the eItemType enumeration:

◊ Object = 0

◊ Group = 1

◊ SelectedObjects = 2

If this item is Objects, data is retrieved for the tendon object specified by the Name item.

If this item is Group, data is retrieved for all tendon objects in the group specified by the Name item.

If this item is SelectedObjects, data is retrieved for all selected tendon objects, and the Name item is ignored.

Return ValueType: $\hat{A}$ Int32

Returns zero if the data is successfully retrieved; otherwise it returns a nonzero value.

*)
-> int
```

Parameters

Name

Type:Â [SystemString](#)

The name of an existing tendon object or group, depending on the value of the ItemType item.

NumberItems

Type:Â [SystemInt32](#)

The total number of items retrieved for the specified tendon objects

TendonName

Type:Â [SystemString](#)

This is an array that includes the name of the tendon object associated with each value.

CurvatureCoeff

Type:Â [SystemDouble](#)

This is an array that includes the curvature coefficient

WobbleCoeff

Type:Â [SystemDouble](#)

This is an array that includes the wobble coefficient [1/L]

LossAnchorage

Type: SystemDouble

This is an array that includes the anchorage set slip [L]

LossShortening

Type: SystemDouble

This is an array that includes the elastic shortening stress [F/L2]

LossCreep

Type: SystemDouble

This is an array that includes the creep stress [F/L2]

LossShrinkage

Type: SystemDouble

This is an array that includes the shrinkage stress [F/L2]

LossSteelRelax

Type: SystemDouble

This is an array that includes the steel relaxation stress [F/L2]

ItemType (Optional)

Type: ETABSv1eItemType

This is one of the following items in the eItemType enumeration:

◊ Object = 0

◊ Group = 1

◊ SelectedObjects = 2

If this item is Objects, data is retrieved for the tendon object specified by the Name item.

If this item is Group, data is retrieved for all tendon objects in the group specified by the Name item.

If this item is SelectedObjects, data is retrieved for all selected tendon objects, and the Name item is ignored.

Return Value

Type: Int32

Returns zero if the data is successfully retrieved; otherwise it returns a nonzero value.

CSI API ETABS v1

cTendonObjAddLanguageSpecificTextSet("LSTFC82FA4A_0?cpp=38204=");SetMethod

Adds/removes tendon objects to/from a specified group.

Namespace: ETABSv1

Assembly: ETABSv1 (in ETABSv1.dll) Version: 1.0.0.0 (1.24.0.0)

Syntax

C#

VB

C++

F#

Copy

```
int SetGroupAssign(
    string Name,
    string GroupName,
    bool Remove = false,
    eItemType ItemType = eItemType.Objects
)
```

```
Function SetGroupAssign (
    Name As String,
    GroupName As String,
    Remove As Boolean = false,
    ItemType As eItemType = eItemType.Objects
) As Integer
```

```
Dim instance As cTendonObj
Dim Name As String
Dim GroupName As String
Dim Remove As Boolean
Dim ItemType As eItemType
Dim returnValue As Integer
```

```
returnValue = instance.SetGroupAssign(Name,
    GroupName, Remove, ItemType)
```

```
int SetGroupAssign(
    String^ Name,
    String^ GroupName,
    bool Remove = false,
    eItemType ItemType = eItemType::Objects
)
```

```
abstract SetGroupAssign :
    Name : string *
    GroupName : string *
    ?Remove : bool *
    ?ItemType : eItemType
(* Defaults:
    let _Remove = defaultArg Remove false
    let _ItemType = defaultArg ItemType eItemType.Objects
*)
-> int
```

cTendonObjid="LSTFC82FA4A_0"AddLanguageSpecificTextSet("LSTFC82FA4A_0?cpp=38204=");Set

Parameters**Name**

Type:Â SystemString

The name of an existing tendon object or group, depending on the value of the ItemType item.

GroupName

Type:Â SystemString

The name of an existing group to which the assignment is made.

Remove (Optional)

Type:Â SystemBoolean

If this item is False, the specified tendon objects are added to the group specified by the GroupName item. If it is True, the tendon objects are removed from the group.

ItemType (Optional)

Type:Â ETABSv1eItemType

This is one of the items in the eItemType enumeration.

If this item is Objects, the tendon object specified by the Name item is added to/removed from the group specified by the GroupName item.

If this item is Group, the tendon objects in the group specified by the Name item are added to/removed from the group specified by the GroupName item.

If this item is SelectedObjects, all selected tendon objects are added to/removed from the group specified by the GroupName item, and the Name item is ignored.

Return Value

Type:Â Int32

Returns zero if the group assignment is successful; otherwise it returns a nonzero value.

▲ **Remarks**▲ **Examples**

VB

Copy

```
Public Sub Example()
    Dim SapModel As cSapModel
    Dim EtabsObject As cOAPI
    Dim ret As Integer = -1
    Dim Name As String
    Dim NumberGroups As Integer
    Dim Groups() as String

    'create ETABS object
    Dim myHelper as cHelper = New Helper
    EtabsObject = myHelper.CreateObjectProgID("CSI.ETABS.API.ETABSObject")

    'start ETABS application
    ret = EtabsObject.ApplicationStart()

    'create SapModel object
    SapModel = EtabsObject.SapModel
```

Introduction

```
'initialize model
    ret = SapModel.InitializeNewModel()

'create steel deck template model
    ret = SapModel.File.NewSteelDeck(4, 12, 12, 4, 4, 24, 24)

'add tendon object manually with name "TendonObject1"
    Name = "TendonObject1"

'define new groups
    ret = SapModel.GroupDef.SetGroup("Group1")
    ret = SapModel.GroupDef.SetGroup("Group2")

'add tendon object to groups
    ret = SapModel.TendonObj.SetGroupAssign(Name, "Group1")
    ret = SapModel.TendonObj.SetGroupAssign(Name, "Group2")

'get tendon object groups
    ret = SapModel.TendonObj.GetGroupAssign(Name, NumberGroups, Groups)

'close ETABS
    EtabsObject.ApplicationExit(False)

'clean up variables
    SapModel = Nothing
    EtabsObject = Nothing
End Sub
```

CSI API ETABS v1

cViewAddLanguageSpecificTextSet("LST5BDB3BD_0? Method

Refreshes the view for the specified window(s).

Namespace: ETABSv1

Assembly: ETABSv1 (in ETABSv1.dll) Version: 1.0.0.0 (1.24.0.0)

Syntax

C#

VB

C++

F#

Copy

```
int RefreshView(
    int Window = 0,
    bool Zoom = true
)
```

```
Function RefreshView (
    Window As Integer = 0,
    Zoom As Boolean = true
) As Integer
```

```
Dim instance As cView
Dim Window As Integer
Dim Zoom As Boolean
Dim returnValue As Integer
```

```
returnValue = instance.RefreshView(Window,
Zoom)
```

```
int RefreshView(
    int Window = 0,
    bool Zoom = true
)
```

```
abstract RefreshView :
    ?Window : int *
    ?Zoom : bool
(* Defaults:
    let _Window = defaultArg Window 0
    let _Zoom = defaultArg Zoom true
*)
-> int
```

Parameters

Window (Optional)

Type: SystemInt32

This is 0 meaning all windows or an existing window number. It indicates the window(s) to have its view refreshed.

Zoom (Optional)

cViewspan id="LST5BDB3BD_0"AddLanguageSpecificTextSet("LST5BDB3BD_0?cpp=::|nu=."3849RefreshView

Type: System.Boolean

If this item is True, the window zoom is maintained when the view is refreshed.
If it is False, the zoom returns to a default zoom.

Return Value

Type: Int32

Returns zero if the window views are successfully refreshed; otherwise it returns a nonzero value.

▲ Remarks

▲ Examples

VB

Copy

```
Public Sub Example()
    Dim SapModel As cSapModel
    Dim EtabsObject As cOAPI
    Dim ret As Integer = -1

    'create ETABS object

CSI API ETABS v1

Breaking changes in v19.0.0, v19.0.1, and v19.0.2

The following inadvertent changes broke compatibility with earlier API versions:

- In ETABS v19.0.0 (ETABSV1.dll version 1.10 and CSiAPIv1.dll version 1.10), eMatTypeSteel_Chinese_Q345 enumeration got renamed to eMatTypeSteel_Chinese_Q355.
 - ◆ Affected programs:
 - ◊ ETABS v19.0.0, v19.0.1, v19.0.2
 - ◆ Affected API clients:
 - ◊ Compiled COM clients (e.g. VB6, Delphi) failed to start.
 - ◊ Interpreted COM clients (e.g. VBA) failed to compile/run if the affected enumeration was used.
 - ◆ Fix:
 - ◊ eMatTypeSteel_Chinese_Q345 enumeration was reinstated
- ETABS versions 19.0.0, 19.0.1, and 19.0.2 and corresponding ETABSV1.dll versions 1.10, 1.11, and 1.12 and CSiAPIv1.dll versions between 1.9 and 1.13 should not to be used for developing plug-ins and/or API scripts to ensure full compatibility with past and future API versions.
